(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on August 5, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on August 5, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Non-OECD Index, 2015 = 100													**116.0**	*123.5*	*130.0*
Percent change from prior year													**-2.3**	*6.4*	*5.3*
Nominal U.S. Dollar Index (b)															
Index, 2015 Q1 = 100	**111.7**	**115.9**	**111.5**	**108.3**	**106.8**	**106.3**	*107.3*	*107.7*	*108.0*	*108.1*	*108.0*	*107.9*	**111.9**	*107.0*	*108.0*
Percent change from prior year	**2.8**	**5.8**	**0.9**	**-1.9**	**-4.4**	**-8.3**	*-3.8*	*-0.5*	*1.2*	*1.7*	*0.7*	*0.2*	**1.9**	*-4.3*	*0.9*

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on August 5, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) For net imports and inventories “Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products; for consumption “Other Oils” also includes renewable fuels except fuel ethanol.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on August 5, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

Notes: EIA completed modeling and analysis for this report on August 5, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on August 5, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on August 5, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Coal Miner Productivity (Tons per hour)	**6.37**	**6.37**	**6.37**	**6.37**	**6.32**	**6.32**	*6.32*	*6.32*	*6.30*	*6.30*	*6.30*	*6.30*	**6.37**	*6.32*	*6.30*
Total Raw Steel Production (Million short tons per day)	**0.268**	**0.174**	**0.197**	**0.224**	**0.246**	**0.258**	*0.282*	*0.325*	*0.320*	*0.280*	*0.276*	*0.286*	**0.216**	*0.278*	*0.290*
Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.93**	**1.91**	**1.93**	**1.92**	**1.91**	**1.88**	*1.89*	*1.86*	*1.89*	*1.88*	*1.84*	*1.82*	**1.92**	*1.89*	*1.86*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on August 5, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on August 5, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on August 5, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on August 5, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 7d part 1. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continues on Table 7d part 2*

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on August 5, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on August 5, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Table 8a. U.S. Renewable Energy Consumption (Quadrillion Btu)

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW)

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in

- = no data available

Notes: EIA completed modeling and analysis for this report on August 5, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on August 5, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.
Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

- = no data available

SAAR = Seasonally-adjusted annual rate

Notes: EIA completed modeling and analysis for this report on August 5, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

- = no data available

Notes: EIA completed modeling and analysis for this report on August 5, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on August 5, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Appendix to the August 2021 *Short-Term Energy Outlook*

This appendix is prepared in fulfillment of section 1245(d)(4)(A) of the National Defense Authorization Act (NDAA) for Fiscal Year 2012, as amended. The law requires the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy, to submit to Congress a report on the availability and price of petroleum and petroleum products produced in countries other than Iran in the two-month period preceding the submission of the report. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The data in this appendix, therefore, should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

EIA consulted with the U.S. Department of the Treasury, the U.S. Department of State, and the intelligence community in the process of developing the NDAA report, which was previously published as a stand-alone report. Detailed background and contextual information not repeated here can be found in early editions of the NDAA report.

This appendix is published in the *Short-Term Energy Outlook* in even numbered months.

Table a1. Summary of Estimated Petroleum and Other Liquids Quantities

	June 2021	July 2021	Jun 2021 – July 2021 Average	Jun 2020 – July 2020 Average	2018 - 2020 Average
Global Petroleum and Other Liquids (million barrels per day)					
Global Petroleum and Other Liquids Production (a)	96.1	97.4	96.8	89.5	98.5
Global Petroleum and Other Liquids Consumption (b)	98.5	98.8	98.6	91.4	97.7
Biofuels Production (c)	3.1	3.2	3.1	3.0	2.7
Biofuels Consumption (c)	2.6	2.6	2.6	2.6	2.6
Iran Liquid Fuels Production	3.6	3.6	3.6	2.9	3.6
Iran Liquid Fuels Consumption	1.8	1.8	1.8	1.7	1.8
Petroleum and Petroleum Products Produced and Consumed in Countries Other Than Iran (million barrels per day)					
Production (d)	89.5	90.7	90.1	83.6	92.2
Consumption (d)	94.1	94.4	94.2	87.1	93.4
Production minus Consumption	-4.7	-3.7	-4.2	-3.5	-1.1
World Inventory Net Withdrawals Including Iran	2.4	1.4	1.9	1.9	-0.8
Estimated OECD Inventory Level (e) (million barrels)	2,873	2,860	2,866	3,204	2,942
Surplus Production Capacity (million barrels per day)					
OPEC Surplus Crude Oil Production Capacity (f)	7.6	6.9	7.2	8.8	3.4

Note: The term "petroleum and other liquids" encompasses crude oil, lease condensate, natural gas liquids, biofuels, coal-to-liquids, gas-to-liquids, and refinery processing gains, which are important to consider in concert due to the inter-related supply, demand, and price dynamics of petroleum, petroleum products, and related fuels.

(a) Production includes crude oil (including lease condensates), natural gas liquids, other liquids, and refinery processing gains.

(b) Consumption of petroleum by the OECD countries is synonymous with "products supplied," defined in the glossary of the EIA Petroleum Supply Monthly, DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel, and loss, and bunkering.

(c) Biofuels production and consumption are based on EIA estimates as published in the International Energy Statistics. Biofuels production in the third quarter tends to be at its highest level in the year as ethanol production in Brazil reaches its seasonal peak and is typically lowest in the first quarter as seasonal production falls in the South/South-Central region of Brazil.

(d) Global production of petroleum and petroleum products outside of Iran is derived by subtracting biofuels production and Iran liquid fuels production from global liquid fuels production. The same method is used to calculate global consumption outside of Iran.

(e) Estimated inventory level is for OECD countries only.
(f) EIA defines surplus oil production capacity as potential oil production that could be brought online within 30 days and sustained for at least 90 days, consistent with sound business practices. This does not include oil production increases that could not be sustained without degrading the future production capacity of a field.

Independent Statistics & Analysis
U.S. Energy Information Administration

September 2021

Short-Term Energy Outlook

Forecast highlights

Global liquid fuels

- The September *Short-Term Energy Outlook* (STEO) remains subject to heightened levels of uncertainty related to the ongoing recovery from the COVID-19 pandemic. U.S. economic activity continues to rise after reaching multiyear lows in the second quarter of 2020 (2Q20). U.S. gross domestic product (GDP) declined by 3.4% in 2020 from 2019 levels. This STEO assumes U.S. GDP will grow by 6.0% in 2021 and by 4.4% in 2022. The U.S. macroeconomic assumptions in this outlook are based on forecasts by IHS Markit. Our forecast assumes continuing economic growth and increasing mobility. Any developments that would cause deviations from these assumptions would likely cause energy consumption and prices to deviate from our forecast.

- Brent crude oil spot prices averaged $71 per barrel (b) in August, down $4/b from July but up $26/b from August 2020. Brent prices have risen over the past year as result of steady draws on global oil inventories, which averaged 1.8 million barrels per day (b/d) during the first half of 2021 (1H21). We expect Brent prices will remain near current levels for the remainder of 2021, averaging $71/b during the fourth quarter of 2021 (4Q21). In 2022, we expect that growth in production from OPEC+, U.S. tight oil, and other non-OPEC countries will outpace slowing growth in global oil consumption and contribute to Brent prices declining to an annual average of $66/b.

- More than 90% of crude oil production in the Federal Offshore Gulf of Mexico (GOM) was offline in late August following Hurricane Ida. As a result of the outage, GOM production averaged 1.5 million b/d in August, down 0.3 million b/d from July. We expect that crude oil production in the GOM will gradually come back online during September and average 1.2 million b/d for the month before returning to an average of 1.7 million b/d in 4Q21.

- Total U.S. crude oil production averaged 11.3 million b/d in June—the most recent monthly historical data point. We forecast it will remain near that level through the end of 2021 before increasing to an average of 11.7 million b/d in 2022, driven by growth in onshore tight oil production. We expect growth will result from operators beginning to increase rig additions, offsetting production decline rates.

- We estimate that 98.4 million b/d of petroleum and liquid fuels was consumed globally in August, an increase of 5.7 million b/d from August 2020 but still 4.0 million b/d less than in August 2019. We forecast that global consumption of petroleum and liquid fuels will average 97.4 million b/d for all of 2021, which is a 5.0 million b/d increase from 2020, and by an additional 3.6 million b/d in 2022 to average 101.0 million b/d, almost even with 2019 levels.

- U.S. regular gasoline retail prices averaged $3.16 per gallon (gal) in August, the highest monthly average price since October 2014. Recent gasoline price increases reflect rising wholesale gasoline margins amid relatively low gasoline inventories. In addition, recent impacts from Hurricane Ida on several U.S. Gulf Coast refineries are adding upward price pressures in the near term. Estimated gasoline margins surpassed 70 cents/gal in late August. We expect margins will remain elevated in the coming weeks as refining operations as U.S. Gulf Coast remain disrupted. We forecast that retail gasoline prices will average $3.14/gal in September before falling to $2.91/gal, on average, in 4Q21. The expected drop in retail gasoline prices reflects our forecast that gasoline margins will decline from currently elevated levels, both as a result of rising refinery runs as operations return in the first half of September following Hurricane Ida and because of typical seasonality.

- Propane net exports in our forecast average close to 1.2 million b/d for the remainder of 2021, reflecting elevated global demand for U.S. propane and reduced supply from other sources related to ongoing OPEC+ production cuts. In 1H22, we assume global production of propane and butanes will rise as OPEC+ countries increase crude oil production. We expect this increase will limit additional demand for U.S. propane exports, despite growing global propane demand, and keep U.S. net propane exports close to 1.2 million b/d in 2022.

Natural Gas

- In August, the natural gas spot price at Henry Hub averaged $4.07 per million British thermal units (MMBtu), which is up from the July average of $3.84/MMBtu. The August increase reflects hotter temperatures in August on average across the United States compared with July, which caused demand for natural gas in the electric power sector to be higher than expected. Prices rose further in late August when Hurricane Ida caused a decline in natural gas production in the GOM.

- Henry Hub spot prices in August were $1.77/MMBtu higher than in August 2020. Steadily rising natural gas prices over the past year primarily reflects: growth in liquefied natural gas (LNG) exports, rising domestic natural gas consumption for sectors other than electric power, and relatively flat natural gas production. We expect the Henry Hub spot price will average $4.00/MMBtu in 4Q21, as the factors that drove prices higher during August lessen. Forecast Henry Hub prices this winter reach a monthly average

peak of $4.25/MMBtu in January and generally decline through 2022, averaging $3.47/MMBtu for the year amid rising U.S. natural gas production and slowing growth in LNG exports.

- More than 90% of natural gas production in the GOM was offline in late August following Hurricane Ida. GOM production of marketed natural gas averaged 1.9 billion cubic feet per day (Bcf/d) in August, down 0.4 Bcf/d from July. We expect that natural gas production in the GOM will gradually come back online during the first half of September and average 1.5 Bcf/d for the month before returning to an average of 2.1 Bcf/d in 4Q21.

- We expect dry natural gas production will average 92.7 Bcf/d in the United States during 2H21—up from 91.7 Bcf/d in 1H21—and then rise to 95.4 Bcf/d in 2022, driven by natural gas and crude oil prices, which we expect to remain at levels that will support enough drilling to sustain production growth.

- We expect that U.S. consumption of natural gas will average 82.5 (Bcf/d) in 2021, down 0.9% from 2020. U.S. natural gas consumption declines in 2021, in part, because electric power generators switch to coal from natural gas as a result of higher natural gas prices. In 2021, we expect residential and commercial natural gas consumption combined will rise by 1.2 Bcf/d from 2020 and industrial consumption will rise by 0.6 Bcf/d from 2020. Rising natural gas consumption in sectors other than the electric power sector results from expanding economic activity and colder winter temperatures in 2021 compared with 2020. We expect U.S. natural gas consumption will average 82.6 Bcf/d in 2022, mostly unchanged from 2021.

- We estimate that U.S. natural gas inventories ended August 2021 at about 2.9 trillion cubic feet (Tcf), which is 7% lower than the five-year (2016–20) average for this time of year. Injections into storage this summer have been below the previous five-year average, largely as a result of hot weather and high exports occurring amid relatively flat natural gas production. We forecast that inventories will end the 2021 injection season (end of October) at almost 3.6 Tcf, which would be 5% below the five-year average.

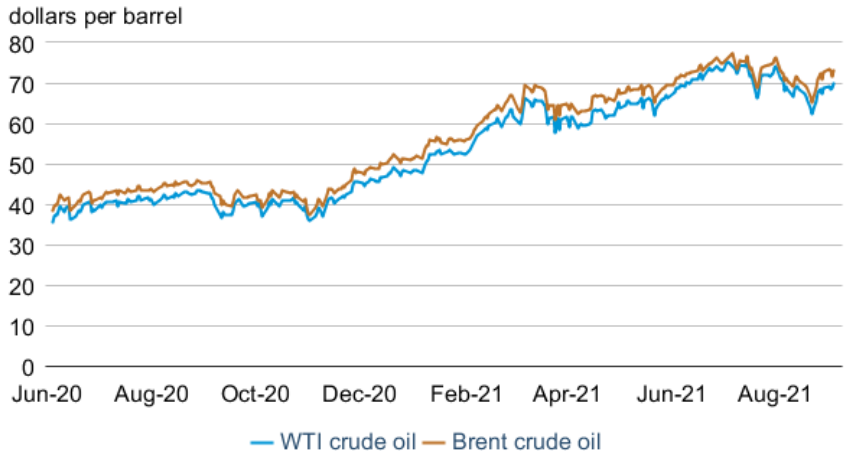
Electricity, coal, renewables, and emissions

- We expect the share of electricity generation produced by natural gas in the United States will average 35% in 2021 and 34% in 2022, down from 39% in 2020. In 2021, the forecast share for natural gas as a generation fuel declines in response to our expectation of a higher delivered natural gas price for electricity generators, which we forecast will average $4.69/MMBtu in 2021 compared with $2.39/MMBtu in 2020. The share of natural gas as a generation fuel also declines through 2022 because of expected increases in generation from renewable sources. As a result of the higher expected natural gas prices, the forecast share of electricity generation from coal rises from 20%

in 2020 to about 24% in both 2021 and 2022. New additions of solar and wind generating capacity are offset somewhat by reduced generation from hydropower this year, resulting in the forecast share of all renewables in U.S. electricity generation to average 20% in 2021, about the same as last year, before rising to 22% in 2022. The nuclear share of U.S. electricity generation declines from 21% in 2020 to 20% in 2021 and to 19% in 2022 as a result of retiring capacity at some nuclear power plants.

- We forecast that planned additions to U.S. wind and solar generating capacity in 2021 and 2022 will increase electricity generation from those sources. We estimate that the U.S. electric power sector added 14.7 gigawatts (GW) of new wind capacity in 2020. We expect 17.6 GW of new wind capacity will come online in 2021 and 6.3 GW in 2022. Utility-scale solar capacity rose by an estimated 10.5 GW in 2020. Our forecast for added utility-scale solar capacity is 15.9 GW for 2021 and 16.3 GW for 2022. We expect significant solar capacity additions in Texas during the forecast period. In addition, we project that after increasing by 4.5 GW in 2020, small-scale solar capacity (systems less than 1 megawatt) will grow 5.8 GW and 5.7 GW in 2021 and 2022 respectively.

- Coal production in our forecast totals 601 million short tons (MMst) in 2021, 66 MMst more than in 2020. We expect demand for coal from the electric power sector to increase by 100 MMst in 2021 as a result of high natural gas prices, and coal exports to increase by 21 MMSt. However, production is unlikely to match those increases in demand in the near term due to capacity constraints at coal mines and limited available transportation. In 2022, we expect coal production to increase by 47 MMst to 648 MMst, despite our forecast of declines in coal consumption, as the production and transportation constraints experienced in 2021 ease. Secondary inventories of coal at electric utilities decreased in 1H21, and we forecast this trend will continue into 2H21 and 2022.



- We estimate that U.S. energy-related carbon dioxide (CO_2) emissions decreased by 11% in 2020 as a result of less energy consumption related to reduced economic activity and responses to COVID-19. For 2021, we forecast energy-related CO_2 emissions will increase about 8% from the 2020 level as economic activity increases and leads to rising energy use. We also expect energy-related CO_2 emissions to rise in 2022 but at a slower rate of 2%. We forecast that after declining by 19% in 2020, coal-related CO_2 emissions will rise by 22% in 2021 and then decrease by 2% in 2022. Short-term changes in energy-related CO_2 can be affected by temperature. A recent STEO supplement examines these dynamics.

Petroleum and natural gas markets review

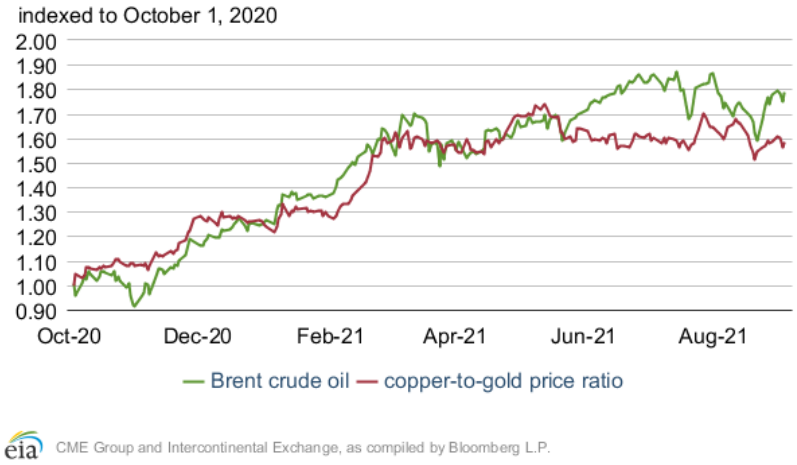
Crude oil

Prices: The front-month futures price for Brent crude oil settled at $73.03 per barrel (b) on September 2, 2021, up 14 cents/b from $72.89/b on August 2. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, decreased by $1.27/b during the same period, settling at $69.99/b on September 2 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices

Sources: Graph by EIA, based on CME Group and Intercontinental Exchange, compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate

Brent and WTI prices both decreased in the first half of August. Increasing OPEC+ crude oil production and flattening global petroleum demand in response to rising COVID-19 cases contributed to the falling crude oil prices. Both benchmarks reached their low points of the month on August 20: Brent at $65/b and WTI at $62/b. Crude oil prices increased in the latter part of the month, and Brent prices are just above where they started August. On a monthly average basis, the Brent spot price in August decreased $4/b compared with July. Although crude oil prices have been gradually increasing in the wake of the initial COVID-19-induced price decrease, August marks the fourth month since May 2020 in which the price has declined. This price decrease may reflect market concerns about the demand impacts of a possibly continuing COVID-19 pandemic and spread of the Delta variant.



In the September STEO, our outlook for global oil markets is largely unchanged from last month, and we continue to expect Brent prices will average $71/b in the fourth quarter of 2021 (4Q21) and $66/b in 2022. One notable change is that we have revised global oil demand expectations down in 2021, accounting for reactions to the proliferation of the Delta variant. We decreased our oil demand expectations primarily in the middle months of 2021, and we reduced forecast global oil demand by an average of 0.5 million b/d in the 3Q21. We now expect global oil

demand to grow by 5.0 million b/d in 2021, down from expected growth of 5.3 million b/d in last month's forecast.

In the near term, the impact of Hurricane Ida on U.S. offshore production, reported incidents at Mexican offshore facilities, and lower-than-expected production in several non-OPEC countries have contributed to lower crude oil production offsetting some of the price effects of lower-than-expected oil demand. How the market will continue to process news about further COVID-19 outbreaks, even in countries with rising numbers of vaccinated people, remains an important uncertainty in our forecast. The production decisions of OPEC+ given an evolving demand outlook will also be a key driver of oil price formation in the coming months. Our forecast assumes that OPEC+ will generally produce at a level that achieves a relatively balanced oil market.

Brent front-month price and copper-to-gold front-month price ratio: Lower crude oil prices in August reflect flattening global petroleum demand, likely driven by responses to rising COVID-19 cases and the spread of the Delta variant. The decline in global commodity prices was not limited to crude oil, however. The copper-to-gold ratio is a measure of the value of copper relative to the value of gold. Copper is a metal whose value increases during periods of growing industrial production and economic activity. Gold is a metal whose value can increase during periods of economic uncertainty or changes in inflation expectations. On August 19, the copper-to-gold ratio (indexed to October 1, 2020, the start of 4Q20) decreased to its lowest level since February 2021 **(Figure 2)**. After rising mostly in tandem with crude oil prices through May 2021, the ratio weakened slightly over the summer, while crude oil prices continued rising through July. The weaker copper-to-gold ratio reflects lower global copper prices over the summer which declined primarily because of responses to rising COVID-19 cases globally. Unlike the copper-to-gold ratio, global crude oil prices were particularly elevated through the summer, reflecting sector-specific impacts on the global crude oil price that are unrelated to other commodities, such as the sustained OPEC+ crude oil production curtailment. However, the recent decreases in crude oil prices have brought its relative change compared to the beginning 4Q20 closer to the change in the copper-to-gold ratio, illustrating the role of macroeconomic demand factors in global commodities markets and the easing of the role of supply side factors that had supported crude oil prices earlier in the summer. Since the August 19 low point for both crude oil and the copper-to-gold ratio, positive reports of reduced COVID-19 cases in China and some other Asian countries have contributed to stronger expectations for global commodities demand, affecting both copper and oil prices.

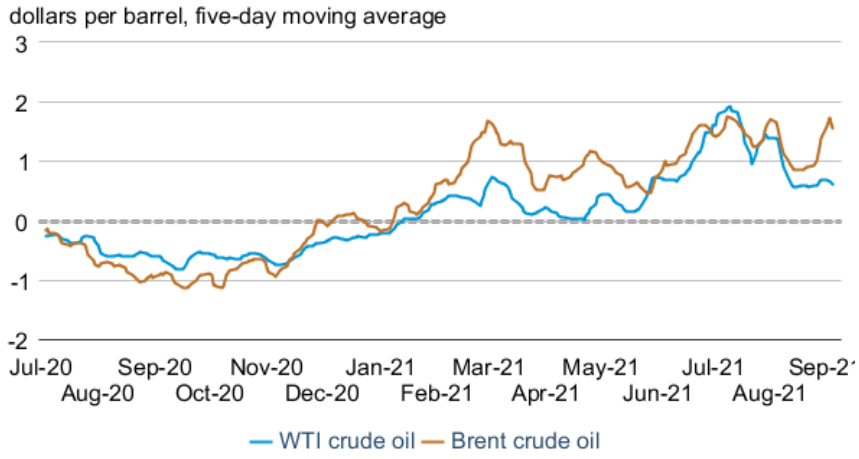


Figure 2. Brent front-month prices and copper-to-gold front-month price ratio

eia CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.

Crude oil front-month to third-month futures price spread: On August 16, the five-day moving average spread between the front-month and third-month futures price for Brent crude oil fell to its lowest level since May 31, 2021 **(Figure 3)**. Although concerns over rising COVID-19 cases introduced downward price pressure and increased volatility into the market in August, the sustained backwardation (when near-term prices are higher than longer-dated ones) in the 1-3 futures spreads indicate that the global petroleum complex is still relying on petroleum inventories to meet demand. High backwardation typically indicates market participants are selling crude oil from storage, resulting in stock draws. The spread for Brent averaged $1.25/b in June and $1.51/b in July, and rarely narrowed below $1.30/b from mid-June through July. Global oil stocks draws from January through July averaged 1.7 million b/d, bolstered by draws of 2.7 million b/d in June. In August, the Brent 1-3 spread narrowed to less than than 90 cents/b. Although the spread remained positive, the decrease likely reflected lower front-month crude oil prices due to temporarily lower demand expectations. We estimate net global stock draws in August were 1.6 million b/d, and we expect them to continue at 1.3 million b/d in September. In line with sustained inventory withdrawals, the Brent 1-3 spread widened back above $1.00/b on August 25 and was $1.56/b as of September 2. The WTI spread experienced a similarly rapid decline in mid-August, reaching its recent low of $0.55/b on August 12, but unlike Brent, it has not increased as much later in the month and has remained below $1.00/b as of September 2.

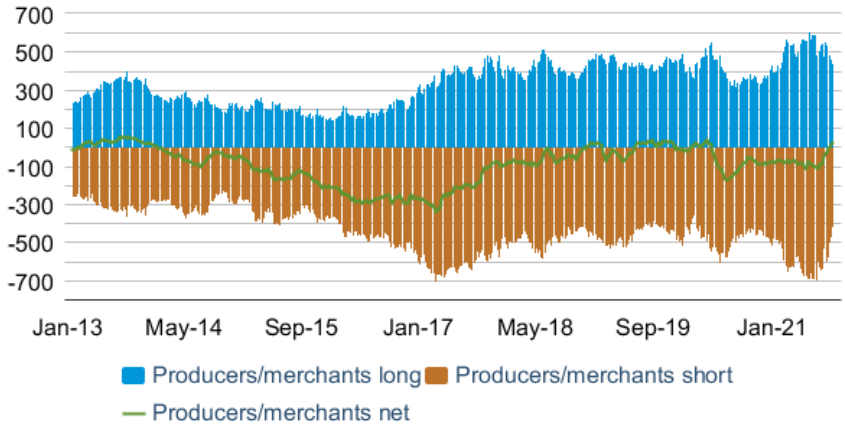

Figure 3. Crude oil front-month to third month futures price spread

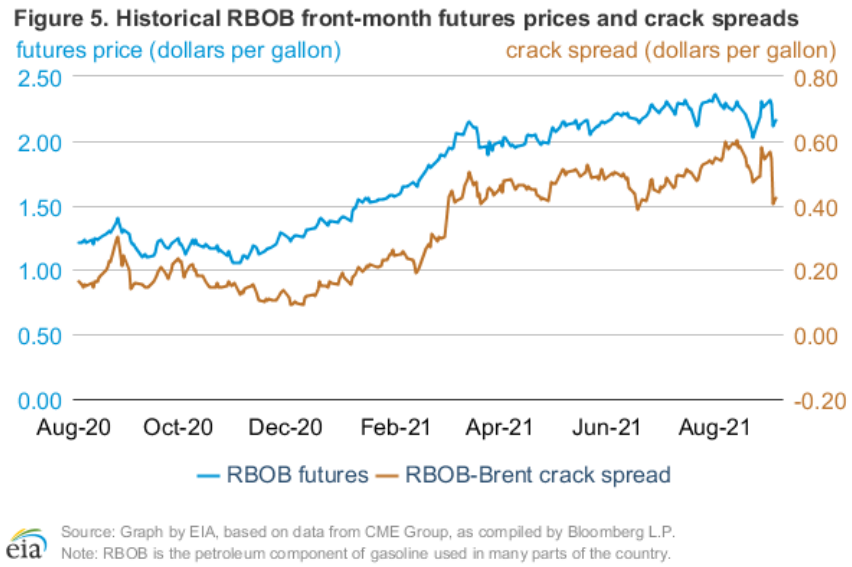
Sources: CME Group, Dubai Mercantile Exchange, and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate

Producer/merchant open interest in WTI futures: Open interest in WTI futures by producers and merchants shifted to a net long position as of the August 24 Commitment of Traders report from the Commodity Futures Trading Commission (CFTC), and overall open interest from producers and merchants has decreased **(Figure 4)**. The lower open interest reflects both an overall reduction in oil commodity futures trading by producers and merchants and a reduction in short positions. Producers and merchants is a CFTC category that include crude oil producers and refiners. These market participants often use futures as a means of financially hedging against crude oil price changes. The net producer/merchant position is often short.

Figure 4. Producer/merchant open interest in WTI futures contracts

Source: U.S. Commodity Futures Trading Commission, Commitment of Traders Report
Note: WTI=West Texas Intermediatee



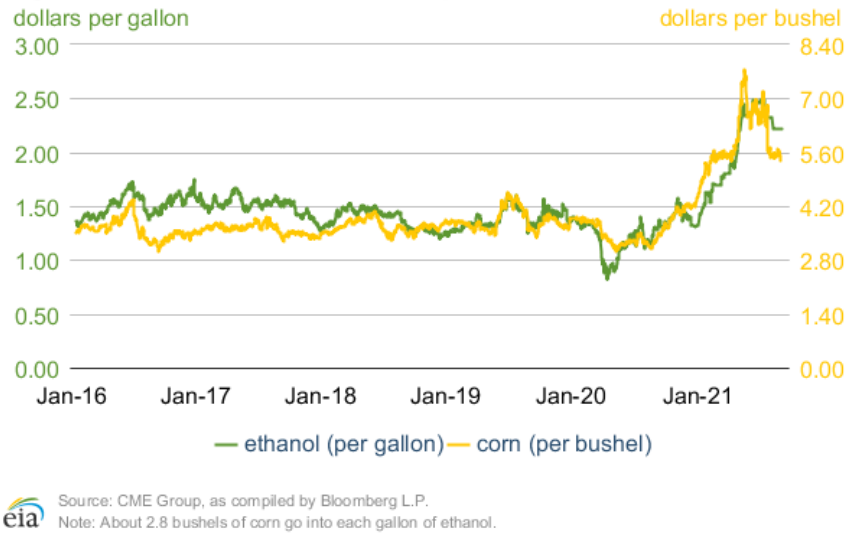
Reduced producer/merchant open interest may reflect an effort by certain upstream producers to reduce their hedged positions because of higher overall crude prices after experiencing particularly high financial losses on hedged crude oil production compared to unhedged barrels

in 1H21. Hedged crude oil can often account for relative losses compared to unhedged production when crude oil prices increase, because producers typically deploy hedges to mitigate downside price risks, but hedged barrels of crude oil do not benefit from any price increases. Because of relatively rapid price increases in 1H21, any barrels that producers hedged at a lower price point resulted in foregoing the benefits of crude oil's rapid price increases during that period.

Some upstream producers such as Devon Energy, Diamondback, and Ovintiv reported losses in their second-quarter financial filings because of hedging at around $50/b. With WTI crude oil spot prices averaging $66/b for the quarter, these companies reported losses on their hedged barrels, usually of around $13/b compared with un-hedged barrels. We previously discussed the decreasing volume of net long positions by money managers in the August STEO, and the decreasing availability of market participants with long positions corresponds with decreased volume of producer/merchant short positions, which had been above 600,000 contracts on a monthly average basis since January 2021, but have since decreased to about 415,000 contracts as of the August 24 report. Producer/merchant open interest in long positions has also decreased compared with earlier in the year, but the overall reduction in long contract volume has been relatively less, contributing to the shift in the net long contract volume to 25,000 contracts. The August 24 report also showed combined producer/merchant open interest had decreased to 856,000 contracts, its lowest volume so far in 2021.

Petroleum products

Gasoline prices: The front-month futures price of RBOB (the petroleum component of gasoline used in many parts of the country) settled at $2.16 per gallon (gal) on September 2, down 11 cents/gal from August 2 **(Figure 5)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) decreased by 11 cents/gal to settle at 42 cents/gal during the same period. The RBOB–Brent crack spread declined by 14 cents/gal on September 1 when the front-month RBOB contract rolled over to October delivery, which reflects winter grade gasoline that is cheaper for refineries to produce. In August, however, the RBOB–Brent crack spread averaged 55 cents/gal, the highest monthly average crack spread since July 2015.

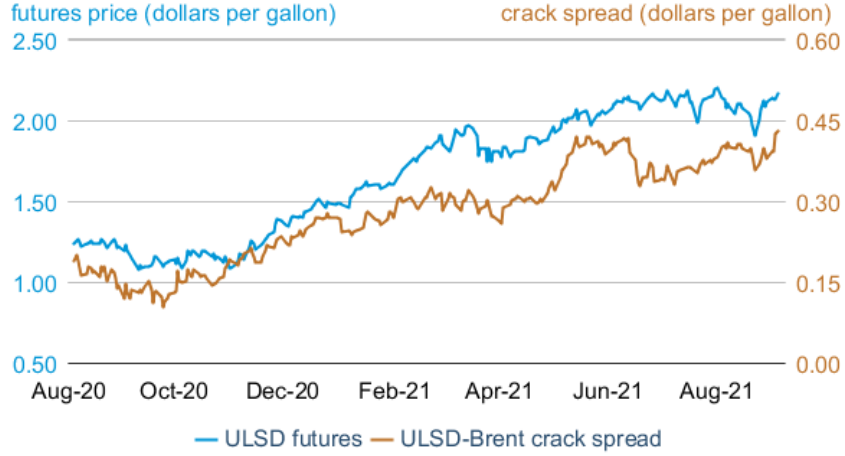


August's high RBOB–Brent crack spread was likely a result of high summer driving demand, low gasoline stocks, refinery disruptions from Hurricane Ida, and relatively high ethanol costs. We estimate U.S. gasoline consumption averaged 9.4 million barrels per day (b/d) in August, which is 0.9 million b/d (10%) higher than in August 2020 but 0.4 million b/d (4%) lower than the August 2019 level. Several months of relatively high gasoline consumption during the summer driving months have combined with low gasoline production to contribute to low gasoline stocks. We estimate gasoline stocks ended August at 225.6 million barrels, the lowest end-of-August level since 2015. Furthermore, refinery disruptions from Hurricane Ida likely supported increased crack spreads at the end of August. The RBOB–Brent crack spread, which was 49 cents/gal on August 24, increased on August 25 and remained around 55 cents/gal through the end of the month. At least nine refineries in Louisiana reduced or shut in operations prior to Hurricane Ida, and we forecast refinery operations in the U.S. Gulf Coast will gradually restart operation over the first half of September. Because of the refinery disruptions, we expect monthly average refinery runs will be about 700,000 b/d lower in September than they would be without the disruptions. Lower refinery runs will likely contribute to continuing declines in gasoline stocks during September and support gasoline crack spreads in the coming weeks.

Recently, record-high prices for renewable identification number (RIN) credits have been another contributing factor to higher-than-average RBOB prices. RINs are the compliance mechanisms used for the Renewable Fuel Standard (RFS) program, which the U.S. Environmental Protection Agency (EPA) administers. For most of the history of RFS, RIN prices have typically been at a level that only minimally affected RBOB prices. In late 2020 and 2021, however, RIN prices have been high in large part because of high biofuel feedstock costs. The higher cost of RFS compliance for gasoline producers and importers as a result of higher RIN prices may pass through to affect RBOB prices. Although RIN prices have decreased from their record highs in August, they still remain high relative to their average levels prior to 2021 and are likely still adding upward pressure to RBOB prices.

Fuel ethanol and corn prices: Corn and ethanol prices have decreased slightly since corn prices peaked at $7.73 per bushel on May 7 and ethanol prices peaked at $2.48/gal in late June. The front-month futures price of corn closed at $5.16 per bushel on September 2, an increase of $1.67 per bushel from September 2, 2020, but $2.57 per bushel lower than the peak price on May 7. The front-month futures price of fuel ethanol settled at $2.22/gal on September 2, 2021, an increase of 86 cents/gal from September 2, 2020, and 6 cents/gal higher than the front-month RBOB contract. The fuel ethanol–corn crush spread (the difference between the price of fuel ethanol and the price of its corn inputs) has been positive since mid-July after a few atypical months of negative spreads **(Figure 6)**.

Figure 6. Corn and fuel ethanol futures prices



Source: CME Group, as compiled by Bloomberg L.P.
Note: About 2.8 bushels of corn go into each gallon of ethanol.

The decrease in fuel ethanol prices is mostly the result of lower prices for corn, which is the feedstock for fuel ethanol. Corn prices increased in the first half of 2021 because of high demand in China, concerns of low production as a result of cold weather in the Midwest, and a La Niña weather pattern that brought hot and dry weather, which is not ideal for corn production, to major exporters Brazil and Argentina. Corn prices have come down since June because of increased planted acreage of corn and increased production forecasts in the United States as well as uncertain demand in Asia.

Ethanol prices have decreased by less than corn prices because ethanol is primarily used for gasoline blending and therefore ethanol prices are also tied to gasoline demand, which has been relatively high. In addition, the uncertainty concerning RVO levels for 2021 has supported high RIN demand and ethanol prices. The fact that RBOB prices generally increased in July and August, despite lower ethanol prices and lower RIN prices in late August, suggests that gasoline inventory draws in August likely contributed to the crack spread increases seen in the second half of August.

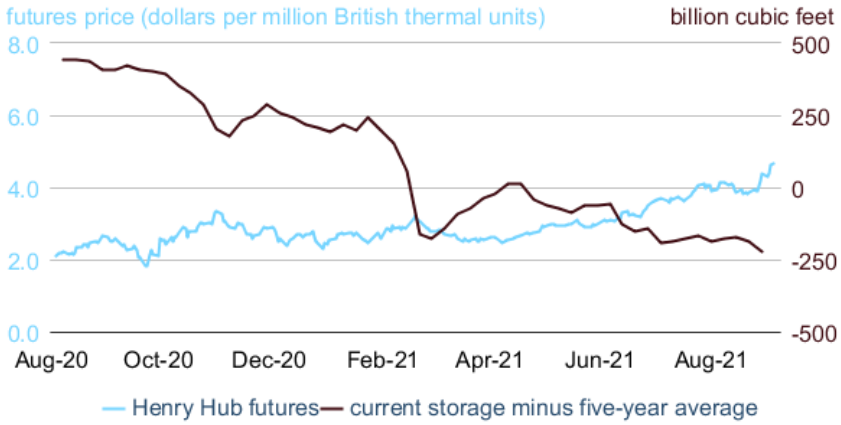
Ultra-low sulfur diesel prices: The front-month futures price for ultra-low sulfur diesel (ULSD) for delivery in New York Harbor settled at $2.17/gal on September 2, up 3 cents/gal from August 2 **(Figure 7)**. The ULSD–Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) increased 3 cents/gal during the same period, settling at 43 cents/gal.

Figure 7. Historical ULSD front-month futures prices and crack spreads

Source: Graph by EIA, based on data from CME Group, as compiled by Bloomberg L.P.
Note: ULSD=ultra-low sulfur diesel

The average ULSD–Brent crack spread increased 3 cents/gal from July to 39 cents/gal in August as a result of higher distillate demand and low production. We estimate that distillate consumption increased by 0.3 million b/d (8%) from July to 4.10 million b/d in August. High freight demand expectations and record congestion at Southern Californian ports suggest that trucking and rail demand will remain high in the upcoming months before winter heating demand provides an additional increase in distillate demand. We forecast distillate demand to exceed 4 million b/d from October 2021 through June 2022.

We also estimate that distillate production in August fell to its lowest level for that month since 2012. Although a reduction in net exports of distillate partly offset the high distillate demand and low distillate production, distillate stocks decreased in August, a month in which distillate stocks typically build.



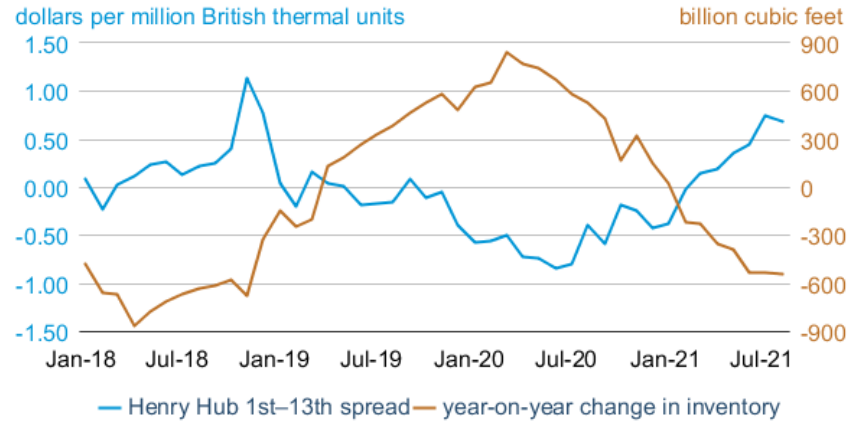
We expect distillate stocks to continue to decrease through November. The forecast decrease partly reflects Hurricane Ida's refinery disruptions on the U.S. Gulf Coast and partly reflects our expectations of high distillate demand during the crop harvesting season. Low inventories and expectations of inventory draws through November are likely supporting current above-average distillate crack spreads.

Natural Gas

Prices: The front-month natural gas futures contract for delivery at the Henry Hub settled at $4.64 per million British thermal units (MMBtu) on September 2, 2021, which was up 71

cents/MMBtu from August 2, 2021 **(Figure 9)**. The average price for front-month natural gas futures contracts in August was $4.03/MMBtu. August was warmer than normal, with 355 cooling degree days (CDD), 8.6% more than the 2011–2020 average. The United States this summer (June—August) had 3.9% more CDDs than the 2011–20 average. The hot weather this summer combined with record exports of liquefied natural gas (LNG) has contributed to month-on-month increases in the Henry Hub futures price since March 2021, leading to the highest August average since 2010. Further upward price pressures came from the arrival of Hurricane Ida, which resulted in more than 90% of offshore natural gas production in the Federal Offshore Gulf of Mexico being shut in during late August.

Figure 8. U.S. natural gas front-month futures prices and storage deviation from five-year average

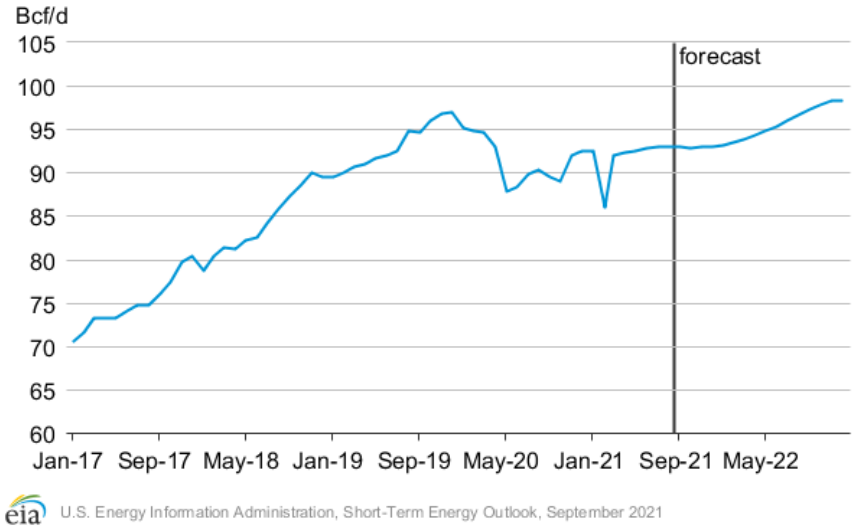


Source: Graph by EIA, based on data from CME Group, as compiled by Bloomberg L.P.

The Henry Hub front-month futures price increased by 47 cents/MMBtu from $3.90/MMBtu on August 25 to $4.37/MMBtu on August 27, as Hurricane Ida approached the U.S. Gulf Coast, leading producers to evacuate personnel from offshore platforms and to shut in production. On August 27, the U.S. Bureau of Safety and Environmental Enforcement (BSEE) began posting daily Gulf of Mexico hurricane impact updates, indicating that from August 27 to August 31, 9.3 billion cubic feet (Bcf), or 1.9 Bcf/d, of natural gas production was shut in. As of September 2, 91.3% of GOM natural gas production remained shut in. Since the arrival of Hurricane Ida, natural gas prices have remained elevated, and they ended August at $4.38/MMBtu.

Futures price spreads: The natural gas 1st–13th trading month price spread averaged 74 cents/MMBtu in July, the most backwardation (where near-term contract prices are higher than longer-dated ones) since December 2018 **(Figure 10)**. In August, the natural gas 1st–13th month price spread averaged 70 cents/MMBtu. Typically, the 1st–13th price spread will increase when natural gas inventories decrease and will decrease when natural gas inventories increase. The August natural gas inventory level was 578 Bcf below last year's August level, its largest year-on-year deficit since November 2018, and 222 Bcf below the 2016–2020 average.

Figure 9. Natural gas 1st–13th futures spread and year-on-year change in inventory



Source: CME Group, as complied by Bloomberg L.P.; U.S. Energy Information Administration
Note: Futures spreads are monthly averages.

Above-average withdrawals of U.S. natural gas from storage during the 2020–2021 winter heating season and below-average injections into storage this summer contributed to our forecast of below-average inventories of natural gas. Relatively flat dry natural gas production and high natural gas exports also contributed to the forecast low inventories. U.S. dry natural gas production and U.S. exports of natural gas (by pipeline and as LNG) were relatively flat from July to August. We expect storage to begin the winter heating season (November 1) at 3,570 Bcf, 182 Bcf below the 2016–2020 average and 359 Bcf below the 2020 level, when natural gas inventories were at near-record highs.

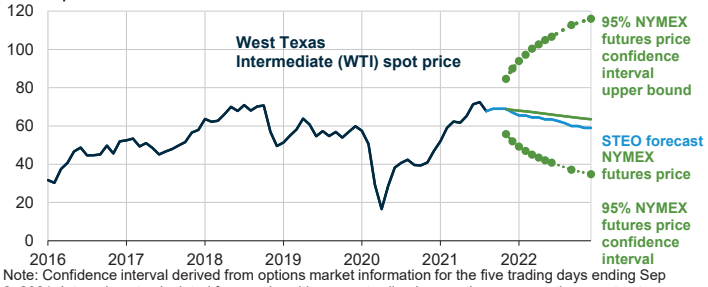
Production: U.S. dry natural gas production has been almost flat this year after its brief decline in February because of severely cold weather in Texas, and we expect production to remain relatively flat for the rest of 2021 **(Figure 11)**. Although production has been increasing, the increase has been relatively small. We expect U.S. dry natural gas production in 2021 to average 92.2 Bcf/d, a 0.8 Bcf/d increase from 2020, compared with an annual average increase of 3.3 Bcf/d from 2011 through 2020. In our forecast, production increases accelerate in 2022, driven by the increase in Henry Hub prices this year. In 2022, we expect production to average 95.4 Bcf/d, an increase of 3.2 Bcf/d from 2021. The increase in production from 2021 to 2022 will put some downward pressure on the Henry Hub price, which we expect to average $3.47/MMBtu next year, a decrease of 16 cents/MMBtu from the average forecast price for 2021.

Figure 10. U.S. dry natural gas production

eia U.S. Energy Information Administration, Short-Term Energy Outlook, September 2021

Notable forecast changes

- In the September STEO, we revised our global liquid fuels consumption forecast down by 0.2 million barrels per day in both 2021 and 2022. The decreased consumption reflects a lower GDP forecast as well as expectations of lower consumption because of travel and other restrictions in response to increases in COVID-19 cases.
- We forecast OPEC crude oil production will average 26.4 million b/d in 2021, down 0.1 million b/d from the August STEO, reflecting our expectation that Iran's crude oil production will be lower in the second half of 2021 (2H21) than we previously expected. We expect OPEC to produce 28.3 million b/d in 2022, down 0.3 million b/d compared with the August STEO. The downward revision to supply growth is driven by lower global oil demand growth, and we expect some producers to continue to restrain output to maintain relatively balanced oil markets in 2022.
- We forecast Henry Hub spot prices will average $4.00 per million British thermal unit (MMBtu) in 2H21, an increase of 41 cents/MMBtu from last month's STEO. Forecast prices average $3.47/MMBtu in 2022, an increase of 39 cents from last month's STEO. The increase largely reflects a higher starting point for our price forecast.
- We forecast U.S. coal production to total 648 million short tons (MMst) in 2022, up 47 MMst (8%) from last month's STEO. Higher U.S. coal production in this forecast is the result of a 54 MMst increase in our forecast for electric power sector demand for coal in 2022.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. Weather															
U.S. Heating Degree-Days	**1,881**	**544**	**71**	**1,422**	**2,107**	**473**	*68*	*1,530*	*2,113*	*488*	*77*	*1,525*	**3,918**	*4,178*	*4,202*
U.S. Cooling Degree-Days	**69**	**392**	**931**	**120**	**49**	**413**	*875*	*92*	*45*	*396*	*848*	*96*	**1,513**	*1,429*	*1,384*

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on September 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109;
Petroleum Supply Annual , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130;
Electric Power Monthly , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on September 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate, natural gas plant liquids, other liquids, refinery processing gain, and other unaccounted-for liquids.

OPEC = Organization of the Petroleum Exporting Countries: Iran, Iraq, Kuwait, Saudi Arabia, and the United Arab Emirates (Middle East); Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Libya, Nigeria, and Venezuela (Other).

Notes: EIA completed modeling and analysis for this report on September 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Forecasts are not published for individual OPEC countries.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on September 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) For net imports and inventories “Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products; for consumption “Other Oils” also includes renewable fuels except fuel ethanol.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on September 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on September 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on September 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.93**	**1.91**	**1.93**	**1.92**	**1.91**	**1.92**	*1.98*	*1.99*	*2.02*	*2.02*	*1.99*	*1.96*	**1.92**	*1.95*	*2.00*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on September 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on September 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on September 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on September 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 7d part 1. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continues on Table 7d part 2*

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on September 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on September 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW)

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in

- = no data available

Notes: EIA completed modeling and analysis for this report on September 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on September 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.
Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on September 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Independent Statistics & Analysis
U.S. Energy Information Administration

October 2021

Short-Term Energy Outlook

Forecast highlights

Winter Fuels Outlook

- We forecast that average U.S. household expenditures for all major home heating fuels will increase significantly this winter primarily because of higher expected fuel costs as well as more consumption of energy due to a colder winter. Average increases vary by fuel, region, and weather assumptions. Compared with last winter, we forecast propane expenditures will rise by 54%, heating oil by 43%, natural gas by 30%, and electricity by 6%. We expect space heating demand to generally be higher this winter based on forecasts from the National Oceanic and Atmospheric Administration (NOAA) that U.S. average heating degree days will be 3% higher than last winter (*Winter Fuels Outlook*). Altering our assumptions for a 10% colder-than-expected winter significantly increases forecast expenditures, while a 10% warmer-than-expected winter still results in increased expenditures, because of price increases.

Global liquid fuels

- The October *Short-Term Energy Outlook* (STEO) remains subject to heightened levels of uncertainty related to the ongoing recovery from the COVID-19 pandemic. U.S. economic activity continues to rise after reaching multiyear lows in the second quarter of 2020 (2Q20). U.S. gross domestic product (GDP) declined by 3.4% in 2020 from 2019 levels. This STEO assumes U.S. GDP will grow by 5.7% in 2021 and by 4.5% in 2022. The U.S. macroeconomic assumptions in this outlook are based on forecasts by IHS Markit. Our forecast assumes continuing economic growth and increasing mobility. Any developments that would cause deviations from these assumptions would likely cause energy consumption and prices to deviate from our forecast.

- Brent crude oil spot prices averaged $74 per barrel (b) in September, up $4/b from August and up $34/b from September 2020. Brent spot prices have risen from their September average to more than $80/b in early October. Oil prices have increased over the past year as result of steady draws on global oil inventories, which averaged 1.9 million barrels per day (b/d) during the first three quarters of 2021. In addition to sustained inventory draws, prices increased after the October 4 announcement by OPEC+ that the group would keep current production targets unchanged.

- We expect Brent prices will remain near current levels for the remainder of 2021, averaging $81/b during the fourth quarter of 2021, which is $10/b higher than our previous forecast. The higher forecast reflects our expectation that global oil inventories will fall at a faster rate than we had previously expected owing largely to lower global oil supply in late 2021 across a range of producers. In 2022, we expect that growth in production from OPEC+, U.S. tight oil, and other non-OPEC countries will outpace slowing growth in global oil consumption and contribute to Brent prices declining from current levels to an annual average of $72/b.

- U.S. regular gasoline retail prices averaged $3.18 per gallon (gal) in September, up 2 cents/gal from August and almost $1/gal higher than in September 2020. Recent gasoline price increases reflect increasing crude oil prices outweighing falling gasoline wholesale margins. We forecast that retail gasoline prices will average $3.21/gal in October before falling to $3.05/gal in December.

- Total U.S. crude oil production averaged 11.3 million b/d in July —the most recent monthly historical data point. We estimate that domestic production fell to 10.6 million b/d in September because of disruptions from Hurricane Ida. We forecast production will be 11.0 million b/d in October and rise to 11.3 million b/d in December. We forecast 2021 production will average 11.0 million b/d, increasing to 11.7 million b/d in 2022 as tight oil production rises in the United States. Growth will come as a result of operators increasing rig counts, which we expect will offset production decline rates.

Natural Gas

- In September, the natural gas spot price at Henry Hub averaged $5.16 per million British thermal units (MMBtu), which was up from the August average of $4.07/MMBtu and up from an average of $3.25/MMBtu in the first half of 2021. The rising prices in recent months reflect U.S. natural gas inventory levels that are below the five-year average and continuing demand for natural gas for power generation use at relatively high prices.

- We expect the Henry Hub spot price will average $5.80/MMBtu in fourth-quarter 2021, which is $1.80/MMBtu higher than we forecast in the September STEO. In the current forecast, Henry Hub prices reach a monthly average peak of $5.90/MMBtu in January and generally decline through 2022, averaging $4.01/MMBtu for the year amid rising U.S. natural gas production and slowing growth in LNG exports. We raised our Henry Hub price forecast through the end of 2022 compared with last month. The increase reflects a higher starting point for our price forecast that incorporates recent developments in U.S. and global natural gas markets. We forecast that U.S. inventory draws will be slightly more than the five-year average this winter, and we expect that factor, along with rising U.S. natural gas exports and relatively flat production through January will keep U.S. natural gas prices near recent levels before downward pressures emerge. Given low natural gas inventories in both U.S. and European natural gas

storage facilities and uncertainty around seasonal demand, we expect natural gas prices to remain volatile over the coming months, with winter temperatures being a key driver of demand and prices.

- We estimate that U.S. LNG exports averaged 9.3 billion cubic feet per day (Bcf/d) in September 2021, down 4% from August. Despite the recent monthly decline, these were the most U.S. LNG exports for September since the United States began exporting LNG from the Lower 48 states in February 2016. Even though September exports were a record for the month, they were limited by weather conditions, which led to the suspension of piloting services for several days at Sabine Pass, Cameron, and Corpus Christi. We expect that LNG exports will average 9.1 Bcf/d in October and then increase in the coming months. Cove Point LNG terminal is scheduled to complete its annual maintenance by mid-October and resume exports this month. Through this winter, LNG exports in the forecast average 10.7 Bcf/d as global natural gas demand remains high and several new LNG export trains—the sixth train at Sabine Pass LNG and the first trains at the new LNG export facility Calcasieu Pass LNG—enter service.

- We estimate that U.S. natural gas inventories ended September 2021 at about 3.3 trillion cubic feet (Tcf), 5% less than the five-year (2016–20) average for this time of year. Injections into storage this summer have been below the previous five-year average, largely as a result of more electricity consumption in June due to hot weather, and increased exports even as domestic natural gas production has remained flat. We forecast that inventories will end the 2021 injection season (at the end of October) at almost 3.6 Tcf, which would be 5% less than the previous five-year average. We expect natural gas inventories to fall by 2.1 Tcf this winter, ending March at less than 1.5 Tcf, which would be 12% less than the 2017–21 average for that time of year.

- We estimate dry natural gas production averaged 93.3 Bcf/d in the United States during the third quarter of 2021—up from 91.6 Bcf/d in in the first half of 2021. Production in the forecast rises to an average of 94.0 Bcf/d during the winter, and averages 96.4 Bcf/d during 2022, driven by natural gas and crude oil prices, which we expect to remain at levels that will support enough drilling to sustain production growth.

Electricity, coal, renewables, and emissions

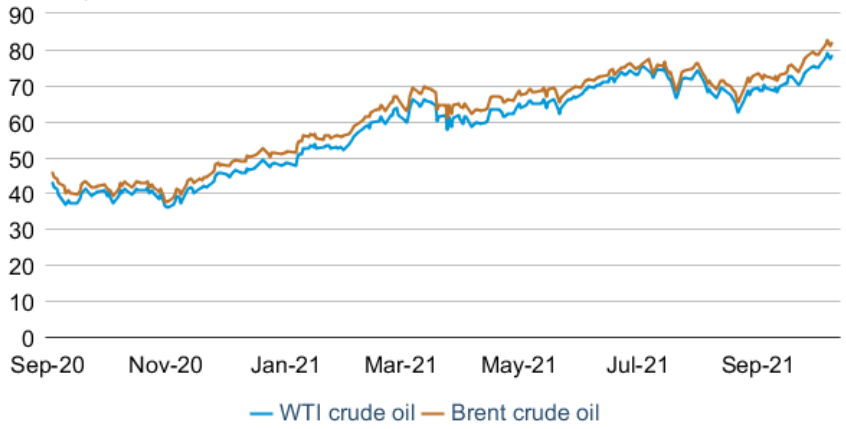
- We expect the share of electricity generation produced by natural gas in the United States will average 36% in 2021 and 35% in 2022, down from 39% in 2020. In 2021, our forecast share for natural gas as a generation fuel declines in response to our expectation of a higher delivered natural gas price for electricity generators, which we forecast will average $5.15/MMBtu compared with $2.39/MMBtu in 2020. As a result of the higher expected natural gas prices, the forecast share of electricity generation from coal rises from 20% in 2020 to about 24% in 2021 and 23% in 2022. For renewable energy sources, new additions of solar and wind generating capacity are offset

somewhat by reduced generation from hydropower this year, resulting in the forecast share of all renewables in U.S. electricity generation to average 20% in 2021, about the same as last year, before rising to 22% in 2022. The nuclear share of U.S. electricity generation declines from 21% in 2020 to 20% in 2021 and 2022.

- Electricity generation from coal-fired power plants has not increased as much in response to rising natural gas prices as it has in the past, or by as much as our models forecasted in recent STEOs. The lower price responsiveness of coal for electricity generation, which is likely the result of constraints on coal supply and low coal stocks, is contributing to upward pressure on natural gas prices. To reflect the lower price responsiveness of coal-fired electricity generation, we have lowered our forecast for U.S. coal generation for the fourth quarter of 2021 and the first half of 2022 by an average of 7 billion kWh (9%) each month, and we have raised our forecast for natural gas generation 5 billion kWh (5%) each month.

- We forecast that planned additions to U.S. wind and solar capacity in 2021 and 2022 will increase electricity generation from those sources. We estimate that the U.S. electric power sector added 14.6 gigawatts (GW) of new wind capacity in 2020. We expect 17.1 GW of new wind capacity will come online in 2021 and 6.5 GW in 2022. Utility-scale solar capacity rose by an estimated 10.5 GW in 2020. Our forecast for added utility-scale solar capacity is 16.0 GW for 2021 and 18.3 GW for 2022. We expect significant solar capacity additions in Texas during the forecast period. In addition, we project that after increasing by 4.5 GW in 2020, small-scale solar capacity (systems less than 1 megawatt) will grow 5.8 GW and 7.8 GW in 2021 and 2022, respectively.

- Coal production in our forecast totals 588 million short tons (MMst) in 2021, 53 MMst more than in 2020. We expect demand for coal from the electric power sector to increase by 84 MMst in 2021. Production growth is unlikely to match the increases in demand in the near term due to many coal mines operating at a reduced capacity and limited available transportation. In 2022, we expect coal production to increase by 34 MMst to 622 MMst, as the production and transportation constraints experienced in 2021 ease. Secondary inventories of coal at electric utilities decreased in the first half of 2021, and we forecast this trend will continue into the second half of 2021 and 2022.



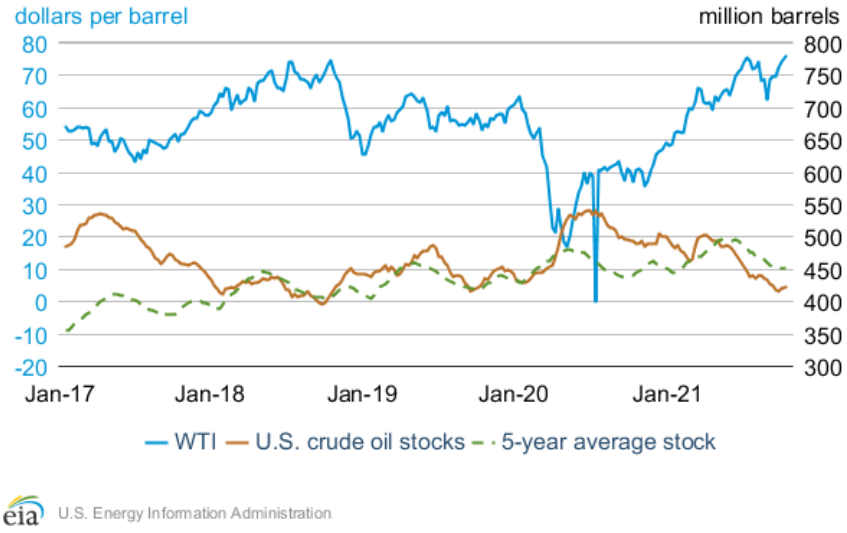
- We estimate that U.S. energy-related carbon dioxide (CO_2) emissions decreased by 11% in 2020 as a result of less energy consumption related to reduced economic activity and responses to COVID-19. For 2021, we forecast energy-related CO_2 emissions will increase about 8% from the 2020 level as economic activity increases and leads to rising energy use. We expect almost no change in energy-related CO_2 emissions in 2022. We forecast that after declining by 19% in 2020, coal-related CO_2 emissions will rise by 20% in 2021 and then fall by 5% in 2022. Short-term changes in energy-related CO_2 can be affected by temperature. A recent STEO supplement examines these dynamics.

Petroleum and natural gas markets review

Crude oil

Prices: The front-month futures price for Brent crude oil settled at $81.95 per barrel (b) on October 7, 2021, up $10.36/b from $71.59/b on September 1. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, increased by $9.71/b during the same period, settling at $78.30/b on October 7 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices



Sources: Graph by EIA, based on CME Group and Intercontinental Exchange, compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate

WTI crude oil prices reached nearly seven-year highs on October 5 after gradually increasing throughout September and the first few trading days of October. Several developments during the past month are contributing to higher oil prices. First, U.S. crude oil inventories have decreased because of Hurricane Ida's impact on crude oil production in the Gulf of Mexico. Second, OPEC+ members decided to follow their scheduled crude oil production increase of 400,000 barrels per day (b/d) in November rather than increase production by more, like some market participants expected based on recent price movements. Third, trade press reports increased purchases of oil and petroleum products as a result of high natural gas prices because electric power generators in parts of Asia and Europe may implement natural gas-to-oil fuel switching to decrease fuel costs. Lastly, crude oil prices continue to rise due to steady and sizable global oil inventory draws. We estimate that global inventories fell by 1.9 million b/d in third-quarter 2021 (3Q21), marking the fifth consecutive quarter of draws; quarterly draws averaged 2.2 million b/d over those five quarters.

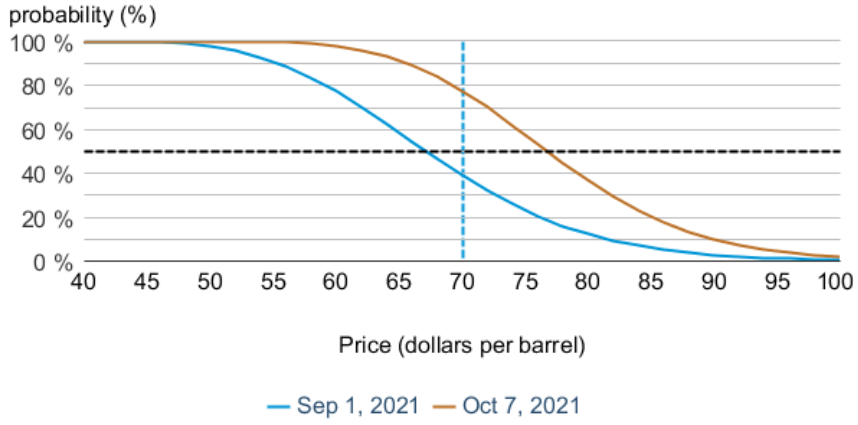
We estimate U.S. crude oil inventories ended September at 420.9 million barrels, the lowest level since September 2018 **(Figure 2)**. U.S. crude oil stocks have decreased each of the past six months, decreasing by 81.0 million barrels (16%) since March, the largest six-month withdrawal on record in our crude oil data for all inventories outside of the Strategic Petroleum Reserve,

which go back to 1973. Furthermore, according to weekly data in our *Weekly Petroleum Status Report*, crude oil stocks on September 17 were 37.0 million barrels (8.2%) below the five-year average for that time of year, the largest percentage below the five-year average since July 4, 2008. Like domestic stocks, we estimate OECD commercial petroleum stocks at the end of September to be at their lowest levels in more than three years.

Figure 2. WTI price and U.S. crude oil stocks (not including SPR)

eia U.S. Energy Information Administration

A major factor contributing to the stock draws has been low crude oil production, which has been outpaced by increases in demand. U.S. oil production averaged 11.0 million b/d from January through August (compared with 12.0 million b/d in the same months in 2019) and decreased to 10.6 million b/d in September because of lower U.S. offshore oil production in the Gulf of Mexico after Hurricane Ida. According to the Bureau of Safety and Environmental Enforcement (BSEE), from August 28 through September 6, more than 80% of oil production in the Gulf of Mexico was shut in, and more than 15% of Gulf of Mexico oil remained shut in through September 23, when BSEE issued its final outage report for Hurricane Ida. In total, disruptions in the Gulf of Mexico reduced crude oil production by about 30 million barrels since Hurricane Ida formed in late August.



Global liquid fuels production has also risen more slowly than global demand this year. Production increased by 2.7 million b/d (3%) from January to September, whereas global consumption increased by 6.3 million b/d (7%) during the same period. Despite relatively low global production and rising crude oil prices, OPEC+ members reaffirmed a previously agreed on production increase of 400,000 b/d in November, as opposed to a higher production increase for the month. Following this announcement on October 4, the price of Brent crude oil settled at $81.26, after beginning the day at $79.28.

In this forecast, we now expect that global oil inventories in 4Q21 and 1Q22 will fall at a faster rate than we had previously expected, which largely reflects lower global oil supply during this

period across a range of producers. We have also raised our expectations for global oil demand during winter 2021–22., In the October STEO, we have increased our forecast for Brent crude oil prices. We now expect falling global oil inventories will keep Brent prices near $80/b this winter, averaging $81/b in 4Q21 and $78/b in 1Q21, both of which are $10/b higher than forecast last month.

***Market-derived probabilities*:** In our most recent forecast, we expect WTI prices to average $78/b in 4Q21. The upward price pressure and market uncertainties are apparent in market-derived price probabilities that are based on futures and options prices. The market-derived probability of the December WTI futures contract expiring higher than $70/b was 77% on October 7, and the probability of the contract expiring higher than $80/b was 37% **(Figure 3)**. On September 1, the market-derived probability of the December WTI futures contract expiring higher than $70/b had been 39%, and the probability of the contract expiring higher than $80/b was 12%. The increase in market-derived price expectations for the December WTI contract from September 1 to October 7 conveys the market's reaction to factors such as decreasing stocks and the potential for natural gas-to-oil switching. The December WTI contract has not expired at more than $70/b since 2014 and has not expired at more than $80/b since 2013.

Figure 3. Probability of the December WTI futures contracts expiring above different price levels

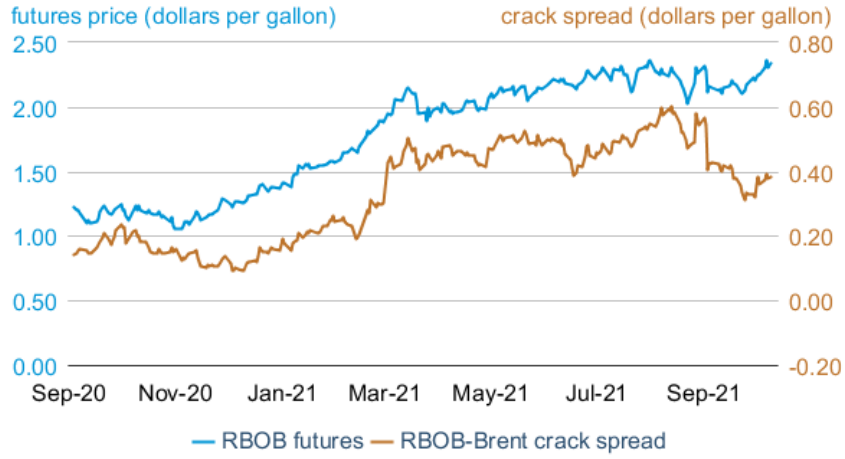
U.S. Energy Information Administration, CME Group
Note: WTI=West Texas Intermediate

Commodity Prices: In 2021, energy commodity prices have increased more than other commodities and asset classes, especially since May, primarily as a result of production and supply developments specific to energy markets. The S&P GSCI (formerly the Goldman Sachs Commodity Index) is an index comprising 24 individual weighted commodity price contracts organized into 5 subindexes, and we use it for comparing energy commodities to other categories of commodities.

As of October 7, the non-energy index (an index consisting of agricultural, livestock, precious metal, and industrial metal commodities) was up 14% from the beginning of 2021 but down 5%

from its peak on May 7. Energy commodities, on the other hand, have increased 27% since May 7 and are up 72% from January 1. The S&P 500, which is up by 19% from January 1, has also increased since May 7, but only by 4% **(Figure 4)**.

Figure 4. Energy versus nonenergy commodities and equities



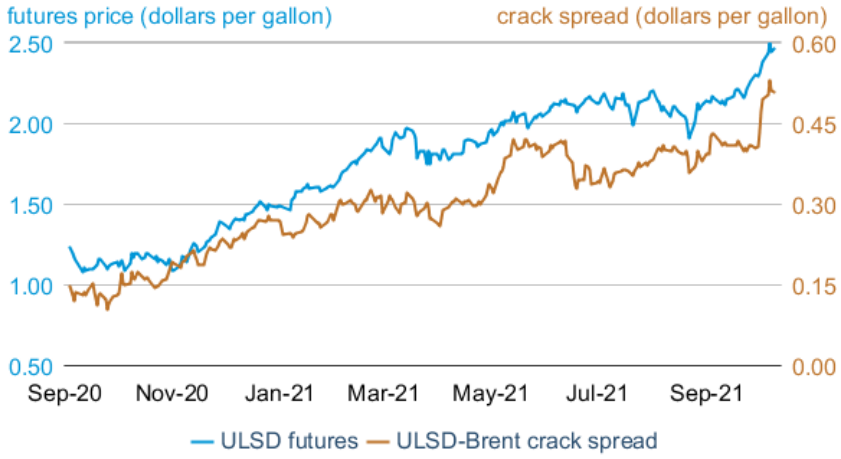
eia Source: S&P Dow Jones, Bloomberg L.P.

Whereas general economic growth likely explained a portion of the increase in energy prices from January 1 through May 7, the growth in energy commodities since then has mostly been a result of factors specific to petroleum markets, such as production increases lagging demand increases. Brent and WTI make up 70% of the energy sub-index's weight. Thus, the price increases from around $50/b for Brent and WTI at the beginning of the year to around $80/b in early October explains a significant portion of the increase in the energy sub-index. Higher prices for petroleum products, which make up 25% of the index, and for Henry Hub natural gas, which makes up the remaining 5% of the index, have also contributed to the rest of the growth in the energy sub-index.

Petroleum products

Gasoline prices: The front-month futures price of RBOB (the petroleum component of gasoline used in many parts of the country) settled at $2.33 per gallon (gal) on October 7, up 22 cents/gal from September 1 **(Figure 5)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) decreased by 2 cents/gal to settle at 38 cents/gal during the same period. The average RBOB–Brent crack spread in September was 38 cents/gal, an increase of 20 cents/gal compared with September 2020.

Figure 5. Historical RBOB front-month futures prices and crack spreads



Source: Graph by EIA, based on data from CME Group, as compiled by Bloomberg L.P.
Note: RBOB is the petroleum component of gasoline used in many parts of the country.

After the RBOB–Brent crack spread averaged 55 cents/gal in August, it fell in September because of rising crude oil prices and lower gasoline prices. Lower gasoline prices compared with August reflect expected lower seasonal demand for gasoline as well as the price decrease for winter grade gasoline, which is relatively less expensive for refiners to produce because of less stringent Reid Vapor Pressure (RVP) requirements. The shift from summer to winter grade gasoline primarily takes place in September, putting downward pressure on the futures contract price in September onward. Temporary weather-related refinery outages along the U.S. Gulf Coast contributed to reduced production and draws on gasoline inventories earlier in September and limited some of the downward pressure on crack spreads. Compared with August 2021, U.S. demand for gasoline in September was an estimated 0.4 million barrels per day (b/d) lower. We estimate U.S. gasoline consumption averaged 9.1 million b/d in September, which is 0.5 million b/d (6%) higher than in September 2020 but also 0.1 million b/d (1%) lower than September 2019 level. We expect gasoline consumption to remain just below 2019 levels through the end of 2022. Combined with high net imports and lower demand, inventories increased during the second half of September; however, lost production from earlier in the month resulted in gasoline stocks ending September at 225.1 million barrels, the lowest end-of-September inventory level since 2017. Overall lower inventories may also have contributed to increasing gasoline crack spreads from October 4 through October 7.

Ultra-low sulfur diesel prices: The front-month futures price for ultra-low sulfur diesel (ULSD) for delivery in New York Harbor settled at $2.46/gal on October 7, up 33 cents/gal from September 1 **(Figure 6)**. The ULSD-Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) increased 8 cents/gal during the same period and settled at 51 cents/gal on October 7. The ULSD–Brent crack spread averaged 41 cents/gal in September.

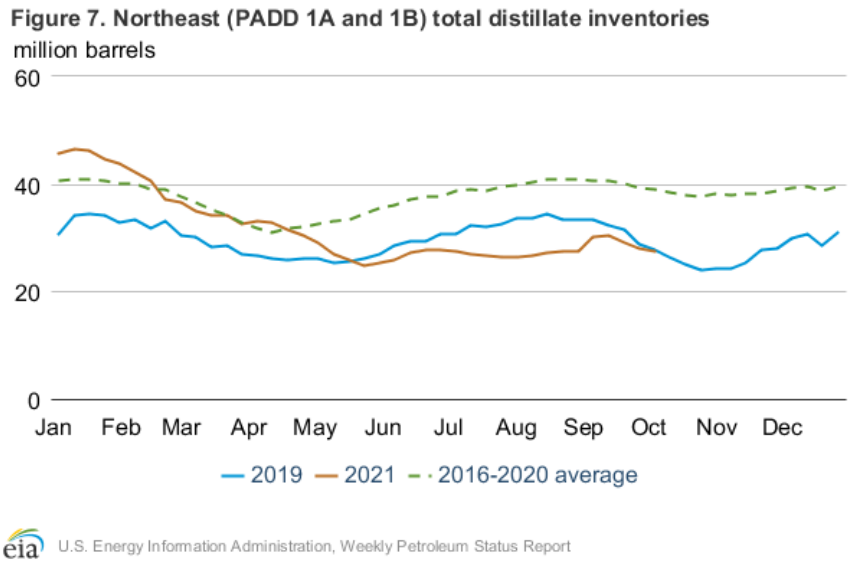


Figure 6. Historical ULSD front-month futures prices and crack spreads

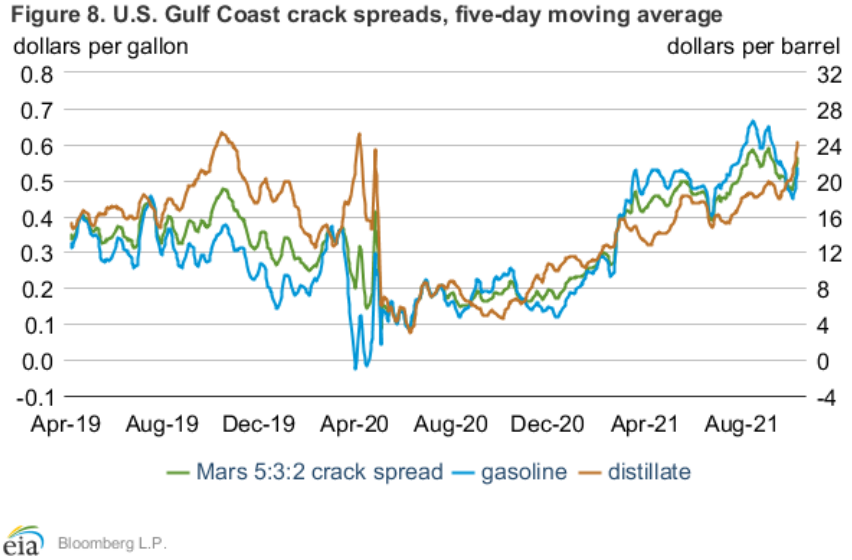
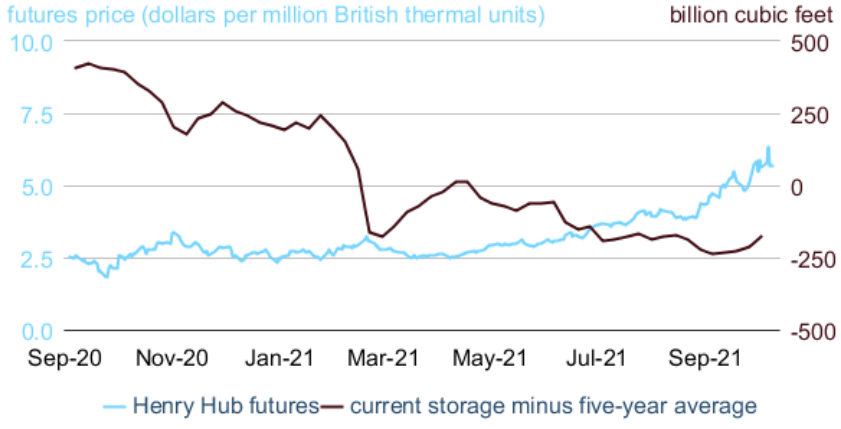


Source: Graph by EIA, based on data from CME Group, as compiled by Bloomberg L.P.
Note: ULSD=ultra-low sulfur diesel

High distillate demand and low distillate production resulted in the highest ULSD-Brent crack spreads seen this year, continuing a trend of rising ULSD crack spreads in recent months. We estimate that distillate consumption was 4 million b/d in September—the highest September level since 2018. Hurricane-related disruptions, including refinery shutdowns and brief closures of Colonial Pipeline Line 2, contributed to reduced production and higher inventory withdrawals. Also, increases in the American Trucking Associations' Truck Tonnage Index and the Cass Freight Index suggest trucking demand remains high as supply chains continue to navigate a backlog of shipping orders. Rapidly rising shipping activity will likely contribute to high distillate demand. While we forecast gasoline demand to remain below 2019 levels throughout 2022, we forecast distillate demand to increase next year to its highest level since 2018.

Rising crack spreads also likely reflect relatively low distillate fuel inventories. Distillate inventories typically increase in the summer to prepare for growth in demand in the fall and winter, when diesel-powered agricultural equipment is used to harvest crops and the winter heating season begins. This year, distillate inventories did not build as much as usual due to high distillate demand and relatively low production. Second- and third-quarter distillate production was 5.5% and 5.1% below the five-year (2016–20) average, respectively. Our estimate of 4.5 million b/d for production this September is 6.9% below the five-year average. As a result, U.S. distillate stocks are below average for this time of year. In the Northeast, where 4.14 million households will use heating oil as their primary source of heat this winter, distillate inventories declined to 27.4 million barrels (30% below the five-year average), according to the latest *Weekly Petroleum Status Report* **(Figure 7)**. Our *Winter Fuels Outlook* forecasts a 43% increase in heating oil expenditure over last year and the highest price per gallon for heating oil since the 2012–13 winter.

U.S. Gulf Coast crack spreads: The Mars crude oil 5:3:2 crack spread at the U.S. Gulf Coast is an indicator of profitability of gasoline and diesel-producing refinery operations for high-conversion refineries along the U.S. Gulf Coast that are able to process denser, more sour crude oil grades, such as Mars. On August 31, the five-day moving average crack spread reached 56 cents/gal, its highest point in 2021 **(Figure 8)**. The high overall crack spread primarily reflects increased gasoline cracks, which also reached an annual high in August. Gasoline crack spreads in the first half of September were elevated because of temporary hurricane outages, which supported the 5:3:2 crack through the middle of the month, continuing the trend from August, as well as increasing distillate crack spreads as the outages resulted in distillate inventory withdrawals. As supply constraints were resolved and refineries came back online, gasoline cracks decreased while distillate cracks continued to increase.



Higher crude oil costs, pressure on gasoline prices from the shift to winter grade, decreasing prices for renewable identification numbers (RINs), and seasonally lower demand has contributed to decreases in gasoline crack spreads in the latter half of September, while lower inventories and increasing seasonal demand continued to contribute to increasing diesel cracks. In addition to elevated crude oil prices globally, production outages in the Gulf Coast limited heavy sour crude oil production in August, and Mars grade in particular has faced extended production outages. As gasoline cracks decreased and distillate cracks increased, the distillate crack spread overtook the gasoline crack spread on September 23 and has remained higher so far into October. The relatively larger reduction in gasoline cracks compared with increasing distillate cracks contributed to decreases in the Mars 5:3:2 crack, which fell from 49 cents/gal on September 15 to 45 cents/gal on September 30. Since October 1, the gasoline and diesel crack five-day average crack spreads have both been increasing, contributing to increases in the Mars 5:3:2 crack as well.

Natural Gas

Prices: The front-month natural gas futures contract for delivery at the Henry Hub settled at $5.68 per million British thermal units (MMBtu) on October 7, 2021, which was up $1.06/MMBtu from September 1, 2021 **(Figure 9)**. The average price for front-month natural gas futures contracts in September was $5.11/MMBtu, the highest monthly average since February 2014. Henry Hub natural gas prices during much of the summer were supported by inventory builds that were below the previous five-year (2016–20) averages. Over the past month, increases in Henry Hub prices have coincided with sharp increases in international prices for natural gas, especially in Europe and Asia, and high international prices have contributed to strong demand for more U.S. liquefied natural gas (LNG) cargoes.

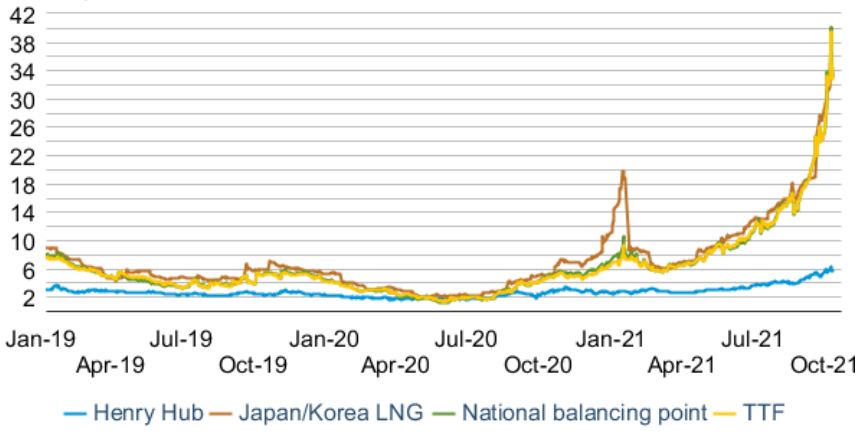


Figure 9. U.S. natural gas front-month futures prices and storage deviation from five-year average

Source: Graph by EIA, based on data from CME Group, as compiled by Bloomberg L.P.

International natural gas prices: LNG spot and forward prices in Europe and Northern Asia ended September at record-high levels. On September 30, 2021, LNG spot prices for Japan/Korea reached $31.10/MMBtu, and the price at the European natural gas benchmark, Title Transfer Facility (TTF), reached $33.20/MMBtu **(Figure 10)**. From the end of January to the end of September, the price spread between LNG prices in Asia and Henry Hub has increased from $6.31/MMBtu to $25.23/MMBtu. The price spread between European spot natural gas prices at TTF and Henry Hub increased from $4.49/MMBtu to $27.34/MMBtu over the same period. These large price differences have supported record LNG exports from the United States to Europe and Asia. U.S. LNG exports also increased because of new export capacity added in 2020. The final liquefaction units were commissioned at Freeport, Cameron, and Corpus Christi LNG, and the remaining small-scale units were placed in service at Elba Island LNG. Additionally, we expect Sabine Pass train 6 and Calcasieu Pass LNG facility to begin exporting by the end of the year.

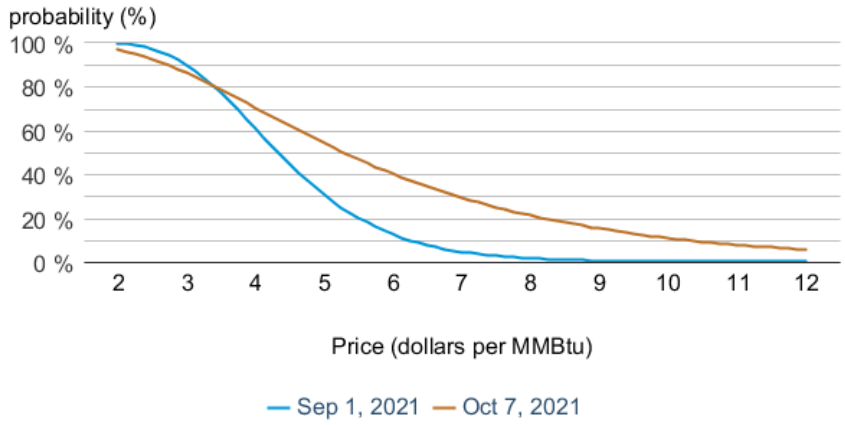
Figure 10. International natural gas prices

Source: Graph by EIA, based on data from CME Group, as compiled by Bloomberg L.P.
Note: TTF=Title Transfer Facility

High natural gas demand in Asia, particularly in China because of disruptions in coal availability, contributed to increased demand for spot LNG shipments in addition to volumes supplied under long-term contracts. U.S. exports of LNG to China nearly quadrupled, increasing from 0.3 billion cubic feet per day (Bcf/d) for the first seven months of 2020 to 1.1 Bcf/d for the same period in 2021. U.S. LNG exports to Japan and South Korea increased by 64% and 62%, respectively, over the same period.

Low European natural gas storage inventories this year have led to high natural gas spot prices in that region as well. According to data from Gas Infrastructure Europe's (GIE) Aggregated Gas Storage Inventory (AGSI+), natural gas stocks in Europe ended September at 2.7 trillion cubic feet, 16% below the five-year average and 8% below the five-year minimum. Colder-than-normal weather late in the 2020–21 heating season and a cold spell in April led to rapid

drawdowns of natural gas inventories early in 2021, contributing to the low inventory levels that are putting upward pressure on prices.



U.S. consumption and price outlook: Consumption of natural gas in the United States tends to decrease in September and October as temperatures are mild. U.S. consumption of natural gas decreased in September by 6.1 billion cubic feet per day (Bcf/d), or 7.9%, compared with August. This decrease was driven by a 6.7 Bcf/d decrease in natural gas consumption in the electric power sector that was partially offset by increases in the commercial, residential, and industrial sectors. U.S. exports of LNG also decreased in September, averaging 9.3 Bcf/d for the month, down from 9.7 Bcf/d in August. Annual maintenance at the Cove Point LNG facility in Maryland began in mid-September, and a power outage in Houston following Hurricane Nicholas resulted in the Freeport LNG terminal shutting down for a few days. Both of these events contributed to lower LNG exports in September. We expect LNG exports to average 10.7 Bcf/d this winter (October–March), a record high for that time period.

We estimate that U.S. working natural gas inventories ended September at 3,304 Bcf, 5.5% below the 2016–2020 average. This level is a decrease in the deficit to the 2016–2020 average when compared with August, which ended the month at 7.4% below the 2016–2020 average.

We expect that Henry Hub prices will remain high this winter, averaging $5.67/MMBtu in the forecast for October through March, which would be the highest winter average since winter 2007–08. However, the price outlook for this winter is very uncertain. Given that natural gas inventories in the United States are below average levels from recent years, the possibility that prices could be volatile is high, particularly if any area in the United States experiences a severe cold snap. Uncertainty in the price forecast also results from linkages between U.S. natural gas markets and global markets. With high demand for U.S. natural gas exports, increases in global natural gas prices have coincided with smaller price increases at Henry Hub.

Given the uncertainty surrounding natural gas prices, market-derived probabilities based on futures and options contracts are showing very wide range of market-implied price outcomes for the January Henry Hub futures contract **(Figure11)**. As of October 7, the market-derived probabilities implied that the January contract had about a 10% chance of expiring below $2.70/MMBtu and an equal chance of expiring above $10.25/MMBtu. A month earlier that probability range was bounded by $3.00/MMBtu on the low end and about $6.25/MMBtu on the high end. This shift shows that the market is increasingly pricing in the possibility of large price shifts in the coming months.

Figure 11. Probability of January 2022 natural gas futures contracts expiring above different price levels

eia U.S. Energy Information Administration, CME Group

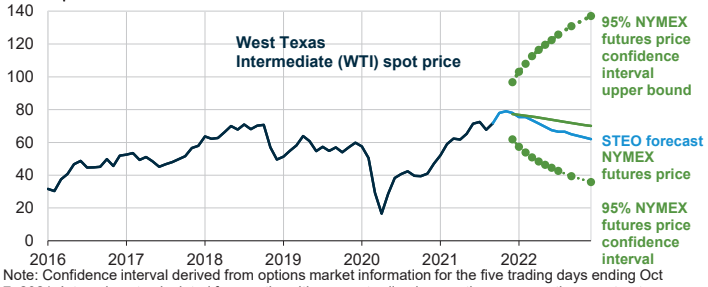
Notable forecast changes

- We forecast Brent crude oil prices will average $81 per barrel (b) during the fourth quarter of 2021 (4Q21) and $78/b during 1Q22, both of which are $10/b higher than our previous forecast. The higher forecast reflects much tighter oil markets during this period than we previously expected. We now expect that global oil inventories in 4Q21 and 1Q22 will decline at an average rate of 0.5 million barrels per day (b/d), compared with a forecast of mostly unchanged inventories during that period in last month's STEO.

- We expect crude oil production in the Federal Offshore Gulf of Mexico will average 1.5 million b/d in 4Q21, more than 0.2 million b/d lower than forecast last month. The lower forecast is mostly the result of Shell's announcement that platforms damaged by Hurricane Ida would remain offline through the end of the year.

- We forecast Henry Hub spot prices will average $5.80 per million British thermal units (MMBtu) in 4Q21, an increase of $1.80/MMBtu from last month's STEO. In this outlook, we expect prices to remain elevated through the first quarter of 2022. Forecast Henry Hub prices for 2022 average $4.01/MMBtu, up 54 cents/MMBtu from last month's STEO.

- In mid-September, Exelon announced that it will continue operating its nuclear reactors at the Byron and Dresden power plants in Illinois. These nuclear plants were previously scheduled to be retired next year. As a result of this decision, we raised our forecast for U.S. nuclear generation in 2022 by 4% above the level forecast in last month's STEO.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. Note: Winter covers the period October 1 through March 31. Fuel prices are nominal prices. Fuel consumption per household is based only on households that use that fuel as the primary space-heating fuel. Included in fuel consumption is consumption for water heating, appliances, electronics, and lighting (electricity). Per-household consumption based on EIA's 2015 Residential Energy Consumption Surveys corrected for actual and projected heating degree days. Number of households using heating oil includes kerosene.

* Prices exclude taxes

** thousand cubic feet

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on October 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on October 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on October 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on October 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) For net imports and inventories “Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products; for consumption “Other Oils” also includes renewable fuels except fuel ethanol.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on October 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on October 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on October 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.93**	**1.91**	**1.93**	**1.92**	**1.91**	**1.92**	**2.02**	*2.02*	*2.04*	*2.03*	*2.00*	*1.98*	**1.92**	*1.97*	*2.01*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on October 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on October 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on October 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on October 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on October 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on October 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW)

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in

- = no data available

Notes: EIA completed modeling and analysis for this report on October 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on October 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.
Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

- = no data available

SAAR = Seasonally-adjusted annual rate

Notes: EIA completed modeling and analysis for this report on October 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

- = no data available

Notes: EIA completed modeling and analysis for this report on October 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on October 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Appendix to the October 2021 *Short-Term Energy Outlook*

This appendix is prepared in fulfillment of section 1245(d)(4)(A) of the National Defense Authorization Act (NDAA) for Fiscal Year 2012, as amended. The law requires the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy, to submit to Congress a report on the availability and price of petroleum and petroleum products produced in countries other than Iran in the two-month period preceding the submission of the report. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The data in this appendix, therefore, should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

EIA consulted with the U.S. Department of the Treasury, the U.S. Department of State, and the intelligence community in the process of developing the NDAA report, which was previously published as a stand-alone report. Detailed background and contextual information not repeated here can be found in early editions of the NDAA report.

This appendix is published in the *Short-Term Energy Outlook* in even numbered months.

Table a1. Summary of Estimated Petroleum and Other Liquids Quantities

	Aug 2021	Sept 2021	Aug 2021 – Sept 2021 Average	Aug 2020 – Sept 2020 Average	2018 - 2020 Average
Global Petroleum and Other Liquids (million barrels per day)					
Global Petroleum and Other Liquids Production (a)	96.1	96.7	96.4	91.4	98.5
Global Petroleum and Other Liquids Consumption (b)	98.5	99.3	98.9	93.7	97.9
Biofuels Production (c)	3.1	3.2	3.1	3.1	2.7
Biofuels Consumption (c)	2.6	2.6	2.6	2.6	2.6
Iran Liquid Fuels Production	3.6	3.6	3.6	2.9	3.6
Iran Liquid Fuels Consumption	1.7	1.9	1.8	1.7	1.8
Petroleum and Petroleum Products Produced and Consumed in Countries Other Than Iran (million barrels per day)					
Production (d)	89.5	89.9	89.7	85.3	92.2
Consumption (d)	94.2	94.8	94.5	89.4	93.5
Production minus Consumption	-4.7	-4.9	-4.8	-4.1	-1.3
World Inventory Net Withdrawals Including Iran	2.4	2.6	2.5	2.4	-0.7
Estimated OECD Inventory Level (e) (million barrels)	2,811	2,786	2,798	3,188	2,943
Surplus Production Capacity (million barrels per day)					
OPEC Surplus Crude Oil Production Capacity (f)	6.8	6.4	6.6	7.6	3.4

Note: The term "petroleum and other liquids" encompasses crude oil, lease condensate, natural gas liquids, biofuels, coal-to-liquids, gas-to-liquids, and refinery processing gains, which are important to consider in concert due to the inter-related supply, demand, and price dynamics of petroleum, petroleum products, and related fuels.

(a) Production includes crude oil (including lease condensates), natural gas liquids, other liquids, and refinery processing gains.

(b) Consumption of petroleum by the OECD countries is synonymous with "products supplied," defined in the glossary of the EIA Petroleum Supply Monthly, DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel, and loss, and bunkering.

(c) Biofuels production and consumption are based on EIA estimates as published in the International Energy Statistics. Biofuels production in the third quarter tends to be at its highest level in the year as ethanol production in Brazil reaches its seasonal peak and is typically lowest in the first quarter as seasonal production falls in the South/South-Central region of Brazil.

(d) Global production of petroleum and petroleum products outside of Iran is derived by subtracting biofuels production and Iran liquid fuels production from global liquid fuels production. The same method is used to calculate global consumption outside of Iran.

(e) Estimated inventory level is for OECD countries only.
(f) EIA defines surplus oil production capacity as potential oil production that could be brought online within 30 days and sustained for at least 90 days, consistent with sound business practices. This does not include oil production increases that could not be sustained without degrading the future production capacity of a field.

Independent Statistics & Analysis
U.S. Energy Information Administration

November 2021

Short-Term Energy Outlook

Forecast highlights

Global liquid fuels

- The November *Short-Term Energy Outlook* (STEO) remains subject to heightened levels of uncertainty related to the ongoing recovery from the COVID-19 pandemic. U.S. gross domestic product (GDP) declined by 3.4% in 2020 from 2019 levels. This STEO assumes U.S. GDP will grow by 5.4% in 2021 and by 4.2% in 2022. The U.S. macroeconomic assumptions in this outlook are based on forecasts by IHS Markit. In addition to uncertainty about macroeconomic conditions, the evolving effects of consumer behavior on energy demand because of the pandemic present a wide range of potential outcomes for energy consumption. Supply uncertainty in the forecast results from the production decisions of OPEC+ along with the rate at which U.S. oil and natural gas producers increase drilling at forecast price levels.

- Brent crude oil spot prices averaged $84 per barrel (b) in October, up $9/b from September and up $43/b from October 2020. Crude oil prices have risen over the past year as result of steady draws on global oil inventories, which averaged 1.9 million barrels per day (b/d) during the first three quarters of 2021. In addition to sustained inventory draws, prices increased after OPEC+ announced in early October—and reaffirmed on November 4—that the group would keep current production targets unchanged. We expect Brent prices will remain near current levels for the rest of 2021, averaging $82/b in the fourth quarter of 2021. In 2022, we expect that growth in production from OPEC+, U.S. tight oil, and other non-OPEC countries will outpace slowing growth in global oil consumption and contribute to Brent prices declining from current levels to an annual average of $72/b.

- We estimate that 98.9 million b/d of petroleum and liquid fuels was consumed globally in October, an increase of 4.5 million b/d from October 2020 but 1.9 million b/d less than in October 2019. We revised up our forecast for consumption of petroleum and liquid fuels for the fourth quarter of 2021, partially as a result of fuel switching from natural gas to petroleum in the electric power sector in parts of Asia and Europe. This fuel switching is a result of increases in natural gas prices in Asia and Europe. We forecast that global consumption of petroleum and liquid fuels will average 97.5 million b/d for all of 2021, which is a 5.1 million b/d increase from 2020. We forecast that global consumption of petroleum and liquid fuels will increase by 3.3 million b/d in 2022.

- U.S. regular gasoline retail prices averaged $3.29 per gallon (gal) in October, up 12 cents/gal from September, and $1.13/gal higher than in October 2020. The October price was the highest monthly average since September 2014. We forecast that retail gasoline prices will average $3.32/gal in November before falling to $3.16/gal in December, which are 16 cents/gal and 11 cents/gal higher than our previous forecast, respectively.

- U.S. crude oil production averaged an estimated 11.4 million b/d in October, up from 10.7 million b/d in September as a result of production increases following disruptions from Hurricane Ida. We forecast production will rise to 11.6 million b/d in December. We forecast annual production will average 11.1 million b/d in 2021, increasing to 11.9 million b/d in 2022 as tight oil production rises in the United States. Growth will come largely as a result of onshore operators increasing rig counts, which we expect will offset production decline rates.

Natural Gas

- In October, the natural gas spot price at Henry Hub averaged $5.51 per million British thermal units (MMBtu), which was up from the September average of $5.16/MMBtu and up from an average of $3.25/MMBtu in the first half of 2021. The rising natural gas prices in recent months reflect U.S. natural gas inventory levels that are below the five-year (2016–20) average. Despite high prices demand for natural gas for electric power generation has remained relatively high, which along with strong global demand for U.S. liquefied natural gas (LNG) has limited downward natural gas price pressures.

- The Henry Hub spot price will average $5.53/MMBtu from November through February in our forecast and then generally decline through 2022, averaging $3.93/MMBtu for the year amid rising U.S. natural gas production and slowing growth in LNG exports. We forecast that U.S. inventory draws will be similar to the five-year average this winter, and we expect that factor, along with rising U.S. natural gas exports and relatively flat production through March, will keep U.S. natural gas prices near recent levels before downward price pressures emerge. Because of uncertainty around seasonal demand, we expect natural gas prices to remain volatile over the coming months with winter temperatures to be a key driver of demand and prices.

- We estimate that U.S. LNG exports averaged 9.8 billion cubic feet per day (Bcf/d) in October 2021, up 0.3 Bcf/d from September, supported by large prices differences between Henry Hub prices in the United States and spot prices in Europe and Asia. LNG exports resumed from Cove Point LNG in late October after that facility's annual maintenance was completed. In our forecast LNG exports average 9.8 Bcf/d for all of 2021, up 50% from 2020. We expect that LNG exports will increase this winter, averaging 11.0 Bcf/d from November through March. We expect high levels of LNG

exports to continue into 2022, averaging 11.5 Bcf/d for the year, up 17% from 2021. The forecast reflects our assumption that global natural gas demand remains high and several new natural liquefaction trains—the sixth train at Sabine Pass LNG and the first trains at the new LNG export facility, Calcasieu Pass LNG—enter service.

- U.S. natural gas inventories ended October 2021 at more than 3.6 trillion cubic feet (Tcf), 3% less than the five-year average for this time of year. Injections into storage this summer were below the previous five-year average, largely as a result of more electricity consumption in June because of hot weather and increased exports, even as domestic natural gas production has remained flat. However, in recent weeks, storage levels have moved closer to average levels as injections outpaced the five-year average in September and October. We expect natural gas inventories to fall by 2.1 Tcf this winter, ending March at 1.6 Tcf, which would be 4% less than the 2017–21 average for that time of year.

- We estimate dry natural gas production averaged 94.9 Bcf/d in the United States in October (up from 94.5 Bcf/d in September) and 91.9 Bcf/d in in the first half of 2021. Production in the forecast rises to an average of 95.2 Bcf/d during the rest of this winter (November–March) and averages 96.7 Bcf/d during 2022, driven by natural gas and crude oil prices, which we expect to remain at levels that will support enough drilling to sustain production growth.

Electricity, coal, renewables, and emissions

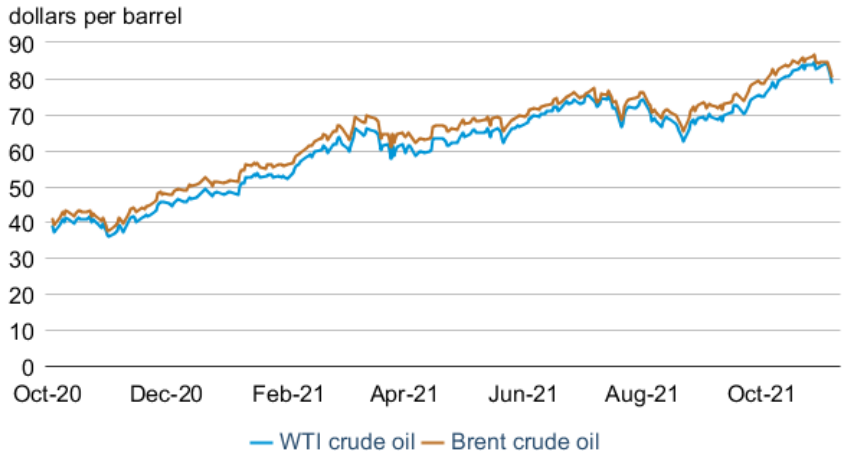
- The share of electricity generation produced by natural gas in the United States averages 36% in 2021 and 35% in 2022 in our forecast, down from 39% in 2020. In 2021, our forecast share for natural gas as a generation fuel declines in response to our expectation of a higher delivered natural gas price for electricity generators, which we forecast will average $5.12/MMBtu compared with $2.39/MMBtu in 2020. As a result of the higher expected natural gas prices, the forecast share of electricity generation from coal rises from 20% in 2020 to about 23% in 2021 and 22% in 2022. For renewable energy sources, new additions of solar and wind generating capacity are offset somewhat by reduced generation from hydropower this year, resulting in the forecast share of all renewables in U.S. electricity generation to average 20% in 2021, about the same as last year, before rising to 22% in 2022. The nuclear share of U.S. electricity generation declines from 21% in 2020 to 20% in 2021 and 2022.

- We expect coal consumption in the electric power sector to rise by 80 million short tons (MMst), or 18%, in 2021. The increase in the electric power sector's use of coal reflects higher natural gas prices this year compared with last year. However, electricity generation from coal-fired power plants has not increased as much in response to rising natural gas prices as it has in the past or by as much as our models had forecast earlier this year. The lower price responsiveness of coal for electricity

generation, which is likely the result of constraints on coal supply and low coal stocks, is contributing to upward pressure on natural gas prices.

- U.S. coal exports in our forecast rise by 20 MMst (29%) in 2021. Higher U.S. exports reflect rising global demand for coal amid high natural gas prices. We expect exports to remain relatively unchanged in 2022, when a 3 MMst increase in metallurgical coal exports is partly offset by a 2 MMst decline in steam coal exports. U.S. coal production growth has not kept pace with rising domestic demand for steam coal in the electric power sector and export growth, leading to a draw down in coal inventories held by the electric power sector.

- Planned additions to U.S. wind and solar capacity in 2021 and 2022 increase electricity generation from those sources in our forecast. We estimate that the U.S. electric power sector added 14.6 gigawatts (GW) of new wind capacity in 2020. We expect 17.0 GW of new wind capacity will come online in 2021 and 6.9 GW in 2022. Utility-scale solar capacity rose by an estimated 10.5 GW in 2020. Our forecast for added utility-scale solar capacity is 15.7 GW for 2021 and 18.2 GW for 2022. We expect significant solar capacity additions in Texas during the forecast period. In addition, we project that after increasing by 4.5 GW to 27.7 GW in 2020, small-scale solar capacity (systems less than 1 megawatt) will grow by 5.8 GW in 2021 and by 7.8 GW in 2022.



- U.S. energy-related carbon dioxide (CO_2) emissions decreased by 11% in 2020 as a result of less energy consumption due to reduced economic activity and to end user responses to COVID-19. For 2021, we forecast energy-related CO_2 emissions will increase about 7% from the 2020 level as economic activity increases and leads to rising energy use. We expect a 1% increase in energy-related CO_2 emissions in 2022. We forecast that after declining by 19% in 2020, coal-related CO_2 emissions will rise by 18% in 2021 and then fall by 5% in 2022.

Petroleum and natural gas markets review

Crude oil

Prices: The front-month futures price for Brent crude oil settled at $80.54 per barrel (b) on November 4, 2021, up $1.26/b from $79.28/b on October 1. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, increased by $2.93/b during the same period, settling at $78.81/b on November 4 **(Figure 1)**.

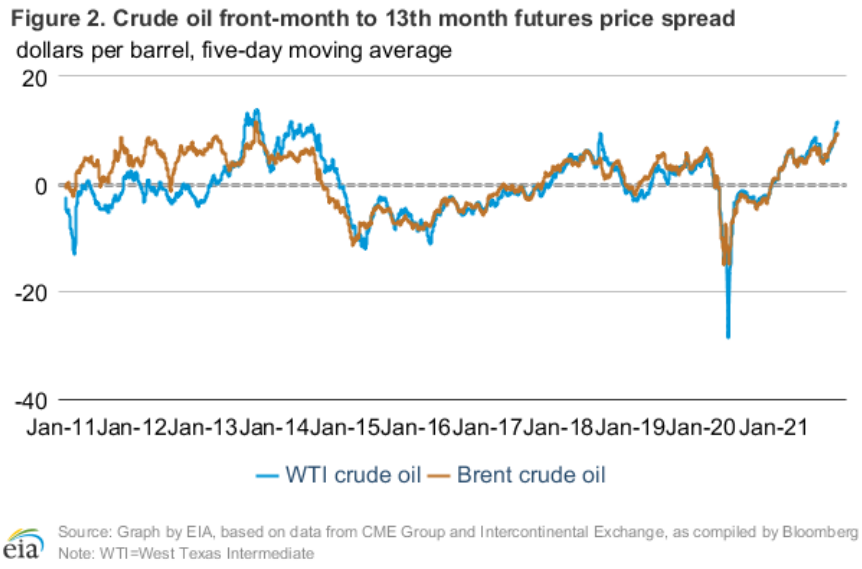


Figure 1. Crude oil front-month futures prices

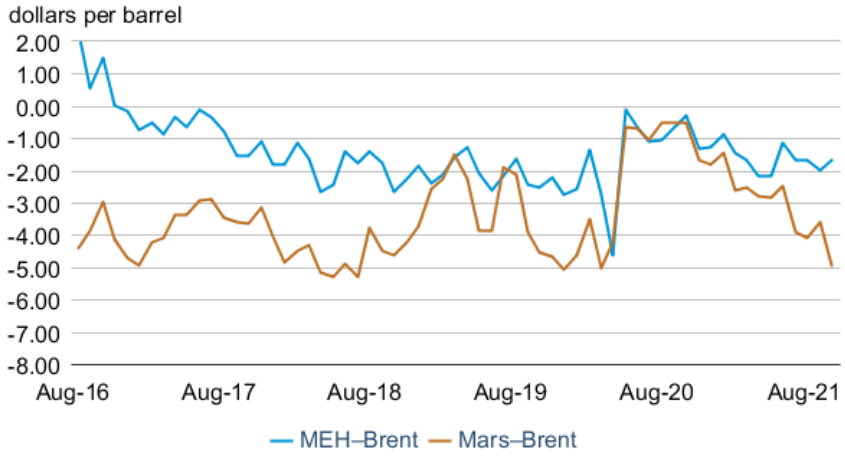
Source: Graph by EIA, based on CME Group and Intercontinental Exchange, compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate

The front-month Brent crude oil price averaged $84/b in October, an increase of $9/b from September, and the WTI price averaged $81/b, an increase of $10/b from September. Without adjusting for inflation, these prices were the highest monthly average nominal prices since October 2014. Restraints on global production and expectations of higher demand this winter continue to contribute to upward price pressures. Trade press has indicated increased purchases of oil and petroleum products from electric generators in parts of Asia and Europe that may switch fuels from natural gas to oil in the winter. Furthermore, several countries, such as Thailand, Israel, Australia, and the United States, eased international border and travel restrictions in early November, which could support more fuel demand for air travel in some locations this winter.

Differences in prices between crude oil contracts for delivery in the near term compared with contracts for delivery further into the future indicate market expectations that stock draws will moderate in the future. Crude oil stock levels, among other factors, affect the relationship between near-term and longer-term futures prices. Because crude oil stocks are currently low globally and in the United States, both Brent and WTI are backwardated (when near-month prices are higher than longer-dated ones) **(Figure 2)**.

The five-day moving average of the spread between prices for the 1st month futures contract and 13th month contract for Brent increased to $9.04/b on November 4 (up from $7.05/b on October 1), and on November 2 was at its highest spread since September 13, 2013. The 1st-13th spread for WTI increased to $11.20/b on November 4 (from $6.78/b on October 1), and on November 2 was at its highest spread since September 20, 2013. We estimate total U.S. crude oil stocks ended October at 435.4 million barrels, the lowest October level since 2018 and 6.2% below the five-year (2016–2020) average for the month. Crude oil inventories are especially low in Cushing, Oklahoma, the delivery point for the WTI crude oil futures contract. In the week ending October 29, crude oil inventories in Cushing were 24.0 million barrels, meaning Cushing's storage capacity utilization was only about 31%. We forecast global stock builds starting in the spring of 2022, which likely will reduce some of the tightness in the market that may be contributing to high front-month prices.

During the past decade, similarly high levels of backwardation in Brent and WTI crude oil have typically only occurred during periods of large, unplanned supply disruptions. This year, however, the significant decline in inventories and resulting backwardation are the result of a strong increase in oil demand as well as restrained crude oil production levels among OPEC+ members. At its early October meeting—and reaffirmed at its November 4 meeting, OPEC+ committed to maintaining its scheduled crude oil production increase of 400,000 barrels per day (b/d) in December rather than increase production by more in response to high crude oil prices and increasing demand.



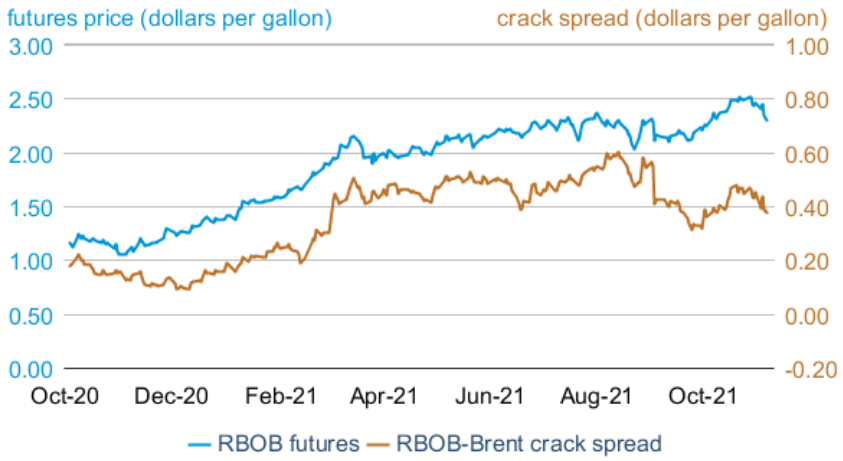
We estimate that world crude oil consumption has exceeded crude oil production for five consecutive quarters going back to the third quarter of 2020. During this period, total petroleum stocks among countries in the Organization for Economic Cooperation and Development (OECD) fell by 424 million barrels—from 9% above the five-year average in June 2020 to 7% below the five-year average at the end of September 2021. We forecast global crude oil demand will

exceed global supply through the end of the year, contribute to some additional stocks draws, and keep the Brent crude oil price above $80/b through December. However, we forecast that global oil stocks will begin building in 2022, driven by rising production from OPEC+ and the United States, along with slowing growth in global oil demand. We expect this shift will put downward pressure on the Brent price, which averages $72/b for 2022 in our forecast.

***Crude oil price spreads*:** The price for crude oils with high levels of sulfur declined relative to those with lower levels, as a result of both rising crude oil exports from OPEC and high natural gas prices that may be affecting the costs of certain refinery operations, among other factors. OPEC has been increasing production and exports during the second half of 2021. Crude oil production from many OPEC countries tend be a sour grade. The increase in OPEC exports has added to global supplies of sour crude oils. Additionally, sour crude oils must first be treated with hydrogen to meet low-sulfur fuel specifications and to avoid damage to refinery units. Because natural gas is used in hydrogen production, the recently high global natural gas prices have contributed to higher refinery feedstock costs, particularly in Europe and Asia. When the cost of natural gas increases, sour crude oils become more costly to run. Higher treatment costs of sour crude oil have likely made them less economic for refiners as global natural gas prices have increased, contributing to higher demand for sweeter crude (lower sulfur) oils such as Magellan East Houston (MEH) and lower demand for more sour crude oils, such as Mars.

These factors are likely reducing the price of certain grades of crude oil that require more processing to be converted to finished petroleum products. For example, Mars crude oil, which is produced in the Federal Offshore Gulf of Mexico and has a sulfur content of 1.93%, decreased in price in October relative to light sweet crude oils such as MEH and Brent, which both have sulfur contents of 0.45%. The Mars–Brent spread widened to an average of -$4.93b in October, from -$3.58/b in September. In comparison, MEH crude oil prices narrowed slightly relative to Brent in October **(Figure 3)**.

Figure 3. Crude oil differentials to Brent

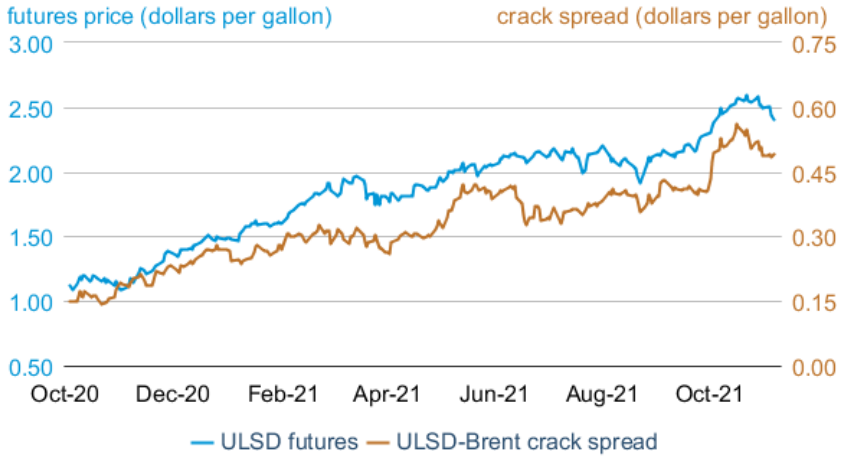


eia Source: Graph by EIA, based on data from CME Group, as compiled by Bloomberg L.P.

Petroleum products

Gasoline prices: The front-month futures price of RBOB (the petroleum component of gasoline used in many parts of the country) settled at $2.29 per gallon (gal) on November 4, up 4 cents/gal from October 1 **(Figure 4)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) increased by 1 cent/gal to settle at 37 cents/gal during the same period. The average RBOB–Brent crack spread in October was 43 cents/gal, up from 38 cents/gal in September.

Figure 4. Historical RBOB front-month futures prices and crack spreads



Source: Graph by EIA, based on data from CME Group, as compiled by Bloomberg L.P.
Note: RBOB is the petroleum component of gasoline used in many parts of the country.

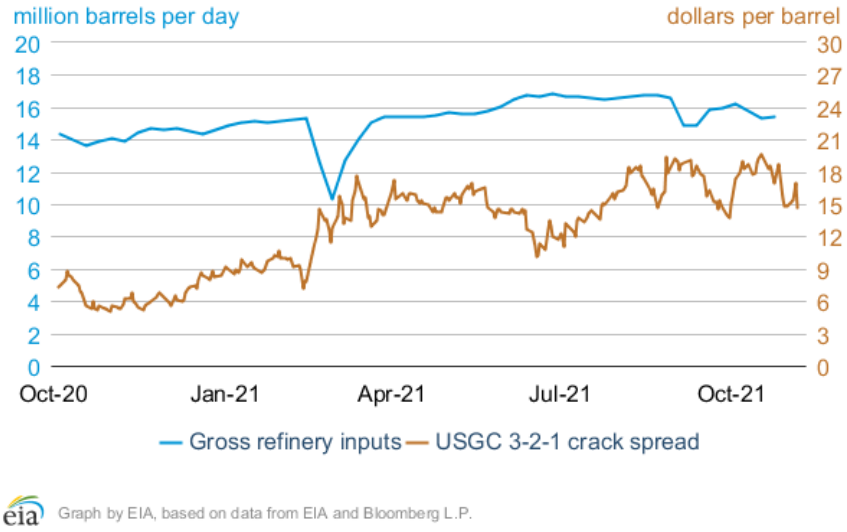
In October, rising crude oil prices contributed to the highest gasoline prices (in nominal prices) since September 2014. Crude oil prices are the primary driver of the higher gasoline price, but the gasoline crack spread also increased in October compared with September, reaching a high of 48 cents/gal on October 18, before it decreased near the end of the month. Rapidly increasing crude oil prices typically reduce product crack spreads, but low inventories are supporting crack spreads. Gasoline inventory draws were relatively large in September, which likely reflects a combination of less refinery production throughout 2021 than in recent years and higher gasoline demand compared with earlier in 2021. We estimate total U.S. gasoline inventories fell by 11.4 million barrels in October compared with September, which was a larger inventory draw than the five-year average and has also resulted in inventory levels near the five-year low.

We estimate U.S. gasoline consumption in October 2021 increased to 9.2 million b/d, higher than levels seen in August and September. Typically, gasoline consumption decreases substantially from August to October, declining by 5% over that period in both 2018 and 2019 and declining by 2% over that period in 2020. We forecast gasoline consumption will decrease to less than 9.0 million b/d in November and remain below that level until May 2022.

Ultra-low sulfur diesel prices: The front-month futures price for ultra-low sulfur diesel (ULSD) for delivery in New York Harbor settled at $2.41/gal on November 4, up 2 cents/gal from October 1 **(Figure 5)**. The ULSD-Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) decreased 1 cent/gal during the same period and settled at 49 cents/gal on November 4. The ULSD–Brent crack spread averaged 52 cents/gal in October.

Figure 5. Historical ULSD front-month futures prices and crack spreads

Source: Graph by EIA, based on data from CME Group, as compiled by Bloomberg L.P.
Note: ULSD=ultra-low sulfur diesel



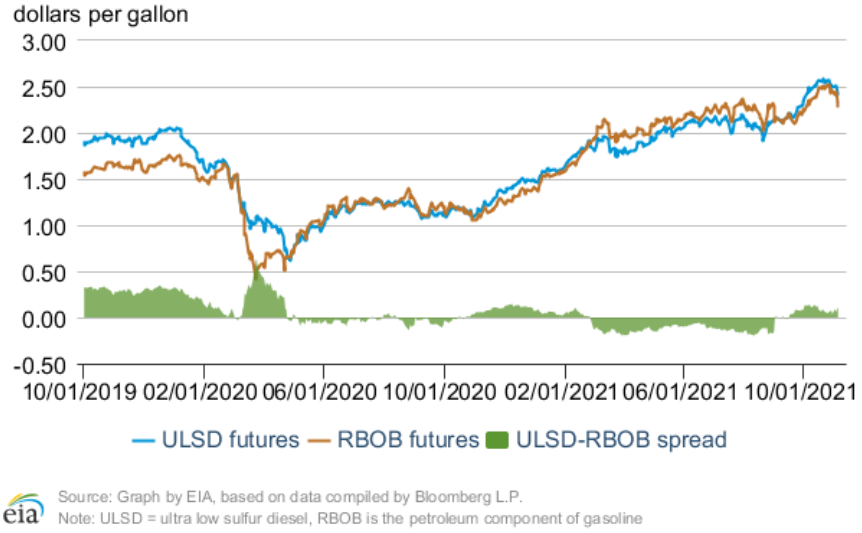
The distillate futures price rose to its highest level (in nominal prices) since October 2014, reaching $2.59/gal on October 20, before declining several cents toward the end of October, reflecting recent movements in crude oil prices. Distillate crack spreads remained elevated in October due to low refinery production, which has contributed to inventory levels near the five-year low. The ULSD crack spread only accounts for the price of crude oil inputs; it does not consider other inputs or operational costs associated with ULSD production. In particular, hydrogen produced at natural gas plants is an important secondary input for ULSD production at many refineries. Higher natural gas prices may be contributing to increased crack spreads, as well as increased refinery costs that may prevent ULSD producers from achieving higher margins.

We estimate U.S. distillate consumption at 4.0 million b/d in October, about the same level compared with September. However, distillate consumption typically increases from September to October. Agricultural use in the peak of the harvest season likely drove this increase in distillate consumption. The rising consumption was likely offset by a mild October in the Northeast that may have reduced some home heating oil consumption there. In addition, a shortage of truck drivers may have limited diesel consumption as well, despite high demand for trucking and rail volumes to respond to supply chain backlogs at U.S. ports. Based on our *Weekly Petroleum Status Report* (WPSR), we estimate four-week average exports as of October 29 were 1.0 million b/d. If confirmed in monthly data, this average for exports would be the lowest level for October since 2014 and would continue the trend of exports lower than the five-year

average in every month since August 2020. This low level of exports contributed to the lowest distillate inventory withdrawals for October since 2009.

Crack spreads and refinery runs: Higher gasoline and distillate crack spreads associated with lower inventories have resulted in sharp increases in estimated overall refining margins during seasonal refinery maintenance **(Figure 6).** Rising gasoline demand contributed to increased gross refinery inputs (runs) in the United States throughout the summer, and runs remained above 16 million b/d from May through August, according to our *Petroleum Supply Monthly* (PSM). September and October are typically the time for seasonal refinery maintenance, and U.S. Gulf Coast refinery operations were reduced because of inclement weather from hurricanes and tropical storms during late August and early September. During this period, the U.S. Gulf Coast 3-2-1 crack spread, which serves as a measure of refinery profitability (by subtracting the prices of two-thirds of a barrel of gasoline and one-third of a barrel of diesel from the price of a barrel of WTI crude oil), increased from $11/b at the start of July to more than $19/b in late August and again in mid-October.

Figure 6. U.S. Refinery runs and 3-2-1 crack spread



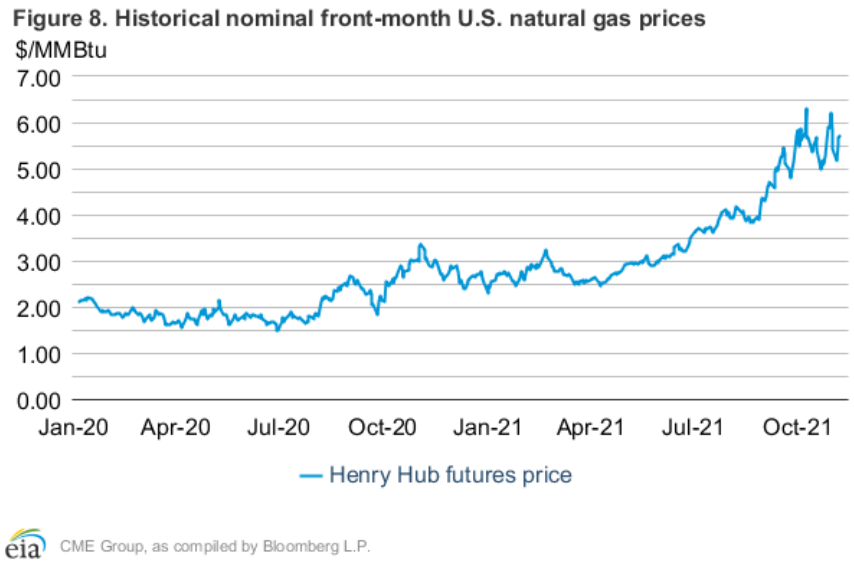
Graph by EIA, based on data from EIA and Bloomberg L.P.

Refinery runs also decreased in early October because of seasonal maintenance, and lower than average product inventories resulted in another increase in the crack spread, which reached $19.63/b on October 15, setting a new high for 2021. Although refinery maintenance often occurs in the fall, higher gasoline demand compared with earlier this year and lower relative inventories of both gasoline and distillate appear to be contributing to a tighter market in 2021.

ULSD-RBOB spread: Relatively higher RBOB prices in the summer months typically indicate higher gasoline demand in the summer and more expensive summer-grade gasoline. Lower gasoline demand in the fall and winter and the lower price of winter-grade gasoline, combined with higher diesel demand from the agricultural and home heating sectors, typically contribute to relatively higher ULSD prices from September through the end of the year. ULSD front-month

futures prices were lower than RBOB prices on a monthly-average basis from March through August of 2021, but traded at a premium to RBOB prices during September and October **(Figure 7)**. We calculate the ULSD-RBOB spread by subtracting the price of ULSD from the price of RBOB.

Figure 7. ULSD-RBOB spread



Source: Graph by EIA, based on data compiled by Bloomberg L.P.
Note: ULSD = ultra low sulfur diesel, RBOB is the petroleum component of gasoline

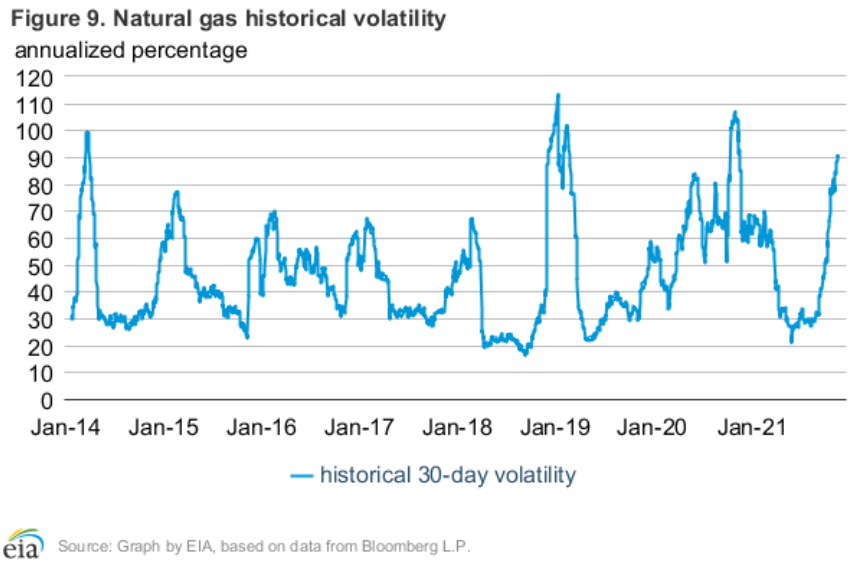
From March to August, RBOB traded on average 13 cents/gal higher than ULSD. During the past five years, the fuels have typically traded at roughly equal prices over that period. The relatively high RBOB prices likely reflected high summer gasoline exports and higher prices for renewable identification numbers (RINS)—which affect gasoline prices more than ULSD prices — over the summer. In addition, low jet fuel demand resulted in refineries reducing jet fuel production and shifting some of that production to ULSD, limiting upward pressure on ULSD prices.

In September, ULSD prices increased relative to RBOB prices and traded at a premium of 4 cents/gal to RBOB, the first monthly average premium since February 2021. However, the spread remained 9 cents/gal below the five-year average in October because some of the trends in 2021 that have contributed to higher relative gasoline prices still persist.

Natural Gas

Prices: The front-month natural gas futures contract for delivery at the Henry Hub settled at $5.72 per million British thermal units (MMBtu) on November 4, 2021, which was up $0.10/MMBtu from October 1, 2021 **(Figure 8)**. The average closing price for front-month natural gas futures contracts in October was $5.57/MMBtu, the highest October monthly average in real terms since October 2009.

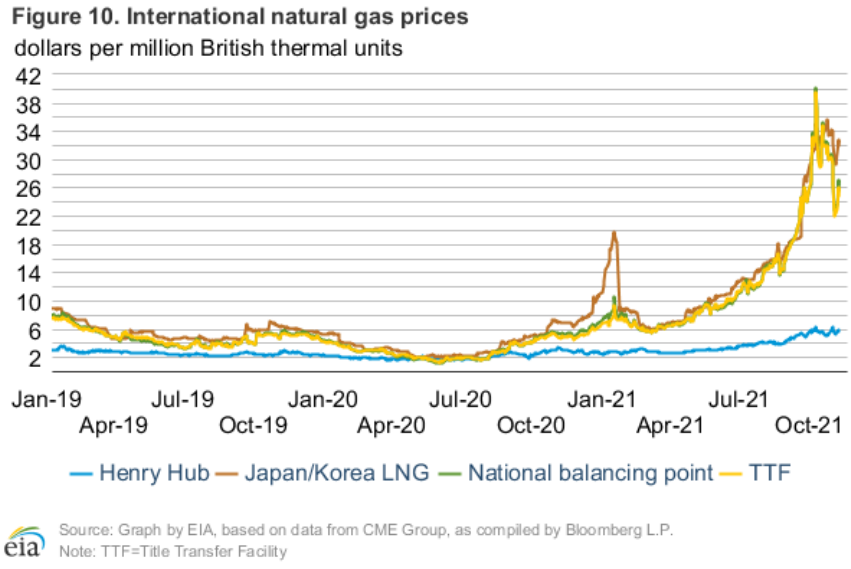
Despite mild weather that contributed to larger-than-average inventory builds, monthly average natural gas prices increased in October. Although builds were larger-than-average, inventories remain below the five-year (2016–20) average level, a condition which has contributed to rising natural gas prices in recent months. Relatively low inventory levels have been partly driven by demand for natural gas in the electric power sector that remained high because of limited ability for utilities to switch to coal for electric power generation. Consumption of natural gas in the United States tends to decline during September and October because temperatures are typically mild, resulting in low demand for both air conditioning and space heating. Consumption of natural gas was 71.8 billion cubic feet per day (Bcf/d) in October, down from an average of 75.0 Bcf/d in the third quarter. The decreased consumption was primarily driven by a decrease in natural gas-fired electric power generation, falling from 37.9 Bcf/d in the third quarter to 29.5 Bcf/d in October. However, natural gas use for power generation in October was 1.9 Bcf/d higher than we had forecast in last month's STEO. Higher-than-expected natural gas use in the electric power sector reflects limited natural gas-to-coal switching capabilities across the country, several planned nuclear outages in October, and lower-than-forecast electricity generation from wind.



As the weather gets colder, natural gas consumption typically shifts from the electric power sector to the residential and commercial sectors. Consumption in these sectors typically begins to increase in October due to colder temperatures, which results in increased natural gas consumption by buildings for space heating. However, because of milder temperatures this year, the residential and commercial sectors combined consumed 12.2 Bcf/d in October, which is 1.8 Bcf/d less than the five-year average. The United States as whole had 186 heating degree days (HDDs) in October, 52 fewer days than the October 2011–20 average of 238 HDDs.

Despite higher-than-expected consumption in the electric power sector, lower-than-average consumption in the residential and commercial sectors during October contributed to natural

gas storage injections outpacing the five-year average. We estimate that U.S. working natural gas inventories increased by 343 billion cubic feet (Bcf) during October, which is 34% more than the five-year average build from September to October. This build resulted in inventories ending October at 3,646 Bcf, which is 3% below the five-year average. This level is a decrease in the deficit to the five-year average compared with September, which ended the month at 6% below the five-year average. Until October, inventories had built at a slower rate than the five-year average for much of the storage injection season that typically begins in April and ends in late October or early November. Low inventory levels have been a contributor to higher prices in recent months. Higher-than-average storage injections in October likely limited upward pressure on natural gas prices toward the end of the month.



The spread between international and domestic prices remained high in October, and contributed to continued strong demand for U.S. liquefied natural gas (LNG) cargoes. U.S. LNG exports averaged 9.8 Bcf/d in October, or approximately 103% of total LNG export capacity. LNG production capacity at U.S. LNG export terminals can be optimized to run at peak (maximum) rates in periods of high demand, above the nameplate (baseload) capacity that LNG export facilities were designed to operate under normal conditions.

Historical volatility: Volatility of U.S. natural gas futures prices has risen substantially in the past two months **(Figure 9)**. Historical volatility measures the magnitude of daily changes in closing prices for a commodity during a given time in the past. Based on rolling front-month contracts, the 30-day historical volatility of U.S. natural gas futures prices was 29.8% for April through August of this year. In September, volatility rose to 49.4%, compared with the 2015–2019 September average of 30.6%. In October, volatility rose to 78.3%, compared with the 2015–2019 October average of 32.7%. In October, daily front-month natural gas futures contract intraday prices ranged as high as $6.47/MMBtu on October 6 and as low as $4.83/MMBtu on October 19. The historical volatility of the natural gas futures price at the Henry Hub in October has corresponded with high volatility at international pricing hubs in Europe and Asia.

International natural gas prices: International LNG spot and forward prices reached record highs in the first week of October. Prices reached $35/MMBtu in northern Asia and nearly $40/MMBtu in Europe in the first week of October **(Figure 10),** according to pricing data by Bloomberg Finance, L.P. Prices in Asia were up nearly twentyfold—and prices in Europe up nearly thirty fold—from record lows during the summer of 2020, when economic responses to the COVID-19 pandemic significantly reduced global energy consumption. Several factors contributed to significant increases in global spot natural gas prices this year, including:

- Large increases in natural gas demand in Asia and Latin America
- Low natural gas storage inventories in Europe following a cold winter and a hot summer
- Reduced global LNG supply because of planned and unplanned outages at LNG export facilities in several countries

Significant growth in natural gas demand in response to economic recovery from the COVID-19 pandemic in Asia, led by China, contributed to increased demand for global spot LNG supplies, in addition to LNG imports supplied under long-term contracts. A shortage of coal supplies in China, higher LNG demand by the electric power and industrial sectors in Japan, and lower output by nuclear power plants in South Korea all contributed to a significant increase in LNG imports into Asia. In addition, natural gas storage inventories in Europe remained relatively low in October, compared with historical averages. At the end of October, natural gas inventories in Europe were 77% full, compared with 95% last year at this time and the 91% five-year average, according to data from Gas Infrastructure Europe's (GIE) Aggregated Gas Storage Inventory (AGSI+).

Recent price declines in Northeast Asia and Western Europe suggest concerns about natural gas supply during the winter have eased to some extent. Natural gas delivered from Europe's LNG import terminals, which between April and September 2021 had been at its lowest level since 2018, started to increase in October, averaging 6.6 Bcf/d, 2% higher than in October 2020, according to data from the GIE's Aggregated LNG Storage Inventory (ALSI). LNG inventories in key Asian LNG-consuming countries have also been gradually filling up, with Japan's LNG stocks reaching five-year high in October.

The difference in natural gas prices in Asia and Europe compared with the Henry Hub price, even after including acquisition and delivery costs to U.S. terminals, remains high. U.S. LNG exports indexed off natural gas futures at the Henry Hub are cost-competitive on the international market. U.S. LNG export capacity utilization was above 100% in September and October, and we expect it to remain at high levels this winter, even with additional liquefaction capacity set to come online in the next few months.

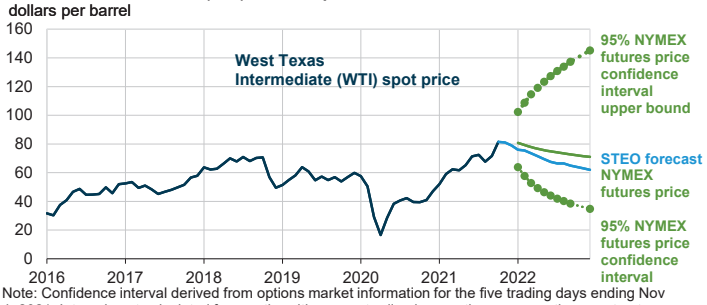
Our forecast assumes total U.S. LNG export capacity will continue to increase between December 2021 and late 2022 as a result of:

- Optimizing operations at Cheniere's Sabine Pass and Corpus Christi terminals, adding up to 0.7 Bcf/d of additional capacity (the Federal Energy Regulatory Commission (FERC) granted Cheniere approval to increase output by up to 11%)
- Completing Train 6 at Sabine Pass LNG, which is expected to be online in December 2021
- Commissioning of 10 mid-scale liquefaction units at a new facility, Calcasieu Pass, in Louisiana, starting in December 2021 and continuing through 2022

We forecast LNG exports will average 11.1 Bcf/d from December 2021 to February 2022, which would be the highest level of U.S. LNG exports on record.

Notable forecast changes

- U.S. crude oil production in the forecast averages 11.9 million b/d for 2022. This forecast is 0.2 million b/d (1.4%) higher than in the October STEO. The higher forecast is the result of our increased expectations for crude oil production in both the Permian Basin and Federal Offshore Gulf of Mexico (GOM). We raised our expectation of production in the Permian Basin as a result of higher expected drilling productivity. We raised our expectation of GOM production because we now expect some projects to come online sooner than previously forecast.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The views in this report therefore should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on November 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on November 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on November 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate, natural gas plant liquids, other liquids, refinery processing gain, and other unaccounted-for liquids.

OPEC = Organization of the Petroleum Exporting Countries: Iran, Iraq, Kuwait, Saudi Arabia, and the United Arab Emirates (Middle East); Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Libya, Nigeria, and Venezuela (Other).

Notes: EIA completed modeling and analysis for this report on November 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Forecasts are not published for individual OPEC countries.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on November 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Total Commercial Inventory	**1326.7**	**1457.7**	**1423.2**	**1343.3**	**1301.7**	**1271.5**	**1237.9**	*1214.1*	*1225.2*	*1287.8*	*1294.3*	*1267.1*	**1343.3**	*1214.1*	*1267.1*
Crude Oil in SPR	**635.0**	**656.0**	**642.2**	**638.1**	**637.8**	**621.3**	**617.8**	*600.6*	*600.6*	*600.6*	*600.6*	*591.0*	**638.1**	*600.6*	*591.0*

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) For net imports and inventories “Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products; for consumption “Other Oils” also includes renewable fuels except fuel ethanol.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on November 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on November 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to Petroleum Administration for Defense Districts (PADD).

See "Petroleum for Administration Defense District" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Marketing Monthly* , DOE/EIA-0380; *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on November 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on November 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Coal Market Indicators															
Coal Miner Productivity (Tons per hour)	**6.37**	**6.37**	**6.37**	**6.37**	**6.32**	**6.32**	**6.32**	*6.32*	*6.30*	*6.30*	*6.30*	*6.30*	**6.37**	*6.32*	*6.30*
Total Raw Steel Production (Million short tons per day)	**0.268**	**0.174**	**0.197**	**0.224**	**0.246**	**0.258**	**0.267**	*0.300*	*0.322*	*0.292*	*0.289*	*0.302*	**0.216**	*0.268*	*0.301*
Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.93**	**1.91**	**1.93**	**1.92**	**1.91**	**1.93**	**2.05**	*2.06*	*2.08*	*2.09*	*2.08*	*2.06*	**1.92**	*1.99*	*2.08*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on November 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on November 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on November 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on November 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 7d part 1. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continues on Table 7d part 2*

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on November 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW)

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in

- = no data available

Notes: EIA completed modeling and analysis for this report on November 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on November 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Miscellaneous															
Vehicle Miles Traveled (b)															
(million miles/day)	**7,764**	**6,868**	**8,262**	**8,009**	**7,682**	**8,939**	**9,031**	*8,881*	*8,181*	*9,305*	*9,408*	*8,993*	**7,728**	*8,638*	*8,975*
Air Travel Capacity															
(Available ton-miles/day, thousands)	**630**	**362**	**478**	**537**	**537**	**595**	**725**	*700*	*657*	*692*	*701*	*648*	**502**	*640*	*675*
Aircraft Utilization															
(Revenue ton-miles/day, thousands)	**328**	**151**	**208**	**238**	**245**	**340**	**391**	*388*	*405*	*451*	*449*	*408*	**231**	*341*	*428*
Airline Ticket Price Index															
(index, 1982-1984=100)	**250.8**	**203.7**	**200.6**	**215.1**	**198.4**	**243.3**	**218.5**	*199.5*	*204.7*	*231.7*	*232.9*	*242.5*	**217.5**	*214.9*	*227.9*
Raw Steel Production															
(million short tons per day)	**0.268**	**0.174**	**0.197**	**0.224**	**0.246**	**0.258**	**0.267**	*0.300*	*0.322*	*0.292*	*0.289*	*0.302*	**0.216**	*0.268*	*0.301*
Carbon Dioxide (CO2) Emissions (million metric tons)															
Petroleum	**558**	**441**	**520**	**523**	**517**	**559**	**568**	*567*	*552*	*569*	*586*	*578*	**2,042**	*2,212*	*2,286*
Natural Gas	**490**	**347**	**381**	**428**	**484**	**353**	**365**	*428*	*472*	*352*	*374*	*441*	**1,647**	*1,631*	*1,638*
Coal	**202**	**177**	**271**	**225**	**255**	**228**	**312**	*237*	*243*	*219*	*288*	*235*	**875**	*1,032*	*984*
Total Energy (c)	**1,252**	**969**	**1,175**	**1,179**	**1,259**	**1,142**	**1,249**	*1,236*	*1,269*	*1,143*	*1,251*	*1,256*	**4,575**	*4,886*	*4,920*

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

- = no data available

SAAR = Seasonally-adjusted annual rate

Notes: EIA completed modeling and analysis for this report on November 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on November 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on November 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

December 2021

Short-Term Energy Outlook

Forecast highlights

Global liquid fuels

- The December *Short-Term Energy Outlook* (STEO) remains subject to heightened levels of uncertainty related to the ongoing recovery from the COVID-19 pandemic. Notably, the emergence of the SARS-CoV-2 Omicron variant raises uncertainty about the level of energy consumption throughout the world compared with last month's forecast. U.S. gross domestic product (GDP) declined by 3.4% in 2020 from 2019 levels. This STEO assumes U.S. GDP will grow by 5.5% in 2021 and by 4.4% in 2022. The U.S. macroeconomic assumptions in this outlook are based on forecasts by IHS Markit. The U.S. macroeconomic forecast and the global macroeconomic forecast from Oxford Economics were completed in mid-November before the Omicron variant was identified. In addition to uncertainty about macroeconomic conditions, winter weather along with the evolving effects of consumer behavior on energy demand because of the pandemic present a wide range of potential outcomes for energy consumption. Supply uncertainty in the forecast results from the production decisions of OPEC+ and with the rate at which U.S. oil and natural gas producers increase drilling.

- Brent crude oil spot prices averaged $81 per barrel (b) in November, a $3/b decrease from October 2021 but a $38/b increase from November 2020. Crude oil prices have risen over the past year as result of steady draws on global oil inventories, which averaged 1.4 million barrels per day (b/d) during the first three quarters of 2021. Crude oil prices fell significantly on November 26, and the Brent spot price began December below $70/b. The drop in prices followed the identification of the new COVID-19 Omicron variant, which raised the possibility that petroleum demand could decline in the near term.

- We expect Brent prices will average $71/b in December and $73/b in the first quarter of 2022 (1Q22). For 2022 as a whole, we expect that growth in production from OPEC+, of U.S. tight oil, and from other non-OPEC countries will outpace slowing growth in global oil consumption, especially in light of renewed concerns about COVID-19 variants. We expect Brent prices will remain near current levels in 2022, averaging $70/b.

- We estimate that 99.7 million b/d of petroleum and liquid fuels was consumed globally in November, a 4.9 million b/d increase from November 2020 but 1.1 million b/d less than in November 2019. We revised down our forecast of consumption of petroleum

and liquid fuels for 4Q21 and 1Q22, partly as a result of recently announced travel restrictions following reported outbreaks of the Omicron variant of COVID-19. The potential effects of the spread of this variant are uncertain, which introduces downside risks to the global oil consumption forecast, particularly for jet fuel. We forecast that global consumption of petroleum and liquid fuels will average 96.9 million b/d for all of 2021, which is a 5.1 million b/d increase from 2020. We forecast that global consumption of petroleum and liquid fuels will increase by 3.5 million b/d in 2022 to average 100.5 million b/d.

- U.S. regular gasoline retail prices averaged $3.39 per gallon (gal) in November, a 10 cents/gal increase from October and $1.29/gal higher than in November 2020. The November monthly average was the highest since September 2014. We forecast that retail gasoline prices will average $3.13/gal in December before falling to $3.01/gal in January and $2.88/gal on average in 2022.

- Total U.S. crude oil production was an estimated 11.7 million b/d in November. We forecast that it will rise to an average of 11.8 million b/d in 2022 and to an average of 12.1 million b/d in 4Q22.

Natural Gas

- In November, the natural gas spot price at Henry Hub averaged $5.05 per million British thermal units (MMBtu), down from the October average of $5.51/MMBtu but up from an average of $3.25/MMBtu in the first half of 2021 (1H21). After rising in recent months, natural gas prices declined in November amid mild weather across much of the country that resulted in less natural gas used for space heating than expected. Decreased demand for natural gas also contributed to inventory levels moving closer to the five-year (2016–20) average. Global demand for U.S. liquefied natural gas (LNG) has remained high, limiting some downward pressure on natural gas prices.

- The Henry Hub spot price averages $4.58/MMBtu from December 2021 through February 2022 in our forecast and then generally declines through 2022, averaging $3.98/MMBtu in 2022 amid rising U.S. natural gas production and slowing growth in LNG exports. We forecast that U.S. inventory draws will be similar to the five-year average this winter, and we expect that factor, along with rising U.S. natural gas exports and relatively flat production through March, will keep U.S. natural gas prices near recent levels before downward price pressures emerge. Because of uncertainty around seasonal demand, we expect natural gas prices to remain volatile over the coming months, and winter temperatures will be a key driver of natural gas consumption and prices.

- We estimate that U.S. LNG exports averaged 10.7 billion cubic feet per day (Bcf/d) in November 2021, a 0.8 Bcf/d increase from October, supported by large price differences

between the Henry Hub price in the United States and spot prices in Europe and Asia. LNG exports resumed from Cove Point LNG in late October after that facility's annual maintenance was completed. In our forecast, LNG exports average 9.8 Bcf/d for all of 2021, a 50% increase from 2020. We expect that LNG exports will average 11.1 Bcf/d from December through March. We expect high levels of LNG exports to continue into 2022, averaging 11.5 Bcf/d for the year, a 17% increase from 2021. The forecast reflects our assumption that global natural gas demand remains high and U.S. LNG export capacity increases.

- U.S. natural gas inventories ended November 2021 at more than 3.5 trillion cubic feet (Tcf), 3% less than the five-year average for this time of year. Less natural gas was injected into storage this summer than the previous five-year average, largely as a result of more electricity consumption in June because of hot weather, and because of increased exports. However, storage levels moved closer to average as injections outpaced the five-year average in September, October, and early November. We expect natural gas inventories to fall by 2.0 Tcf during the November-to-March withdrawal season, ending March below 1.7 Tcf, which would be 2% less than the 2017–21 average for that time of year.

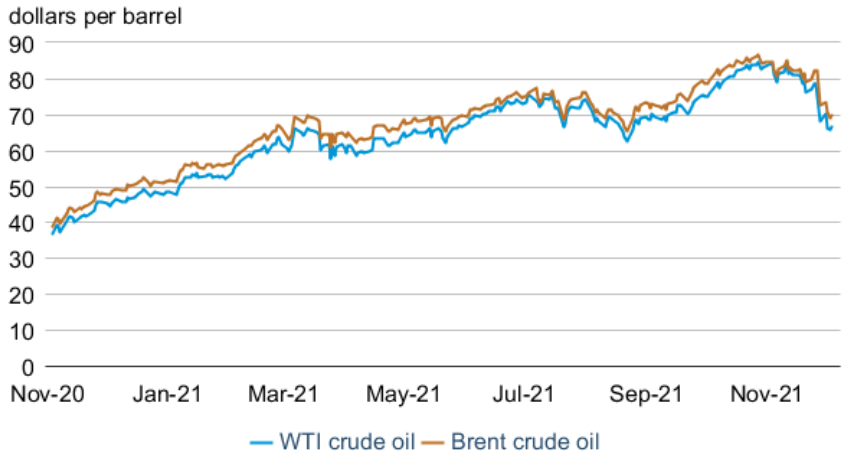
- We estimate dry U.S. natural gas production averaged 96.1 Bcf/d in the United States in November, up 1.0 Bcf/d from the average in October. Production in November was up from an average of 91.9 Bcf/d in 1H21. Natural gas production in the forecast rises to an average of 95.3 Bcf/d during the rest of this winter (December−March) and averages 96.0 Bcf/d for all of 2022, driven by natural gas and crude oil price levels that we expect will be sufficient to support enough drilling to sustain production growth.

Electricity, coal, renewables, and emissions

- We forecast that the share of electricity generation produced by natural gas in the United States will average 37% in 2021 and 35% in 2022, down from 39% in 2020. For 2021, the annual share for natural gas as a generation fuel declines in response to our expectation of a higher delivered natural gas price for electricity generators, which we forecast will average $4.99/MMBtu compared with $2.40/MMBtu in 2020. The natural gas share declines in 2022 as a result of continued high fuel costs and an increasing share of renewable generation. As a result of the higher expected natural gas prices, the annual forecast share of electricity generation from coal rises from 20% in 2020 to 23% in 2021 and then drops slightly to 22% in 2022. For renewable energy sources, new additions of solar and wind generating capacity have been offset somewhat by reduced generation from hydropower this year. As a result, we forecast that the share of all renewables in U.S. electricity generation will average 20% in 2021, about the same as last year, before rising to 22% in 2022. The nuclear share of U.S. electricity generation declines from 21% in 2020 to 20% in 2021 and 2022.

- We expect coal production to rise by 48 million short tons (MMst), or 9%, in 2021 and by an additional 38 MMst (6%) in 2022. The increase in production reflects more demand and higher prices for coal in the electric power sector because of higher natural gas prices this year compared with last year. Despite the increase in production, growth has not kept pace with rising domestic demand for steam coal in the electric power sector and export growth. As a result, coal inventories held by the electric power sector fall by an expected 51 MMst (38%) in 2021 and a further 10 MMst (13%) in 2022.

- Planned additions to U.S. wind and solar capacity in 2021 and 2022 increase electricity generation from those sources in our forecast. We estimate that the U.S. electric power sector added 14.6 gigawatts (GW) of new wind capacity in 2020. We expect 17.2 GW of new wind capacity will come online in 2021 and 7.1 GW in 2022. Utility-scale solar capacity rose by an estimated 10.4 GW in 2020. Our forecast for added utility-scale solar capacity is 16.2 GW for 2021 and 20.9 GW for 2022. We expect significant solar capacity additions in Texas during the forecast period. In addition, in 2020, small-scale solar capacity (systems less than 1 megawatt) increased by 4.4 GW to 27.6 GW. In particular, Texas and Florida had large increases of small-scale solar capacity in 2020. We project that small-scale solar capacity will grow by 5.1 GW in 2021 and by 5.0 GW in 2022.



- U.S. energy-related carbon dioxide (CO_2) emissions decreased by 11% in 2020 as a result of less energy consumption due to reduced economic activity and to end user responses to the COVID-19 pandemic. For 2021, we forecast energy-related CO_2 emissions will increase about 7% from 2020 as economic activity increases and leads to rising energy use. We expect a 1% increase in energy-related CO_2 emissions in 2022. We forecast that after declining by 19% in 2020, coal-related CO_2 emissions will rise by 17% in 2021 and then fall by 3% in 2022.

Petroleum and natural gas markets review

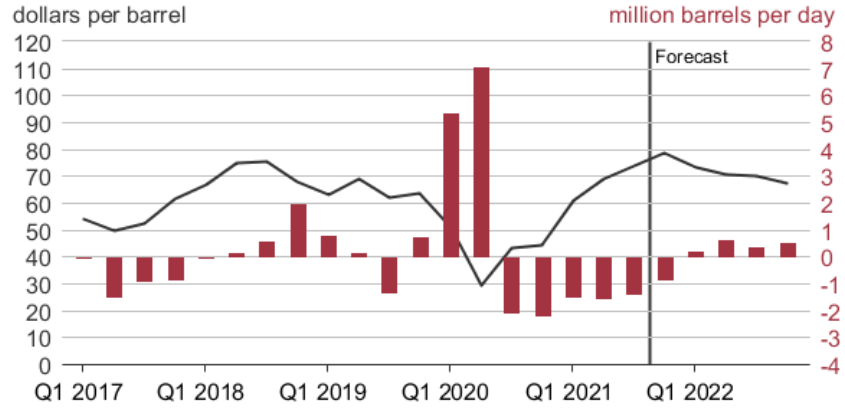
Crude oil

Prices: The front-month futures price for Brent crude oil settled at $69.67 per barrel (b) on December 2, 2021, a decrease of $15.04/b from the November 1 price of $84.71/b. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, decreased by $17.55/b during the same period, settling at $66.50/b on December 2 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices

Source: Graph by EIA, based on CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate

The front-month futures price for Brent crude oil decreased $9.50/b (11.6%) on November 26 after the World Health Organization designated the SARS-CoV-2 Omicron variant as a *Variant of Concern*. The price decline reflected market expectations that oil consumption might fall in the coming months as a result of the Omicron variant. The one-day percentage decrease for Brent crude oil on November 26 was the largest since April 21 2020, and larger percentage decreases have occurred on only four days since 2000 (three of which were in March and April 2020, the other in September 2001). In comparison, daily Brent crude oil prices typically change by less than 2%, and in 2021, prior to the price drop, the most the Brent crude oil price decreased in a single day was 6.9%.



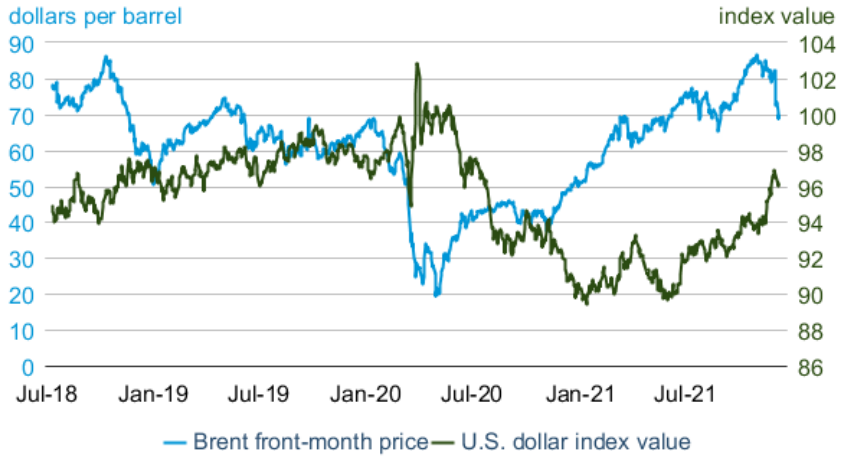
Prior to the price decrease on November 26, crude oil prices were already lower than they were at the beginning of November, likely due to gradual increases in production from OPEC+ members and the United States and rising COVID-19 counts in Europe. These factors had already introduced additional uncertainty in oil demand forecasts, even before the Omicron variant was identified. High COVID-19 case counts in November have prompted renewed mobility restrictions in Austria, work-from-home mandates in Ireland and the Netherlands, and several other guidelines in the rest of Europe. Although COVID-related concerns may have placed some

downward pressure on prices earlier in the month, prices remained above $80/b throughout most of November as a result of the same trends that have caused prices to rise for much of 2021. Those trends include declining global petroleum stocks amid crude oil production restraint from OPEC+ and the potential for natural gas-to-oil fuel switching in parts of Asia and Europe.

Crude oil prices may have also experienced downward pressures in early November because of expectations that the United States and other countries would release strategic oil reserves. The United States announced the release of 50 million barrels of crude oil from the Strategic Petroleum Reserve (SPR) on November 23, and other nations also agreed to release reserves.

We estimate that world crude oil consumption has exceeded crude oil production for five consecutive quarters going back to the third quarter of 2020 (3Q20), which has resulted in persistent global petroleum stock withdrawals that have averaged 1.7 million barrels per day (b/d) over this period **(Figure 2)**. These stock draws have contributed to consistent increases in crude oil prices in each of those quarters. We forecast stock draws will slow to 0.9 million b/d in 4Q21. With global oil stocks forecast to continue falling in December and with supply and demand moving into relative balance in 1Q22, we expect limited upward price pressure could emerge in the coming months. We forecast Brent spot prices will average $73/b in 1Q22. In our forecast, global oil stocks rise by an average of 0.5 million b/d from 2Q22 through 4Q22, as production begins to increase faster than global demand. These stock builds should contribute to downward pressure on crude oil prices, and our Brent forecast averages $71/b in 2Q22, $70/b in 3Q22, and $67/b in 4Q22.

Figure 2. World liquid fuels stock changes and Brent crude oil prices



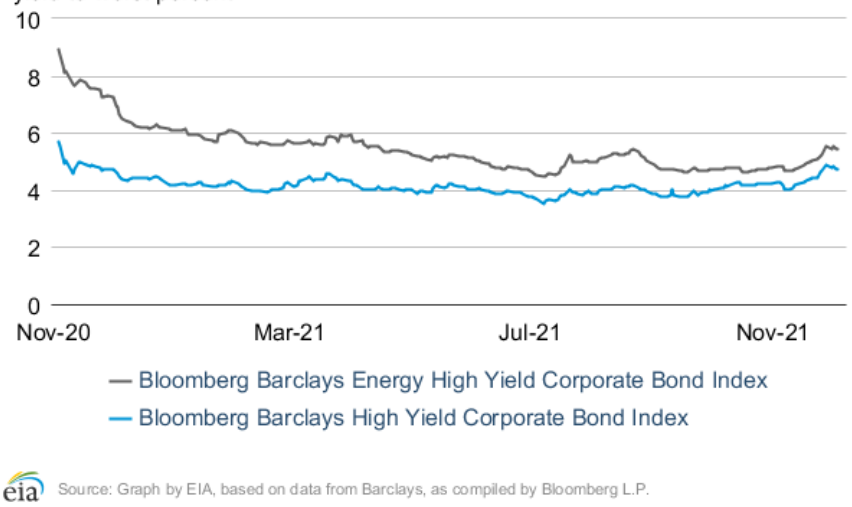
eia Source: U.S. Energy Information Administration

The Omicron variant has introduced additional uncertainty into oil markets for the coming months, and this uncertainty is reflected in the recent increase in oil price volatility. It is not yet clear how Omicron will affect oil markets and the broader economy. One of the most likely markets to be affected is jet fuel, and some flights have already been canceled because of the

variant. We expect global oil demand to rise by 3.5 million b/d in 2022. The forecast is subject to significant revisions.

Crude oil prices and the U.S. dollar index: The U.S. dollar index increased in November and developed a negative correlation with crude oil prices, which could reflect both reduced global economic growth expectations and financial flows from risky assets, such as commodities, into safer assets, such as U.S. Treasury bills. The U.S. dollar index measures the value of the U.S. dollar against the exchange rates of six currencies. The euro represents 58% of the currency weighting in the index, and the Japanese yen, British pound, Canadian dollar, Swiss franc, and Swedish krona make up the rest. The U.S. dollar index increased in November and reached 96.2 on December 2, which aside from a few days in late November was the highest since July 16, 2020 **(Figure 3)**. The higher value of the U.S. dollar likely reflects increased demand for dollars as a financial safe haven as the euro has decreased in value, likely following increased COVID-19 case counts in Eurozone countries. The higher value of the dollar may also reflect expectations of higher U.S. interest rates, following announcements that the Federal Reserve will reduce its monthly asset purchases.

Figure 3. Brent crude oil price vs. the value of the U.S. dollar



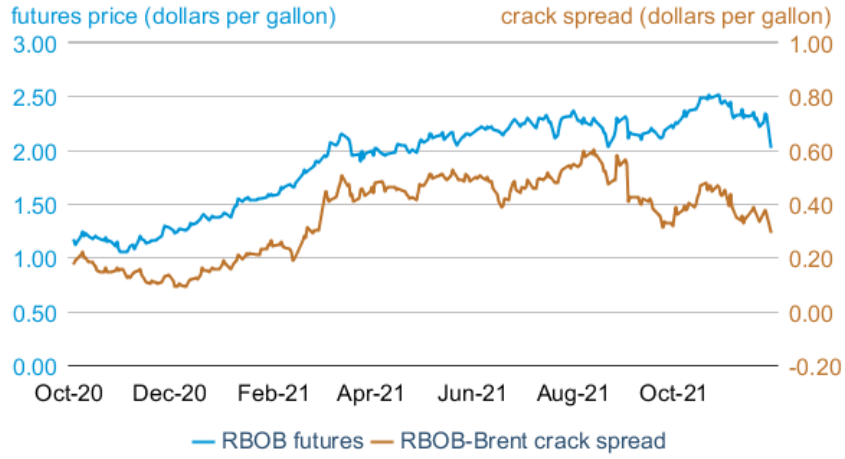
eia Source: Graph by EIA, based on data from Intercontinental Exchange, as compiled by Bloomberg L.P.

Because Brent crude oil is priced in dollars, oil-importing countries that use a currency that has depreciated relative to the dollar have not experienced the full extent of falling crude oil prices. From November 1 to December 2, the price of Brent crude oil decreased $15.04/b (17.8%). However, the euro fell by 2.6% compared with the U.S. dollar over the same period, meaning countries that use the euro have not experienced as steep of a relative price decrease in crude oil compared with countries that use the U.S. dollar or have currencies pegged to the dollar.

High yield bonds: Bond yields for companies with a credit rating lower than investment grade, called high yield bonds, were low for energy companies as well as broadly across all sectors in the first nine months of 2021. The lower yields reflected less default risk and reduced borrowing

costs for these companies. However, yields increased slightly in October and increased more substantially in November, particularly in the second half of the month, likely in response to some of the recent economic growth concerns and heightened market volatility. The Bloomberg Barclays Energy High Yield Corporate Bond Index's yield-to-worst (YTW), which represents the minimum achievable yield on the bonds after accounting for early prepayment, increased to 5.43% as of December 2, 2021, and the broader high yield index increased to 4.71% **(Figure 4)**. The low bond yields for exploration and production companies along with relatively high crude oil prices should result in an ample availability of funding to support the production increase in 2022. We forecast U.S. crude oil production will average 11.8 million b/d in 2022, a 0.7 million b/d increase from this year. Production in our forecast surpasses 12.0 million b/d in 4Q22.

Figure 4. High yield bonds



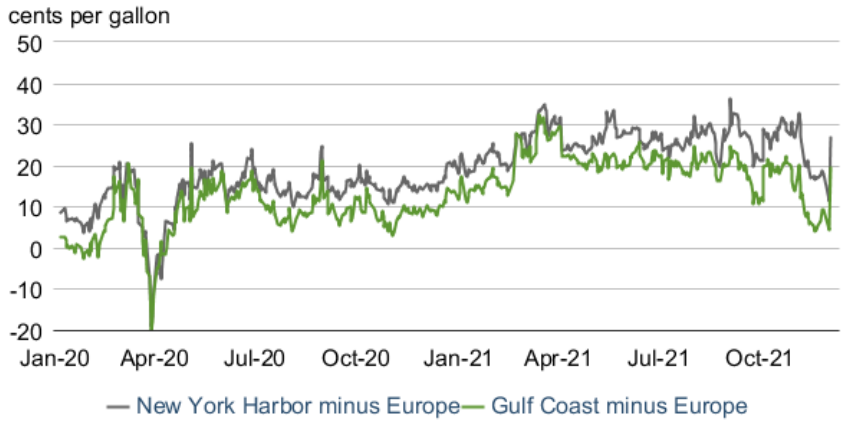
eia Source: Graph by EIA, based on data from Barclays, as compiled by Bloomberg L.P.

Recent declines in crude oil prices and heightened volatility increase the risk of some oil producers' ability to repay principal and interest on their debt. Furthermore, recent increases in interest rates likely reflect some market expectations for tighter monetary policy, which would also affect high yield bonds. Despite the recent increase in yields, the energy high yield bond index has narrowed to an average of 0.61% higher than the broad high yield index in November. Also, despite the recent increase in yields, bond yields for exploration and production companies remain relatively low.

Petroleum products

Gasoline prices: The front-month futures price of RBOB (the petroleum component of gasoline used in many parts of the country) settled at $1.97 per gallon (gal) on December 2, a 44 cents/gal decrease from November 1 **(Figure 5)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) decreased by 8 cents/gal to settle at 31 cents/gal during the same period. The average RBOB–Brent crack spread in November was 36 cents/gal, a 7 cents/gal decrease from October.

Figure 4. Historical RBOB front-month futures prices and crack spreads

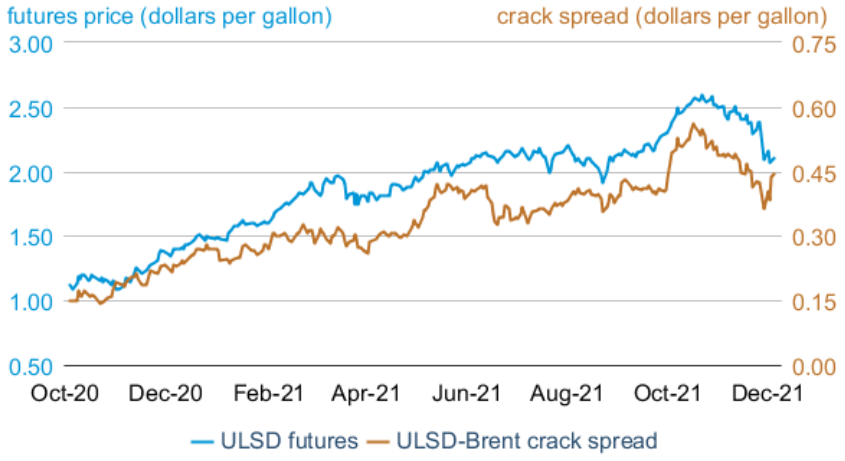


Source: Graph by EIA, based on data from CME Group, as compiled by Bloomberg L.P.
Note: RBOB is the petroleum component of gasoline used in many parts of the country.

The front-month RBOB price in November averaged $2.28/gal for the month, a 14 cent/gal decrease from October. The decrease partly reflects a decline in U.S. gasoline consumption, which fell by 0.3 million barrels per day (b/d) from October to 8.9 million b/d in November. Lower demand, combined with increased refinery production, contributed to an overall increase in gasoline inventories in the United States of almost 3.4 million barrels from October. The RBOB price decreased to $1.98/gal at the end of November, a 43 cents/gal decrease from November 1, primarily reflecting lower crude oil prices. The gasoline crack spread in late November similarly decreased to just under 30 cents/gal, its lowest level since February 2021. The decrease in RBOB prices and the crack spread likely reflected market expectations that responses to the Omicron variant could reduce demand.

Gasoline price differentials to Europe: In mid-November, U.S. gasoline spot price differentials to Europe narrowed to 17 cents/gal at New York Harbor (NYH) and 4 cents/gal at the U.S. Gulf Coast (USGC)—the smallest difference since 2020. Spreads in NYH narrowed further to 11 cents/gal at the end of November **(Figure 6)**. The narrowing spreads occurred as a drop in U.S. gasoline demand coincided with increased petroleum product prices in Europe. Higher prices in Europe likely reflect increased refining costs because of higher natural gas prices, along with higher-than-average gasoline demand since July. Gasoline crack spreads in Europe have been increasing compared with the five-year average since early October, during a period when they would normally be decreasing because of colder weather and lower seasonal demand. The rising prices in Europe have contributed to the mid-November decline in differentials to U.S. prices and to decreased U.S. imports of gasoline. According to our *Weekly Petroleum Status Report*, the rolling four-week average of U.S. gasoline imports decreased from 949,000 b/d during the week ending October 1 to 588,000 b/d during the week ending November 5, a 38% decline.

Figure 6. Gasoline spot price differentials, United States and Europe (Jan 2020–Nov 2021)



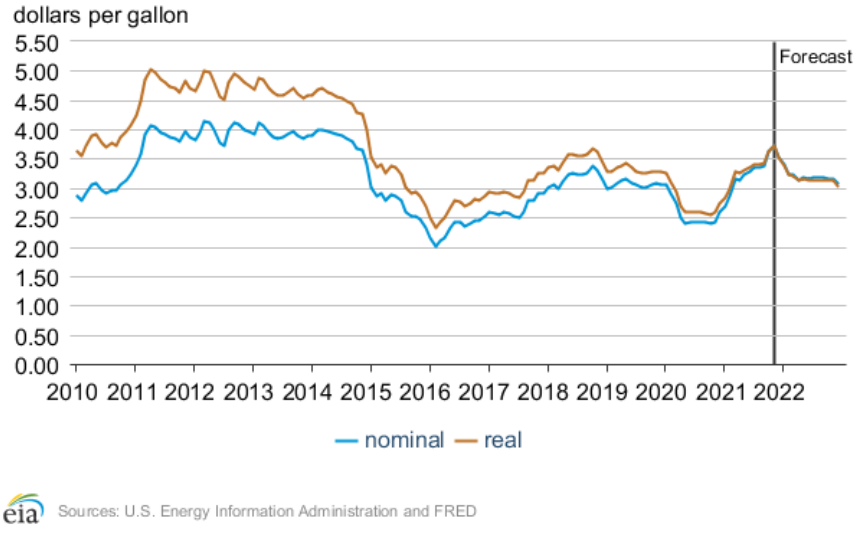
Source: Graph by EIA, based on data from Bloomberg L.P.

After the U.S. gasoline premiums narrowed for much of the past month, they widened during early December amid market volatility and uncertainty over the demand impact from the Omicron variant.

Ultra-low sulfur diesel prices: The front-month futures price for ultra-low sulfur diesel (ULSD) for delivery in New York Harbor settled at $2.10/gal on December 2, a 40 cents/gal decrease from November 1 **(Figure 7)**. The ULSD-Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) decreased 4 cents/gal during the same period and settled at 44 cents/gal on December 2.

Figure 7. Historical ULSD front-month futures prices and crack spreads

Source: Graph by EIA, based on data from CME Group, as compiled by Bloomberg L.P.
Note: ULSD=ultra-low sulfur diesel



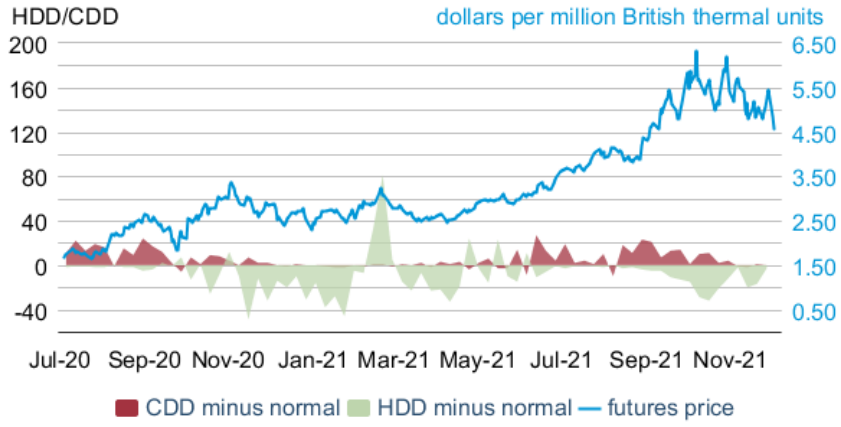
The ULSD–Brent crack spread in November averaged 45 cents/gal, down 7 cents/gal from October's average but up 25 cents/gal from November 2020. Recent changes in crude oil prices

caused by concerns about the Omicron variant increased volatility in the crack spread, which decreased 6 cents/gal on November 26 (the largest single-day decrease since April 2020) and then increased 7 cents/gal through December 1. We estimate that U.S. distillate consumption increased by 0.1 million b/d (2.8%) from October to 4.2 million b/d in November, more than the five-year average but just below 2019 levels. U.S. distillate production increased from October as refineries came back from maintenance, but it remained below the five-year average.

Our recent *Weekly Petroleum Status Report* data show that lower-than-average distillate production and relatively high distillate demand resulted in continued inventory drawdowns, mainly in the Midwest (PADD 2). In the Northeast (PADDs 1A and 1B), where heating oil is used as a primary source of home heating, inventories remained relatively flat, likely mild because of temperatures in October and November. Inventories in the Northeast have been at least 20% below average since mid-May.

Retail diesel prices: The average retail price for on-highway diesel in November was $3.73/gal, $1.30/gal (53%) higher than in November 2020. Compared with levels before the COVID-19 pandemic, prices are 66 cents/gal (21%) higher than at the same time in 2019 **(Figure 8)**. Rising crude oil prices are the primary driver of U.S. diesel prices, making up 52% of the total cost to produce a gallon of diesel in October 2021. Diesel serves as an input cost to other sectors of the economy, such as trucking, where rising diesel prices have contributed to freight rates increasing 36% year over year as of October. Although the November price was the highest since September 2014 in nominal terms, adjusting for inflation shows that recent prices are nearly the same in real terms as prices in 2018, but lower than prices in 2014. Compared with November 2014, November 2021 nominal prices are 2% higher, but in real terms they are 12% lower. We forecast nominal diesel prices will decline from December 2021 and average $3.19/gal in 2022.

Figure 8. U.S. monthly average retail diesel price

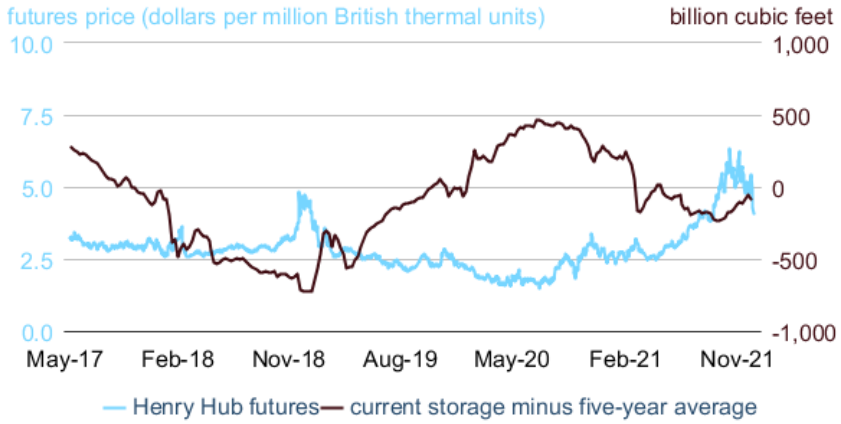


eia Sources: U.S. Energy Information Administration and FRED

Natural Gas

Prices: The front-month natural gas futures contract for delivery at the Henry Hub settled at $4.06 per million British thermal units (MMBtu) on December 2, 2021, down $1.13 cents/MMBtu from November 1, 2021 **(Figure 9)**. The average closing price for front-month natural gas futures in November was $5.12/MMBtu, the highest November monthly average in real terms since November 2009.

Figure 9. Natural gas front-month futures prices and actual minus historical average HDD and CDD



Sources: CME Group and National Oceanic and Atmospheric Administration, as compiled by Bloomberg L.P.
Note: HDD=heating degree days, CDD=cooling degree days.

Mild weather throughout November and forecasts for a warm start to December have contributed to a decline in natural gas futures prices. As weather gets colder, consumption of natural gas typically increases in the residential and commercial sectors for space heating. However, November 2021 was relatively warm; the United States experienced 479 heating degree days (HDDs), 38 fewer than the November 2011–20 average of 517 HDDs. Milder temperatures affected demand for natural gas in the residential and commercial sectors. We estimate that combined residential and commercial natural gas consumption was 26.7 billion cubic feet per day (Bcf/d) in November, 1.0 Bcf/d less than the five-year (2016–20) average.

Less-than-average natural gas consumption in the residential and commercial sectors in November resulted in natural gas storage levels increasing against their five-year average **(Figure 10)**. U.S. natural gas storage typically experiences a net draw during November. Injections often continue through mid-November, but those injections are usually more than offset by draws in the second half of the month. We estimate that U.S. working natural gas inventories decreased by 103 Bcf during November, which was 3.5% less than the five-year average inventory change for that time. At the end of the month, we estimate that storage inventories totaled 3,540 Bcf, which was 3.0% below the five-year average.

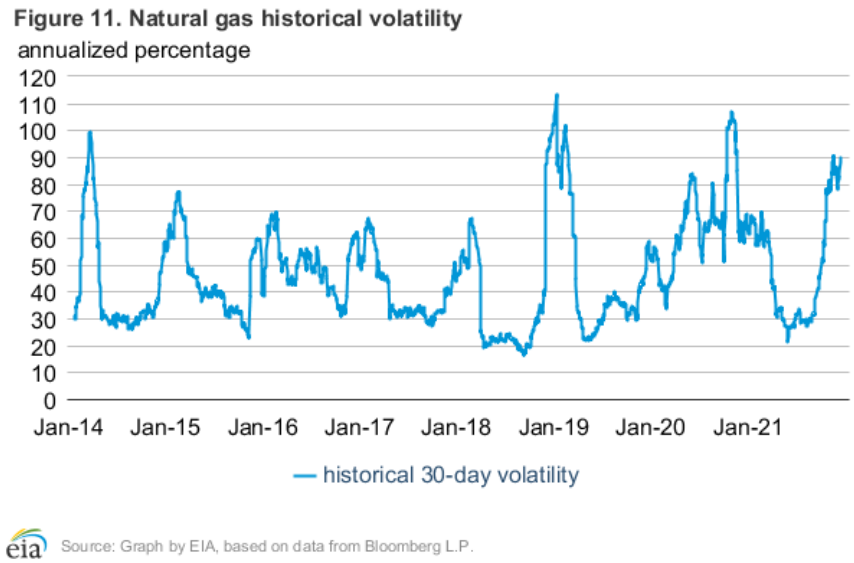


Figure 10. U.S. natural gas front-month futures prices and current storage deviation from five-year average

eia Source: Graph by EIA, based on data from CME Group, as compiled by Bloomberg L.P.

The spread between international and domestic natural gas prices remained high in November and contributed to high demand for U.S. liquefied natural gas (LNG) exports. International LNG spot and forward prices established records during the first week of October in northern Asia and Europe. They remained high throughout November. U.S. LNG exports averaged 10.7 Bcf/d in November, or approximately 104% of total nameplate LNG export capacity. We forecast LNG exports will continue to increase between December 2021 and late 2022 as a result of the optimization of operations at Cheniere's Sabine Pass and Corpus Christi terminals; the completion of Train 6 at Sabine Pass LNG, which started producing LNG in November; and the completion of a new LNG terminal at Calcasieu Pass, Louisiana. We forecast LNG exports will average 11.1 Bcf/d from December 2021 to February 2022, with exports above 11 Bcf/d in each month during that period. If those levels are reached, December would be the first month on record in which U.S. LNG exports are more than 11 Bcf/d.

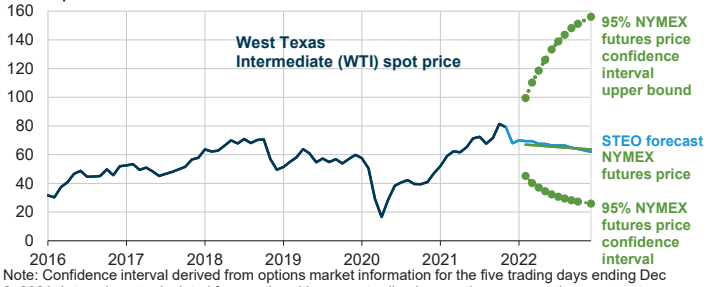
Historical volatility: Volatility of U.S. natural gas futures prices has risen in the past three months **(Figure 11)**. Historical volatility measures the magnitude of daily changes in closing prices for a commodity during a given time in the past. Based on rolling front-month contracts, the 30-day historical volatility of U.S. natural gas futures prices was 29.8% for April through August of this year. In September, volatility rose to 49.4%, compared with the 2015–19 September average of 30.6%. In October, volatility once again rose to 78.3%, compared with the 2015–19 October average of 32.7%. In November, historical volatility averaged 85.0%, compared with the 2015−19 November average of 53.7%. During November, daily front-month prices for intraday natural gas futures contracts ranged as high as $5.88/MMBtu on November 4, and as low as $4.48/MMBtu on November 30.

We forecast the Henry Hub spot price will average $4.50/MMBtu in December, $4.64/MMBtu in January, and $4.61/MMBtu in February. These prices are lower than we forecast last month. We expect U.S. working natural gas in storage to end March at 1,659 Bcf, which is 36 Bcf higher than forecast last month. However, this forecast is highly uncertain as reflected in the recent price volatility. Weather, which is a significant source of uncertainty in this forecast, will continue to be a key indicator of price formation this winter.

Notable forecast changes

- The December STEO forecast incorporates the latest updates to EIA's *International Energy Statistics*, including historical petroleum consumption and production data for all non-OECD countries for 2019 and updated 2020 petroleum consumption data for several of the largest consuming countries. These historical data updates resulted in us lowering supply and consumption data for 2019 and 2020, and lowering total supply and consumption forecasts through 2022. We made the most significant revisions to data for Argentina, Brazil, Russia, and Hong Kong for 2019 and 2020. We also made additional revisions to a number of data series from 2000 to 2019 that resulted in lower values for consumption, which were offset by nearly equivalent reductions to refinery gains for most countries. These changes to historical data are reflected in our forecast.

- We forecast natural gas spot prices at Henry Hub will average $4.58/MMBtu in 1Q22, compared with a forecast of $5.24/MMBtu in the November STEO. The lower forecast reflects our expectation that U.S. natural gas inventories will finish the withdrawal season at the end of March at a higher level than previously expected.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The views in this report therefore should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on December 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Average for all sulfur contents.

(b) Average self-service cash price.

(c) Includes fuel oils No. 4, No. 5, No. 6, and topped crude.

- = no data available

Notes: EIA completed modeling and analysis for this report on December 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation; prices exclude taxes unless otherwise noted.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Marketing Monthly* , DOE/EIA-0380; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; and *Monthly Energy Review* , DOE/EIA-0035.

Natural gas Henry Hub and WTI crude oil spot prices from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on December 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on December 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Percent change from prior year													**-2.2**	*6.1*	*5.1*
Nominal U.S. Dollar Index (b)															
Index, 2015 Q1 = 100	**111.7**	**115.9**	**111.5**	**108.3**	**106.8**	**106.3**	**107.7**	*109.3*	*109.3*	*109.4*	*109.2*	*108.9*	**111.9**	*107.5*	*109.2*
Percent change from prior year	**2.8**	**5.8**	**0.9**	**-1.9**	**-4.4**	**-8.3**	**-3.4**	*0.9*	*2.4*	*2.9*	*1.3*	*-0.4*	**1.9**	*-3.9*	*1.6*

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on December 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) For net imports and inventories “Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products; for consumption “Other Oils” also includes renewable fuels except fuel ethanol.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on December 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

Notes: EIA completed modeling and analysis for this report on December 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on December 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on December 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Total Raw Steel Production (Million short tons per day)	**0.268**	**0.174**	**0.197**	**0.224**	**0.246**	**0.258**	**0.267**	*0.276*	*0.311*	*0.287*	*0.284*	*0.295*	**0.216**	*0.262*	*0.294*
Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.92**	**1.91**	**1.93**	**1.91**	**1.91**	**1.92**	**2.03**	*2.03*	*2.04*	*2.04*	*2.03*	*2.02*	**1.92**	*1.98*	*2.03*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on December 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on December 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on December 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on December 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 7d part 1. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continues on Table 7d part 2*

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on December 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on December 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW)

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in

- = no data available

Notes: EIA completed modeling and analysis for this report on December 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on December 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

- = no data available

SAAR = Seasonally-adjusted annual rate

Notes: EIA completed modeling and analysis for this report on December 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

- = no data available

Notes: EIA completed modeling and analysis for this report on December 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on December 2, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Appendix to the December 2021 *Short-Term Energy Outlook*

This appendix is prepared in fulfillment of section 1245(d)(4)(A) of the National Defense Authorization Act (NDAA) for Fiscal Year 2012, as amended. The law requires the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy, to submit to Congress a report on the availability and price of petroleum and petroleum products produced in countries other than Iran in the two-month period preceding the submission of the report. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The data in this appendix, therefore, should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

EIA consulted with the U.S. Department of the Treasury, the U.S. Department of State, and the intelligence community in the process of developing the NDAA report, which was previously published as a stand-alone report. Detailed background and contextual information not repeated here can be found in early editions of the NDAA report.

This appendix is published in the *Short-Term Energy Outlook* in even numbered months.

Table a1. Summary of Estimated Petroleum and Other Liquids Quantities

	Oct 2021	Nov 2021	Oct 2021 - Nov 2021 Average	Oct 2020 - Nov 2020 Average	2018 - 2020 Average
Global Petroleum and Other Liquids (million barrels per day)					
Global Petroleum and Other Liquids Production (a)	97.9	99.0	98.4	92.1	98.2
Global Petroleum and Other Liquids Consumption (b)	98.5	99.7	99.1	94.1	97.3
Biofuels Production (c)	2.8	2.6	2.7	2.8	2.7
Biofuels Consumption (c)	2.7	2.6	2.6	2.6	2.6
Iran Liquid Fuels Production	3.5	3.6	3.5	2.9	3.6
Iran Liquid Fuels Consumption	1.8	1.9	1.8	1.8	1.9
Petroleum and Petroleum Products Produced and Consumed in Countries Other Than Iran (million barrels per day)					
Production (d)	91.5	92.8	92.2	86.3	91.9
Consumption (d)	94.1	95.3	94.7	89.7	92.8
Production minus Consumption	-2.6	-2.4	-2.5	-3.4	-0.9
World Inventory Net Withdrawals Including Iran	0.7	0.7	0.7	2.0	-0.9
Estimated OECD Inventory Level (e) (million barrels)	2,777	2,767	2,772	3,109	2,943
Surplus Production Capacity (million barrels per day)					
OPEC Surplus Crude Oil Production Capacity (f)	6.2	5.9	6.1	7.7	3.4

Note: The term "petroleum and other liquids" encompasses crude oil, lease condensate, natural gas liquids, biofuels, coal-to-liquids, gas-to-liquids, and refinery processing gains, which are important to consider in concert due to the inter-related supply, demand, and price dynamics of petroleum, petroleum products, and related fuels.

(a) Production includes crude oil (including lease condensates), natural gas liquids, other liquids, and refinery processing gains.

(b) Consumption of petroleum by the OECD countries is synonymous with "products supplied," defined in the glossary of the EIA Petroleum Supply Monthly, DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel, and loss, and bunkering.

(c) Biofuels production and consumption are based on EIA estimates as published in the International Energy Statistics. Biofuels production in the third quarter tends to be at its highest level in the year as ethanol production in Brazil reaches its seasonal peak and is typically lowest in the first quarter as seasonal production falls in the South/South-Central region of Brazil.

(d) Global production of petroleum and petroleum products outside of Iran is derived by subtracting biofuels production and Iran liquid fuels production from global liquid fuels production. The same method is used to calculate global consumption outside of Iran.

(e) Estimated inventory level is for OECD countries only.

(f) EIA defines surplus oil production capacity as potential oil production that could be brought online within 30 days and sustained for at least 90 days, consistent with sound business practices. This does not include oil production increases that could not be sustained without degrading the future production capacity of a field.

January 2022

Short-Term Energy Outlook

Forecast highlights

- This edition of the *Short-Term Energy Outlook* (STEO) is the first to include forecasts for 2023.
- The STEO continues to reflect heightened levels of uncertainty as a result of the ongoing COVID-19 pandemic. Notably, the Omicron variant of COVID-19 raises questions about global energy consumption. U.S. real GDP declined by 3.4% in 2020 from 2019 levels. Based on forecasts that use the IHS Markit macroeconomic model, we estimate U.S. GDP increased 5.7% in 2021 and that it will rise by 4.3% in 2022 and by 2.8% in 2023. In addition to macroeconomic uncertainties, uncertainty about winter weather and consumer energy demand also present a wide range of potential outcomes for energy consumption. Supply uncertainty in the forecast stems from uncertainty about OPEC+ production decisions and the rate at which U.S. oil and natural gas producers will increase drilling.
- Brent crude oil spot prices averaged $71 per barrel (b) in 2021, and we forecast Brent prices will average $75/b in 2022 and $68/b in 2023.
- We estimate global liquid fuels inventories fell by an average of 1.4 million barrels per day (b/d) in 2021 compared with inventory growth of 2.1 million b/d in 2020. Global oil inventories rise in the forecast, increasing at a rate of 0.5 million b/d in 2022 and 0.6 million b/d in 2023.
- Global consumption of petroleum and liquid fuels averaged 96.9 million b/d in 2021, up by 5.0 million b/d from 2020, when consumption fell significantly because of the pandemic. We expect global liquid fuels consumption will grow by 3.6 million b/d in 2022 and 1.8 million b/d in 2023.
- Crude oil production from OPEC member countries averaged 26.3 million b/d in 2021, up from 25.6 million b/d in 2020. We forecast that average OPEC crude oil production will rise by 2.5 million b/d to average 28.8 million b/d in 2022 and average 28.9 in 2023.
- U.S. crude oil production averaged 11.2 million b/d in 2021. We expect production to average 11.8 million b/d in 2022 and to rise to 12.4 million b/d in 2023, which would be the highest annual average U.S. crude oil production on record. The current record is 12.3 million b/d, set in 2019.

- U.S. regular gasoline retail prices averaged $3.02 per gallon (gal) in 2021, compared with an average of $2.18/gal in 2020. We forecast gasoline prices will average $3.06/gal in 2022 and $2.81/gal in 2023. U.S. diesel fuel prices averaged $3.29/gal in 2021, compared with $2.56/gal in 2020, and we forecast diesel prices will average $3.33/gal in 2022 and $3.27/gal in 2023.

- The natural gas spot price at Henry Hub averaged $3.91 per million British thermal units (MMBtu) in 2021. Monthly average prices reached $5.51/MMBtu in October, but they declined in November and December as mild weather prevailed across much of the country, resulting in less natural gas used for space heating. We expect Henry Hub spot prices will average $3.82/MMBtu in the first quarter of 2022 and average $3.79/MMBtu for all of 2022 and $3.63/MMBtu in 2023.

- We estimate that U.S. liquefied natural gas (LNG) exports averaged 9.8 billion cubic feet per day (Bcf/d) in 2021, compared with 6.5 Bcf/d in 2020. We expect U.S. LNG export capacity increases will contribute to LNG exports averaging 11.5 Bcf/d in 2022 and 12.1 Bcf/d in 2023.

- U.S. dry natural gas production averaged 93.5 Bcf/d in 2021, up 2.0 Bcf/d from 2020. Natural gas production in the forecast averages 96.0 Bcf/d for all of 2022 and then rises to 97.6 Bcf/d in 2023.

- U.S. natural gas inventories ended December 2021 at 3.2 trillion cubic feet (Tcf), 3% more than the 2016–20 average. We forecast inventories will end March 2022 at 1.8 Tcf, which would be 8% more than the 2017–21 average for the end of March.

- U.S. coal production totaled 579 million short tons (MMst) in 2021, up 8% from 2020. We expect coal production will increase by 6% in 2022 and then rise 1% to a total of 619 MMst in 2023.

- U.S. coal consumption was 545 MMst in 2021, a 14% increase from 2020. The increase reflected more use of coal-fired electricity generation amid high natural gas prices. We expect coal consumption will fall by 2% in 2022 and then be relatively unchanged in 2023 at a total of 532 MMst in 2023.

- Total U.S. retail sales of electricity remain relatively unchanged in our forecast for 2022 after increasing by 2.2% in 2021. Forecast increases in sales to the commercial and industrial sectors in 2022 offset lower sales to the residential sector. We forecast total U.S. retail sales of electricity across all sectors will grow by 1.4% in 2023.

- The share of U.S. electric power generation produced by natural gas averaged 37% in 2021, and we expect it will average 35% in 2022 and 34% in 2023. Our forecast for the natural gas share as a generation fuel declines primarily as a result of increased generation from new renewable energy generating capacity. Coal's average generation

share rose to 23% in 2021 as a result of higher natural gas prices, but we expect it to decline slightly over the next two years, averaging near 22% in 2022 and 2023. We expect the nuclear share of generation will remain near 20% over the next two years.

- We expect electricity-generating capacity from renewable energy sources to continue to grow in 2022 and 2023. Our forecast includes both wind and solar capacity growth, with solar capacity growing at a faster rate. The extreme drought conditions in the West may moderate somewhat in the next year, and we forecast that the share of U.S. generation from hydropower will rise from 6% in 2021 to 7% in 2022 and 2023.

- The U.S. retail electricity price for the residential sector in our forecast averages 14.2 cents per kilowatthour in 2022, which is 4% higher than the average retail price in 2021. Forecast residential prices remain relatively the same in 2023.

- Total energy-related carbon dioxide (CO_2) emissions increased by 6.2% in 2021 as the U.S. economy started to recover from the impacts of the COVID-19 pandemic. We forecast that emissions will rise by 1.8% in 2022 and by 0.5% in 2023. Even with growth over the next two years, forecast CO_2 emissions in 2023 are 3.4% lower than 2019 levels. Energy-related CO_2 emissions are sensitive to changes in weather, economic growth, energy prices, and fuel mix.

Global liquid fuels

The COVID-19 pandemic continued to affect global oil markets in 2021. Oil consumption and oil production fell sharply in early 2020 in response to the pandemic. During the second half of 2020 (2H20), however, rising economic activity and the easing of pandemic-related restrictions on other activities caused oil consumption to increase. This trend continued into 2021 with rollouts of COVID-19 vaccinations. In much of the world, vaccines contributed to increased personal travel and business activity, resulting in global oil consumption rising by 5.5% in 2021 from 2020. However, global consumption in 2021 remained 3% below 2019 levels.

For more than a year now, oil consumption has outpaced oil production. Production has remained restrained as a result of crude oil production curtailments by OPEC+ members, investment restraint from U.S. oil producers, and other supply disruptions. Oil consumption outpacing oil production has led to persistent withdrawals from global oil inventories and significant increases in oil prices. We estimate that global oil inventories have fallen for six consecutive quarters going back to the third quarter of 2020 (3Q20), declining at an average rate of 2.1 million barrels per day (b/d) in 2H20 and at an average rate of 1.4 million b/d in 2021. Brent crude oil spot prices increased from an average of $43 per barrel (b) in 3Q20 to an average of $79/b in 4Q21.

Uncertainty in global oil markets has increased heading into 2022. The way in which the Omicron variant of COVID-19 will affect economic activity and oil consumption this year is still unknown. In late 2021, some restrictions to mitigate the spread of COVID-19 began to return in

many regions, notably Europe, even before the Omicron variant surfaced. These restrictions, in combination with increased measures to combat the Omicron variant, raised the possibility that global oil consumption could decline in the coming months and added downward pressure to oil prices.

We forecast that global oil production will outpace global oil consumption during both 2022 and 2023, resulting in rising global oil inventories. We expect global oil inventories will rise by an average of 0.5 million b/d in 2022 and by 0.6 million b/d in 2023 and that these inventory builds will generally put downward pressure on crude oil prices. Brent prices average $75/b in 2022 and $68/b in 2023 in our forecast. However, oil market balances are subject to significant uncertainties during the forecast period, notably, the way in which the ongoing pandemic affects economic growth, oil demand, and the production decisions of OPEC+ members. These factors, among others, could keep oil prices volatile.

***Global petroleum and other liquid fuels consumption*.** Based on preliminary data and estimates, global consumption of petroleum and other liquid fuels grew by 5.0 million b/d in 2021. This growth followed a decline of 8.4 million b/d in 2020. We forecast global oil consumption will grow by 3.6 million b/d in 2022 and by 1.8 million b/d in 2023, reaching 100.5 million b/d in 2022 and 102.3 million b/d in 2023. If realized, the 2022 global liquid fuels consumption level would surpass the pre-pandemic 2019 level and represent a new record for world liquid fuels consumption.

Slowing growth in global oil demand in our forecast mostly reflects slowing economic growth. Our global economic growth assumptions come from Oxford Economics, which forecasts global GDP will increase by 4.5% in 2022 and by 3.9% in 2023, compared with an increase of 5.8% in 2021. In addition, oil demand in early 2021 was still significantly affected by pandemic-mitigation measures. As business activity and personal mobility increased through much of 2021, air travel remained the most affected segment of liquid fuels demand in 2021. Our forecast assumes air travel will increase throughout 2022 and into 2023, but it will continue to remain below pre-pandemic levels. With air travel and jet fuel consumption below pre-pandemic levels, we expect economic growth will be the main driver of oil consumption growth, as demand increases for fuels such as gasoline, diesel, and hydrocarbon gas liquids (HGLs).

We expect non-OECD countries, where economic growth tends to be more oil-intensive than in OECD countries, to lead the growth in demand for oil in 2022 and 2023. In our forecast, non-OECD oil consumption grows by 2.2 million b/d during 2022 and by 1.4 million b/d in 2023. Oil consumption in OECD countries grows by 1.4 million b/d in 2022 and by 0.3 million b/d in 2023.

Governments in non-OECD countries in the Asia-Pacific and Latin American regions eased mobility and business activity restrictions during 2021 as an increasing share of the population was vaccinated. However, outbreaks of the Omicron variant in some Asia-Pacific countries have led their governments to delay reopening plans or to extend current restrictions. The Middle East and African regions have been relatively slower to ease mobility restrictions than Europe

and the United States. Outbreaks of COVID-19 infections and renewed restrictions on mobility and business activity still pose a significant downside risk in these regions.

Strict mobility restrictions imposed by many of the European OECD countries in 1Q21 gradually eased in 2Q21 as a result of increasing vaccination levels. As a result, Europe experienced a significant jump in economic activity, as capacity limits and restrictions on mobility and nonessential business activity were either reduced or eliminated. However, the spread of the Omicron variant led to a sharp increase in new infections in 4Q21. Some governments have responded by renewing some measures that limit mobility and business activity. Overall, we expect relatively milder movement and business activity restrictions than in 2020 because significant portions of the populations in European countries are fully vaccinated and because some of the new government restrictions have targeted unvaccinated segments of the population.

If currently available vaccines provide insufficient protection against future variants, countries may decide to increase mobility and activity restrictions. This strategy would lead to a longer, more drawn-out recovery in global oil consumption. In addition, the pace of economic growth will drive oil consumption in 2022 and 2023. However, if supply chain issues or central bank measures to limit inflation contribute to GDP growth rates that are lower than those from Oxford Economics that are assumed in this forecast, oil consumption will likely also be lower than forecast.

Non-OPEC production of petroleum and other liquid fuels. We estimate that in 2021, non-OPEC production increased by 0.7 million b/d compared with 2020. Most of this increase came from the three largest non-OPEC producers: the United States, Russia, and Canada. We expect non-OPEC production to increase by 2.8 million b/d in 2022 and by an additional 1.6 million b/d in 2023. The United States and Russia lead production growth among non-OPEC countries in our forecast during both 2022 and 2023. Brazil, Norway, and Canada also contribute significantly to growth in the forecast.

After the United States, Russia is the world's second-largest producer of liquid fuels. Its liquid fuels production averaged 10.8 million b/d in 2021, 0.3 million b/d more than in 2020. We forecast Russia's liquid fuels production will continue to grow in 2022 and 2023 but at a slower rate. From December 2020 to December 2021, Russia's liquid fuels production grew by 0.9 million b/d. However, most of the growth in 2021 occurred during the second half of the year as OPEC+, in which Russia participates, consistently raised its production targets. This growth used up most of Russia's available spare capacity. We forecast that annual growth in oil production in Russia will average almost 0.8 million b/d during 2022 and 0.3 million b/d in 2023.

Canada's liquid fuels production increased by 0.3 million b/d in 2021 to reach a record high annual average of 5.6 million b/d. Production growth in Canada followed increased refinery demand for crude oil in the United States, the removal of production curtailments set by Alberta's provincial government, and the restart of oil sands expansion projects deferred during

the COVID-19 pandemic. In our forecast, we assume that no new upstream projects come online in Canada during 2022 or 2023. We expect oil sands output will continue to grow at smaller increments. Canada's oil sands producers have adjusted the scale and pace of upstream development and investment. These producers have increasingly moved toward smaller incremental expansions or optimizations of existing projects rather than toward larger expansions or greenfield projects. Some growth will also come from removing the bottlenecks from pipeline capacity.

We forecast Canada's production of petroleum and other liquid fuels will increase by 0.2 million b/d in 2022. Some increase in our forecast of Canada's 2022 production follows the expansion of the Enbridge Line 3 crude oil pipeline (0.37 million b/d), which became operational in October 2021. The TransMountain pipeline expansion project (0.59 million b/d) is slated to enter service at the end of 2022. Additional Enbridge expansions and optimizations to its existing pipeline system, if completed, will add more than 0.4 million b/d of export capacity over the forecast period. With this new pipeline capacity from Enbridge and other expansions, oil export constraints will be eliminated by the end of 2023. In 2023, we expect Canada's production of petroleum and other liquid fuels to grow by less than 0.1 million b/d.

Brazil's production of petroleum and other liquid fuels fell slightly in 2021. This decline reflects pandemic-related supply chain disruptions and difficulties Petrobras experienced last year when it restarted the fields that had undergone heavy maintenance in 4Q20. We expect Brazil's production to increase by 0.3 million b/d in 2022, reaching 4.0 million b/d for the first time as production facilities return to normal operation. Our forecast assumes six new floating production storage and offloading (FPSO) units will ramp up through 2023 and continue to drive growth, notably at the Sepia, Mero, and Buzios fields. Once they reach full capacity, these FPSOs will each produce between 70,000 b/d and 180,000 b/d. We expect Brazil's production of petroleum and other liquid fuels to grow by 0.1 million b/d during 2023.

Norway's production of petroleum and other liquid fuels grew by less than 0.1 million b/d in 2021, and we expect output to grow by 0.1 million b/d in 2022 and by 0.2 million b/d in 2023. Most of the growth in 2022 comes from the ramp-up in production at the Martin Linge field, which came online in July 2021. The Johan Sverdrup field, which was the main driver of growth in 2021, again is the main source of our forecast growth in 2023. Production from Phase 1 of the project averaged over 0.5 million b/d in 2021, almost 0.1 million b/d more than the peak production of 0.44 million b/d originally expected by the project developers. Phase 2 of the project, with an expected peak production of 0.22 million b/d, will start in 4Q22.

Some of the largest production declines in our forecast occur in Mexico. Mexico's crude oil and other liquid fuels production averaged 1.9 million b/d in 2021, almost unchanged from 2020 and 2019. Last year, the ramp-up of output from the Ixachi, Pokoch, and Hokchi fields stemmed Mexico's long-term production declines. Production in Mexico of petroleum and other liquids falls slightly in 2022 in our forecast. We expect Mexico's oil production to fall faster in 2023, with a decline of 0.1 million b/d. These decreases reflect financial constraints at Mexico's

national oil company, PEMEX, and continued large declines in mature fields. New growth in foreign-operated fields in 2021 and beyond will not offset declines from PEMEX's older fields, in particular the Maloob field.

We forecast that output across a number of other non-OPEC producers will decline in 2022 and 2023, notably in Indonesia and Colombia.

OPEC production of petroleum and other liquid fuels. At the January 2022 OPEC+ meeting, participants reaffirmed their decision to continue to increase production by 0.4 million b/d monthly, with future adjustments possible depending on market conditions. Our forecast assumes that OPEC member countries will not fully increase production in accordance with their targets in 2022. Some countries will be unable to meet their new targets because of wide-ranging challenges to bring idled capacity back online, and other countries will limit increases to avoid large global imbalances between oil production and oil demand.

OPEC crude oil production averaged 26.3 million b/d in 2021, up 0.7 million b/d from 2020. We forecast that average OPEC crude oil production will increase by an additional 2.5 million b/d to average 28.8 million b/d in 2022 and then average 28.9 million b/d in 2023. Our OPEC crude oil production forecast is subject to considerable uncertainty, driven both by country compliance with existing production targets and uncertain future global demand growth.

OPEC+ has instituted monthly meetings to assess global oil market conditions, and the group's production targets are subject to regular adjustments. OPEC+ has indicated that it will adjust production targets in response to changes in global oil demand, but the path of global oil demand in the coming months remains uncertain.

Even with increased OPEC crude oil production, remaining surplus production capacity will be more than sufficient to meet additional demand even if consumption exceeds our expectations. We expect that OPEC surplus crude oil production capacity will decline from 6.0 million b/d in 2021 to average 3.9 million b/d in both 2022 and 2023, compared with an average surplus capacity of 2.2 million b/d from 2010–19. These estimates do not include additional capacity in Iran that is offline because of U.S. sanctions.

Among the OPEC countries, Iran, Libya, and Venezuela are not subject to production targets in the OPEC+ agreement. The STEO forecast assumes current U.S. sanctions remain in place for Iran and Venezuela for the entire forecast period. We also expect that OPEC+ will not implement further production cuts to accommodate any potential increases in oil output from Iran or Venezuela.

After five years of declines, Venezuela's crude oil production rose from 0.5 million b/d in 2020 to almost 0.6 million b/d in 2021, driven by increased service company activity and increased access to condensate and other diluents for blending with Venezuela's heavy crude oil. Despite increases in 2021, we expect Venezuela's crude oil production to decline as a result of ongoing operational difficulties, lack of field and facility maintenance, and continuing sanctions.

Libya's crude oil production rose by 0.8 million b/d to an average of almost 1.2 million b/d in 2021 compared with 2020 after the eastern and western security forces signed a ceasefire agreement in October 2020. The newly formed unified government provided stability among the various factions in Libya in March 2021. Our forecast assumes generally stable production in Libya in 2022 and 2023. However, our forecast of Libya's crude oil production is subject to heightened uncertainty as a result of the tentative political and security situation in Libya and the lack of a budget to support oil and natural gas infrastructure maintenance and repair. Presidential and parliamentary elections set for December 2021 were delayed. Additionally, a blockade at four oil fields disrupted 0.3 million b/d of crude oil production in Libya in late December.

OPEC non-crude oil liquids. OPEC production of non-crude oil liquids increased from 5.1 million b/d on average in 2020 to 5.3 million b/d in 2021. The 2021 production level reflects increases in production of associated liquids as a result of relaxed OPEC production cuts. We expect production of non-crude oil liquids will increase further in 2022 to 5.5 million b/d and stay at that level in 2023.

Global oil inventories. We estimate that global oil inventories decreased by an average of 1.4 million b/d in 2021, after increasing by 2.1 million b/d in 2020. In our forecast, global oil inventories increase by 0.5 million b/d in 2022 and by 0.6 million b/d in 2023. This inventory growth in largely reflects growth in global oil production paired with slowing growth in oil consumption. Global oil supply increases in the forecast, in part, because of easing production cuts from OPEC+ producers and the effects of higher 2021 oil prices on U.S. tight oil production.

Total oil inventories in the OECD fell from 3.0 billion barrels at the end of 2020 to 2.7 billion barrels at the end of 2021. We expect oil inventories in the OECD to rise to 2.8 billion barrels at the end of 2022 and to 2.9 billion barrels at the end of 2021.

Crude oil prices. Oil prices rose during much of 2021, with Brent crude oil spot prices averaging $71/b for the year compared with $42/b in 2020. Rising prices reflected growth in global oil demand that outpaced near-term growth in oil production, resulting in falling global oil inventories. During 2021, Brent prices reached their highest monthly average of $84/b during October. Brent prices fell to an average of $74/b in December, which largely reflected concerns about how the Omicron variant and potential mitigation efforts may affect near-term oil demand. In addition, increases in crude oil supply from OPEC+ members have likely also contributed to lower oil prices. However, crude oil prices ended December at $77/b as concerns that Omicron would lead to significant declines in oil consumption eased and as some crude oil production went offline in Libya.

We expect Brent crude oil spot prices will average $75/b in 2022. Forecast prices remain near current levels in 1Q22, averaging $79/b for the quarter. Oil markets are generally balanced in 1Q22 in our forecast. After 1Q22, we expect inventory builds through the end of 2022, averaging 0.7 million b/d from 2Q22 through 4Q22. We expect some downward oil price

pressures during this period, with Brent crude oil prices falling to an average of $71/b by 4Q22. Although inventories build in our forecast, inventory levels are currently lower than in 2019, which may dampen some of the downward price pressures associated with rising inventories. Forecast inventory builds accelerate in 2023, and we expect that Brent crude oil prices will average $68/b for the year.

Global economic developments and numerous uncertainties surrounding the pandemic in the coming months could push oil prices higher or lower than our current price forecast. Our current price path reflects global oil consumption that increases by 4% from 2021 in 2022 and by an additional 2% in 2023. However, this forecast depends on how any potential new COVID-19 variants develop and how oil consumption behavior changes as the pandemic evolves. Global supply chain disruptions have also likely exacerbated inflationary price effects across all sectors in recent months. How central banks respond to inflation may affect economic growth and oil demand during the forecast period. The duration of, and compliance with, the latest OPEC+ production targets also remains uncertain. Our forecast includes the assumption that OPEC+ will limit production increase to less than the current target of 0.4 million b/d per month. However, this assumption leaves more spare OPEC crude oil production capacity than seen during much of the 2010–19 period. If OPEC countries choose to produce from this capacity rather than hold it as spare, prices would likely be lower than our forecast. In addition, the degree to which the U.S. shale industry responds to the recent relatively high oil prices will affect the oil price path in the coming quarters.

We forecast West Texas Intermediate (WTI) crude oil prices will average about $3/b less than Brent prices in the first half of 2022 before widening to a discount of $4/b less than Brent prices through 2023. This price discount is based on our assumption that the recent discount of WTI to Brent, which averaged less than $3/b in 2021, reflected low global demand for oil exports and relatively low levels of U.S. crude oil production. As global refinery demand for crude oil and U.S. crude oil supply increases, we expect the WTI discount to return to $4/b by 2H22. This discount reflects the relative cost of exporting crude oil from the distribution hub in Cushing, Oklahoma, to Asia, compared with the cost of exporting Brent crude oil from the North Sea to Asia.

U.S. liquid fuels

U.S. Consumption. We forecast that petroleum and liquid fuels consumption in the United States will average 20.6 million barrels per day (b/d) in 2022, which would slightly surpass consumption from 2019. In 2023, we forecast that consumption will surpass 2019 levels and reach 20.9 million b/d. The forecast growth in petroleum and liquid fuels consumption is led by increases in gasoline consumption in 2022 and by hydrocarbon gas liquids (HGLs) in 2023.

We forecast that U.S. consumption of HGLs will increase by 0.2 million b/d in 2022 and by 0.1 million b/d in 2023, to reach annual averages of 3.6 million b/d in 2022 and 3.7 million b/d in 2023. We expect all of the HGL consumption growth in 2022 and nearly all of the growth in 2023 to be from increased use of ethane as a petrochemical feedstock. We expect two additional

petrochemical crackers to come online in the United States during the next two years, both of which will exclusively use ethane as a feedstock. As a result, our forecast of ethane consumption rises by 0.3 million b/d in 2022 and by 0.1 million b/d in 2023.

In this STEO, we expect that continuing effects from the COVID-19 pandemic will limit U.S. gasoline consumption and that consumption through 2023 will remain below levels seen before the pandemic in 2019. We forecast that gasoline consumption will increase by almost 0.3 million b/d (3.1%) from 2021 levels to an average approaching 9.1 million b/d in 2022. In 2023, we expect that consumption growth will slow to 0.1 million b/d (1.0%) and that annual consumption will average more than 9.1 million b/d, below the 2019 consumption level of 9.3 million b/d.

Although we expect U.S. gasoline consumption will remain below 2019 levels, we forecast that vehicle miles traveled (VMT) will exceed 2019 levels in 2022 and 2023. In the first half of 2022 (1H22), we expect VMT will be below 1H19 levels. We expect that people's responses to the COVID-19 pandemic will continue to limit driving activity, particularly in 1Q22. We assume the effects of the COVID-19 pandemic on gasoline demand will decrease after 1Q22, and driving activity will increase over the summer season, with personal travel and employment growth bringing VMT above 2019 levels in 2H22. Annual VMT in our forecast for 2022 is about equal to 2019 levels. We expect that VMT growth will continue in 2023 and that VMT will increase by 2.2% compared with 2022.

We expect increasing vehicle fuel efficiency, measured in miles per gallon, to offset some of the increased VMT. In 2022 and 2023, vehicle efficiency will likely increase 1%–2% each year. On December 20, the Biden administration released a final rule for greenhouse gas emissions from cars and trucks for model years 2023–26. The final rule increases the stringency of emissions standards by 5%–10% for each model year and replaces the previous standard that increased 1.5% annually. Because the new rule only applies to new cars and because car manufactures have a great deal of flexibility of when they announce a new model year, we expect that the new rule will have limited effects on fleet-wide vehicle efficiency during 2023.

U.S. distillate consumption increased by almost 0.2 million b/d (4.3%) in 2021. We expect that distillate consumption will increase by more than 0.1 million b/d (3.1%) in 2022 and by less than 0.1 million b/d (1.4%) in 2023, largely because of slowing U.S. GDP growth. Based on forecasts from IHS Markit, annual GDP growth in 2021 averaged 5.7% and is expected to fall to 4.3% in 2022 and 2.8% in 2023. The decreasing rate of GDP growth in our forecast largely slows demand growth for distillate fuel, which includes diesel fuel. Distillate demand, particularly diesel fuel, is closely tied with economic activity and freight movement (such as trucking and rail). We assume that the effects of supply chain bottlenecks on distillate demand will generally decrease compared with 2021, contributing to annual distillate demand growth. If supply chain bottlenecks worsen, however, actual distillate fuel consumption may be less than forecast. Conversely, if supply chain bottlenecks improve, distillate demand could rise above the current forecast.

U.S. jet fuel consumption in the forecast rises from 1.4 million b/d in 2021 to 1.6 million b/d in 2022 and 1.7 million b/d in 2023. We expect responses to the COVID-19 pandemic will have decreasing effects on jet fuel consumption moving further into the forecast period. Jet fuel demand, however, has been the most affected by the pandemic, decreasing from 1.7 million b/d in 2019 to 1.1 million b/d in 2020. Variants of COVID-19 (such as Omicron) could deter people from flying, which may lead to jet fuel consumption being less than forecast.

U.S. Crude oil supply. U.S. crude oil production averaged 11.2 million b/d in 2021, down 0.1 million b/d from 2020 as a result of well freeze-offs during extreme cold in February and well shut-ins during Hurricane Ida in late August and early September. Production in 2021 was 1.1 million b/d lower than the annual record of 12.3 million b/d set in 2019. We expect annual average U.S crude oil production to increase to 11.8 million b/d in 2022 and to 12.4 million b/d in 2023, which would set a new record. Despite our forecast of record annual average crude oil production in 2023, we do not expect production in any month in the forecast will surpass the monthly record of 12.97 million b/d set in November 2019. Production growth reflects oil prices that we expect will be sufficient to lead to continued increases in upstream development activity, which we forecast will proceed at a pace that will more than offset decline rates.

Annual average production numbers can conceal important monthly trends in oil production. For example, in February 2021, monthly average crude oil production from the Lower 48 states (L48) fell by 14% from January, from 8.8 million b/d to 7.6 million b/d, as a result of extreme cold. This event disrupted production operations across the country, particularly in Texas, which experienced widespread well freeze-offs. L48 production increased to 8.9 million b/d in March, as normal operations resumed. Because most L48 production is unconventional tight oil, we expect drilling activity and decline rate dynamics to mainly drive L48 production going forward. Tight oil wells have steep declines in the early years of their production, requiring continuous drilling of new wells to maintain unchanging production rates.

We expect production to increase for most of 2022, as more new wells come online to offset decline rates. For U.S. tight oil production, our models include a four-to-six-month lag between a change in oil price and change in production. We expect that WTI crude oil prices above $70/b during most of 2H21 and 1H22 increase the number of active drilling rigs and contribute to L48 production growth. We expect annual average L48 production of 9.6 million b/d for 2022.

We expect the WTI crude oil price to average $71/b in 2022. This price is up $3/b from the 2021 average and is sufficient for producers to realize positive cash flows in many areas, particularly the more productive areas of the Permian Basin. Producers saw increased cash flow in 2021, having held back on capital investments and cut costs, as crude oil prices rose significantly. Restrained investment led to fewer rig additions than what we have observed at similar crude oil price levels in previous years. With financial conditions among operators improved, we expect development to proceed at a modest pace. We expect average month-over-month L48 production growth to be 50,000 b/d in 2022. Most of L48 growth in the forecast comes from the Permian Basin. We expect L48 production growth to slow to a monthly average of 40,000 b/d in

2023, as a decline in oil prices in our forecast slows rig additions. Annual average L48 crude oil production for 2023 is 10.2 million b/d.

From 2020 to 2021, annual average production in the U.S. Federal Gulf of Mexico (GOM) increased from 1.6 million b/d to 1.7 million b/d. This increase occurred despite Hurricane Ida, which affected the GOM in late August 2021, causing monthly average crude oil production from the region to decline from 1.9 million b/d in July 2021 to 1.1 million b/d in September 2021. At the peak of the hurricane-related disruptions, 96% of GOM crude oil production was shut in, according to estimates by the U.S. Department of Interior's Bureau of Safety and Environmental Enforcement. We expect annual average GOM production of 1.8 million b/d in 2022 and remain near that level in 2023, still below the record 1.9 million b/d of 2019.

Alaska's crude oil production in the forecast stays near the 2021 level of 0.4 million b/d in both 2022 and 2023.

Hydrocarbon gas liquids supply. We forecast U.S. production of hydrocarbon gas liquids (HGLs) to increase by 0.5 million b/d in 2022 to an average of 5.9 million b/d and then increase to an average of 6.1 million b/d in 2023. HGL production will increase as a result of rising production of natural gas in 2022 and 2023, higher rates of natural gas processing plant utilization, and continuing efficiency improvements in the U.S. natural gas processing plant fleet. Ethane production will rise to meet growing demand from the domestic industry and global importers for ethane as a petrochemical feedstock. We expect U.S. ethane production to increase by 0.3 million b/d and by 0.2 million b/d in 2022 and 2023, respectively, reaching an average of 2.6 million b/d in 2023. We expect net ethane exports to grow by 40,000 b/d in 2022 and by 20,000 2023 as a result of rising global petrochemical demand and additional capacity to ship U.S. ethane overseas. We forecast propane production will rise by almost 0.1 million b/d in both 2022 and 2023.

Liquid biofuels. After COVID-19-related responses reduced demand for transportation fuels in 2020, U.S. biofuels consumption returned near to pre-pandemic levels in 2021. We forecast biofuels consumption will increase further in 2022, based on our expectation of increased demand for transportation fuels and the current targets in the Renewable Fuel Standard (RFS) program. Based on the current RFS targets, we forecast increases in biomass-based diesel production, consumption, and net imports.

U.S. biodiesel production increases in 2022 and 2023 in our forecast. U.S. biodiesel production decreased by 10% from 2020 to 2021, averaging an estimated 107,000 b/d in 2021. We expect biodiesel production will increase by 7% to average 114,000 b/d in 2022 and increase to 115,000 b/d in 2023. These production increases follow our expectation of growing U.S diesel consumption, along with higher RFS targets and the continuation of the $1/gal biodiesel and renewable diesel tax credit through December 2022.

Net U.S. imports of biomass-based diesel increased by 31% to 28,000 b/d in 2021, and we expect net imports to increase to an average of 46,000 b/d in both 2022 and 2023. Increased net imports of biomass-based diesel primarily reflect increased volumes of renewable diesel imported to meet both California Low Carbon Fuel Standard requirements and the federal RFS targets.

U.S. ethanol production increased in 2021 from 2020 but remained lower than 2019 levels. U.S. ethanol production in 2021 averaged 980,000 b/d, an increase of 8% from 2020. Ethanol production in our forecast rises to an average of 1.02 million b/d in both 2022 and 2023.

U.S. ethanol consumption averaged 910,000 b/d in 2021, an increase of 10% from 2020. We forecast ethanol consumption will average 930,000 b/d in 2022 and almost 950,000 b/d in 2023. The increase in ethanol consumption reflects our expectation of increasing gasoline demand. At the forecast levels for 2022 and 2023, the ethanol share of gasoline consumption would be near 2020 and 2021 levels of 10.3%.

Product prices. Reduced demand for liquid fuels in the United States during 2020 led to low prices for gasoline and diesel fuel during the same period. In 2021, increases in economic activity and personal mobility contributed to increasing prices for crude oil, gasoline, and diesel fuel compared with 2020. U.S. retail prices for regular-grade gasoline averaged $3.02/gal during 2021, and retail diesel prices averaged $3.29/gal, up 84 cents/gal and 73 cents/gal, respectively, from their 2020 averages.

Higher retail prices for gasoline and diesel in the United States reflect an increase in demand for petroleum fuels as well as increasing crude oil prices. After decreasing significantly in 2020, refinery margins (the difference between the wholesale price of gasoline and the price of Brent crude oil) reached their highest levels since 2014 for both gasoline and diesel in 2021. Refinery margins increased significantly beyond their recent five-year averages, driven primarily by rising fuel demand amid still restrained refinery production. Significant increases in renewable identification number (RIN) prices, which are embedded in wholesale product prices, also raised refinery margins.

Supply disruptions also contributed to increased refinery margins for those facilities that continued operations during several instances in 2021. In February, a severe cold weather system in Texas resulted in a reduction in refinery operations along the U.S. Gulf Coast. In May, a cyberattack on the Colonial Pipeline put upward pressure on retail fuel prices because of related logistical constraints. In August, hurricanes along the U.S. Gulf Coast (particularly in Louisiana) caused flooding and temporary refinery shutdowns, which also contributed to lower refinery production at that time.

Wholesale U.S. refinery gasoline margins started 2021 at a monthly average of 27 cents/gal in January, before increasing to 62 cents/gal in August. We estimate margins averaged 49 cents/gal in December, resulting in an average of 48 cents/gal for 2021, up from 31 cents/gal in

2020 and 32 cents/gal in 2019. As forecast refinery runs continue to increase and inventories grow, we estimate gasoline refinery margins will decrease over the forecast period, averaging 42 cents/gal in 2022 and 38 cents/gal in 2023.

Ongoing uncertainty and volatility related to the COVID-19 pandemic, the Omicron variant, and potential future variants all present additional downside risks for refinery margins and wholesale product prices. However, potential short-term disruptions related to inclement weather, like those that took place in February and August 2021, present upside risks for product prices throughout the forecast.

We expect U.S. regular retail gasoline prices will average $3.20/gal in 1Q22, 64 cents/gal higher than at the same time last year, but down 13 cents/gal compared with 4Q21. We expect the U.S. regular retail gasoline price will average $3.28/gal in January 2022 before decreasing through the year as crude oil prices and refinery margins fall, eventually averaging $2.77/gal in December 2022. We forecast the U.S. regular gasoline retail price, which averaged $3.02/gal in 2021, will average $3.06/gal in 2022 and $2.81/gal in 2023.

Regional annual average forecast prices for 2022 range from a low of $2.71/gal in the Gulf Coast region (PADD 3) to a high of $3.86/gal in the West Coast region (PADD 5). Reduced refinery capacity on the West Coast compared with 2019 pre-pandemic levels is likely to contribute to higher refinery margins, wholesale prices, and resale margins in that region in the future.

The retail price of diesel fuel in the United States averaged $3.29/gal in 2021, which was 73 cents/gal higher than in 2020. We forecast the diesel price will average $3.33/gal in 2022 and $3.27/gal in 2023. We expect that global economic activity returning to pre-pandemic levels will help drive diesel refinery margins higher than their multiyear lows in 2020 during the forecast period. Diesel refinery margins averaged 42 cents/gal in 2021, which was 4 cent/gal higher than the 2016–20 average and 12 cents/gal higher than levels seen in 2020. We forecast that diesel refinery margins will average 47 cents/gal in 2022 and 45 cents/gal in 2023.

Natural gas

Natural gas consumption. Consumption of natural gas in the United States averaged 83.0 billion cubic feet per day (Bcf/d) in 2021, almost unchanged from 2020. We expect U.S. natural gas consumption will remain at nearly the same level in both 2022 and 2023.

The largest natural gas-consuming sector in the United States is the electric power sector. We forecast that the electric power sector will consume an average 28.8 Bcf/d in 2022, which is 6% less than in 2021. This decline is a result of rising electricity-generating capacity from renewable energy. We expect that the consumption of natural gas by the electric power sector will decline by 0.5 Bcf/d (2%) in 2023.

Industrial sector consumption of natural gas in our forecast increases by 3% during 2022, averaging 23.2 Bcf/d, and grows to 23.5 Bcf/d in 2023, as demand for industrial goods and economic activity increases.

We expect combined U.S. residential and commercial natural gas consumption will average 22.6 Bcf/d in 2022, up 4% from 2021. Based on National Oceanic and Atmospheric Administration forecasts, this STEO assumes colder temperatures this year, with 6% more heating degree days (HDDs) across the United States in 2022 compared with 2021. We expect natural gas consumption in the U.S. residential and commercial sectors to increase by 1% to 22.8 Bcf/d in 2023, driven by the assumption of slightly colder weather than 2022.

Natural gas production. U.S. production of dry natural gas averaged an estimated 93.5 Bcf/d in 2021, up 2.0 Bcf/d (2%) from 2020. Natural gas production fell in 2020 as a result of low natural gas and oil prices that reduced drilling activity. Production grew in 2021 as drilling activity came back online, especially in the Permian Basin, where associated gas production in that region contributed to the overall growth in natural gas production. We forecast dry natural gas production will increase by 2.5 Bcf/d (3%) in 2022. Recent increases in oil and domestic natural gas prices contribute to an overall increase in drilling activity in 2022 that will lead to production growth from 2Q22 onward. Growth in dry natural gas production in 2022 is led by the Haynesville region, where production tends to be sensitive to change in U.S. benchmark Henry Hub natural gas prices, and by the Permian Basin, where production tends to be more sensitive to oil prices. In 2023, we expect dry natural gas production to increase by 1.5 Bcf/d (2%) to reach 97.6 Bcf/d.

Natural gas trade. We forecast natural gas exports will reach record highs in 2022 and continue to grow in 2023. Net natural gas exports averaged 10.7 Bcf/d in 2021 and we forecast that they will increase to 13.4 Bcf/d in 2022 and 14.3 Bcf/d in 2023. A combination of both rising liquefied natural gas (LNG) exports and increases in pipeline exports to Mexico will drive this increase.

The United States exported an estimated 11.2 Bcf/d of LNG in December 2021, an increase of 0.7 Bcf/d over the previous record set in November. LNG export growth in 2021 was driven by rising natural gas demand and high LNG prices in Europe and Asia, reductions in global supply because of several unplanned outages at LNG export facilities worldwide, and cold weather in key LNG consumption markets, particularly in Asia.

Rising demand for LNG imports in Europe and Asia and the completion of planned projects that will bring new U.S. LNG export capacity online in 2022 supports growth in LNG exports in the forecast. We forecast that U.S. LNG exports will average 11.5 Bcf/d in 2022, up from 9.8 Bcf/d in 2021. In 2023, we forecast that U.S. LNG exports will average 12.1 Bcf/d. The completion of Train 6 at Sabine Pass, the optimization of operations at Sabine Pass and Corpus Christi LNG terminals, and the completion of a new LNG export facility—Calcasieu Pass LNG—are all expected

in 2022; these expansions will increase total U.S. LNG export capacity in 2022 to become the world's largest.

As of December 2021, existing U.S. LNG baseload liquefaction capacity was 10.1 Bcf/d, and peak capacity was 12.2 Bcf/d (including uprates to LNG production capacity at Sabine Pass and Corpus Christi). By the end of 2022, U.S. baseload capacity will increase to 11.4 Bcf/d, and peak capacity will increase to 13.8 Bcf/d, across seven LNG export facilities and 44 liquefaction trains, including 16 full-scale, 18 mid-scale, and 10 small-scale trains at Sabine Pass, Cove Point, Corpus Christi, Cameron, Elba Island, Freeport, and Calcasieu Pass.

Pipeline exports of U.S. natural gas have also increased as more infrastructure has been built to transport natural gas both to and within Mexico and as more natural gas-fired power plants come online in Mexico. Gross U.S. pipeline exports to Mexico and Canada in the forecast average 8.9 Bcf/d in 2022, up 0.4 Bcf/d (5.0%) from 2021, and 9.2 Bcf/d in 2023.

U.S. natural gas pipeline imports, almost all of which come from Canada, increased by 0.7 Bcf/d in 2021. We forecast natural gas pipeline imports to decrease 0.7 Bcf/d in 2022 because the United States will import less natural gas in response to increases in domestic production. Pipeline imports in the forecast remain relatively unchanged in 2023.

Natural gas inventories. U.S. working natural gas inventories ended December at 3,221 Bcf, 4% less than one year ago, but 3% more than the five-year (2016–20) average. We forecast close-to-average storage withdrawals in 1Q22, resulting in inventories that total 1,822 Bcf at the end of March, which would be 8% more than the five-year (2017–21) average for that time of year. For the 2022 April–October storage injection season, injections in our forecast do not keep pace with the five-year average rate. The lower-than-average injections reflect demand growth in the industrial sector and rising demand for U.S. exports. We expect that inventories will reach 3,668 Bcf at the end of October 2022, which would be within 1% of the five-year average for the end of October and nearly identical to inventory at the end of October 2021.

Natural gas prices. Henry Hub spot prices averaged $3.91/MMBtu in 2021. Natural gas prices were volatile throughout 2021. Early in 2021, volatility resulted from near record-high spot prices during the extreme winter weather in February. During the rest of the year, Henry Hub prices rose from $2.62/MMBtu in March to $5.51/MMBtu in October, before falling back to $3.76/MMBtu in December, amid a warmer-than-normal start to the heating season across most of the country.

We forecast the Henry Hub spot price will average $3.79/MMBtu in 2022. In 1Q22, we forecast the average Henry Hub spot price of natural gas will be $3.82/MMBtu. We expect prices will stay near current levels as natural gas inventory levels remain near the five-year average levels. Prices average $3.78/MMBtu for the remaining three quarters of 2022. We expect the Henry Hub spot price of natural gas to average $3.63/MMBtu in 2023.

Although we expect natural prices to decline in 2022 and 2023 compared with 2021, prices in the forecast stay relatively high compared with recent years. This dynamic is partly the result of reductions in coal-fired electricity-generating capacity and ongoing constraints in the coal market, which make increases in coal generation (and associated decreases in natural gas generation) less sensitive to rising natural gas prices than they have been in recent years. In addition, natural gas price volatility could result from weather-related increases or decreases in demand and uncertainties about the way in which rising levels of natural gas exports could affect the U.S. market.

Coal

Coal production. U.S. coal production totaled 579 million short tons (MMst) in 2021, up 44 MMst (8%) from 2020. The 2021 increase primarily reflected more consumption of coal in the electric power sector amid an increase in natural gas spot prices, which made coal more economically competitive relative to natural gas for electricity generation dispatch.

In 2022, we expect U.S. coal production to increase by 33 MMst (6%) to 612 MMst. Our forecast coal production increases by 27 MMst (8%) in the Western Region, 3 MMst (3%) in the Interior Region, and 2 MMst (2%) in Appalachia.

In 2023, we expect coal production to increase by 8 MMst (1%) to 619 MMst. Coal production rises by 8 MMst (2%) in the Western Region and by 3 MMst (3%) in the Interior Region. Forecast production declines by 2 MMst (1%) in Appalachia.

Despite less demand from the electric power sector, we expect coal production will grow in 2022 and 2023. The expected increased production reflects demand to replenish depleted coal stocks. Electric power sector inventories saw significant draws in 2021, and we expect stocks to increase by the end of 2023. In our forecast, inventories reach 85 MMst at the end of 2022 and 91 MMst at the end of 2023. In addition, we expect rising demand for coking coal—used for steelmaking—both domestically and for export.

Much of the decrease in coal mine capacity that occurred in 2020 appears to be permanent. Coal producers have experienced labor and capital shortages, which we expect will continue to limit supply in the forecast. Despite these limitations, we forecast more coal production in 2022 and 2023 than in 2021 as utilization at existing mines rises.

Coal consumption. In this forecast, we expect the retirement of approximately 19 gigawatts (GW) of coal-fired power plant capacity through 2023, a decline of 9%. As a result, we forecast electric power sector demand for coal will decrease by 14 MMst in 2022 and by 2 MMst in 2023. Rising natural gas prices led to increased demand for coal-fired power generation in 2H21. We expect that natural gas prices will remain relatively high compared with past years, keeping coal consumption in the electric power sector above 2020 levels but below 2021 levels. The expected decline in electric power sector consumption leads to a decline in overall coal consumption in

our forecast. We forecast total U.S. coal consumption for all sectors to decrease by 11 MMst (2%) in 2022 to 534 MMst and by a further 3 MMst (<1%) in 2023 to 532 MMst.

Coal is an essential component of the steel-making process. Demand for coal to make steel increases by 16% in 2022 and by 3% in 2023, particularly for infrastructure-related materials. As a result, we expect demand for coking coal to rise by more than 3 MMst from 2021 to 2023, offsetting some of the decline in electric power sector coal consumption.

Coal trade. Annual U.S. coal exports increased by an estimated 26% in 2021 to reach 87 MMst. Metallurgical coal exports were 47 MMst in 2021, 12% more than the previous year, and steam coal exports were 40 MMst, 47% more than in 2020.

A majority of the 25 leading U.S. coal export destinations increased their imports of U.S. coal in 2021 through October, which is our most recent data. The ongoing trade dispute between Australia and China has continued to increase opportunities for swing coal suppliers, such as the United States, to gain market share and increase overall exports of coal. Between January and October 2021, China imported almost 11 MMst of U.S. coal, more than in the previous four years combined. Metallurgical coal accounts for a large share of China's imports, representing about 90% of China's imports of U.S. coal in 2021.

We expect U.S. coal exports will rise by 1 MMst in 2022 and by 3 MMst in 2023. The increase reflects our assumption that the seaborne coal market in 2022 and 2023 will experience slightly higher demand for U.S. coal. Metallurgical coal will drive the increase in coal exports. We assume global steel production, which increased moderately 2021, will grow further during the forecast period and increase U.S. metallurgical coal exports to 50 MMst in 2022 and 55 MMst in 2023. Forecast U.S. steam coal exports total 38 MMst in 2022 and 37 MMst in 2023, largely unchanged from 2021.

Coal prices. The delivered coal price to U.S. electricity generators averaged an estimated $1.98/MMBtu in 2021. Coal prices increased throughout the year as a result of coal market constraints, averaging $1.92/MMBtu in 1H21 and $2.03/MMBtu in 2H21. We forecast that coal prices will fall to $1.94/MMBtu in 2022 and to $1.81/MMBtu in 2023.

Electricity

Electricity consumption. We forecast that consumption of electricity in the United States, including retail sales and direct use of electricity, will increase by 0.6% in 2022 and 1.4% in 2023. Preliminary data indicate that electricity consumption grew by 2.0% in 2021, and year-over-year growth was fastest in the first half of last year when the economy began to return to pre-pandemic patterns.

Year-to-year changes in residential electricity consumption are most related to changes in temperature, often measured using heating degree days (HDDs) and cooling degree days (CDDs). In 2021, retail sales of electricity to the residential sector grew by 1.2%. Most of this

growth last year occurred in 1Q21 when residential electricity consumption grew by 11% from the same quarter in 2020 in response to colder weather. Part of this increased residential consumption during the first quarter may also have reflected changing patterns of electricity use as more people work from home compared with the months in 1Q20 before the pandemic. Residential electricity sales during the last three quarters of 2021 averaged about 1.8% less than the same period in 2020.

In 2022, our forecast include 6.5% more HDDs for the United States than last year, with most of that increase occurring in 4Q22 compared to a mild start to this winter. The increase is less in the southern area of the country where heating with electricity is more prevalent. Cooler temperatures during the summer months of 2022 throughout most of the country (6.4% fewer CDDs) than in 2021 would lead to less use of air-conditioning. The effect of cooler forecast summer temperatures offsets the effect of a colder forecasted 4Q22, leading to an overall 2.2% decline in annual residential retail sales of electricity in our forecast during 2022. We expect residential electricity sales to grow by 2.1% in 2023.

The colder winter weather early in 2021 led to more electricity consumption in the commercial sector, but economic activity and growth in private-sector jobs were still limited at that time. The number of people employed during 1Q21 was 5.6% lower than during the same period in 2020; however, employment during the last three quarters of 2021 returned to an average of 5.8% year-over-year growth. As a result, retail sales of electricity to the commercial sector grew by an estimated 2.7% in 2021. For 2022, we forecast commercial sector electricity use to grow by 1.7%, reflecting the effect of continued economic growth offset somewhat by expected milder summer temperatures this year. We expect commercial sector electricity consumption to grow by 0.4% in 2023.

The U.S. industrial production index for electricity-intensive industries increased by 5.9% in 2021 after declining by 6.4% in 2020. This increase helped to raise U.S. retail electricity sales to the industrial sector by an estimated 2.9% last year. We expect the electricity-weighted industrial production index to grow by 4.1% and 2.5% in 2022 and 2023, respectively, leading to forecast growth in U.S. industrial sector electricity use of 2.8% in 2022 and 1.7% in 2023.

Electricity generation. Electricity generation by the U.S. electric power sector grew by an estimated 2.9% in 2021 after having fallen 2.9% in 2020, which was the largest decline in generation since 2009. We expect the U.S. electric power sector will generate about the same amount of electricity in 2022 as in 2021. Total electric power sector generation in the forecast grows by 1.3% in 2023.

Up until 2021, U.S. coal-fired electricity generation had fallen every year since 2014. However, we estimate that coal generation in 2021 grew by 17%. Some of this increase was a result of the overall increase in U.S. electricity demand last year after the pandemic-related decline in 2020, but most of the increase in coal generation last year was in response to natural gas prices that have been much higher than in past years. We estimate that the cost of natural gas delivered to

U.S. electric generators in 2021 averaged $4.88/MMBtu, twice the average cost in 2020. Higher fuel costs also contributed to an estimated 3% decline in U.S. natural gas generation in 2021.

We expect the delivered cost of natural gas for electricity generation will fall to an average of $4.10/MMBtu in 2022. However, that price remains higher than the average price in recent years. Despite a forecast of lower fuel costs, U.S. natural gas generation is likely to decline in 2022 as rapidly growing renewable energy sources produce more generation. We forecast the share of total U.S. generation from natural gas will average 35% in 2022, down from 37% in 2021. The decline in natural gas generation is especially pronounced in Texas, where a large amount of solar and wind capacity is scheduled to come online.

Lower natural gas prices also tend to discourage generation from coal, and we forecast the U.S. coal generation share to average 22% in 2022, which is slightly below last year. This forecast decline in coal generation is largest in the Northeast and western areas of the country.

We expect the share of generation from renewable sources will increase from 20% in 2021 to 23% in 2022 and to 24% in 2023. We expect most of the increase in renewables generation will come from new solar and wind capacity expansions in the electric power sector. We forecast that hydropower will fuel about 7% of generation in both 2022 and 2023. In 2021, the drought affecting the West restrained electricity generation by hydropower. U.S. hydropower generation contributed about 6% of the total in 2021, which is the lowest share since 2015. In the forecast, the share of total generation for renewables other than hydropower, which was 13% in 2021, rises to 16% in 2022 and to 17% in 2023.

In April 2021, New York's Indian Point nuclear power plant retired. This retirement contributed to the reduction in the nuclear share of U.S. total generation from 21% in 2020 to 20% last year. The Palisades nuclear power plant in Michigan is scheduled to retire in the summer of 2022. However, we expect the amount of U.S. nuclear generation will remain relatively steady in the forecast as two reactors at the Vogtle plant in Georgia are scheduled to come online in 2022 and 2023.

Over the next two years, our forecast of the U.S. electricity generating capacity from renewable sources continues to grow. Growth in wind capacity begins to moderate, but growth in solar capacity remains strong. Since 2019, more non-hydropower renewables capacity has been added to the U.S. generation fleet than natural gas capacity. This trend continues during the forecast period; operators report 29 gigawatts (GW) of planned utility-scale solar and wind capacity additions in 2022 and 28 GW in 2023. Preliminary data indicate that operators plan to add 5 GW of battery storage capacity in 2022 and 5 GW in 2023, annual increases of 84% in 2022 and 47% in 2023. Most planned battery storage additions will be paired with solar capacity.

We forecast that in 2022 additions of utility-scale solar capacity in GW will exceed wind additions for the first time. We expect that 21 GW of solar photovoltaic (PV) capacity will be

added by the electric power sector in 2022. We forecast an additional 25 GW for 2023. We forecast small-scale solar PV capacity will increase by about 5 GW in 2022 and by a similar amount in 2023. Residential PV accounts for 70% of this additional small-scale solar PV capacity for 2022 and 64% for 2023.

Preliminary data indicate that solar PV capacity additions continued in 2021 despite tariff and supply chain issues. Forecast solar capacity growth reflects various state and federal policies to support renewable energy. We expect growth to continue over the forecast period, supported by the solar investment tax credit (ITC) under the Consolidated Appropriations Act. Under the ITC, projects that start in 2022 are eligible for a 26% tax credit. The credit drops to 22% for projects that start in 2023. States such as Texas and Florida are set to add significant solar PV in the next two years.

Wind capacity in the electric power sector grows by 7 GW in 2022 in our forecast and by an additional 4 GW in 2023. This growth in forecast wind capacity for 2022 and 2023 marks a decline from the record of 17 GW added in 2021, which surpassed the previous record of 14 GW set in 2020. This slowing growth in wind can be partly attributed to the phasedown of the production tax credit (PTC) and supply chain issues. The PTC, which at the end of 2020 was extended through the 2021 calendar year, provides a 2.5 cents per kilowatthour (kWh) benefit for facilities entering service or securing 5% safe harboring (spending at least 5% of total estimated project cost). Producers of safe harbored projects are able to claim the PTC four years after they qualify.

Because wind capacity is often added at the end of the calendar year, increases in generation frequently lag behind increases in capacity for the year they occur in, and they are reflected in the generation for the next year.

Electricity prices. Wholesale electricity prices throughout the country trended higher in 2021, reflecting the increasing cost of natural gas for power generation. Last year, average annual wholesale prices ranged from $38 per megawatthour (MWh) in Florida to $190/MWh in Texas, though the Texas average would be $43/MWh excluding February when severely cold temperatures caused hourly prices to surge in excess of $6,000/MWh. We expect 2022 average wholesale electricity prices at trading hubs in the eastern part of the country will generally be higher than in 2021, with the exception of PJM, where we expect prices will be mostly unchanged. In the central and western areas, we expect wholesale prices will be lower at most hubs in 2021, with the exception of California where we expect slightly higher prices.

We forecast the U.S. retail electricity price for the residential sector will average 14.2 cents/kWh in 2022, which is 3.8% higher than the average retail price in 2021. Forecast residential prices remain relatively constant in 2023.

U.S. economic assumptions and energy-related carbon dioxide emissions

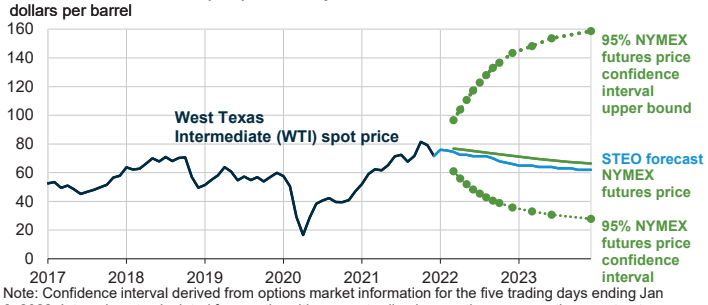
U.S. economy. We incorporate IHS Markit's macroeconomic forecast model for the United States with our own energy price forecasts to create STEO forecasts.

Based on this model, we estimate that U.S. real GDP grew by 5.7% in 2021. In 2022, U.S. real GDP will grow by 4.3% and by 2.8% in 2023. In comparison, real U.S. GDP fell by 3.4% in 2020. Total industrial production mirrors this pattern. Following a decline of 7.2% in 2020, we estimate it grew by 5.6% in 2021 and will increase by 4.6% in 2022 and 2.8% in 2023. The unemployment rate fell to an estimated 4.2% in December 2021 and our forecast assumes it will fall to an average 3.6% in 2022 and to 3.4% in 2023. This follows an unemployment rate of 8.1% in 2020. Nonfarm payroll employment increased by a total of 3.9 million persons in 2021 (2.7%), and our forecast assumes it will rise by 5.6 million in 2022 (3.8%) and 2.4 million in 2023 (1.6%). Price levels were notably elevated in 2021 when the Consumer Price Index (CPI) rose 4.6%. However, CPI growth in our forecast slows to 3.4% in 2022 and to 2.1% in 2023.

Energy-related carbon dioxide emissions. Energy-related carbon dioxide (CO_2) emissions rose by 6.2% in 2021 relative to 2020, and we estimate that they will rise by 1.8% in 2022 and by 0.5% in 2023. Energy-related CO_2 emissions are sensitive to changes in weather, economic growth, energy prices, and fuel mix. Forecast petroleum-related CO_2 emissions increase by 4.8% in 2022 and by 1.1% in 2023 as economic and mobility activity return to pre-pandemic patterns. We forecast a decrease in coal CO_2 emissions and a modest increase in natural gas CO_2 emissions over the next two years. We forecast CO_2 emissions from coal to fall by 3.0% in 2022 and by 0.3% in 2023 as coal-fired electricity generation is displaced, primarily by renewable sources. We expect CO_2 emissions from natural gas to rise by 0.7% in 2022 and by 0.1% in 2023 as demand for space heating rises.

Notable forecast changes

- For more information, see the detailed table of forecast changes.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The views in this report therefore should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

U.S. Cooling Degree-Days	**49**	**410**	**901**	**124**	*48*	*402*	*847*	*93*	*42*	*403*	*849*	*93*	**1,485**	*1,390*	*1,387*

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on January 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Average for all sulfur contents.

(b) Average self-service cash price.

(c) Includes fuel oils No. 4, No. 5, No. 6, and topped crude.

- = no data available

Notes: EIA completed modeling and analysis for this report on January 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation; prices exclude taxes unless otherwise noted.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Marketing Monthly* , DOE/EIA-0380; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; and *Monthly Energy Review* , DOE/EIA-0035.

Natural gas Henry Hub and WTI crude oil spot prices from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on January 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on January 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on January 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) For net imports and inventories “Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products; for consumption “Other Oils” also includes renewable fuels except fuel ethanol.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on January 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

Notes: EIA completed modeling and analysis for this report on January 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on January 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on January 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Total Raw Steel Production (Million short tons per day)	**0.246**	**0.258**	**0.267**	**0.260**	*0.278*	*0.273*	*0.278*	*0.285*	*0.300*	*0.292*	*0.296*	*0.303*	**0.258**	*0.279*	*0.298*
Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.91**	**1.93**	**2.03**	**2.03**	*2.03*	*2.03*	*1.88*	*1.88*	*1.81*	*1.82*	*1.81*	*1.80*	**1.98**	*1.94*	*1.81*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on January 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on January 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on January 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on January 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on January 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW)

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in

- = no data available

Notes: EIA completed modeling and analysis for this report on January 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on January 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.
Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

- = no data available

SAAR = Seasonally-adjusted annual rate

Notes: EIA completed modeling and analysis for this report on January 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

- = no data available

Notes: EIA completed modeling and analysis for this report on January 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

February 2022

Short-Term Energy Outlook

Forecast highlights

Global liquid fuels

- The February *Short-Term Energy Outlook* (STEO) assumes U.S. GDP grew by 5.7% in 2021 and will grow by 4.2% in 2022 and by 2.8% in 2023. We use the IHS Markit macroeconomic model to generate our U.S. economic assumptions. Global macroeconomic assumptions in this forecast are from Oxford Economics and include global GDP growth of 4.4% in 2022 and 4.0% in 2023, compared with growth of 5.8% in 2021. A wide range of potential macroeconomic outcomes could significantly affect energy markets during the forecast period. In addition, the evolving effects of consumer behavior on energy demand because of the pandemic present a wide range of potential outcomes for energy consumption. Supply uncertainty in the forecast results from the potential for disruptions, the production decisions of OPEC+, and the rate at which U.S. oil and natural gas producers increase drilling.

- Brent crude oil spot prices averaged $87 per barrel (b) in January, a $12/b increase from December 2021. Crude oil prices have risen steadily since mid-2020 as result of consistent draws on global oil inventories, which averaged 1.8 million barrels per day (b/d) from the third quarter of 2020 (3Q20) through the end of 2021. We estimate that global oil inventories fell further in January—compared with our expectation of an increase in last month's STEO—and that commercial inventories in the OECD ended the month at 2.68 billion barrels, which is the lowest level since mid-2014. Oil prices have also risen as result of heightened market concerns about the possibility of oil supply disruptions, notably related to tensions regarding Ukraine, paired with receding market concerns that the Omicron variant of COVID-19 will have widespread effects on oil consumption.

- We expect Brent prices will average $90/b in February as continuing draws in global oil inventories in our forecast keep crude oil prices near current levels in the coming months. However, we expect downward price pressures will emerge in the middle of the year as growth in oil production from OPEC+, the United States, and other non-OPEC countries outpaces slowing growth in global oil consumption. This dynamic leads to rising global oil inventories from 2Q22 through the end of 2023, and we forecast the Brent spot price will fall to an average of $87/b in 2Q22 and $75/b in 4Q22. We expect the Brent price will average $68/b for all of 2023. However, low inventory levels create an environment for potentially heightened crude oil price volatility and potential risk for

prices to rise significantly if supply growth does not keep pace with demand growth. Global supply chain disruptions have also likely exacerbated inflationary price effects across all sectors in recent months. How central banks respond to inflation may affect economic growth and oil prices during the forecast period.

- We estimate that 99.0 million b/d of petroleum and liquid fuels was consumed globally in January 2022, an increase of 6.6 million b/d from January 2021. We forecast that global consumption of petroleum and liquid fuels will average 100.6 million b/d for all of 2022, which is up 3.5 million b/d from 2021 and more than the 2019 average of 100.3 million b/d. We forecast that global consumption of petroleum and liquid fuels will increase by 1.9 million b/d in 2023.

- U.S. regular gasoline retail prices averaged $3.31 per gallon (gal) in January, unchanged from December 2021 and up 98 cents/gal from January 2021. Retail diesel prices averaged $3.72/gal in January, up 8 cents/gal from December and up $1.04/gal from last January. Product prices have risen compared with year-ago levels because of rising crude oil prices and high refining margins. We expect diesel prices will average $3.49/gal from 2Q22 through 4Q22. The forecast decline in prices reflects our expectation of falling crude oil prices, particularly in the second half of 2022 (2H22), as well as lower refining margins as refineries increase throughputs in the coming months.

- U.S. crude oil production reached almost 11.8 million b/d in November 2021 (the most recent monthly historical data point), the most in any month since April 2020. We forecast that production will rise to an average of 12.0 million b/d in 2022 and 12.6 million b/d in 2023, which would be record-high production on an annual-average basis. The previous annual average record of 12.3 million b/d was set in 2019.

Natural Gas

- In January, the natural gas spot price at Henry Hub averaged $4.38 per million British thermal units (MMBtu), up from the December average of $3.76/MMBtu. Higher prices in January were a result of colder-than-normal weather in parts of the country, particularly the Northeast and the Midwest where demand increased for natural gas used for space heating and for power generation. STEO uses weather forecasts from the National Oceanic and Atmospheric Administration (NOAA), and NOAA published the forecast we used in this STEO in late January. Temperatures have continued to be cold in parts of the country in early February, which we expect will contribute to Henry Hub prices averaging $4.70/MMBtu for the month. The winter weather forecasts are highly variable and create a significant amount of uncertainty in our price forecast. In addition, global demand for U.S. liquefied natural gas (LNG) has remained high, limiting some of the downward pressure on natural gas prices. We expect natural gas prices could remain volatile over the coming months, and the way that temperatures affect natural gas demand in February and March will be a key driver of how inventories end the

withdrawal season, which will be important for natural gas price formation in the coming months.

- We estimate that U.S. LNG exports averaged 11.2 billion cubic feet per day (Bcf/d) in January 2022, up from 10.4 Bcf/d in 4Q21, supported by large price differences between the Henry Hub price in the United States and spot prices in Europe and Asia. In particular, inventories in Europe remain much lower than their five-year averages and are contributing to strong demand for LNG imports. We expect high levels of U.S. LNG exports to continue into 2022, averaging 11.3 Bcf/d for the year, a 16% increase from 2021. The forecast reflects our assumptions that global natural gas demand remains strong and that expected additional U.S. LNG export capacity comes online.

- Colder-than-normal temperatures in January resulted in U.S. natural gas inventories falling below the five-year average to end the month at 2.3 trillion cubic feet (Tcf). We expect natural gas inventories to fall by about 730 Bcf for the rest of the withdrawal season, ending March just below 1.6 Tcf, which would be 8% less than the 2017–21 average for that time of year.

- We expect U.S. consumption of natural gas will average 105.2 billion cubic feet per day (Bcf/d) in February, down 3% from February 2021. Consumption in our forecast declines the most in the residential and commercial sectors, where consumption will average a combined 43.8 Bcf/d, down 10% from last February. We forecast electric power section consumption will be 27.8 Bcf/d in February, down 1% from last February. The changes are partly offset by industrial sector consumption, which grows by 4% from February 2021 in the forecast to average 24.8 Bcf/d for the month.

- We estimate dry U.S. natural gas production averaged 95.5 Bcf/d in the United States in January, down 2.1 Bcf/d from December 2021. Production in January was lower due, in some part, to freezing temperatures in certain production regions. We forecast natural gas production to average 95.6 Bcf/d in February and 96.1 Bcf/d for all of 2022, driven by natural gas and crude oil price levels that we expect will be sufficient to support enough drilling to sustain production growth. We expect production to rise to an average of 98.0 Bcf/d in 2023.

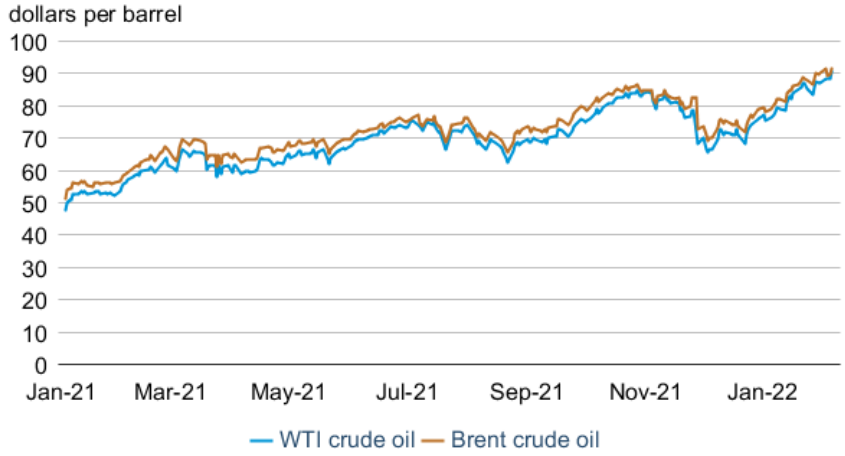
Electricity, coal, renewables, and emissions

- We forecast that the share of U.S. electric power sector generation produced by natural gas will average 35% in 2022 and 2023, down from 37% in 2021. The estimated cost of natural gas delivered to power generators averaged $4.97/MMBtu in 2021, and we expect it to fall to $4.16/MMBtu in 2022 and $3.86/MMBtu in 2023. Despite the forecast decline in fuel costs, the share of electricity generation from natural gas declines in the forecast because of growth in renewable generation. We expect the renewable generation share to increase from 20% in 2021 to 22% in 2022 and 24% in

2023. Increasing renewable generation contributes to our forecast that the share of generation from coal will decline from 23% in 2021 to an average of 22% over the next two years. Forecast generation from nuclear remains relatively constant through the forecast at an average generation share of 20%.

- We expect U.S. coal production to increase by almost 28 million short tons (MMst) (5%) in 2022 to 606 MMst and then rise by 18 MMst (3%) in 2023. Producers in the Powder River Basin have increased employment at mines in recent months to boost production to meet domestic demand, but we expect tight supply conditions to remain through the remainder of the year. We expect U.S. coal consumption to decrease by 2 MMst in 2022 as a 5 MMst (1%) decline in consumption from the electric power sector is somewhat offset by a 2 MMst (14%) increase in consumption for coke plants. Exports are expected to increase by 3 MMst (4%) in 2022 because international prices continue to be high for U.S. coal.

- Planned additions to U.S. wind and solar capacity in 2022 and 2023 increase electricity generation from those sources in our forecast. We estimate that the U.S. electric power sector added 16.3 gigawatts (GW) of new wind capacity in 2021. We expect 7.6 GW of new wind capacity will come online in 2022 and 4.3 GW in 2023. Utility-scale solar capacity rose by an estimated 13.9 GW in 2021. Our forecast for added utility-scale solar capacity is 21.8 GW for 2022 and 24.1 GW for 2023. We expect solar additions to account for nearly half of new electric generating capacity in 2022. In addition, in 2021, small-scale solar capacity (from systems less than 1 megawatt) increased by 5.1 GW to 32.7 GW. We project that small-scale solar will grow by 4.4 GW per year in both 2022 and 2023.



- U.S. energy-related carbon dioxide (CO_2) emissions increased by more than 6% in 2021 as economic activity increased and contributed to rising energy use. We expect a 2% increase in energy-related CO_2 emissions in 2022, primarily from growing transportation-related petroleum consumption. Forecast energy-related CO_2 emissions remain almost unchanged in 2023. We expect petroleum emissions to increase by 4% in 2022, and this growth rate slows to less than 1% in 2023. Natural gas emissions increase by 2% in 2022 and then decrease slightly in our forecast for 2023. We forecast that coal-related CO_2 emissions will decline by 1% in 2022 and by 2% in 2023.

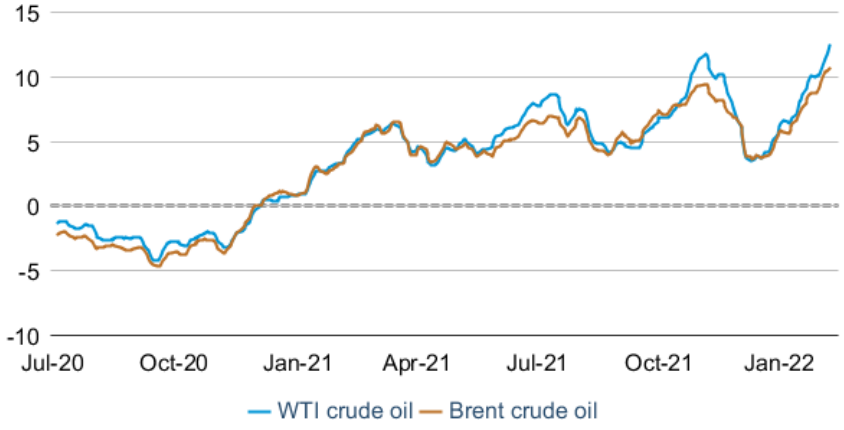
Petroleum and natural gas markets review

Crude oil

Prices: The front-month futures price for Brent crude oil settled at $91.11 per barrel (b) on February 3, 2022, an increase of $12.13/b from the January 3, 2022, price of $78.98/b. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, increased by $14.19/b during the same period, settling at $90.27/b on February 3 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices

Source: Graph by EIA, based on CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate



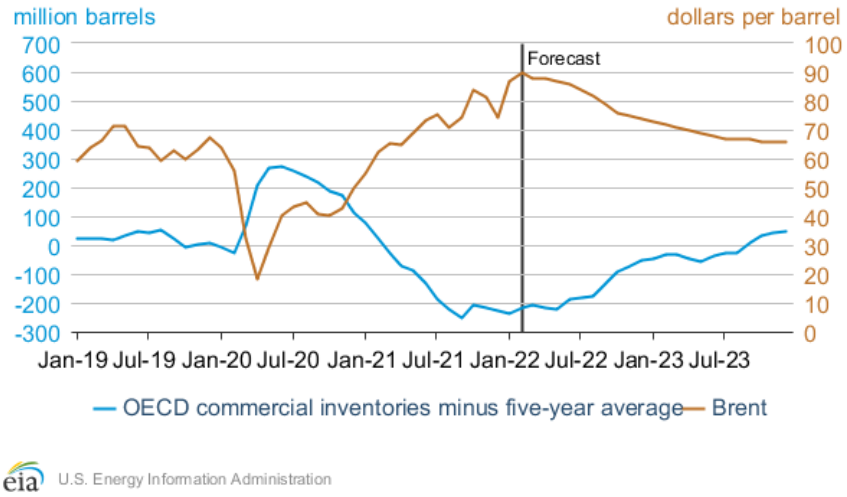
Brent crude oil prices increased throughout January as persistent global oil inventory draws and geopolitical tensions contributed to market concerns about disruptions to oil production. On several days in late-January and early February the nominal (not adjusted for inflation) front-month Brent price reached more than $90/b for the first time since October 2014. Global oil consumption has exceeded global oil supply since mid-2020, leading to six consecutive quarters of global oil inventory draws. We estimate global oil inventories declined again in January, contributing to commercially held inventories in OECD countries reaching the lowest levels since mid-2014. A major contributing factor to the low global oil inventories is some OPEC+ countries producing less than their targeted amounts due to operational difficulties ramping up production. During 4Q21, we estimate that the 10 OPEC countries subject to production targets produced less than those targets by a combined average of more than 0.6 million barrels per day (b/d).

More recently, geopolitical conflicts have also put upward pressure on oil prices. Prices can be more sensitive to concerns about supply disruptions during periods of low inventories. Tensions related to Ukraine have increased market concerns about the possibility of oil supply disruptions. In the Middle East, several missile attacks on Abu Dhabi—one of which hit a fuel

storage facility— has added to uncertainties for future oil supply, which may also be affected by political unrest in Libya and Kazakhstan. Libya's oil production has increased following blockades that shut in crude oil production in late December and early January, and production in Kazakhstan has increased following disruptions that occurred during protests from January 2–January 11 related to higher liquefied petroleum gas prices. Concerns about low oil inventories and potential supply disruptions have outweighed downward price pressure from China's announcement that it will release crude oil from its national strategic stockpiles.

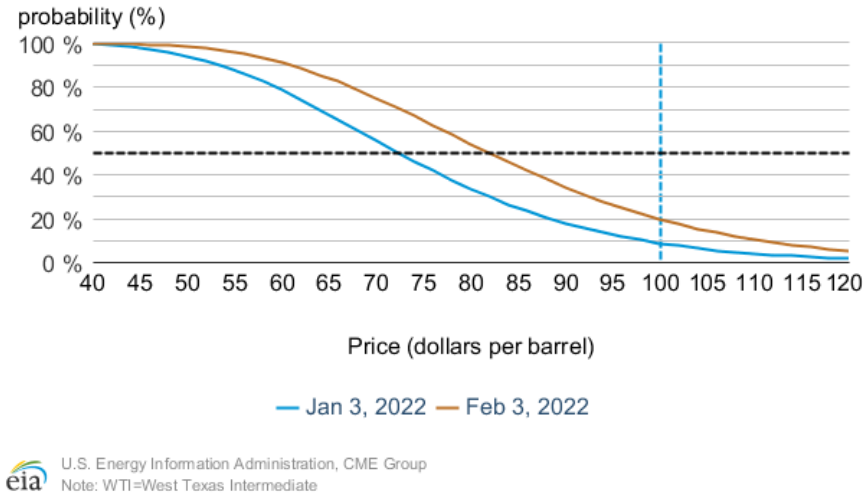
Although the front-month Brent crude oil price reached more than $90/b at times in late-January, longer-dated contracts did not increase as much. This wide backwardation (when near-month prices are higher than longer-dated ones) suggests market participants are paying higher prices to secure oil from available inventories amid the large imbalance between supply and demand. The five-day moving average of the spread between prices for the 1st month futures contract and the 13th month contract for Brent widened to $10.46/b on February 3, from $5.62/b on January 3, and the spread between the 1st month futures contract and 13th month contract for WTI was even higher at $11.88/b on February 3, an increase from $6.45/b on January 3 **(Figure 2)**.

Figure 2. Crude oil front-month to 13th month futures price spread
dollars per barrel, five-day moving average



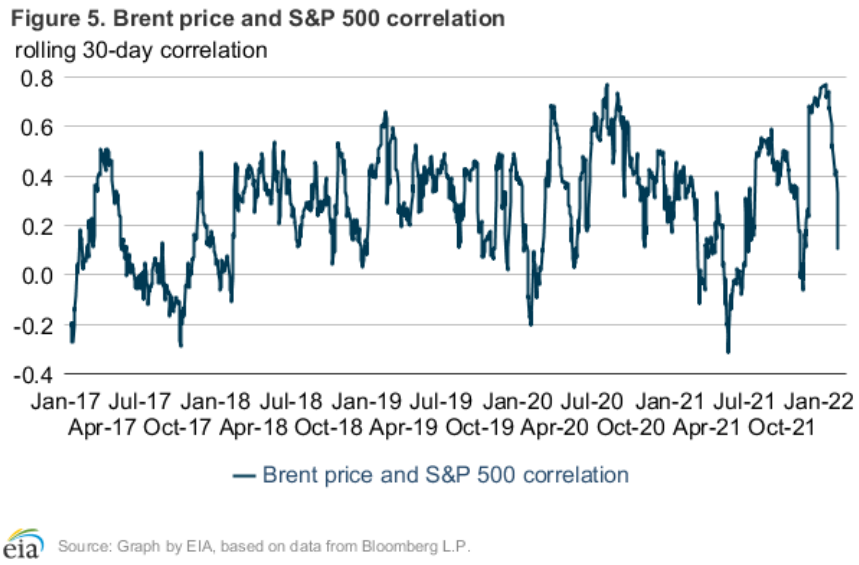
Source: Graph by EIA, based on data from CME Group and Intercontinental Exchange, as compiled by Bloomberg
Note: WTI=West Texas Intermediate

We forecast global inventory draws in February, with an average Brent spot price of $90/b. However, we expect oil inventories will begin rebuilding in March and continue throughout the forecast, which will result in lower crude oil prices. We forecast the Brent crude oil price to decrease to an average of $87/b in 2Q22 and $75/by 4Q22. We expect the Brent spot price to average $68/b in 2023. We estimate that OECD commercial inventories in January 2022 were 270 million barrels (9%) below their five-year (2017–2021) January average and that absolute inventory levels were at their lowest level since 2014 **(Figure 3)**. We forecast OECD commercial inventories will increase to their five-year average by mid-2023. Although we expect inventories to rise, the low inventory levels in recent months will likely limit downward price pressure for



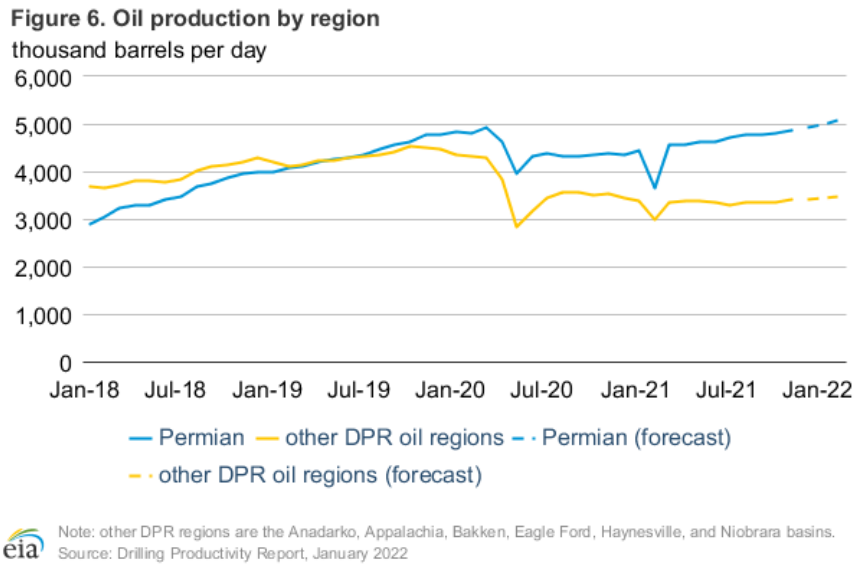
much of the first half of 2022 (1H22). In addition, until inventories move closer to five-year average levels, the potential for a supply disruption to significantly affect price levels and volatility is greater. Inventory growth in the forecast is driven by rising global oil production, largely from OPEC+ and the United States, along with slowing growth in global oil consumption. Our expectation of falling oil prices, particularly beyond 1H22, is contingent on our forecast of oil production and inventory growth. However, oil production might not meet our expectations because of possible changes in production targets from OPEC+, continuing technical issues among some producers, and changes in the investment decisions of U.S. tight oil operators, among other possible reasons.

Figure 3. OECD commercial liquid inventories minus five-year average and Brent price



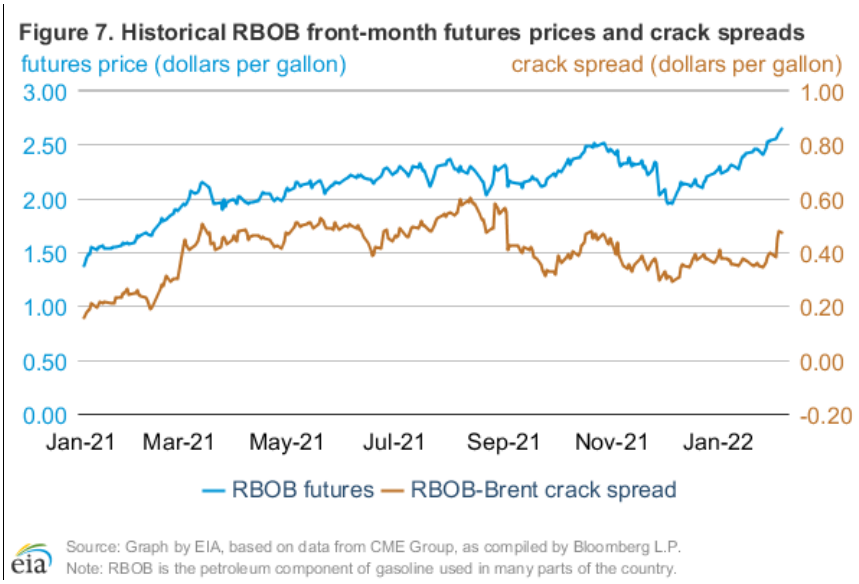
Market-derived probabilities: Crude oil prices continue to be subject to high levels of uncertainty due to COVID-19-related end-user behavior, geopolitical factors, and other disruptions to global oil supply and demand. Market-derived price probabilities that are based on futures and options prices reflect this price uncertainty. As of February 3, the probability of the June 2022 WTI contract expiring at more than $90/b was 34% **(Figure 4)**. Furthermore, market participants increased trading in call options with strike prices of $100/b throughout much of January. A *call option* is a financial instrument that gives the owner the right, but not the obligation, to purchase WTI futures at a certain price by an expiration date. Call options increase in value when the WTI futures price increases. The market-derived probability of $100/b WTI for the June contract increased from 8% on January 3 to 19% on February 3. Open interest for June WTI call options with a strike price of $100/b increased from 18,079 contracts on January 3 to 23,911 contracts on February 3. Trading volume increased from an average of 862 contracts per day in the first half of the month (January 3–January 14) to an average of 1,544 contracts per day in the second half of the month (January 17–January 31). Although the market-derived price probability of $100/b WTI crude oil has increased, the probability of it expiring at less than $70/b is slightly higher, at 25%. These large differences in market-derived probabilities reflect the significant uncertainty and high volatility in the oil market.

Figure 4. Probability of June 2022 WTI futures contracts expiring above different price levels



U.S. Energy Information Administration, CME Group
Note: WTI=West Texas Intermediate

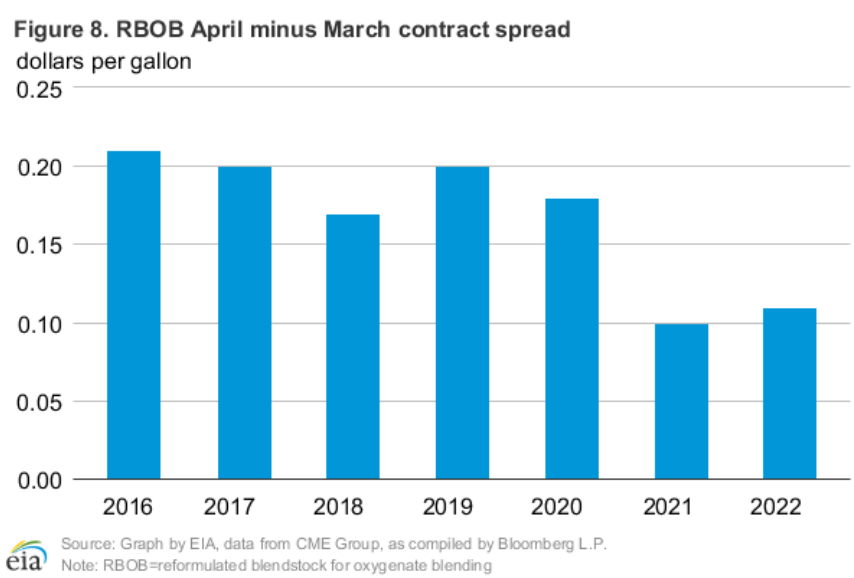
Brent Price and S&P 500 correlation: Typically, the correlation between equity prices and crude oil prices are highest when demand-side factors, such as global economic growth, are driving crude oil prices. In recent weeks, the correlation between daily price changes in the S&P 500, an equity index of widely traded U.S. public companies, and Brent crude oil has decreased from a multiyear high reached on January 4. Since January 2017, the rolling 30-day correlation between the S&P 500 and Brent crude oil has been higher than 0.75 on two occasions **(Figure 5)**. The first occasion was in July 2020, when both the S&P 500 and the Brent crude oil price were increasing from their low points following the onset of the COVID-19 pandemic. The second occasion was in December 2021 and early January 2022, when equities, oil, and many other commodities were beginning to return to normal levels following a demand shock that began on November 26 when the World Health Organization designated the SARS-CoV-2 Omicron variant as a concern.



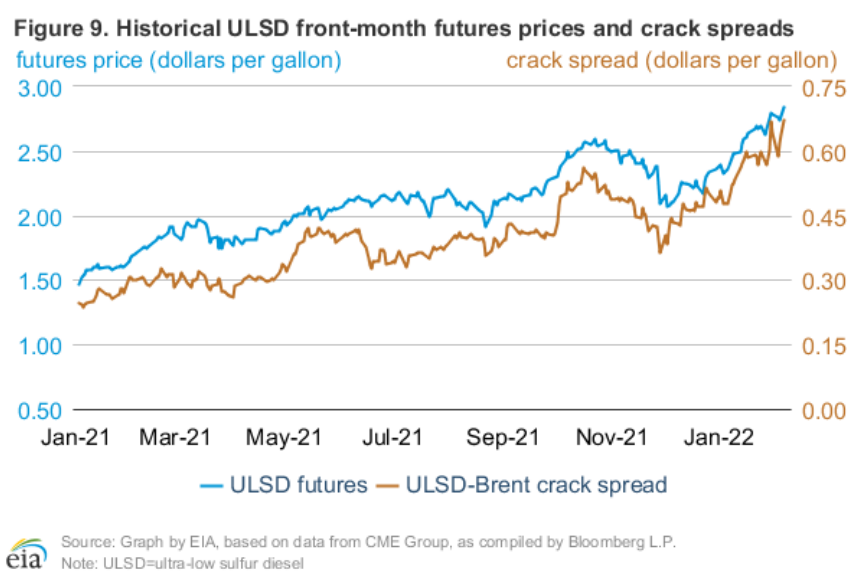
The correlation between the S&P 500 and Brent crude oil has been steeply decreasing since mid-January as concerns about the Omicron variant have lessened and factors more specific to the oil market have caused trends in crude oil prices to deviate from those of the S&P 500. Although the stock market and S&P 500 have been generally decreasing in reaction to changing expectations that the Federal Reserve may increase interest rates in 2022 more than previously expected, low oil inventories and the possibility that geopolitical issues could affect crude oil supply have been driving crude oil prices higher. As of February 3, the rolling 30-day correlation between the two was 0.11, the lowest it has been since the November 26 Omicron announcement.

U.S. production by region: After averaging 7.7 million b/d in the first half of 2021, according to our *Drilling Productivity Report*, U.S. crude oil production in all major shale regions increased to 8.2 million b/d in the second half of the year, largely because of rising production in the Permian Basin. Increases in well completions and rig counts in the Permian Basin have led to record production in that area, with forecasted oil production in the Permian Basin exceeding 5.0 million b/d for February 2022 **(Figure 6)**. The region's favorable geology combined with technological and operational improvements have supported the record production levels. In contrast to the record production in the Permian Basin, we expect production in other shale basins to average almost 3.5 million b/d in February, which is nearly 1.1 million b/d less than the record for production in these regions set in October 2019. The lack of growth and recovery in these other regions reflects more investments flowing to the Permian Basin than to other basins. According to Baker Hughes rig counts, from January 29, 2021, to January 28, 2022, the number of oil-directed rigs in the Permian Basin increased from 192 to 293. In the entire United States, the oil-directed rig count had increased by 200 during that period, meaning rig count growth in the Permian Basin accounts for more than half of the U.S. total.

Petroleum products



Gasoline prices: The front-month futures price of RBOB (the petroleum component of gasoline used in many parts of the country) settled at $2.64 per gallon (gal) on February 3, up 39 cents/gal from January 3 **(Figure 7)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) settled at 47 cents/gal on February 3, up 10 cents/gal from the start of January. The average RBOB–Brent crack spread in January was 37 cents/gal, 1 cent/gal higher than the average spread in December.

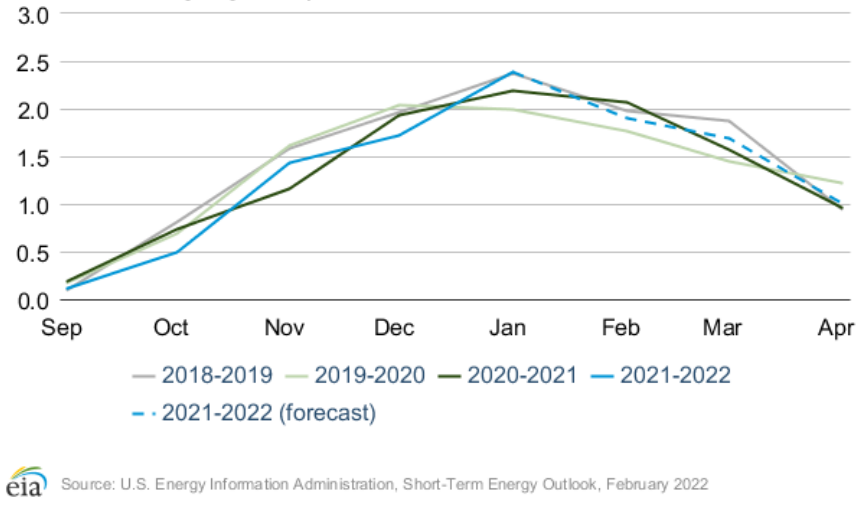


The RBOB–Brent crack spread remains wider than the five-year average for this time of year, continuing a trend of above-average crack spreads since January 2021. Since August, every

month was a record crack spread for that month in data going back to 2008. January's crack spread is more than double the five-year average. Rising crude oil prices and relatively low gasoline production contributed to higher front-month RBOB prices. Rapidly increasing crude oil prices typically reduce product crack spreads, but lower-than-average inventories are supporting these higher crack spreads.

March to April RBOB contract spread: The RBOB futures contract for April delivery is the first contract during the year that trades summer-grade gasoline, which is more expensive to produce and typically trades at higher prices than winter-grade gasoline. As a result, April contracts trade at a premium to March contracts. The 2016–2020 average spread during January trading between RBOB contracts for April delivery and RBOB contracts for March delivery was 19 cents/gal (**Figure 8**). This year the spread was 11 cents/gal, similar to the spread last year and only 1 cent/gal higher than the lowest spread recorded, which occurred in 2010. The relatively low spread could indicate new streamlining rules for testing summer-grade gasoline that the U.S. Environmental Protection Agency rolled out last year to make it easier to transition from winter to summer specifications has led to lower RBOB prices for summer-grade gasoline.

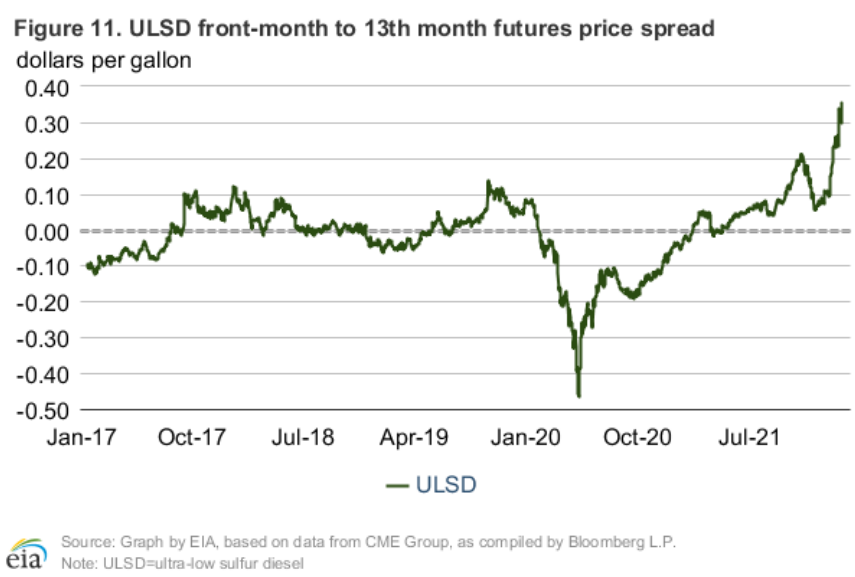
Ultra-low sulfur diesel prices: The front-month futures price for ultra-low sulfur diesel (ULSD) for delivery in New York Harbor settled at $2.84/gal on February 3, a 48 cents/gal increase from January 3 **(Figure 9)**. The ULSD-Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) increased 19 cents/gal during the same period and settled at 67 cents/gal on February 3.



The ULSD–Brent crack spread in January averaged 57 cents/gal, up 10 cents/gal from December 2021 and up 31 cents/gal from January 2021. Rising crude oil prices throughout January contributed to the increase in outright ULSD prices, while seasonal demand for heating oil in the U.S. Northeast and mid-Atlantic regions related to cold temperatures contributed to more demand for distillate fuel oil. Lower ULSD inventories and the increasing ULSD crack spread may result from less refinery production and potential reductions in distillate yields to increase jet fuel production compared with December.

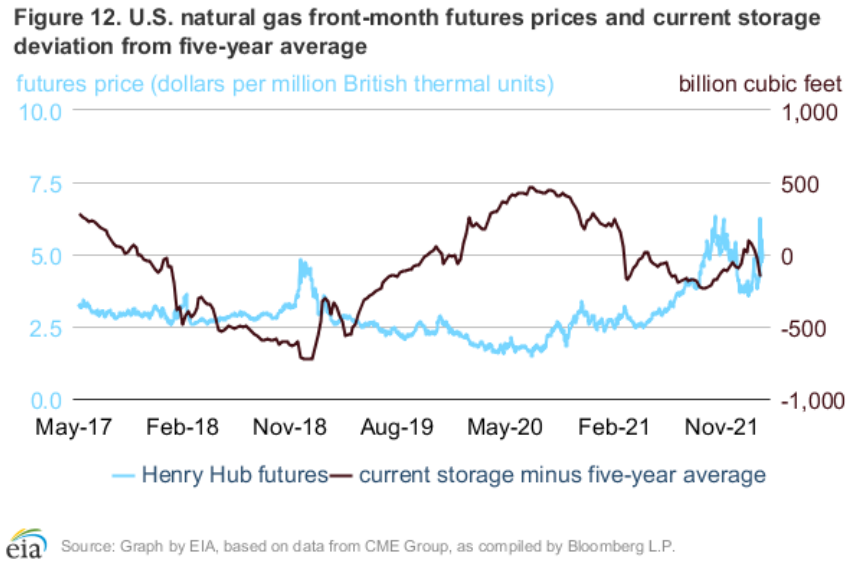
We estimate U.S. distillate consumption in January was 4.4 million b/d in January, an increase of 0.3 million b/d from December 2021, and 0.4 million b/d more than January 2021. Although more than last year, distillate consumption is at a similar level to January 2019 and is less than January 2018. We expect distillate consumption to decrease in the coming months as the weather becomes milder. Distillate inventories ended January at 123 million barrels, 19% below the five-year average. We expect continued draws on distillate inventories until June as low refinery production during turnaround season constrains production while demand for road diesel persists. Low distillate inventories, combined with high crude oil prices will contribute to higher ULSD prices, and we expect wholesale ULSD prices to remain above $2/gal through the rest of 2022 and 2023.

The increase in U.S. distillate consumption in January was driven by colder weather. We measure the effects of winter weather on energy markets by analyzing heating degree days (HDDs). The more HDDs, the colder the weather. In New England (PADD 1A) and the mid-Atlantic (PADD 1B), heating oil remains a substantial source in the energy mix in the residential home-heating sector, unlike much of the United States where home heating is primarily provided by natural gas or electricity. December 2021 temperatures in New England and the mid-Atlantic were relatively mild compared with previous seasons, and HDDs totaled 1,722 for the month, which was fewer than the past three winters and 186 HDDs fewer than the 10-year



average **(Figure 10)**. January weather was cold, and HDDs increased to 2,485 HDDs, 204 HDDs more than the 10-year average. We forecast warmer weather in the coming months will lead to fewer HDDs and, as a result, less home heating oil consumption in the Northeast and mid-Atlantic.

Figure 10. U.S. Northeast (PADD 1A+1B) Heating Degree Days

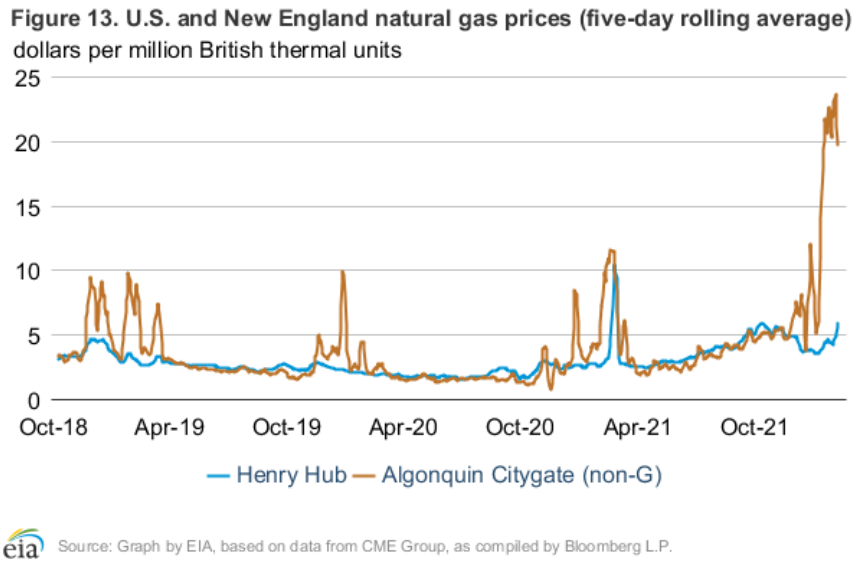


eia Source: U.S. Energy Information Administration, Short-Term Energy Outlook, February 2022

ULSD front 13th month spread: The spread between the front-month and the 13th month price for ULSD futures is a measure of the value of ULSD delivered in the near term compared with ULSD for delivery one year in the future. A large price spread typically indicates a market in which demand exceeds supply, leading to draws on inventories. The spread climbed rapidly in January, reaching its widest level since 2014, at 35 cents/gal as of February 3 **(Figure 11)**. The wide spread is related to distillate inventories that were 19% below the five-year (2017–2021) average for the week ending January 28, according to our *Weekly Petroleum Status Report*. The wide spread between the front-month and the 13th month contracts for crude oil is a contributing factor to the wide ULSD spread for the same contracts. Typically, the spread for ULSD is narrower than the spread for crude oil, however in January 2022, the spread for ULSD exceeded Brent crude oil by an average of 4 cents. The substantial role of seasonally related weather demand is an important element of the current high prices, and we expect that U.S. distillate consumption will decline in the coming months while refinery production of distillate will increase.

Natural Gas

Prices: The front-month natural gas futures contract for delivery at the Henry Hub settled at $4.89 per million British thermal units (MMBtu) on February 3, 2022, which was up $1.07/MMBtu from January 3, 2022 **(Figure 12)**. The average closing price for front-month natural gas futures contracts in January was $4.26/MMBtu, the highest January monthly average in real terms since January 2014.



The average price for front-month natural gas futures contracts in January was 40 cents higher than the December average closing price of $3.86/MMBtu. January was colder than December, which resulted in greater use of natural gas for space heating in the residential and commercial sectors. December 2021 was much warmer than normal, and natural gas withdrawals from

storage were below the five-year average (2016−2020), which contributed to lower natural gas prices throughout the month. In January, colder-than-normal temperatures resulted in storage withdrawals that exceeded the five-year average (2017−2021) by 219 Bcf in order to meet the demand for both space heating and electric power burn. We forecast that combined demand in the residential and commercial sectors in January averaged 48.4 Bcf/d, which is 14.5 Bcf/d more than December 2021 and 3.0 Bcf/d more than the January five-year average.

Record U.S. liquefied natural gas (LNG) exports, increased power demand, and a decline in January natural gas production all contributed to above-average storage withdraws in January, putting upward pressure on prices. In January, U.S. LNG exporters continued to operate at maximum capacity, resulting in exports above 11 Bcf/d for the second consecutive month. We estimate LNG exports averaged 11.2 Bcf/d in January as the new Train 6 at Sabine Pass LNG continues to ramp up production. Continued strong demand for LNG imports in Europe and Asia supports facilities operating at maximum capacity. In addition to more LNG exports, we estimate that demand for natural gas used to generate electric power averaged 31.0 Bcf/d in January, 2.9 Bcf/d more than last year. Lastly, we estimate that U.S. dry natural gas production declined in January, averaging 95.5 Bcf, 2.1 Bcf/d less than December. Cold temperatures and freeze-offs in certain producing areas likely contributed to the decline in production.

The cold weather particularly affected New England, where well-below-normal temperatures led to increased natural gas consumption in the region. In addition, natural gas pipeline supply into New England is constrained, particularly during peak demand periods in the winter. Due to strong demand for natural gas this winter, the spot price at the Algonquin Citygate—a benchmark hub for the natural gas price in New England—exceeded $20/MMBtu on several days **(Figure 13)** and averaged $20.55/MMBtu in January—the highest monthly average price since February 2014. In the past three winters, the monthly average spot price at Algonquin Citygate traded between $3/MMBtu and $6/MMBtu, and the daily price never exceeded $14/MMBtu for any of the three winters. In contrast to the high prices this winter in the Northeast, the daily spot price at Henry Hub averaged $4.38/MMBtu in January.

Notable forecast changes

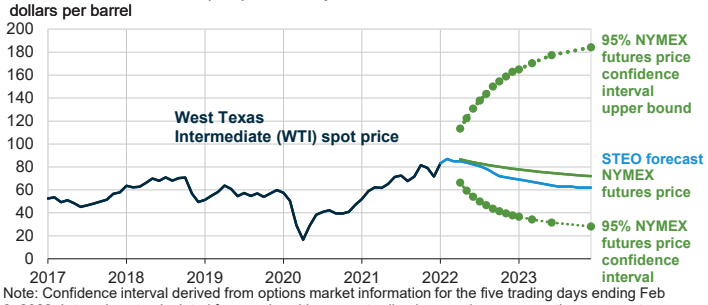
- We forecast the Brent crude oil spot price will average $83/b in 2022, which is $8/b more than we forecast in the January STEO. The higher price forecast partly reflects a reduction in our forecast of OECD inventories in 1H22. Although we continue to expect crude oil prices to decline beginning in March, crude oil price increases over the past month mean that declines will begin from a higher price level, which also contributes to higher crude oil price levels in our forecast throughout 2022. The increase in crude oil prices in the forecast also results in higher prices for gasoline and diesel fuel in 2022 compared with last month's forecast. It also results in more U.S crude oil production compared with last month's forecast.

- Based on data from the Federal Highway Administration, we updated and released historical data for vehicle miles traveled in the STEO. The latest data reflect more vehicle miles traveled in 2021 than previously reported, which increased our estimates of vehicle efficiency. As a result, we increased our forecasts for vehicle miles traveled and vehicle efficiency. The revisions to vehicle efficiency, however, were more significant and drove our forecast gasoline consumption down in both 2022 and 2023. In 2022, we now forecast that gasoline consumption in the United States will average 8.9 million b/d, down from 9.1 million b/d in the January STEO. In our February STEO, we forecast that gasoline consumption in 2023 will average 9.0 million b/d, down from a forecast of 9.1 million b/d in the January STEO.

- Beginning with this STEO, we will provide new forecasts for biodiesel, renewable diesel, and other biofuels, which includes fuels such as renewable jet fuel and renewable naphtha. In our custom table builder, we will provide production, consumption, and net imports for each of these fuels. The changes reflect the inclusion of these series in Table

10.4 of the *Monthly Energy Review* (MER) beginning in mid-2021. Related to this change, we have added a line for consumption (product supplied) of other hydrocarbons and oxygenates in Table 4a of STEO. *Product supplied of other hydrocarbons and oxygenates* is a category that includes biodiesel, renewable diesel, and other biofuels, which in the *Petroleum Supply Monthly* (PSM) are collectively called *renewable fuels excluding fuel ethanol*. In the PSM, product supplied of renewable fuels excluding fuel ethanol plus refinery and blender net inputs of renewable fuels excluding fuel ethanol is equal to the consumption of biodiesel, renewable diesel, and other biofuels as reported in MER.

- For more information, see the detailed table of forecast changes.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The views in this report therefore should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on February 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

U.S. Commercial Inventory	**1,302**	**1,271**	**1,241**	**1,188**	*1,190*	*1,261*	*1,275*	*1,250*	*1,251*	*1,307*	*1,327*	*1,284*	**1,188**	*1,250*	*1,284*
OECD Commercial Inventory	**2,911**	**2,868**	**2,749**	**2,682**	*2,688*	*2,769*	*2,812*	*2,828*	*2,845*	*2,921*	*2,967*	*2,972*	**2,682**	*2,828*	*2,972*

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on February 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on February 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on February 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Total Commercial Inventory	**1301.7**	**1271.5**	**1240.7**	**1187.7**	*1190.0*	*1261.1*	*1274.6*	*1250.4*	*1250.6*	*1307.1*	*1327.4*	*1284.0*	**1187.7**	*1250.4*	*1284.0*
Crude Oil in SPR	**637.8**	**621.3**	**617.8**	**593.6**	*569.3*	*560.6*	*560.6*	*552.8*	*545.0*	*537.2*	*540.6*	*530.1*	**593.6**	*552.8*	*530.1*

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on February 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on February 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on February 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.91**	**1.93**	**2.03**	**2.04**	*2.05*	*2.06*	*1.91*	*1.91*	*1.85*	*1.85*	*1.84*	*1.82*	**1.98**	*1.98*	*1.84*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on February 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on February 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on February 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 7c. U.S. Regional Retail Electricity Prices (Cents per Kilowatthour)

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on February 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 7d part 1. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continues on Table 7d part 2*

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on February 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distrib

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biodiesel, renewable diesel, and other biofuels consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on February 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum Supply*
Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on February 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.
Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

- = no data available

SAAR = Seasonally-adjusted annual rate

Notes: EIA completed modeling and analysis for this report on February 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on February 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on February 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Appendix to the February 2022 *Short-Term Energy Outlook*

This appendix is prepared in fulfillment of section 1245(d)(4)(A) of the National Defense Authorization Act (NDAA) for Fiscal Year 2012, as amended. The law requires the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy, to submit to Congress a report on the availability and price of petroleum and petroleum products produced in countries other than Iran in the two-month period preceding the submission of the report. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The data in this appendix, therefore, should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

EIA consulted with the U.S. Department of the Treasury, the U.S. Department of State, and the intelligence community in the process of developing the NDAA report, which was previously published as a stand-alone report. Detailed background and contextual information not repeated here can be found in early editions of the NDAA report.

This appendix is published in the *Short-Term Energy Outlook* in even numbered months.

Table a1. Summary of Estimated Petroleum and Other Liquids Quantities

	Dec 2021	Jan 2022	Dec 2021 – Jan 2022 Average	Dec 2020 - Jan 2021 Average	2018 - 2020 Average
Global Petroleum and Other Liquids (million barrels per day)					
Global Petroleum and Other Liquids Production (a)	98.6	99.0	98.8	93.2	98.2
Global Petroleum and Other Liquids Consumption (b)	101.2	99.0	100.1	94.0	97.3
Biofuels Production (c)	2.4	2.2	2.3	2.3	2.7
Biofuels Consumption (c)	2.6	2.5	2.5	2.5	2.6
Iran Liquid Fuels Production	3.6	3.8	3.7	3.1	3.6
Iran Liquid Fuels Consumption	2.2	2.4	2.3	2.1	1.9
Petroleum and Petroleum Products Produced and Consumed in Countries Other Than Iran (million barrels per day)					
Production (d)	92.6	93.0	92.8	87.9	91.9
Consumption (d)	96.4	94.1	95.2	89.4	92.8
Production minus Consumption	-3.8	-1.1	-2.4	-1.5	-0.9
World Inventory Net Withdrawals Including Iran	2.6	0.0	1.3	0.8	-0.9
Estimated OECD Inventory Level (e) (million barrels)	2,682	2,676	2,679	3,025	2,943
Surplus Production Capacity (million barrels per day)					
OPEC Surplus Crude Oil Production Capacity (f)	4.2	4.2	4.2	6.1	3.2

Note: The term "petroleum and other liquids" encompasses crude oil, lease condensate, natural gas liquids, biofuels, coal-to-liquids, gas-to-liquids, and refinery processing gains, which are important to consider in concert due to the inter-related supply, demand, and price dynamics of petroleum, petroleum products, and related fuels.

(a) Production includes crude oil (including lease condensates), natural gas liquids, other liquids, and refinery processing gains.

(b) Consumption of petroleum by the OECD countries is synonymous with "products supplied," defined in the glossary of the EIA Petroleum Supply Monthly, DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel, and loss, and bunkering.

(c) Biofuels production and consumption are based on EIA estimates as published in the International Energy Statistics. Biofuels production in the third quarter tends to be at its highest level in the year as ethanol production in Brazil reaches its seasonal peak and is typically lowest in the first quarter as seasonal production falls in the South/South-Central region of Brazil.

(d) Global production of petroleum and petroleum products outside of Iran is derived by subtracting biofuels production and Iran liquid fuels production from global liquid fuels production. The same method is used to calculate global consumption outside of Iran.

(e) Estimated inventory level is for OECD countries only.

(f) EIA defines surplus oil production capacity as potential oil production that could be brought online within 30 days and sustained for at least 90 days, consistent with sound business practices. This does not include oil production increases that could not be sustained without degrading the future production capacity of a field.

Independent Statistics & Analysis
U.S. Energy Information Administration

March 2022

Short-Term Energy Outlook

Forecast highlights

Global liquid fuels

- The March *Short-Term Energy Outlook* (STEO) is subject to heightened levels of uncertainty resulting from a variety of factors, including Russia's further invasion of Ukraine. This STEO assumes U.S. GDP will grow by 3.6% in 2022 and by 2.7% in 2023, after growing by 5.7% in 2021. We use the S&P Global (formerly IHS Markit) macroeconomic model to generate our U.S. economic assumptions. Global macroeconomic assumptions in our forecast are from Oxford Economics and include global GDP growth of 4.3% in 2022 and 4.0% in 2023, compared with growth of 5.9% in 2021. These GDP forecasts were completed in mid-February. The rest of the forecast was completed on March 3 and accounts for available information to that point. A wide range of potential macroeconomic outcomes could significantly affect energy markets during the forecast period. Supply uncertainty results from the conflict in Ukraine, the production decisions of OPEC+, and the rate at which U.S. oil and natural gas producers increase drilling.

- Brent crude oil spot prices averaged $97 per barrel (b) in February, an $11/b increase from January. Daily spot prices for Brent closed at almost $124/b in the first week of March as the further invasion of Ukraine by Russia and subsequent sanctions on Russia and other actions created significant market uncertainties about the potential for oil supply disruptions. These events are occurring against a backdrop of low oil inventories and persistent upward oil price pressures. Global oil inventories have fallen steadily since mid-2020, and inventory draws averaged 1.8 million barrels per day (b/d) from the third quarter of 2020 (3Q20) through the end of 2021. We estimate that oil inventories fell further in the first two months of 2022 and that commercial inventories in the OECD ended February at 2.64 billion barrels, which is the lowest level since mid-2014.

- We expect the Brent price will average $117/b in March, $116/b in 2Q22, and $102/b in the second half of 2022 (2H22). We expect the average price to fall to $89/b in 2023. However, this price forecast is highly uncertain. Actual price outcomes will be dependent on the degree to which existing sanctions imposed on Russia, any potential future sanctions, and independent corporate actions affect Russia's oil production or the sale of Russia's oil in the global market. In addition, the degree to which other oil producers respond to current oil prices, as well as the effects macroeconomic developments might have on global oil demand, will be important for oil price formation

in the coming months. Although we reduced Russia's oil production in our forecast, we still expect that global oil inventories will build at an average rate of 0.5 million b/d from 2Q22 through the end of 2023, which we expect will put downward pressure on crude oil prices. However, if production disruptions—in Russia or elsewhere—are more than we forecast, resulting crude oil prices would be higher than our forecast.

- We forecast that global consumption of petroleum and liquid fuels will average 100.6 million b/d for all of 2022, up 3.1 million b/d from 2021. We forecast that consumption will increase by 1.9 million b/d in 2023 to average 102.6 million b/d. Economic forecasts in this outlook were completed before Russia's further invasion of Ukraine. The outlook for economic growth and oil consumption in Russia and surrounding countries is highly uncertain. Oil consumption will depend on how economic activity and travel respond to recent and any potential future events and sanctions.

- U.S. regular gasoline retail prices averaged $3.52 per gallon (gal) in February, up 20 cents/gal from January and up $1.02/gal from February 2021. Retail diesel prices averaged $4.03/gal in February—the highest average price (not adjusted for inflation) for any month since March 2013. Product prices have risen compared with year-ago levels because of rising crude oil prices and high refining margins. We expect crude oil price increases will push the U.S. average gasoline price to $4.10/gal on average in 2Q22, which would be the first time that gasoline prices (not adjusted for inflation) have reached at least $4/gal in any month since July 2008. We expect diesel prices will average $4.43/gal during 2Q22. Gasoline and diesel prices are closely tied to crude oil prices. We forecast gasoline prices will average $3.71/gal in 2H22, and we forecast diesel prices will average $4.04/gal over the same period. However, actual prices could be significantly affected by the same factors that affect crude oil prices.

- U.S. crude oil production fell below 11.6 million b/d in December 2021 (the most recent monthly historical data point), a decline of 0.2 million b/d from November 2021. We forecast that production will rise to average 12.0 million b/d in 2022 and then to record-high production on an annual-average basis of 13.0 million b/d in 2023. The previous annual-average record of 12.3 million b/d was set in 2019.

Natural Gas

- In February, the Henry Hub natural gas spot price averaged $4.69 per million British thermal units (MMBtu), which was up from the January average of $4.38/MMBtu. Although temperatures across the eastern part of the United States were close to normal in February, reducing natural gas consumption from January levels, natural gas production fell slightly last month relative to January, in part as a result of temporary freeze-offs in producing regions. The drop in production partly contributed to inventory draws outpacing the five-year (2017–2021) average in February. This outlook assumes that temperatures in March will be milder than February and near the 10-year average

for March. We expect production will rise from February levels, contributing to a lower average Henry Hub price of $4.10/MMBtu for March. We expect the Henry Hub price will average $3.83/MMBtu in 2Q22 and $3.95/MMBtu for all of 2022. We expect the Henry Hub spot price will average $3.59/MMBtu in 2023.

- We estimate that inventory withdrawals in February were 627 billion cubic feet (Bcf) and that natural gas inventories ended the month at 1.6 trillion cubic feet (Tcf). We expect natural gas inventories to fall by about 95 Bcf in March, ending the withdrawal season at about 1.5 Tcf, which would be 10% less than the five-year average for this time of year. We forecast that natural gas inventories will end the 2022 injection season (end of October) at 3.5 Tcf, which would be 4% less than the five-year average.

- In February, U.S. liquefied natural gas (LNG) exports averaged 10.9 billion cubic feet per day (Bcf/d), down from 11.2 Bcf/d in January. Similar to last year, U.S. LNG exports in February were limited by fog in the Gulf of Mexico that affected vessel traffic and led to piloting services being suspended for several days on the Sabine Pass, Lake Charles (location of Cameron LNG), and Corpus Christi waterways. Although exports fell in February, they were higher than in any month prior to December 2021. Many U.S. LNG cargoes were delivered to Europe last month, where inventories are lower than the five-year average and potential supply disruptions related to the conflict in Ukraine are a concern. Although Europe's inventories are low, the additional LNG imports, as well as a mild winter, are helping bring inventories closer to the five-year average than they were at the beginning of the winter. We expect high levels of U.S. LNG exports to continue in 2022, averaging 11.3 Bcf/d for the year, a 16% increase from 2021.

- We expect that U.S. consumption of natural gas will average 84.6 Bcf/d in 2022, up 2% from 2021. The increase in U.S. natural gas consumption reflects rising demand in the industrial sector as a result of increased manufacturing activity. In addition, the increase in natural gas consumption reflects higher consumption in the residential and commercial sectors as a result of colder temperatures this year compared with 2021. Higher consumption in these sectors is partly offset by lower consumption in the electric power sector due to a forecast increase in generation from renewable energy sources.

- We estimate dry natural gas production averaged 95.3 Bcf/d in the United States in February, down 0.6 Bcf/d from January. Production in January and February was lower than in December because of freezing temperatures in certain production regions. We forecast natural gas production to average 95.7 Bcf/d in March. For 2022, we expect that natural gas production will average 96.7 Bcf/d, which is 3.1 Bcf/d more than in 2021. We expect dry natural gas production to rise to an average of 99.1 Bcf/d in 2023.

Electricity, coal, renewables, and emissions

- U.S. electric power sector generation in February 2022 was 1.3% lower than generation in February 2021, when generation was high because of extreme cold weather. We forecast that the annual share of U.S. electricity generation from renewable energy sources will rise from 20% in 2021, to 22% in 2022, and to 24% in 2023, as a result of continuing increases in solar and wind generating capacity. This increase in renewables generation leads to an expected decline in natural gas generation, which falls from a 37% share in 2021, to 36% in 2022, and to 35% in 2023. Natural gas generation falls in the forecast even though we expect the cost of natural gas for power generation to fall from $4.97/MMBtu in 2021, to $4.16/MMBtu in 2022, and to $3.80/MMBtu in 2023. Increasing renewable generation also contributes to our forecast that the share of generation from coal will fall from 23% in 2021 to 22% in 2022 and 21% in 2023. Nuclear generation remains relatively constant in the forecast at an average share of 20%.

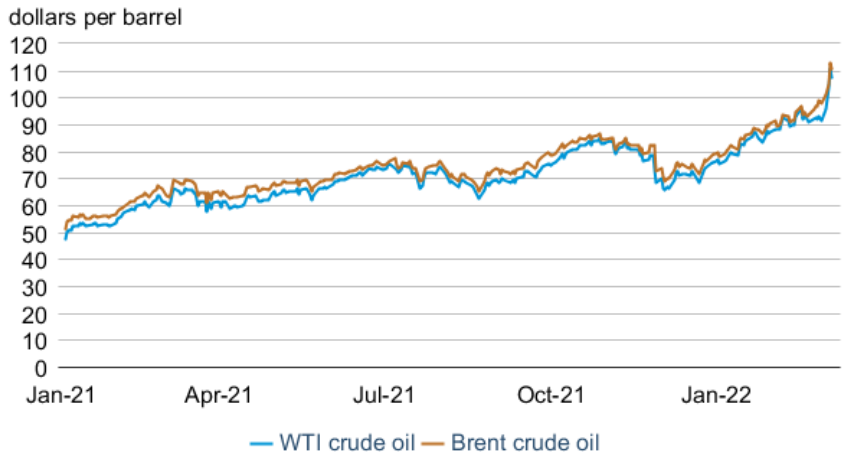
- Planned additions to U.S. wind and solar capacity in 2022 and 2023 increase electricity generation from those sources in our forecast. The U.S. electric power sector added 14 gigawatts (GW) of new wind capacity in 2021. We expect 10 GW of new wind capacity will come online in 2022 and 5 GW in 2023. Utility-scale solar capacity rose by 13 GW in 2021. Our forecast for added utility-scale solar capacity is 22 GW for 2022 and 24 GW for 2023. We expect solar additions to account for nearly half of new electric generating capacity in 2022. In addition, in 2021, small-scale solar capacity (systems less than 1 megawatt) increased by 5.4 GW to 33 GW. We project that small-scale solar capacity will grow by 4.0 GW in 2022 and 4.3 GW in 2023.

- We expect U.S. coal production to increase by more than 25 million short tons (MMst) (4%) in 2022 to 604 MMst and then rise by 9 MMst (1%) in 2023. Although labor strikes at some metallurgical mines in Appalachia continue to affect production, we expect producers to regain a portion of that production later during 1H22. Increased production of coal will help support rising export demand as well as help replenish coal inventories at power plants that were depleted during 2021.

- We expect U.S. coal consumption to decrease by 7 MMst in 2022 and by 15 MMst in 2023. In both forecast years, declining consumption from the electric power sector is somewhat offset by rising consumption at coke plants.

- Coal exports in our forecast total 88 MMst in 2022, up 3% from 2021, and 91 MMst in 2023. We assume international prices will remain supportive of U.S. coal exports as the conflict in Ukraine creates the potential to disrupt supplies from that region.

- U.S. energy-related carbon dioxide (CO_2) emissions increased by nearly 7% in 2021 as economic activity increased and contributed to rising energy use. We expect a 2% increase in energy-related CO_2 emissions in 2022, primarily from growing



transportation-related petroleum consumption. Forecast energy-related CO_2 emissions remain almost unchanged in 2023. We expect petroleum emissions to increase by 4% in 2022 compared with 2021, and this growth rate slows to less than 1% in 2023. Natural gas emissions increase by 2% in 2022 and then decrease slightly in our forecast for 2023. We forecast that coal-related CO_2 emissions will fall by 3% in 2022 and by 2% in 2023.

Petroleum and natural gas markets review

Crude oil

Prices: The front-month futures price for Brent crude oil settled at $110.46 per barrel (b) on March 3, 2022, an increase of $21.30/b from the February 1, 2022, price of $89.16/b. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, increased by $19.47/b during the same period, settling at $107.67/b on March 3 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices

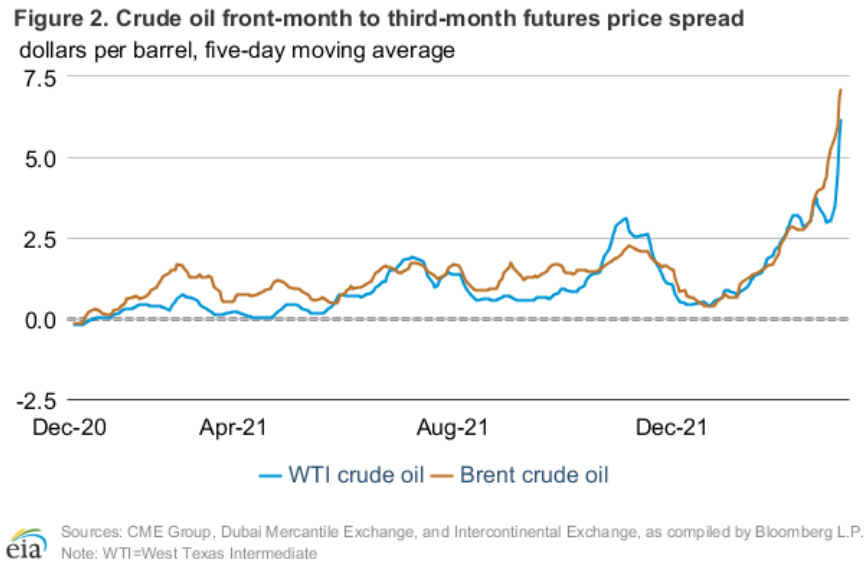
Source: Graph by EIA, based on CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate

The Russian invasion further into Ukraine on February 24 and the subsequent escalation of armed conflict, which had been preceded by increasing tensions in earlier weeks, contributed to rising crude oil prices. On February 28, the front-month Brent crude oil price settled at over $100/b for the first time since September 2014. The increase in crude oil prices reflects potential effects of the extensive sanctions levied by the United States, European Union, and others on Russian entities in response to Russia's continued invasion of Ukraine, as well as the risk of potential disruptions to crude oil and energy production and infrastructure related to the conflict. The sanctions that have so far been announced have primarily targeted Russian individuals and financial institutions but avoided direct sanctions on Russia's energy companies, including crude oil and natural gas production and exports. Although sanctions so far have generally avoided direct sanctions on Russia's energy companies, there are trade press reports

that sanctions targeting financial institutions have increased concerns among oil market participants about purchasing energy from Russia and about the potential for additional sanctions.

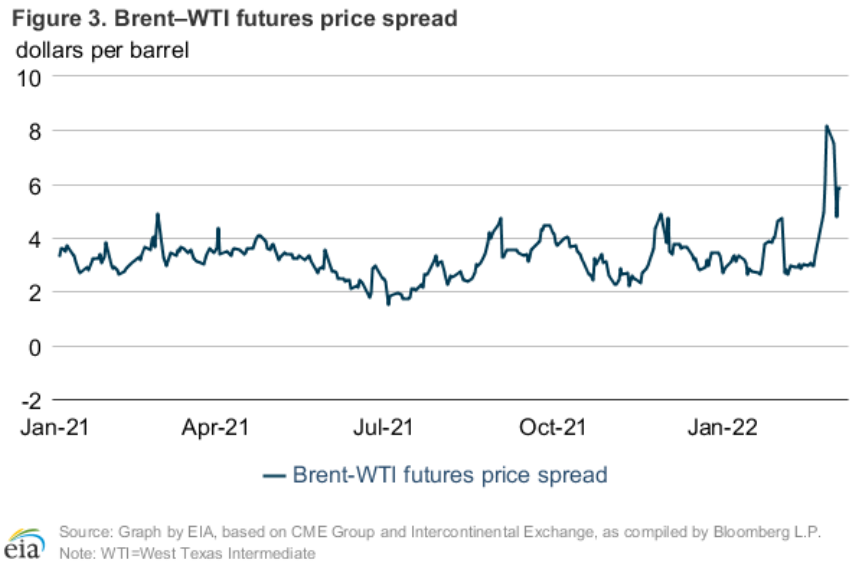
The February monthly average front-month Brent crude oil futures price was $94/b, up $9/b over January 2022 and up $32/b over February 2021. The increased risks to oil supplies presented by Russia's further invasion of Ukraine builds on a number of other factors that have been underpinning crude oil price increases for the past several months. First, oil consumption has persistently been greater than oil production since mid-2020, contributing to a decline in global oil inventories in all but one month from June 2020 through February 2022. As a result, total commercial oil inventories in the OECD have fallen to their lowest levels since mid-2014. Second, several minor geopolitical disruptions contributed to increased risks in recent months. Port closures contributed to reduced crude oil production in Libya, while Houthi attacks targeting the United Arab Emirates and political unrest in Kazakhstan also contributed to additional risks to global supplies. Third, several OPEC members have been unable to increase production in line with previously agreed on targets. Finally, decreasing COVID-19 cases and natural gas-to-oil switching in the electric power sector have likely contributed to demand increases.

A number of western energy companies, including ExxonMobil, Shell, BP, and Equinor have announced they are stopping operations in Russia and ending partnerships with Russian firms. Trade press also reports that a number of European refiners, shippers, and insurance companies are not purchasing or shipping crude oil from Russia, even without formal energy sanctions. This distancing from Russian markets by private entities has contributed to significant price discounts on some Russian crude oil streams. However, as of March 3, trade press reported significant volumes of Russian crude oil and petroleum products remained unsold as shippers and refiners refuse to take cargoes from Russia. We expect that the withdrawal of some firms from Russia, combined with limitations on finance, are likely to contribute to ongoing constraints on new field development and crude oil production with ongoing effects into the medium term. Market participant trading activity combined with the active conflict involving Russia remains a substantial source of uncertainty and risk for global crude oil production and prices.



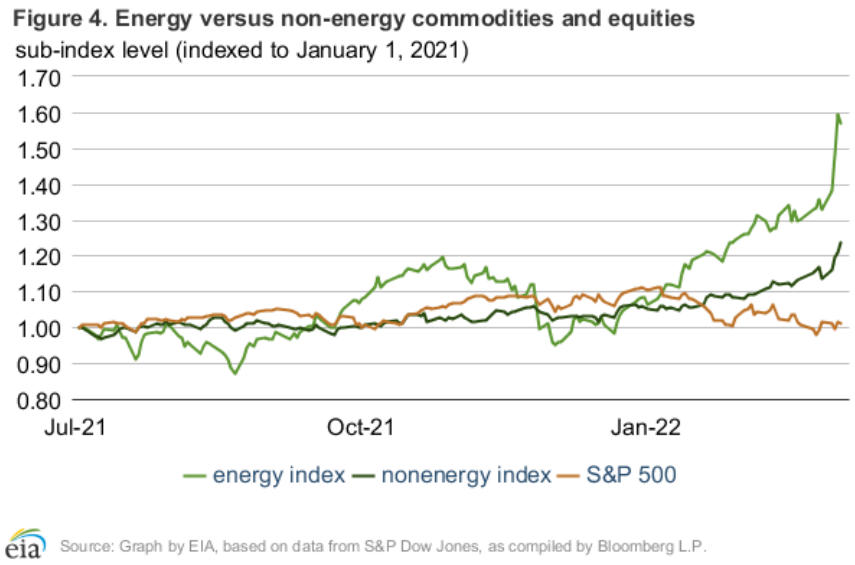
We estimate Russia produced 11.3 million b/d of petroleum and other liquids in February 2022, and given most recent reports, we expect that production in Russia will fall by 0.25 million b/d in March, with an additional decline of 0.5 million b/d in April. We expect production to temporarily decrease as some shippers refrain from picking up crude oil cargoes from Russia, mainly as a result of current sanctions or anticipation of additional sanctions. Although Russia's crude oil production and export capacity will continue to be available, there is considerable uncertainty to which degree countries will continue to import crude oil and petroleum products from Russia. While we recognize that the range of outcomes for Russia's oil production is wide, we assume that there will be a decrease in Russian crude oil exports, and therefore in production, in the coming months. With crude oil exports decreasing, onshore storage likely will

fill up quickly because of limited onshore storage capacity, which will necessitate production shut-ins and the use of floating storage on ships. We assess that most of Russia's crude oil will find export destinations, but we expect there will be a temporary dislocation of production and exports as new trade routes are established and as Russia finds other crude oil buyers. However, this assessment is based on sanctions as of March 3, 2022, and it is subject to significant uncertainty about the way in which market participants will respond to those sanctions.



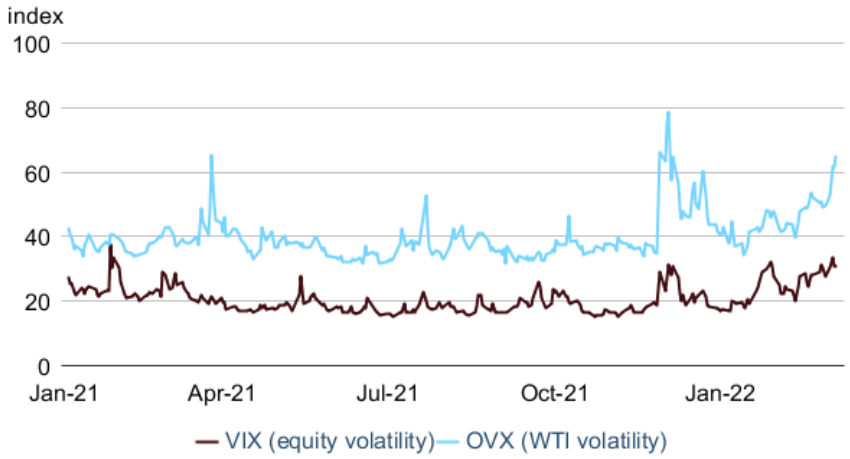
We expect that Russia's liquid fuels production will decrease by about 0.7 million b/d in 2Q22 compared with 1Q22 and then increase slightly in 3Q22. Overall, we expect Russia's production to be about 0.5 million b/d lower in December 2022 compared with February and to remain flat in 2023. Compared with our forecast last month, in which were expecting growth in Russia's liquid fuels production, we now expect Russia's liquid fuels production to be 1.0 million b/d less on average from 2Q22 through the end of 2023. This forecast remains subject to significant revisions because the extent to which sanctions and other private corporate actions will affect production remains unclear.

We expect the Brent crude oil spot price to average $117/b in March, then average $116/b in 2Q22 and $102/b in 2H22, although this forecast remains highly uncertain in light of current geopolitical developments. The effect that current sanctions and private corporate action will have on production in Russia or on global purchases of crude oil from Russia remains a major source of uncertainty in the outlook. Similarly, the effect that current and near-term high price levels have on production outside of Russia remains a potential risk and is highly variable in our current outlook, because high prices increase the incentive for new production.



Crude oil front-month to 3rd month futures spread: Oil market uncertainties linked to Russia's further invasion of Ukraine have occurred while global petroleum inventory levels are low. This situation has contributed to historically high levels of backwardation (when near-term prices are higher than longer-dated ones). The spread between crude oil front-month contracts and third-month contracts (1-3) reflects heightened calls on crude oil inventories in the very short term **(Figure 2)**. The Brent 1-3 spread increased to its highest level on record at $7.06/b on March 3. The spread averaged $3.55/b throughout February, more than doubling from January, when the spread was $1.46/b, and is also well above the 2021 annual average of $1.11/b. The WTI 1-3 crude oil price spread increased similarly to the Brent spread in February, reaching a high of $6.15/b on March 3 and averaging $3.12/b in February, also doubling the January level.

The increase in the spread for WTI futures is not quite as sharp as the spread with Brent, which is also reflected in the front-month prices **(Figure 3)**. The spread between Brent and WTI increased by $1.60/b to $4.93/b on February 22, when the possibility of further Russian invasion into Ukraine heightened, and widened another $3.21/b over the next two days to $8.14/b on February 24, the day the invasion escalated. The highest Brent-WTI spread in 2021 was $4.90/b, and the spread averaged $3.38/b in January 2022. Since February 22, the spread has averaged $6.40/b, likely reflecting the impact of risks related to the Russian invasion further into Ukraine. European oil markets are likely to be affected more significantly than U.S. or western hemisphere markets, which may be better captured by the WTI price. Countries in OECD Europe received 24% of their crude oil and condensate imports from Russia in 2020. About 48% of Russia's crude oil and condensate exports in 2020 went to countries in Europe. Slight differences in the delivery times of the WTI and Brent crude oil futures contracts may also be contributing to some of the difference in the spread.



Energy and non-energy commodity indexes: Since the start of 2022, price increases in energy commodities have outpaced increases in non-energy commodities. The energy component of the S&P Goldman Sachs Commodity Index (GSCI) is heavily weighted toward crude oil, although it also includes smaller shares of natural gas, gasoline, and distillate commodity prices. The non-energy component accounts for a basket of other commodities, including agricultural products, livestock, and metals. The increase in the energy segment of the index reflects the drivers of increased crude oil prices discussed previously. Non-energy commodity prices have also been increasing through much of February, although not necessarily by as much as energy commodities. Although Russia's energy exports may be the largest source of uncertainty for global markets, Ukraine and Russia are both substantial producers and exporter of agricultural products, and the impact of the conflict is also likely reflected in risks to non-energy agricultural commodities. Equities in the S&P 500, conversely, have experienced downward pressure in February as a result of rising prices for global commodities, concerns over inflation, and risks of commercial disruptions related to the Ukraine conflict. As of March 3, the energy index had increased 57% over July 1, 2021, compared with an increase of 23% for the non-energy index, and the S&P 500 increased 1% over July 1 levels **(Figure 4)**.

U.S. volatility indexes: The Volatility Index (VIX) is a measure of implied volatility in U.S. equity prices, calculated from prices of put and call options on the S&P 500 index, by the Chicago Board of Options Exchange. The Crude Oil Volatility Index (OVX) is a similar estimate derived from options prices for the United States Oil Fund, reflecting the WTI crude oil futures price. The OVX is generally higher than the VIX, partially because it represents the price volatility of a single commodity instead of a diversified group of large U.S. companies **(Figure 5)**. In addition, since the beginning of the COVID-19 pandemic, energy markets have been more volatile compared with equities markets, likely related to the unique effects of the pandemic on oil production and consumption. In 2021, the OVX averaged almost double the VIX over the course of the year. New volatility introduced by Russia's invasion further into Ukraine in February 2022 pushed the monthly average OVX value to higher than in any month in 2021, other than December, averaging 47% in February and peaking at 64% on March 3. This volatility remained below the peak related to the COVID-19 Omicron variant on December 1, 2021, which was 78%. The impact on equities from Russia's invasion further into Ukraine was also high, with the VIX averaging 26% in February, higher than any monthly average last year, and peaking at 33% on March 1 (exceeding the Omicron-related peak of 31% in December 2021).

Figure 5. Equity and crude oil volatility indexes

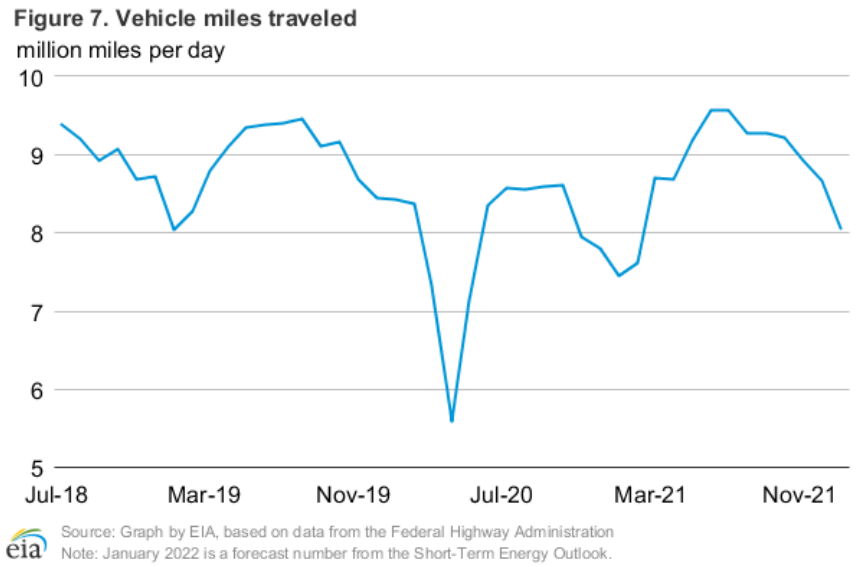
Petroleum products

Gasoline prices: The front-month futures price of RBOB (the petroleum component of gasoline used in many parts of the country) settled at $3.28 per gallon (gal) on March 3, up 71 cents/gal from February 1 **(Figure 6)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) settled at 65 cents/gal on March 3, up 20 cents/gal during the same period. The average RBOB–Brent crack spread in February was 45 cents/gal, 8 cents/gal higher than January and 19 cents/gal higher than February 2021.

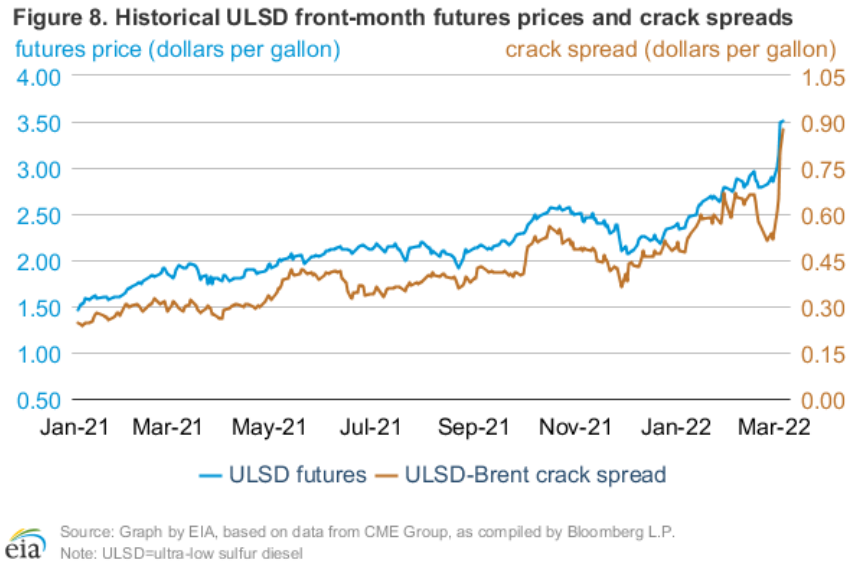
Figure 6. Historical RBOB front-month futures prices and crack spreads

Source: Graph by EIA, based on data from CME Group, as compiled by Bloomberg L.P.
Note: RBOB is the petroleum component of gasoline used in many parts of the country.



The RBOB–Brent crack spread remains well above the average for this time of year, likely as a result of low gasoline stocks and relatively low gasoline production. Gasoline inventories tend to build in the winter in preparation for the summer driving season, when gasoline demand is at its

highest. However, after building in January, we estimate U.S. gasoline inventories declined to 246 million barrels, a 2.1 million barrel draw in February, putting inventories 4.3 million barrels (1.7%) below the five-year average. Gasoline inventories have been below the five-year average since January 2021. From February 28 to March 3, the RBOB-Brent crack spread increased by 67%, from 39 cents/gal to 65 cents/gal, as oil prices increased.

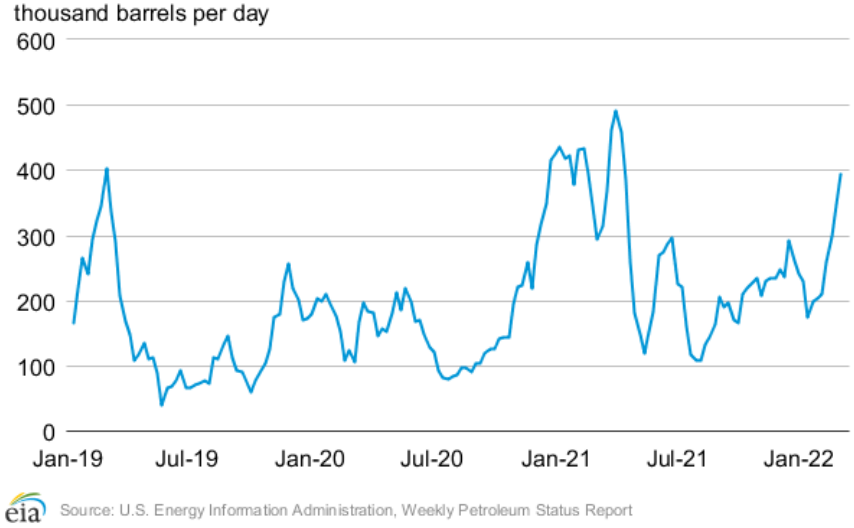


We estimate U.S. gasoline consumption averaged 8.5 million barrels per day (b/d) in February, about 0.5 million b/d (5.7%) below the 2016–2020 average, which for February are the years preceding the effects of the pandemic. Meanwhile, we estimate finished motor gasoline production in February totaled 9.2 million b/d, around 0.5 million b/d (4.9%) below the 2016–2020 average for this time of year. Both planned and unplanned refinery outages, including cold weather-related power outages at several Houston area refineries and an explosion at Marathon's 578,000-b/d Garyville, Louisiana, refinery, likely contributed to lower production and higher crack spreads.

RBOB prices reached $3.31/gal on March 2, the highest price since September 2012. Rising crude oil prices are supporting higher prices for RBOB. Starting from the most recent low of $1.95/gal on December 1, 2021, when news of the outbreak of the Omicron variant created expectations of reduced demand, RBOB prices have increased 68%. One third of the increase happened since February 28.

Gasoline demand: The Federal Highway Administration's (FHWA) report, *Traffic Volume Trends*, estimates vehicle miles traveled based on hourly traffic count data reported by states. Transportation makes up 96% of the end use for motor gasoline, which makes changes in vehicle miles traveled a direct factor on gasoline demand. The latest FHWA report shows total vehicle miles traveled in December 2021 were 268.4 billion, about 1.3% above the five-year (2015–19) average of 264.9 billion. Seasonally adjusted data shows a 1.1 billion mile (0.4%) decline in total vehicle miles traveled from November to December 2021. Total vehicle miles (for both passenger vehicles and trucks) increased for most of 2021, surpassing 2019 levels in every month from June to November **(Figure 7)**. For passenger vehicles alone, November marked the first time since the beginning of the COVID-19 pandemic that total miles traveled in weekly data surpassed 2019 levels. Since then, passenger vehicle miles traveled have been below 2019 levels in every week through February 27. The emergence of the Omicron variant at the end of November may have contributed to less driving in the following months.

Ultra-low sulfur diesel prices: The front-month futures price for ultra-low sulfur diesel (ULSD) for delivery in New York Harbor settled at $3.50/gal on March 3, a 76 cent/gal increase from February 1 **(Figure 8)**. The ULSD-Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) increased 26 cents/gal during the same period and settled at 87 cents/gal on March 3.

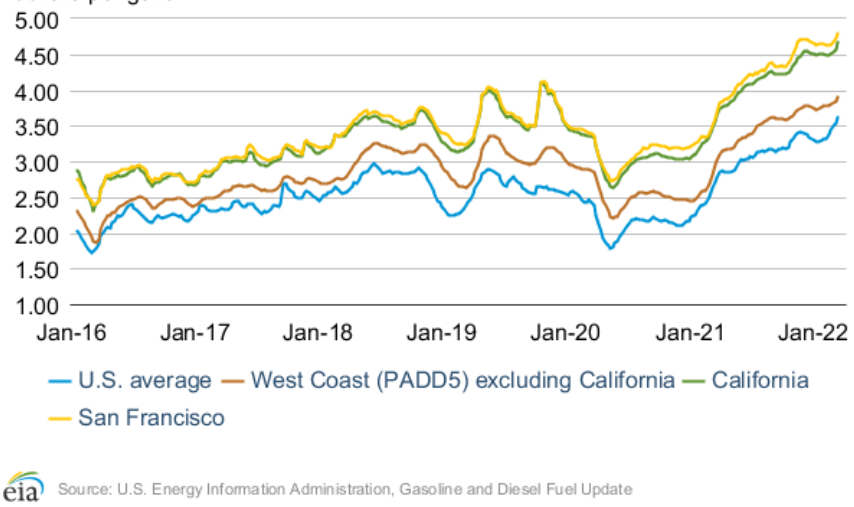


The front-month ULSD contract averaged higher in February than in any month since June 2008. The ULSD–Brent crack spread increased significantly on February 28 and the first three trading days of March because of the possibility of reduced distillate exports from Russia. After a particularly cold January in New England, the U.S. region that relies most heavily on heating oil, ULSD crack spreads began February at 62 cents/gal and reached as high as 67 cents/gal on February 3. Crack spreads decreased in the second half of February due in part to warmer

weather. We estimate that there were 295 (23%) fewer heating degree days in New England in February than in January, contributing to slightly lower consumption for distillate fuel in February than in January. However, our 4.3 million b/d estimate of distillate consumption for February is 0.3 million b/d (8%) higher than in February 2021. One reason for higher distillate demand from a year ago is congestion at U.S. ports leading to increased trucking demand, as shown by the American Trucker's Associations' Truck Tonnage Index. This index measures freight tonnage transported by trucks, which increased 1.2% year-over-year in January 2022. Consistently high demand has resulted in low distillate stocks. We estimate that United States distillate fuel oil stocks totaled 118.4 million barrels in February, the lowest level since May 2018, and 17% lower than the five-year February average. We forecast distillate stocks to begin increasing in May 2022.

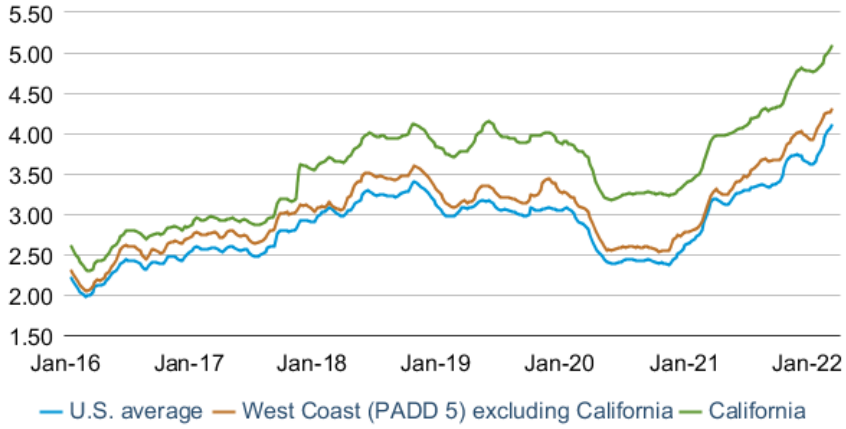
East Coast distillate fuel oil imports: Distillate imports into the U.S. East Coast (PADD 1) have recently been increasing, likely due to a combination of lower prices abroad, high demand in the United States, and low domestic stocks. According to our *Weekly Petroleum Status Report*, the four-week average of distillate imports increased every week from January 7 through February 25, and the four-week average of distillate imports to the East Coast was 393,000 b/d as of February 25 **(Figure 9)**. If confirmed in monthly data, this would be the most East Coast distillate imports for the month of February since 2004, likely because of high heating oil demand.

Figure 9. Four-week average of U.S. East Coast distillate fuel oil imports



West Coast retail fuel prices: On February 28, the average U.S. regular-grade retail gasoline price was $3.61/gal, the highest price (in nominal terms, meaning not adjusted for inflation) since July 2014 **(Figure 10)**. Over the past two years, the average U.S. gasoline price increased by $1.84/gal (103%) from the pandemic low of $1.77/gal on April 27, 2020. In California, a market with higher and more variable prices than other states, prices have increased more than in any other state. The average California price has increased by $2.04/gal (77%) from the pandemic low of $2.64/gal to average $4.67/gal as of February 28, the highest nominal price according to

data going back to 2000. San Francisco's average price of $4.80/gal is the highest price in city-level data and the highest nominal price on record for any city in data going back to 2000.



Crude oil prices are the most important factor in determining gasoline prices, making up 56% of the total cost to produce a gallon of gasoline in January 2022. In addition, refinery closures could be contributing to higher prices in the West as suppliers rely more on imports and structurally different supply sources. We forecast West Coast gasoline prices to continue to increase through May as higher crude oil prices increase the cost to produce gasoline.

Figure 10. Nominal U.S. and West Coast weekly regular retail gasoline prices

The nominal average retail price for on-highway diesel in the United States exceeded $4.00/gal on February 14 for the first time since March 17, 2014, and was $4.10/gal on February 28 **(Figure 11)**. Crude oil prices are the primary driver of U.S. retail diesel prices, making up 51% of the total cost to produce a gallon of diesel in January 2022. On the West Coast (PADD 5), excluding California, the average retail diesel price was $4.30/gal on February 28. In California, the average retail diesel price was $5.08/gal on February 28, which when adjusting for inflation is the highest retail diesel price in California since September 2013.

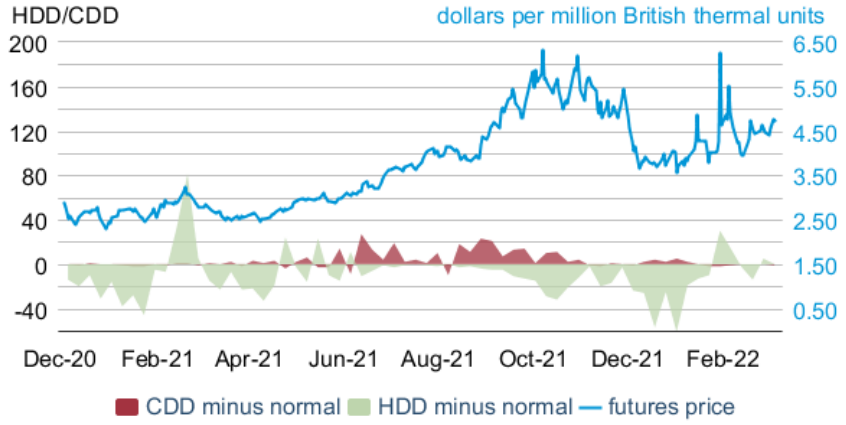
Natural Gas

Prices: The front-month natural gas futures contract for delivery at the Henry Hub was $4.72 per million British thermal units (MMBtu) on March 3, 2022, which was down 3 cents from February 1, 2022 **(Figure 12)**. The average closing price for front-month natural gas futures prices in February was $4.46/MMBtu, the highest February monthly average in real terms since February 2014.

Figure 12. U.S. natural gas front-month futures prices and current storage deviation from five-year average



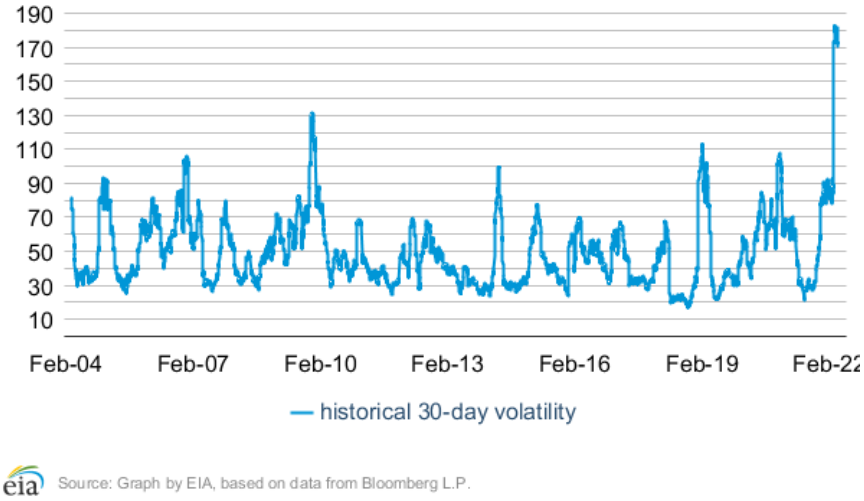
Source: Graph by EIA, based on data from CME Group, as compiled by Bloomberg L.P.

Natural gas storage withdrawals outpaced the five-year (2017−2021) average at the beginning of February. Colder-than-normal weather during the second half of January and early February contributed to higher-than-average consumption of natural gas used for space heating in the residential and commercial sectors, resulting in increased natural gas storage withdrawals.

Weekly storage withdrawals for the Lower 48 states during most of January and early February (weeks ending January 14 to February 11) each totaled at least 190 billion cubic feet (Bcf), compared with a five-year average range of 150 Bcf–167 Bcf for those same weeks. As a result, total inventories fell to 12% below the five-year average as of February 11.

Despite the colder-than-normal temperatures in early February, the weather across the country was near the 10-year average for the entire month. For February, heating degree days (HDDs) totaled 696, which is 1% fewer than the 10-year average **(Figure 13)**. The cold start to February followed by warmer-than-normal weather for the rest of the month contributed to storage inventories ending February at 1,626 Bcf, or 13% below the five-year average.

Figure 13. Natural gas front-month futures prices and actual minus historical average HDD and CDD



Sources: CME Group and National Oceanic and Atmospheric Administration, as compiled by Bloomberg L.P.
Note: HDD=heating degree days, CDD=cooling degree days.

Warmer weather on average in February compared with January contributed to a decrease in natural gas consumption in the residential and commercial sectors, which averaged an estimated combined 45.5 billion cubic feet per day (Bcf/d) in February, down 4.1 Bcf/d (8%) from January. Natural gas consumption in the electric power sector was also down in February, averaging 28.4 Bcf/d, or 2.3 Bcf/d (7%) less than in January. Despite the decrease in natural gas consumption compared with January, natural gas futures prices increased in February and remained above $4/MMBtu. Prices were supported by below-average inventories and by high demand for U.S. liquefied natural gas (LNG) exports – a result of high international prices. We estimate U.S. LNG exports were 10.9 Bcf/d in February, down 0.3 Bcf/d from January and up 3.5 Bcf/d from February 2021. We forecast U.S. LNG exports to increase to 13.0 Bcf/d by the end of 2022 and average 12.1 Bcf/d in 2023.

Historical volatility: Volatility of U.S. natural gas futures prices has risen during the past seven months, reaching record-high levels in February **(Figure 14)**. Historical volatility measures the magnitude of daily changes in the closing price for a commodity during a specific time in the past. Based on rolling front-month contracts, the 30-day historical volatility of the U.S. natural

gas futures price was 179.1% for February, almost doubling from January. The previous record natural gas price volatility for any month was October 2009, when the historical volatility averaged 123.8%. The historical volatility of the natural gas futures price at the Henry Hub in February has corresponded with volatility at international pricing hubs in Europe and Asia. Daily front-month natural gas futures prices ranged from a monthly intraday high of $5.57/MMBtu on February 2 to a low of $3.88/MMBtu on February 11.

eia Source: Graph by EIA, based on data from Bloomberg L.P.

Notable forecast changes

- We forecast the Brent crude oil spot price will average $105/b in 2022, which is $22/b more than we forecast in the February STEO. The higher price forecast partly reflects the uncertainties about disruptions to supply and additional sanctions related to Russia's further invasion of Ukraine. It also reflects a reduction in our forecast of OECD inventories throughout the forecast. The increase in crude oil prices in the forecast also results in higher prices for gasoline and diesel fuel in 2022 compared with last month's forecast.

- We forecast U.S. crude oil production to average 13.0 million b/d in 2023, 0.4 million b/d more than in last month's forecast. The higher production forecast is the result of higher forecast crude oil prices.

- Our forecast for Russia's liquid fuels production averages 10.8 million b/d in both 2022 and 2023, which is unchanged from 2021, but 0.7 million b/d and 1.1 million b/d lower, respectively, than we forecast in the February STEO.

- We forecast global oil inventories will rise by 0.4 million b/d in both 2022 and 2023. Our current expectation for 2022 inventory builds are 0.4 million b/d less than forecast last month and builds for 2023 are 0.6 million b/d less.
- For more information, see the detailed table of forecast changes.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on March 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on March 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on March 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 3c. OPEC Crude Oil (excluding condensates) Production (million barrels per day)

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on March 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on March 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

Notes: EIA completed modeling and analysis for this report on March 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on March 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on March 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.91**	**1.92**	**2.03**	**2.05**	*1.80*	*1.74*	*1.58*	*1.58*	*1.59*	*1.61*	*1.60*	*1.59*	**1.98**	*1.67*	*1.60*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on March 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on March 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on March 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 7c. U.S. Regional Retail Electricity Prices (Cents per Kilowatthour)

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on March 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on March 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on March 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distrib

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Subtotals for the industrial and commercial sectors might not equal the sum of the components. The subtotal for the industrial sector includes ethanol consumption that is not shown separately. The subtotal for the commercial sector includes ethanol and hydroelectric consumption that are not shown separately.

(f) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(g) Fuel ethanol and biodiesel, renewable diesel, and other biofuels consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on March 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum Supply*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on March 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.
Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

- = no data available

SAAR = Seasonally-adjusted annual rate

Notes: EIA completed modeling and analysis for this report on March 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on March 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Independent Statistics & Analysis
U.S. Energy Information Administration

April 2022

Short-Term Energy Outlook

Forecast highlights

Global liquid fuels

- The April *Short-Term Energy Outlook* (STEO) is subject to heightened levels of uncertainty resulting from a variety of factors, including Russia's further invasion of Ukraine. This STEO assumes U.S. GDP will grow by 3.4% in 2022 and by 3.1% in 2023, following growth of 5.7% in 2021. We use the S&P Global macroeconomic model to generate our U.S. economic assumptions. Global macroeconomic assumptions in our forecast are from Oxford Economics and include global GDP growth of 4.0% in 2022 and 3.7% in 2023, compared with growth of 6.0% in 2021. A wide range of potential macroeconomic outcomes could significantly affect energy markets during the forecast period. Energy supply uncertainty results from the conflict in Ukraine, the production decisions of OPEC+, and the rate at which U.S. oil and natural gas producers increase drilling.

- The Brent crude oil spot price averaged $117 per barrel (b) in March, a $20/b increase from February. Crude oil prices increased following the further invasion of Ukraine by Russia. Sanctions on Russia and other actions contributed to falling oil production in Russia and created significant market uncertainties about the potential for further oil supply disruptions. These events occurred against a backdrop of low oil inventories and persistent upward oil price pressures. Global oil inventory draws averaged 1.7 million barrels per day (b/d) from the third quarter of 2020 (3Q20) through the end of 2021. We estimate that commercial oil inventories in the OECD ended 1Q22 at 2.61 billion barrels, up slightly from February, which was the lowest level since April 2014.

- We expect the Brent price will average $108/b in 2Q22 and $102/b in the second half of 2022 (2H22). We expect the average price to fall to $93/b in 2023. However, this price forecast is highly uncertain. Actual price outcomes will depend on the degree to which existing sanctions imposed on Russia, any potential future sanctions, and independent corporate actions affect Russia's oil production or the sale of Russia's oil in the global market. In addition, the degree to which other oil producers respond to current oil prices, as well as the effects macroeconomic developments might have on global oil demand, will be important for oil price formation in the coming months. Although we reduced Russia's oil production in our forecast, we still expect that global oil inventories will build at an average rate of 0.5 million b/d from 2Q22 through the end of 2023, which we expect will put downward pressure on crude oil prices. However, if production

disruptions—in Russia or elsewhere—are more than we forecast, the resulting crude oil prices would be higher than our current forecast.

- We estimate that 98.3 million b/d of petroleum and liquid fuels was consumed globally in March 2022, an increase of 2.4 million b/d from March 2021. We forecast that global consumption of petroleum and liquid fuels will average 99.8 million b/d for all of 2022, which is a 2.4 million b/d increase from 2021. However, this forecast is down by 0.8 million b/d from last month's forecast as a result of downward revisions to global GDP growth from Oxford Economics. We forecast that global consumption of petroleum and liquid fuels will rise by 1.9 million b/d in 2023 to average 101.7 million b/d. The outlook for economic growth and oil consumption in Russia and surrounding countries continues to be highly uncertain.

- We are publishing the *Summer Fuels Outlook* as a supplement to this STEO. We expect U.S. prices for retail gasoline will average $3.84 per gallon (gal) this summer (April–September), which would be up from $3.06/gal last summer and the highest price (adjusted for inflation) since the summer of 2014. Retail diesel prices for the summer average $4.57/gal in the forecast, which would also be the highest inflation-adjusted price for the summer since 2014.

- U.S. crude oil production in the forecast averages 12.0 million b/d in 2022, up 0.8 million b/d from 2021. We forecast production to increase another 0.9 million b/d in 2023 to average almost 13.0 million b/d, surpassing the previous annual average record of 12.3 million b/d set in 2019.

Natural Gas

- In March, the Henry Hub natural gas spot price averaged $4.90 per million British thermal units (MMBtu), which was up from the February average of $4.69/MMBtu, as inventory withdrawals slightly outpaced the five-year (2017–2021) average. We expect liquefied natural gas (LNG) exports will increase from March levels, contributing to a Henry Hub price of $5.95/MMBtu for April. We expect the Henry Hub price will average $5.68/MMBtu in 2Q22 and $5.23/MMBtu for all of 2022. We expect the Henry Hub spot price will average $4.01/MMBtu in 2023. The forecast drop in prices for 2023 reflects our expectation that storage levels will be higher during 2023 than in 2022.

- We estimate that natural gas inventories ended March at 1.4 trillion cubic feet (Tcf), which is 17% below the five-year (2017−2021) average. Inventory withdrawals in March were 203 billion cubic feet (Bcf), resulting from relatively flat production and rising natural gas exports. We expect natural gas inventories to increase by 245 Bcf in April, as the injection season begins, ending the month at about almost 1.7 Tcf, which would be 14% below the five-year average for this time of year. We forecast that natural gas

inventories will end the 2022 injection season (end of October) at 3.5 Tcf, which is 4% below the five-year average.

- In March, U.S. LNG exports averaged 11.9 billion cubic feet per day (Bcf/d), an increase of 0.7 Bcf/d from February. LNG prices in Europe remain high amid supply uncertainties due to Russia's further invasion of Ukraine and the need to replenish Europe's natural gas inventories, which has kept Europe's demand for LNG elevated. Inventories in Europe were 26% full as of March 31, compared with the five-year average of 34%. We expect high levels of U.S. LNG exports to continue in 2022, averaging 12.2 Bcf/d for the year, a 25% increase from 2021.

- We expect that U.S. consumption of natural gas will average 84.1 Bcf/d in 2022, up 1% from 2021. The increase in U.S. natural gas consumption is a result of colder forecast temperatures in 2022 compared with 2021, which results in more consumption in the residential and commercial sectors. In addition, we expect the industrial sector to consume more natural gas in 2022 in response to expanding economic activity. We expect U.S. natural gas consumption will average 84.7 Bcf/d in 2023.

- We estimate dry natural gas production averaged 96.2 Bcf/d in the United States in March, up 1.2 Bcf/d from February. Similar to January and February, production in March was lower than in December because of brief periods of freezing temperatures in certain production regions and, in part, because of maintenance, according to public sources. We forecast dry natural gas production to average 96.9 Bcf/d in April. For all of 2022, we expect that dry natural gas production will average 97.4 Bcf/d, which would be 3.8 Bcf/d more than in 2021. We expect dry natural gas production to average of 100.9 Bcf/d in 2023.

Electricity, coal, renewables, and emissions

- We forecast that the annual share of U.S. electricity generation from renewable energy sources will rise from 20% in 2021, to 22% in 2022, and to 23% in 2023, as a result of continuing increases in solar and wind generating capacity. This increase in renewable generation leads to a decline in natural gas generation, which falls from a 37% share in 2021 to 35% in both 2022 and 2023. Natural gas generation falls in the forecast even though we expect the cost of natural gas for power generation to fall from an average of $5.85/MMBtu in 2Q22 to an annual average of $4.21/MMBtu in 2023. Although new natural gas-fired power generating units are scheduled to come online in 2022, they are likely to be run at lower utilization rates than in recent years. Increasing renewable generation also contributes to our forecast that the share of generation from coal will fall from 23% in both 2021 and 2022 to 21% by 2023. A major contributor to coal's declining generation share next year will be the retirement of coal-fired generating capacity during 2022. Nuclear generation remains relatively constant in the forecast at an average share of 20%. Although one nuclear reactor will be retired during 2022, that

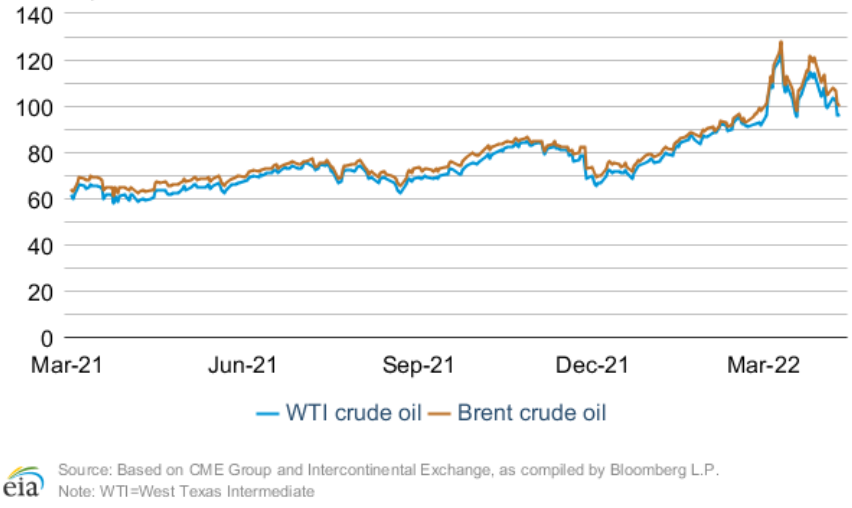
loss will be offset by the opening of one new 1.1 GW reactor late in 2022, which will be the first new nuclear reactor to open in the United States since 2016.

- Planned additions to U.S. wind and solar capacity in 2022 and 2023 increase electricity generation from those sources in our forecast. We estimate that the U.S. electric power sector added 14 gigawatts (GW) of new wind capacity in 2021. We expect 10 GW of new wind capacity will come online in 2022 and 4 GW in 2023. Utility-scale solar capacity rose by 13 GW in 2021. Our forecast for added utility-scale solar capacity is 20 GW for 2022 and 24 GW for 2023. We expect solar additions to account for nearly half of new electric generating capacity in 2022. In addition, in 2021 small-scale solar increased by 5 GW to a total of 33 GW. We expect small-scale solar capacity (systems less than 1 megawatt) will grow by 4 GW in 2022 and by almost 6 GW in 2023.

- U.S. coal production in the forecast increases by 43 million short tons (MMst) (7%) in 2022 to 621 MMst and increases by 12 MMSt (2%) in 2023. We expect production in the Western region to drive the increases. Additional coal production will help refill electric sector inventories that were depleted during 2021.

- We expect U.S. coal consumption to increase by 14 MMst in 2022 and then decrease by 32 MMst in 2023 due to natural gas prices that are currently high, but which we expect will decline through the forecast. We expect coke plant consumption to fall by 10% in 2022 but increase next year back to 2021 levels.

- Coal exports in our forecast total 89 MMst in 2022, up 4% from 2021. We assume international prices will continue to drive increasing U.S. coal exports as the conflict in Ukraine creates the potential to disrupt supplies from Russia. However, exports to Asia, and particularly China, which supported U.S. coal exports in 2021 have slowed in 1Q22. We also assume transportation and terminal capacity constraints will limit exports in the forecast.



- U.S. energy-related carbon dioxide (CO_2) emissions increased by more than 6% in 2021 as economic activity increased and contributed to rising energy use. We expect a 2% increase in energy-related CO_2 emissions in 2022, primarily from growing transportation-related petroleum consumption. Forecast energy-related CO_2 emissions remain almost unchanged in 2023. We expect petroleum emissions to increase by 4% in 2022 compared with 2021, though this growth rate slows to less than 1% in 2023. Natural gas emissions are relatively flat in 2022 and then increase by 2% in our forecast for 2023. We forecast that coal-related CO_2 emissions will grow by 3% in 2022 and then fall 6% in 2023.

Petroleum and natural gas markets review

Crude oil

Prices: The front-month futures price for Brent crude oil settled at $100.58 per barrel (b) on April 7, 2022, a decrease of $4.39/b from the March 1, 2022, price of $104.97/b. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, decreased by $7.38/b during the same period, settling at $96.03/b on April 7 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices

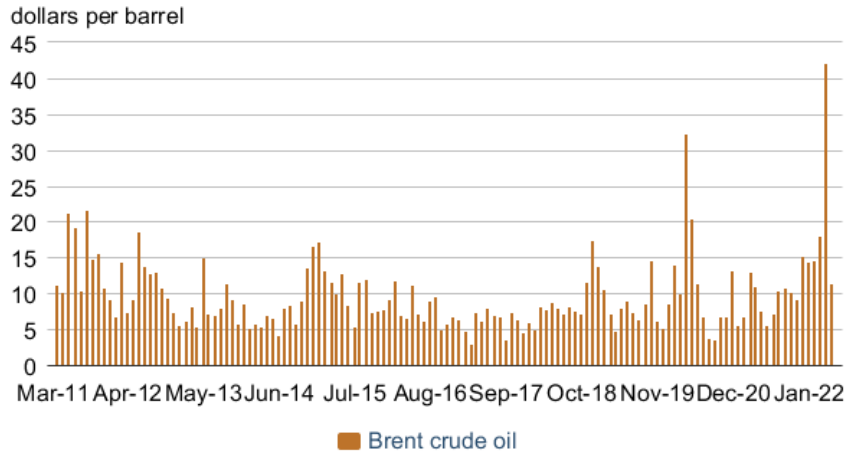
Source: Based on CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate

Crude oil prices in March were subject to a wide range of price pressures and sustained price volatility throughout most of the month. Russia's further invasion of Ukraine, which began on February 24—as well as trade disruptions, sanctions, and private sector divestments from doing business in Russia—continued to contribute to substantial uncertainty in petroleum markets during March. The conflict in Ukraine increased crude oil prices to over $100/b in late February, and the Brent crude oil price closed above $100/b for all but two trading days in March. On March 8, the United States government announced a ban on petroleum imports from Russia, further contributing to temporary price increases associated with trade displacement. In addition to western sanctions and the U.S. import ban, weather-related disruptions at Kazakhstan's Caspian Pipeline Consortium (CPC) terminal along Russia's Black Sea Coast, as well as a fire related to a Houthi missile attack at a Saudi Aramco oil storage and distribution facility in Jeddah, contributed to additional volatility and risk of supply disruptions. On March 31, the White House announced a release of 1 million barrels of crude oil per day for a period of six months from the U.S. Strategic Petroleum Reserve (SPR) to expand supply and ease pressure on prices. On April 7, the International Energy Agency (IEA) confirmed an additional coordinated release. These releases from strategic reserves have contributed to downward oil price pressure by offsetting market perceptions of the risk of supply disruptions.

In addition to substantial supply-side uncertainty in March, city-scale mobility restrictions in China related to surging cases of COVID-19 contributed to heightened demand-side risks and downward pressure on crude oil prices during the month. Reports of restrictions began in early March, notably in the Jilin province and major industrial city of Shenzhen. On March 28, restrictions were announced in Shanghai and were extended on an indefinite basis on April 4.

Although front-month oil futures prices in early April have fallen from their early March levels, monthly average crude oil prices in March increased substantially over February. The average Brent front-month futures price in March 2022 was $112/b, an increase of $18/b (20%) over February 2022 and $47/b (71%) over March 2021. The Brent crude oil price in March closed at a monthly high of $128/b on March 8, and WTI also closed at a high of almost $124/b on the same day.

We lowered our outlooks for both global oil production and consumption in this STEO compared with last month's forecast. Lower expected oil production is primarily driven by reduced expectations of petroleum production in Russia, while lower expected consumption reflects reduced expectations of economic growth and associated fuels demand, as well as the impact of present COVID-19 responses in China. Despite the lower forecast for oil consumption, we continue to expect consumption to increase going into the summer. We forecast that rising consumption, falling oil production in Russia, and the risk of supply outages amid low global inventory levels will support crude oil prices in the coming months. However, we expect the release of strategic reserves by the United States and the IEA will limit upward price pressures. We forecast the Brent crude oil price in the second quarter (2Q22) will average $108/b before decreasing to $104/b in the 3Q22 and $101/b in 4Q22. Although we forecast Russia's oil production will decline by 1.7 million b/d from February 2022 to the end of 2023, global oil production will nonetheless increase as a result of higher production elsewhere, mostly from the United States and OPEC. We forecast that increasing production will be sufficient to contribute to net global builds in total petroleum inventories in 2Q22, and we expect global inventory to continue to build on a quarterly basis through the end of 2023. Significant sources of uncertainty in our forecast include:



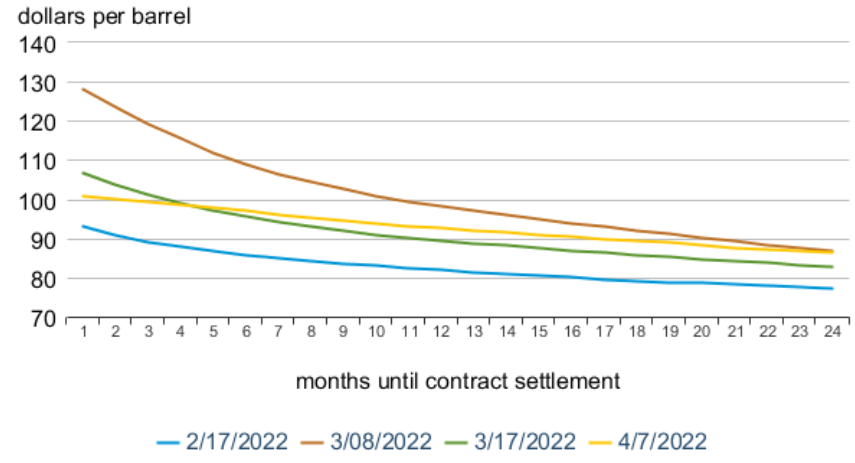
- Uncertainty related to geopolitical developments between Russia and Ukraine, the way in which existing sanctions on Russia will affect its oil production, and potential additional U.S. and EU sanctions on Russia
- The pace of oil demand growth in the summer
- The volume of new crude oil production at current price levels
- The potential for demand destruction because of high retail prices for petroleum products

Brent crude oil price trading range: The monthly price trading range for front-month Brent crude oil futures in March was $42/b, which was 38% of the monthly average price of $112/b

(Figure 2). This trading range is the widest since April 2020 in percentage terms, when the range averaged 77% of the monthly average price of $27/b. In March and April 2020, the market experienced significant price volatility from the initial effects of the COVID-19 pandemic. The wide price range is one measure of substantial volatility in the market, reflecting rapid changes in crude oil prices and heightened sensitivity to new market information. Several factors contributed to the wide swings in price within March, including:

- The competing pressures of trade displacement associated with sanctions on Russia and related divestments
- The impact of new mobility restrictions in China
- The announced SPR release
- Ongoing sources of uncertainty on future COVID-19 developments
- Additional geopolitical risks related to Iran and Libya

Figure 2. Monthly Brent crude oil price trading ranges



eia Source: Based on data from CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.

Brent futures strips: Energy market participants typically look at futures contracts in the form of futures strips to compare the price of crude oil over time. Crude oil futures strips show the sequential delivery of future contracts over a 24-month period. In the past six weeks, increased volatility in the Brent crude oil price has led to substantially different prices throughout the crude oil futures price strip **(Figure 3)**. On February 17, before the start of Russia's further invasion into Ukraine, the front-month Brent future price was $92.97/b, and the price for delivery two years in the future was trading below $80/b. By March 8, when prices reached their most recent peak, the front-month price was $127.98/b, and the price for crude oil delivery in August 2023 increased to $92.90/b. Backwardation, the condition in futures markets where

near-term prices are higher than longer-dated ones, increased to $30.90/b for the one-year ahead price spread between the front-month contracts and 13th-month contracts (1−13).

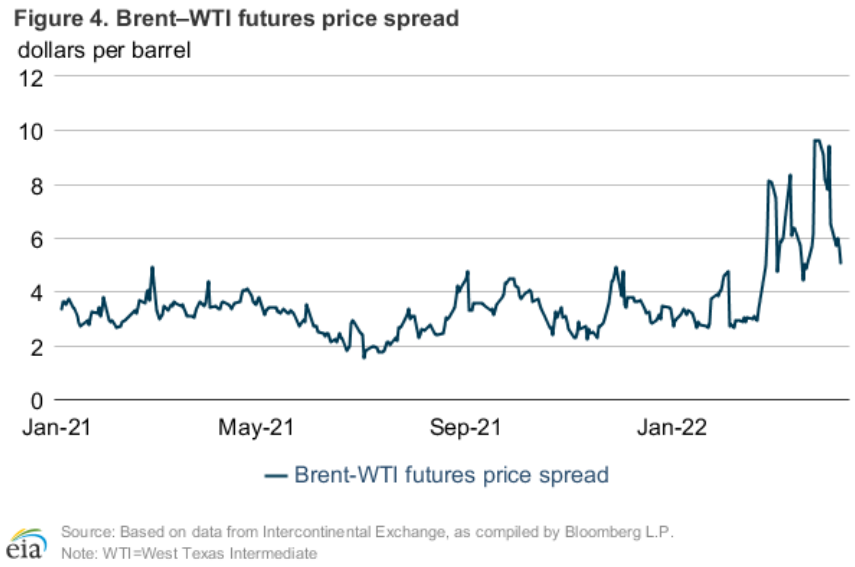


Figure 3. Brent crude oil futures price curves

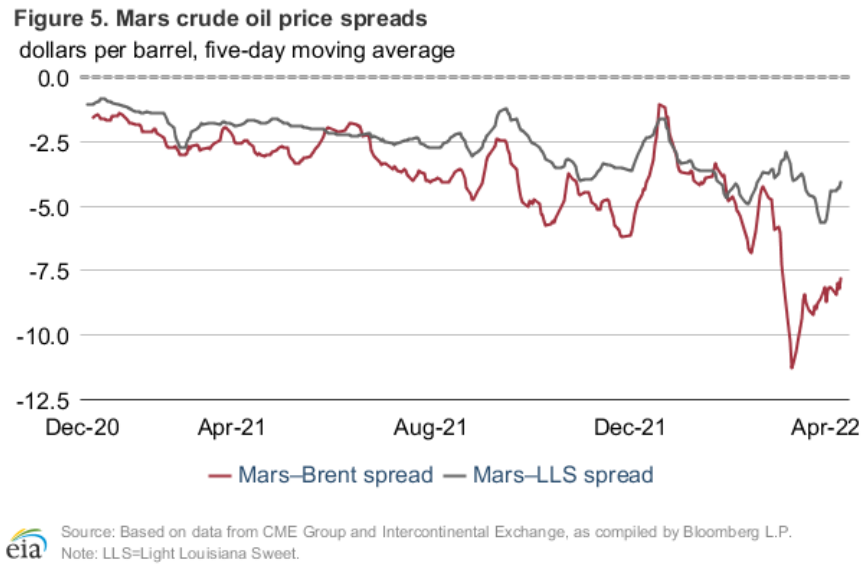
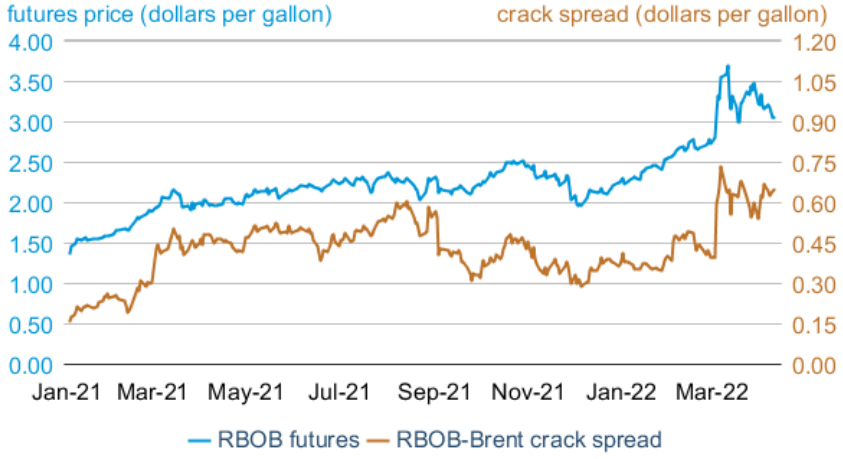


Source: Based on data from CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.

On April 7, backwardation decreased with the front-month price at $100.58/b and the 1–13 price spread at $8.54/b, less than the 1–13 spread on February 17 of $11.67/b. Although shorter-term contract prices have decreased, which may be related to the recently announced release of expanded crude oil supply from the SPR, longer-term futures prices remain elevated. Prices do not fall below $80/b for crude oil delivery through the next two years, indicating a tighter crude oil market in the long term. A higher price for long-dated Brent crude oil could be the result of market uncertainty around future Russian crude oil production and availability.

Crude oil price differentials: Sharp widening in the differentials between Brent crude oil and WTI crude oil likely reflects the effects of current market risks and disruptions from European markets compared with markets in the Western Hemisphere. This regional price spread is reflected in both spot market and front-month futures prices. After increasing sharply in late February, the front-month futures spread between Brent and WTI increased to a monthly average of $6.83/b in March; its highest point since June 2019 **(Figure 4)**. As of April 7, the spread was $5.07/b. We forecast the Brent-WTI spot price spread will average $6.00/b in April and May before declining to $5.50/b by July 2022. Brent crude oil and WTI crude oil are both light, sweet crude oil grades, meaning they have low sulfur contents and relatively high API gravity.

The impacts of recent market uncertainty have also affected the spread between Brent crude oil and other North American grades. The price differentials between the Mars crude oil spot price and the Brent spot price continued to widen in March 2022 **(Figure 5)**. Mars is a medium, sour crude oil grade with an API gravity of 28.0 and a sulfur content of 1.93%, in contrast to Brent with an API gravity of 37.9 and a sulfur content of 0.45%. Medium and heavy grades, as well as sour grades, typically sell at a discount to light, sweet grades because they require more complex refining units to produce profitable yields of higher quality refined products such as gasoline or distillate fuel oil. However, the relative value of this discount varies according to market conditions and can reflect relative scarcity of certain grades. In addition to the difference in crude oil quality, the Mars-Brent differential also reflects geographic disparities, similar to the Brent-WTI differential. The Mars-Brent spread averaged -$8.98/b in March, and the five-day moving average was -$7.83/b on April 7.



Unlike Brent, the Light Louisiana Sweet (LLS) benchmark is priced at the U.S. Gulf Coast, but similar to Brent and WTI, it is a light, sweet crude oil. The Mars-LLS spread averaged -$4.32/b in March, and the five-day moving average was -$4.11/b on April 7. The wide Mars-LLS spread reflects an increasing price premium for LLS based on its crude oil quality over Mars because both grades are priced at the U.S. Gulf Coast spot market and reflect market conditions for U.S. Gulf Coast refiners. Although not as wide as the Mars-Brent spread, the wide Mars-LLS differential suggests an increasing premium on light, sweet crude oil grades, or conversely, an increasing discount on medium, sour crude oil grades.

Mars is a U.S. benchmark grade but is also relatively similar in terms of quality to Russia's Urals grade, another medium, sour crude oil. Urals is the most exported Russian crude oil grade and has been subject to the most disruption in response to the sanctions levied on Russia. As Russia's crude oil production and exports decrease, it may contribute to rising medium, sour crude oil prices as volumes of Urals are taken off the market. However, the current width in the Mars-LLS spread suggests that a reduction in Russia's exports to the global market may not be currently reflected in the crude oil quality price spread at the U.S. Gulf Coast. One potential explanation may be that because Urals is forced to sell at a substantial discount to global benchmarks, the Urals discount may be putting downward pressure on other global medium, sour crude oil prices. As many buyers distance themselves from Russian purchases, buyers are still willing and able to buy discounted Urals, while non-Russian medium, sour crude oil grades may be experiencing some pressure on prices to remain competitive with Urals in certain markets. Alternatively, the widening Mars-LLS differential may not yet reflect reduced global supplies of medium, sour crude oil because of the distance from European markets or general market volatility.

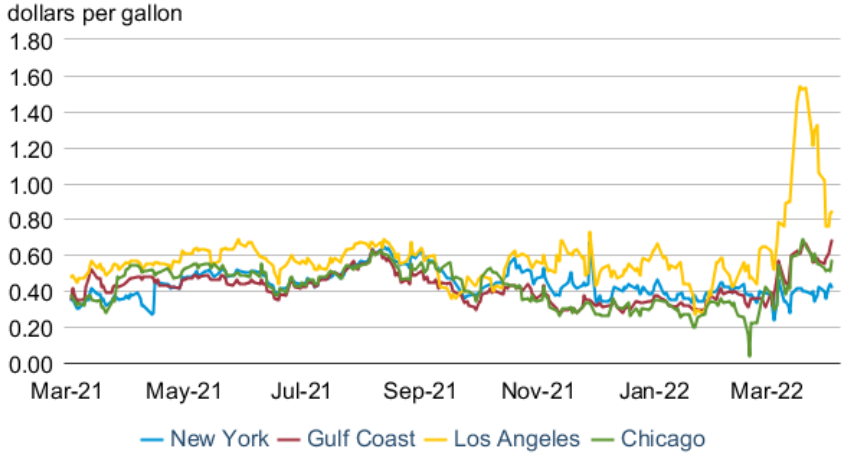
Petroleum products

Gasoline prices: The front-month futures price of RBOB (the petroleum component of gasoline used in many parts of the country) settled at $3.04 per gallon (gal) on April 7, down 5 cents/gal from March 1 **(Figure 6)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) settled at 65 cents/gal on April 7, up 6 cents/gal during the same period. The average RBOB–Brent crack spread in March was 62 cents/gal, 17 cents/gal higher than February.

Figure 6. Historical RBOB front-month futures prices and crack spreads

Source: Based on data from CME Group, as compiled by Bloomberg L.P.
Note: RBOB is the petroleum component of gasoline used in many parts of the country.

Increases in RBOB prices and the crack spread reflect rapidly increasing crude oil prices and reduced Russian petroleum products trade in the international market. Prices and crack spreads also increased as a result of the seasonal shift to producing more expensive summer-grade gasoline. Over a five-day period from February 28 to March 4, the crack spread increased by 34 cents/gal and closed on March 4 at 73 cents/gal. Since March 4, the crack spread has not fallen below 54 cents/gal. On March 8, RBOB prices settled at $3.68/gal. The average RBOB price in March was $3.30/gal.



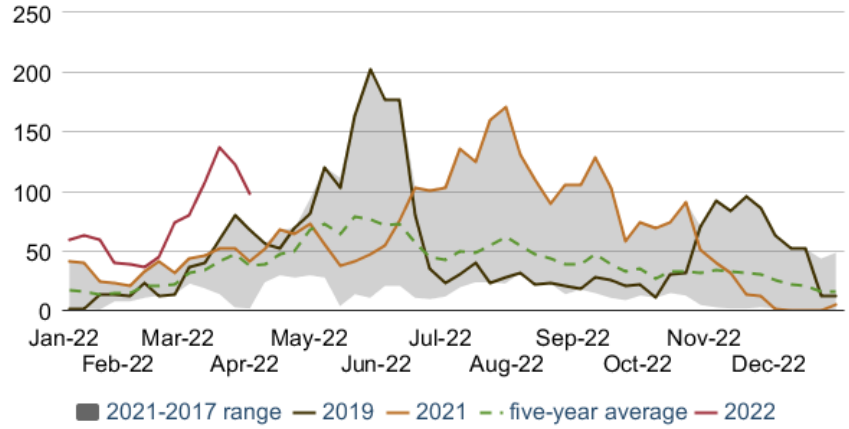
We estimate U.S. gasoline consumption averaged 8.6 million barrels a day (b/d) in March, which is 0.7 million b/d (7%) lower than the 2015–19 average and slightly higher than in March 2021. We expect vehicle miles traveled to increase by 1 billion miles per day (12%) between March and July as the summer travel season begins. We estimate gasoline inventories decreased by 7.8 million barrels in March and were 2.6% below the five-year (2017–2021) average. However, expected production increases in response to higher crack spreads suggest U.S. inventories will increase above the five-year average by June and remain above average for the rest of 2022.

West Coast gasoline spot market: Products in the West Coast gasoline spot market typically sell at a premium to those in other parts of the country because the region is relatively isolated from other refining centers in the United States and more expensive gasoline specifications in

California narrow supply options. However, West Coast premiums in March rose to the highest levels on a real basis since mid-2015, as reduced refinery capacity, unplanned refinery and other infrastructure outages, and higher than normal volatility in market prices constrained an already tight market for gasoline. Planned refinery outages typically do not drive large price increases. Refineries prepare ahead of outages to ensure adequate inventories and alternative sources of supplies are available. However, unplanned refinery outages can result in large price increases, especially when they occur at the same time as planned outages in a tightly balanced market.

Recent planned outages include turnaround activity at Marathon's 382,000-b/d Los Angeles refinery and Valero's 93,000-b/d Wilmington refinery, which extended its maintenance schedule after unplanned flaring on March 26. Unplanned outages this month include Kinder Morgan's SFPP pipeline entering unplanned maintenance on March 4 due to a petroleum product release at its Watson facility in Long Beach, PBF's 166,200-b/d Torrance refinery beginning unplanned maintenance on March 6 that has continued to disrupt operations as of April 5, and Valero's 149,000-b/d Benicia refinery experiencing mechanical issues on March 10. With West Coast gasoline inventories below average since the beginning of the year, an increasingly tight market pushed the Los Angeles CARBOB-Brent crack spread to $1.53/gal on March 18, a $1.12/gal premium over the New York Harbor spot crack spread **(Figure 7)**.

Figure 7. Spot market gasoline crack spread



eia Source: Based on data from CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.

Refinery closures in the West may be contributing to low refinery output of gasoline and resulting low inventories, which contributes to higher prices. Another consequence of these refinery closures, particularly during unplanned refinery outages, is more gasoline imports into the West Coast. From mid-2020, refinery capacity in the West Coast has declined by about 200,000 b/d (7.5%). Since the beginning of the year, data from our *Weekly Petroleum Status Report* shows West Coast gasoline imports have been higher than the five-year range maximum for this time of year, reaching a four-week average of 137,000 b/d in the week ending March 18 **(Figure 8)**. In previous years, imports have generally been low except for similar periods of

market tightness, such as during several refinery outages in mid-2019. Total gasoline imports into the West Coast began increasing in 2021, reaching high levels even in the absence of significant unplanned outages, such as in the summer of 2021. This trend suggests the region may need more imports to offset the loss of supplies from reduced refining capacity. According to trade press reports, arrivals of gasoline and alkylate (a gasoline blending stock needed to produce Los Angeles CARBOB specification fuel) helped spur a drop in the Los Angeles spot market gasoline crack spread in the second half of March.

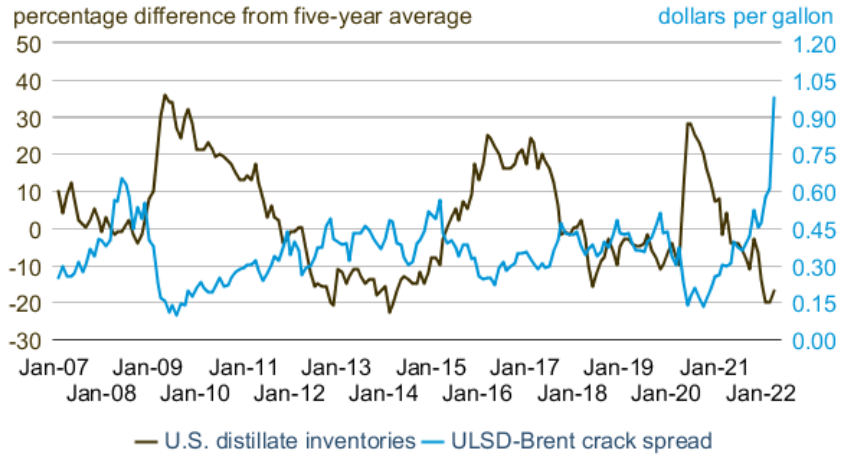
Ultra-low sulfur diesel prices: The front-month futures price for ultra-low sulfur diesel (ULSD) for delivery in New York Harbor settled at $3.27/gal on April 7, a 12 cent/gal increase from March 1 **(Figure 9)**. The ULSD-Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) increased 22 cents/gal during the same period and settled at 87 cents/gal on April 7.

Figure 9. Historical ULSD front-month futures prices and crack spreads



Source: Based on data from CME Group, as compiled by Bloomberg L.P.
Note: ULSD=ultra-low sulfur diesel

Low inventories and high consumption globally contributed to the increasing ULSD-Brent crack spread in March. The ULSD-Brent crack spread reached as high as $1.39/gal on March 8 and averaged 97 cents/gal for the month, which—even when adjusted for inflation—is the highest monthly average crack spread in our data going back to July 1988. Our 4.0 million b/d estimate for distillate fuel oil consumption in March was 3% lower than the five-year average. Additionally, our March distillate production estimate of 5.0 million b/d was the highest since April 2020 and contributed to the first distillate inventory build since October 2021.

U.S. distillate inventories in March were 17% below their five-year March average **(Figure 10)**. As distillate inventories have come down from their June 2020 peak, ULSD-Brent crack spreads have been increasing. The more recent increase in the ULSD-Brent crack spread has been due to the possibility of reduced distillate exports from Russia, adding to the already short global supply. We estimate U.S. distillate production in March increased by 0.4 million b/d (8%), contributing to a slight inventory build, and we forecast inventories to generally increase throughout 2022.

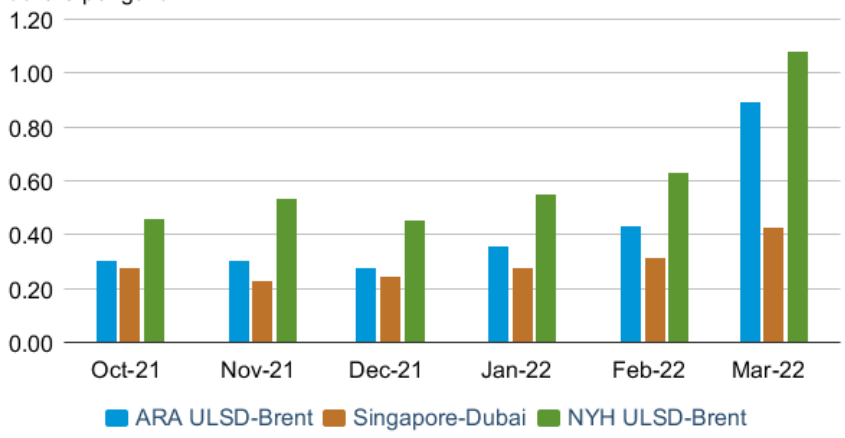


Figure 10. U.S. distillate inventories and ULSD-Brent crack spread

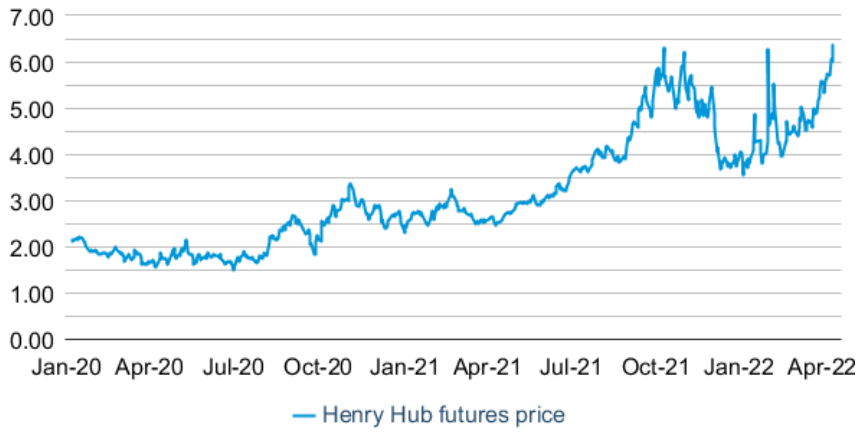
eia Source: Based on data from CME Group, as compiled by Bloomberg, L.P.

Low distillate inventories across the globe have been causing high spot distillate crack spreads at the major global trading hubs in Amsterdam, Rotterdam, and Antwerp (ARA); Singapore; and New York Harbor (NYH). In March, the ARA ULSD-Brent crack spread averaged 90 cents/gal, the Singapore-Dubai crack spread averaged 43 cents/gal, and the NYH ULSD-Brent crack spread averaged $1.08/gal **(Figure 11)**. Although distillate crack spreads have been increasing across the globe, they increased more at the ARA and NYH trading hubs in March, likely because of bans on petroleum imports from Russia into the United States and parts of Europe. The distillate crack spread increased by less at the Singapore hub because changes in Russia's oil trading patterns may have had less of an effect in the East of Suez market, a region that primarily exports diesel. Nevertheless, the Singapore crack spread has increased 15 cents/gal since October 2021. Distillate inventories are at more-than-five-year lows for the month of March at all three trading hubs.

Figure 11. International ULSD crack spreads



eia Source: Based on data from CME Group, as compiled by Bloomberg L.P.
Note: ARA=Amsterdam, Rotterdam, and Antwerp; ULSD=ultra-low sulfur diesel; NYH=New York Harbor

Natural Gas

Prices: The front-month natural gas futures contract for delivery at the Henry Hub settled at $6.36 per million British thermal units (MMBtu) on April 7, 2022, which was up $1.79/MMBtu from March 1, 2022 **(Figure 12)**. The average closing price for front-month natural gas futures prices in March was $4.98/MMBtu, the highest March monthly average in real terms since 2014.

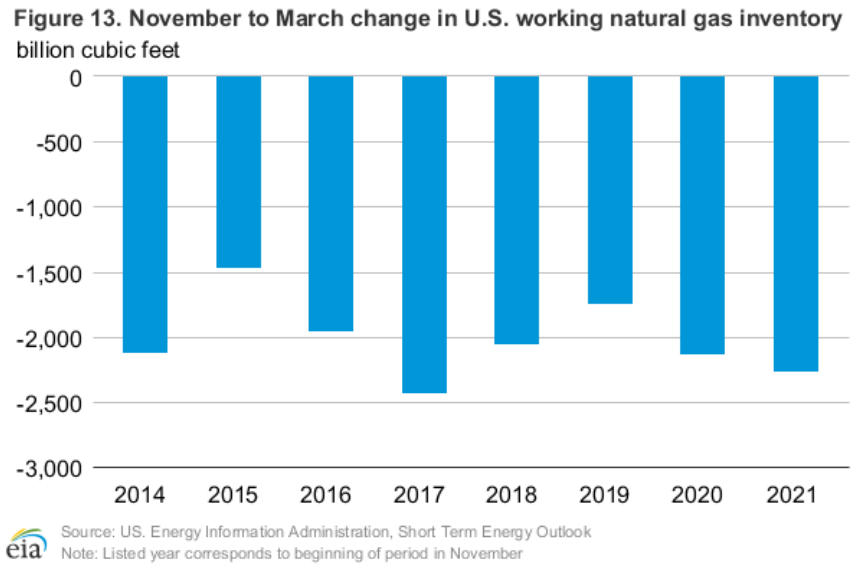


Figure 12. Historical nominal front-month U.S. natural gas prices

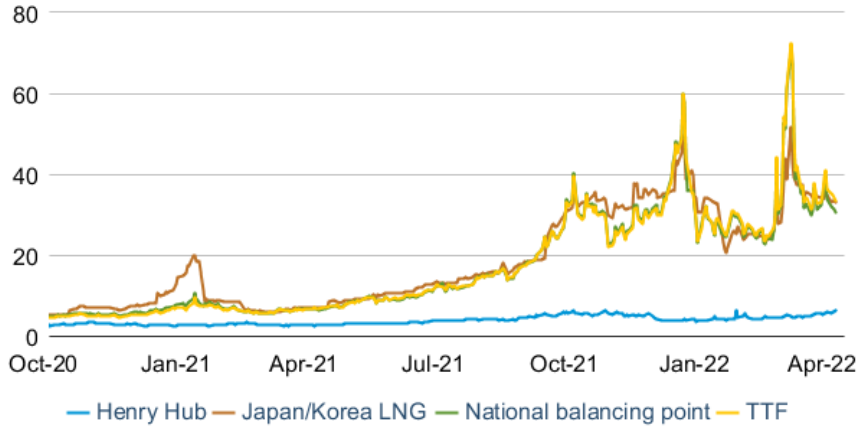
eia Source: Based on data from CME Group, as compiled by Bloomberg L.P.

The front-month natural gas futures contract price rose above $5.00/MMBtu in the second half of March and climbed above $6.00/MMBtu in early April amid high demand in the residential, commercial, and electric power sectors, along with high levels of U.S. liquefied natural gas (LNG) exports. In addition, storage inventories below the five-year (2017–2021) average coupled with only modest increases in production both contributed to upward pressure on natural gas futures prices. Natural gas consumption in the residential and commercial sectors was 31.1 billion cubic feet per day (Bcf/d) in March, which is 1.4 Bcf/d higher than March last year. Natural gas consumption in the electric power sector averaged 25.8 Bcf/d, up 1.5 Bcf/d from March last year. U.S. LNG export levels set another record high in March of 11.9 Bcf/d, which is 1.5 Bcf/d higher than March last year and 2.1 Bcf/d higher than the annual average last year, as facilities continue to operate at high utilization rates and new capacity comes online.

In STEO, we estimate storage inventories remained below the five-year average in March, finishing the month at 1.4 trillion cubic feet (Tcf), which is 17% lower than the five-year average for this time of year. U.S. dry natural gas production peaked in December 2021 at 97.3 Bcf/d, but then it declined to 94.9 Bcf/d in January, partially due to freeze-offs in key producing regions. Production has yet to return to its December level, averaging 96.2 Bcf/d in March.

We estimate natural gas storage inventories ended the withdrawal season (November–March) at 1.4 Tcf, which is almost 0.3 Tcf lower than the five-year average and 0.4 Tcf lower than last year at this time **(Figure 13)**. Despite weather near the 10-year average over the course of the winter, natural gas withdrawals during winter were the most since winter 2017–2018, and the second highest in the past eight years. Consumption of natural gas in the residential and commercial sectors was about the same as last year, averaging 37.3 Bcf/d from November–March. However, natural gas consumption in the electric power sector averaged 28.8 Bcf/d, which was 1.9 Bcf/d higher than last winter. The increase in natural gas consumption in the electric power sector in recent months is partly the result of reductions in coal-fired electricity-generating capacity and ongoing constraints in the coal market, which make coal-to-natural gas fuel switching less sensitive to rising natural gas prices than they have been in recent years.



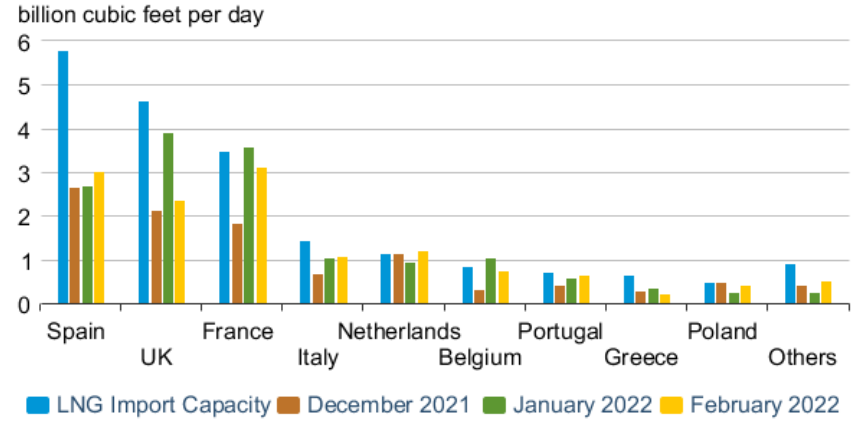
U.S. LNG exports have been at record-high levels since December 2021 and set another all-time record in March 2022. According to our estimates, LNG exports averaged 11.9 Bcf/d—an increase of 0.5 Bcf/d compared with the previous peak set in January (11.4 Bcf/d) and 0.7 Bcf/d higher than exports in February. The incremental increase in exports compared with prior months came from ramping up LNG production at a new U.S. LNG export facility, Calcasieu Pass LNG. The first LNG cargo from Calcasieu Pass was exported on March 1. During March 2022, Calcasieu Pass exported five LNG cargoes totaling 0.6 Bcf/d. We expect Calcasieu Pass to achieve its full LNG production capacity of 1.3 Bcf/d baseload (1.6 Bcf/d peak) by the third quarter of this year.

International natural gas prices: Most U.S. LNG exports since December 2021 have been shipped to countries in Europe, driven by high natural gas prices in Europe **(Figure 14)**. From January through November 2021, the United States shipped 49% of its LNG to countries in Asia, 27% to European Union (EU) countries and the United Kingdom, and 24% to other countries. However, from December 2021 through February 2022, 57% of U.S. LNG exports went to EU

countries and the United Kingdom, averaging 5.6 Bcf/d in December, 7.0 Bcf/d in January, and 6.6 Bcf/d in February.

Figure 14. International natural gas prices

dollars per million British thermal units



Source: Based on data from CME Group, as compiled by Bloomberg L.P.
Note: TTF=Title Transfer Facility

LNG swap prices in Europe remain high because of Europe's increased demand for LNG amid supply uncertainties due to Russia's further invasion of Ukraine. Europe's LNG imports will remain high to replenish natural gas inventories, which were 26% full as of March 31, 2022, compared with the five-year average of 34% and last year's level of 30% full.

Currently, 15 EU countries and the United Kingdom import LNG. Eleven of these countries account for 99% of Europe's total LNG imports and import capacity. Utilization of LNG import capacity across these 11 countries was relatively high this winter, averaging 66% compared with 39% last winter. Regionally, the European natural gas pipeline grid is not fully integrated between its northern and southern parts. Some countries, such as Belgium and the Netherlands, act as transit countries, delivering natural gas to other parts of Northwest Europe. Other countries in Southern Europe, including Spain, Portugal, Italy, and Greece, have limited pipeline interconnectivity and, therefore, use LNG imports primarily for domestic consumption. Belgium, the Netherlands, and France averaged utilization of 88% this winter, while Spain, Portugal, Italy, and Greece averaged 58% **(Figure 15)**.

Note: 'Others' include Lithuania, Croatia, Sweden, Finland, Malta, Gibraltar, and Norway

Notable forecast changes

- We forecast production of crude oil and other liquids in Russia will average 10.1 million b/d from 2Q22 through 4Q22, which would be down from 11.3 million b/d in 1Q22 and 0.6 million b/d less than we forecast in the March STEO. We forecast Russia's production will average 9.8 million b/d in 2023, which is 1.0 million b/d lower than we forecast in the March STEO. The lower forecast reflects our assumption that sanctions and independent corporate actions will limit crude oil production in Russia more than we expected last month.

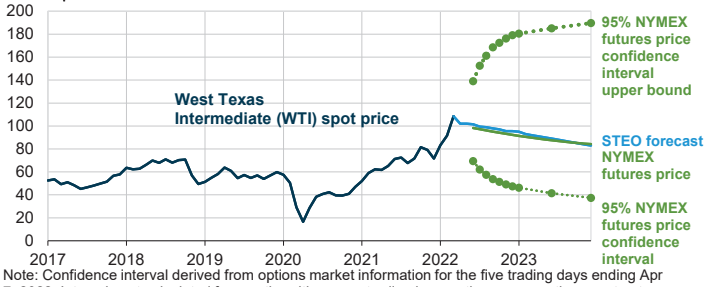
- We revised our forecast for growth in world liquid fuels consumption in 2022 down by 0.7 million b/d from the March STEO to 2.4 million b/d. The effects on oil consumption and on economic growth in Russia and surrounding countries contributed to most of the downward revision. Our forecast for world GDP growth in 2022 from Oxford Economics is 4.0%, down from 4.3% in the March STEO. Other revisions to the global liquid fuels consumption forecast stemmed from an increase in mobility restrictions in China as a result of recent increases in COVID-19 cases.

- In this outlook, we have updated our assumptions to include the announced release of 1 million b/d of crude oil from the U.S. Strategic Petroleum Reserve (SPR) from May through October. Our assumption that SPR inventories will fall by 1.0 million b/d from May through October is changed from our assumption last STEO than SPR inventories would fall by 0.1 million b/d over the same period.

- In the April STEO, U.S. LNG exports for 2022 average 12.2 billion cubic feet per day (Bcf/d,) which is 0.9 Bcf/d more than we forecast in last month's STEO. The updated forecast factored in the recent agreement between the United States and EU that the United States will ensure additional LNG volumes for the EU market. We assume this

agreement will result in higher utilization at U.S. export facilities throughout the year than we had previously forecast. In addition, we assume that the Calcasieu Pass LNG export facility in Louisiana achieves full production sooner than we had previously forecast.

- The Henry Hub natural gas spot price average is $5.23/MMBtu in 2022 in this month's STEO. That forecast is $1.28/MMBtu higher than we had forecast in last month's STEO. The higher forecast largely reflects our forecast that natural gas exports in 2022 will be higher than we previously expected. It also reflects a reduction in our forecast of capacity additions of solar power generation, which increases the need for electric power generation from other sources, including natural gas.
- The electric power sector is currently scheduling 20 gigawatts (GW) of new solar PV capacity to be added in 2022, down from scheduled additions of 22 GW for 2022 that were reported in the last STEO. Some of these projects have been delayed into 2023, when we expect 24.0 GW will be added.
- You can find more information in the detailed table of forecast changes.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The views in this report therefore should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on April 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on April 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on April 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on April 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on April 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

Notes: EIA completed modeling and analysis for this report on April 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on April 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on April 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.91**	**1.93**	**2.03**	**2.05**	**2.05**	*1.89*	*1.76*	*1.77*	*1.82*	*1.83*	*1.82*	*1.79*	**1.98**	*1.86*	*1.81*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on April 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on April 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on April 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 7c. U.S. Regional Retail Electricity Prices (Cents per Kilowatthour)

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on April 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 7d part 1. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continues on Table 7d part 2*

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on April 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on April 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distrib

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Subtotals for the industrial and commercial sectors might not equal the sum of the components. The subtotal for the industrial sector includes ethanol consumption that is not shown separately. The subtotal for the commercial sector includes ethanol and hydroelectric consumption that are not shown separately.

(f) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(g) Fuel ethanol and biodiesel, renewable diesel, and other biofuels consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on April 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum Supply*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on April 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

- = no data available

SAAR = Seasonally-adjusted annual rate

Notes: EIA completed modeling and analysis for this report on April 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on April 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Appendix to the April 2022 *Short-Term Energy Outlook*

This appendix is prepared in fulfillment of section 1245(d)(4)(A) of the National Defense Authorization Act (NDAA) for Fiscal Year 2012, as amended. The law requires the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy, to submit to Congress a report on the availability and price of petroleum and petroleum products produced in countries other than Iran in the two-month period preceding the submission of the report. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The data in this appendix, therefore, should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

EIA consulted with the U.S. Department of the Treasury, the U.S. Department of State, and the intelligence community in the process of developing the NDAA report, which was previously published as a stand-alone report. Detailed background and contextual information not repeated here can be found in early editions of the NDAA report.

This appendix is published in the *Short-Term Energy Outlook* in even numbered months.

Table a1. Summary of Estimated Petroleum and Other Liquids Quantities

	Feb 2022	Mar 2022	Feb 2022 – Mar 2022 Average	Feb 2021 – Mar 2021 Average	2019 – 2021 Average
Global Petroleum and Other Liquids (million barrels per day)					
Global Petroleum and Other Liquids Production (a)	99.4	99.3	99.3	92.0	96.5
Global Petroleum and Other Liquids Consumption (b)	100.5	98.3	99.4	95.1	96.7
Biofuels Production (c)	2.3	2.3	2.3	2.2	2.7
Biofuels Consumption (c)	2.5	2.5	2.5	2.5	2.6
Iran Liquid Fuels Production	3.7	3.7	3.7	3.3	3.2
Iran Liquid Fuels Consumption	2.2	1.9	2.1	1.8	1.9
Petroleum and Petroleum Products Produced and Consumed in Countries Other Than Iran (million barrels per day)					
Production (d)	93.4	93.3	93.3	86.5	90.6
Consumption (d)	95.8	93.9	94.8	90.7	92.3
Production minus Consumption	-2.4	-0.6	-1.5	-4.2	-1.7
World Inventory Net Withdrawals Including Iran	1.2	-1.0	0.0	3.1	0.2
Estimated OECD Inventory Level (e) (million barrels)	2,601	2,614	2,608	2,934	2,943
Surplus Production Capacity (million barrels per day)					
OPEC Surplus Crude Oil Production Capacity (f)	3.4	3.6	3.5	6.7	4.4

Note: The term "petroleum and other liquids" encompasses crude oil, lease condensate, natural gas liquids, biofuels, coal-to-liquids, gas-to-liquids, and refinery processing gains, which are important to consider in concert due to the inter-related supply, demand, and price dynamics of petroleum, petroleum products, and related fuels.

(a) Production includes crude oil (including lease condensates), natural gas liquids, other liquids, and refinery processing gains.

(b) Consumption of petroleum by the OECD countries is synonymous with "products supplied," defined in the glossary of the EIA Petroleum Supply Monthly, DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel, and loss, and bunkering.

(c) Biofuels production and consumption are based on EIA estimates as published in the International Energy Statistics. Biofuels production in the third quarter tends to be at its highest level in the year as ethanol production in Brazil reaches its seasonal peak and is typically lowest in the first quarter as seasonal production falls in the South/South-Central region of Brazil.

(d) Global production of petroleum and petroleum products outside of Iran is derived by subtracting biofuels production and Iran liquid fuels production from global liquid fuels production. The same method is used to calculate global consumption outside of Iran.

(e) Estimated inventory level is for OECD countries only.

(f) EIA defines surplus oil production capacity as potential oil production that could be brought online within 30 days and sustained for at least 90 days, consistent with sound business practices. This does not include oil production increases that could not be sustained without degrading the future production capacity of a field.

Forecast highlights

Global liquid fuels

- The May *Short-Term Energy Outlook* (STEO) is subject to heightened levels of uncertainty resulting from a variety of factors, including Russia's full-scale invasion of Ukraine. This STEO assumes U.S. GDP will grow by 3.1% in both 2022 and 2023, following growth of 5.7% in 2021. We use the S&P Global macroeconomic model to generate our U.S. economic assumptions. Global macroeconomic assumptions in our forecast are from Oxford Economics and include global GDP growth of 3.4% in 2022 and 3.5% in 2023, compared with growth of 6.0% in 2021. A wide range of potential macroeconomic outcomes could significantly affect energy markets during the forecast period. Major factors driving energy supply uncertainty include how sanctions affect Russia's oil production, the production decisions of OPEC+, and the rate at which U.S. oil and natural gas producers increase drilling.

- The Brent crude oil spot price averaged $105 per barrel (b) in April, a $13/b decrease from March. Although down from March, crude oil prices remain above $100/b following Russia's full-scale invasion of Ukraine. Sanctions on Russia and other independent corporate actions contributed to falling oil production in Russia and continue to create significant market uncertainties about the potential for further oil supply disruptions. These events occurred against a backdrop of low oil inventories and persistent upward oil price pressures. Global oil inventory draws averaged 1.7 million barrels per day (b/d) from the third quarter of 2020 (3Q20) through the end of 2021. We estimate that commercial oil inventories in the OECD ended 1Q22 at 2.63 billion barrels, up slightly from February, which was the lowest level since April 2014.

- We expect the Brent price will average $107/b in 2Q22 and $103/b in the second half of 2022 (2H22). We expect the average price to fall to $97/b in 2023. However, this price forecast is highly uncertain. Actual price outcomes will largely depend on the degree to which existing sanctions imposed on Russia, any potential future sanctions, and independent corporate actions affect Russia's oil production or the sale of Russia's oil in the global market. We completed this outlook on May 5, therefore it does not include an EU ban on oil imports from Russia. However, the bans being reported at the time of writing would likely contribute to tighter oil balances and higher oil prices than our current forecast. In addition, the degree to which other oil producers respond to current oil prices and the effects macroeconomic developments might have on global oil

demand will be important for oil price formation in the coming months. We reduced Russia's oil production in this month's forecast compared with our April forecast, and we now expect oil markets to be mostly balanced from 2Q22 through the end of 2023. Because oil inventories are currently low, we expect downward oil price pressures will be limited and market conditions will exist for significant price volatility.

- We estimate that 97.4 million b/d of petroleum and liquid fuels was consumed globally in April 2022, an increase of 2.1 million b/d from April 2021. We forecast that global consumption of petroleum and liquid fuels will average 99.6 million b/d for all of 2022, which is a 2.2 million b/d increase from 2021. We revised down our forecast for 2022 global consumption of petroleum and liquid fuels by 0.2 million b/d from the April STEO, primarily as a result of downward revisions to consumption growth in China and the United States. We forecast that global consumption of petroleum and liquid fuels will increase by 1.9 million b/d in 2023 to average 101.5 million b/d.

- U.S. crude oil production in the forecast averages 11.9 million b/d in 2022, up 0.7 million b/d from 2021. We forecast that production will increase to more than 12.8 million b/d in 2023, surpassing the previous annual average record of 12.3 million b/d set in 2019.

Natural gas

- In April, the Henry Hub natural gas spot price averaged $6.59 per million British thermal units (MMBtu), which was up from the March average of $4.90/MMBtu and higher than the April 2021 average of $2.66/MMBtu. We expect the Henry Hub price to average $7.83/MMBtu in 2Q22 and average $8.59/MMBtu in 2H22. High forecast natural gas prices reflect our expectation that natural gas storage levels will remain less than the five-year (2017−2021) average this summer. Lower-than-average storage levels partly result from limited opportunities for natural gas-to-coal switching for power generation, which we forecast will keep the demand for natural gas for power generation high despite high prices. Natural gas prices could rise significantly above forecast levels if summer temperatures are hotter than assumed in this forecast and electricity demand is higher. In addition, we expect that U.S. liquefied natural gas exports (LNG) will remain high during the summer. We expect the Henry Hub spot price will average $4.74/MMBtu in 2023. The forecast drop in prices for 2023 reflects our expectation that the rate of natural gas production will increase next year while LNG export and demand growth slow, contributing to higher storage levels in 2023 than in 2022.

- We estimate that natural gas inventories ended April at 1.6 trillion cubic feet (Tcf), which is 17% below the five-year average. Inventories at the end of April were 190 billion cubic feet (Bcf) higher than at the end of March. This increase was below the five-year average as a result of below-normal temperatures that raised demand for natural gas for heating amid relatively flat production. We expect natural gas inventories to increase by 418 Bcf in May, ending the month at 2.0 Tcf, which would be 14% below the

five-year average for this time of year. We forecast that natural gas inventories will end the 2022 injection season (end of October) at almost 3.4 Tcf, which is 9% below the five-year average. However, summer temperatures will be key to storage, and a hotter-than-normal summer that results in high electricity demand could cause inventories to be lower than forecast and result in prices that are higher than forecast.

- In April, U.S. LNG exports averaged 11.6 billion cubic feet per day (Bcf/d), slightly below an all-time peak of almost 12.0 Bcf/d set in March. We forecast that U.S. LNG exports will average 12.1 Bcf/d from May through August, which is slightly lower than our previous forecast. This forecast reflects our assumption of slightly lower LNG demand in Asia and Europe this summer compared with our previous assumption, in part because of sustained high natural gas prices. We expect U.S. LNG exports to average 12.0 Bcf/d this year, a 23% increase from 2021. Growth in LNG exports in recent years has been driven by capacity expansions. However, we do not expect any new export facilities to come online in the forecast period, and as a result, forecast growth in LNG exports slows to 5% in 2023, with LNG exports averaging 12.6 Bcf/d for the year.

- We expect that U.S. consumption of natural gas will average 85.7 Bcf/d in 2022, up 3% from 2021. The increase in U.S. natural gas consumption is a result of colder temperatures and related higher consumption in the residential and commercial sectors in 2022 compared with 2021. We also expect the industrial sector to consume more natural gas in 2022 in response to expanding economic activity. In addition, forecast natural gas consumption in the electric power sector increases in 2022 because of limited natural gas-to-coal switching despite high natural gas prices. For 2023, we forecast natural gas consumption will average 85.3 Bcf/d, down 1%, mostly as a result of assumed milder winter temperatures (based on forecasts from the National Oceanic and Atmospheric Administration) that will reduce residential and commercial consumption.

- We estimate dry natural gas production averaged 95.5 Bcf/d in the United States in April, up 0.4 Bcf/d from March. Although production in April was lower than the recent peak in December 2021, it increased in each of the past two months. Periods of below-normal temperatures and snow in some producing regions, along with seasonal maintenance on pipelines, limited the production increases in April compared with March. We forecast dry natural gas production to average 95.8 Bcf/d in May. For all of 2022, we expect that dry natural gas production will average 96.7 Bcf/d, which would be 3.2 Bcf/d more than in 2021. We expect dry natural gas production to average 101.7 Bcf/d in 2023.

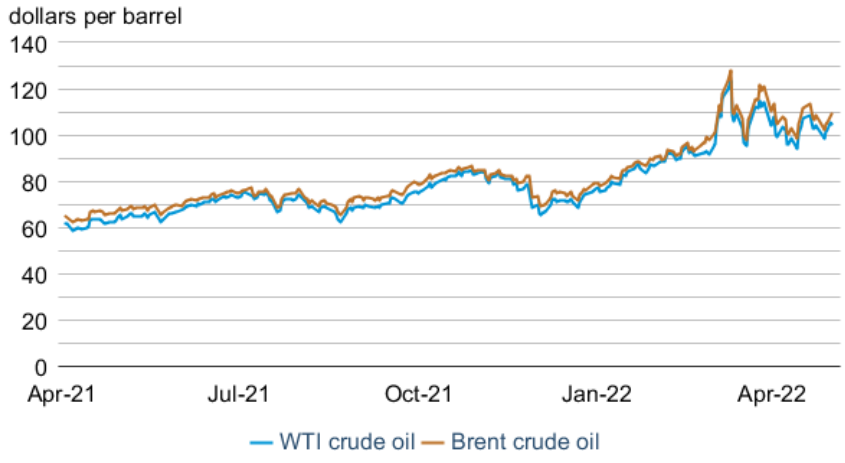
Electricity, coal, renewables, and emissions

- We forecast that the annual share of U.S. electricity generation from renewable energy sources will rise from 20% in 2021 to 22% in 2022 and to 23% in 2023 because of continuing increases in solar and wind generating capacity. We forecast that natural gas

will provide almost 37% of generation in 2022, which is similar to the level in 2021, and we forecast natural gas generation will provide 36% of generation in 2023. Despite significantly higher natural gas fuel costs this year compared with last year, we do not expect an increase in electricity generation from coal-fired power plants, which have in the past acted as a primary substitute for natural gas in the power industry. Along with the continued retirement of coal-fired generating capacity, the remaining coal fleet has been facing constraints in regard to fuel delivery and coal stocks. We forecast coal will provide 21% of total U.S. generation 2022 and 20% in 2023, compared with a share of 23% last year. Nuclear generation remains relatively constant in the forecast at an average share between 19% and 20%. One nuclear reactor will retire during 2022, and two reactors at the Vogtle nuclear power plant are scheduled to come online in 2023, the first new nuclear units to open in the United States since 2016.

- Planned additions to U.S. wind capacity increase wind electricity generation in our forecast. We estimate that the U.S. electric power sector added 14 GW of wind capacity in 2021. Wind capacity additions in the forecast total 10 GW in 2022 and 4 GW in 2023. The electric power sector added 13 GW of utility-scale solar capacity in 2021, and forecast solar capacity additions in the power sector total 20 GW for 2022 and 23 GW for 2023. We expect additions to solar capacity and batteries to account for more than half of new electric sector capacity in 2022 and 2023. In addition, in 2021 small-scale solar (systems less than 1 megawatt) rose by 5 GW to 33 GW. We expect that small-scale solar capacity will grow by 5 GW in 2022 and 6 GW in 2023.

- U.S. coal production in the forecast increases by 20 million short tons (MMst) (3%) in 2022 to 598 MMst and by 7 MMst (1%) in 2023. We expect production in the Western region to drive the forecast increases. The forecast increase occurs despite our expectation that coal use in the power sector will decline. We expect rising coal production will replenish electric power sector inventories in 2023 that were depleted during 2021. We also expect coal exports will remain at high levels during the forecast period as a result of high global coal prices. Although exports and inventory builds contribute to rising coal production in the forecast, labor shortages, rail congestion, and challenges obtaining equipment are expected to limit production gains.



- U.S. energy-related carbon dioxide (CO_2) emissions increased by more than 6% in 2021 as a result of rising energy use. We expect a 2% increase in energy-related CO_2 emissions in 2022, primarily from growing transportation-related petroleum consumption. Forecast energy-related CO_2 emissions remain relatively unchanged in 2023. We expect petroleum emissions to increase by 3% in 2022 compared with 2021 before growth slows to 1% in 2023. Natural gas emissions rise by 3% in our forecast for 2022, then remain unchanged in 2023. We forecast that coal-related CO_2 emissions will fall by 2% in 2022 and by 5% in 2023.

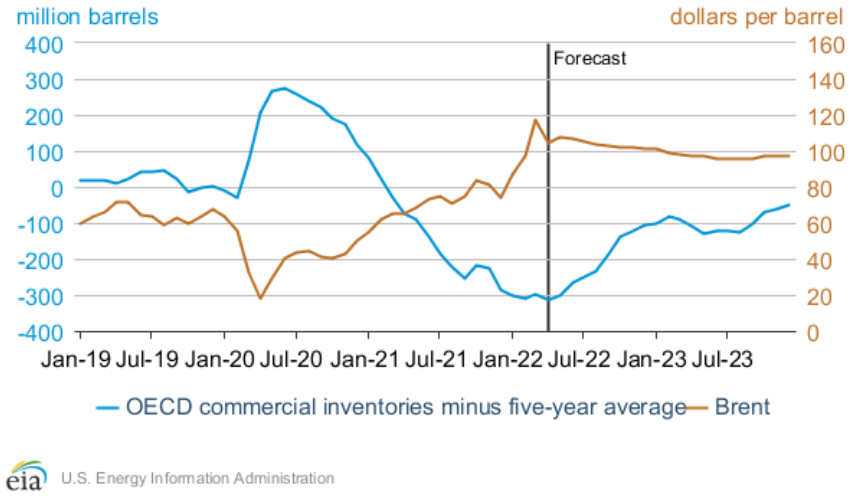
Petroleum and Natural Gas Markets Review

Crude oil

Prices: The front-month futures price for Brent crude oil settled at $110.90 per barrel (b) on May 5, 2022, an increase of $6.51/b from the April 1, 2022, price of $104.39/b. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, increased by $8.99/b during the same period, settling at $108.26/b on May 5 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices

eia Source: Based on CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate



The April monthly average front-month Brent crude oil price was $106/b, $7/b less than the March 2022 average but $41/b more than April 2021. The monthly average WTI crude oil price was $102/b, similarly $7/b less than March 2021 and $40/b more than April 2021. Monthly average crude oil prices in April decreased slightly from March levels but remained near the highest prices since 2014 on an inflation-adjusted basis. The possibility of oil supply disruptions resulting from Russia's full-scale invasion of Ukraine and associated sanctions on Russia continue to contribute to the Brent crude oil price remaining above $100/b. This uncertainty is occurring amid low inventory levels globally. Relatively slow increases in global oil production amid more rapid increases in consumption contributed to global inventories declining for six consecutive quarters from the third quarter of 2020 to the fourth quarter of 2021 (3Q20 through 4Q21). Global inventories increased in 1Q22 as a result of reduced January consumption related to COVID-19 measures, reduced March consumption related to COVID-19 responses in China, and relatively steady global production increases; declines in Russia's oil production were not substantial until April. At the same time, potential decreases in demand from factors including the ongoing severe COVID-19 containment measures in China, particularly in Shanghai, as well as a decrease in the reported first-quarter U.S. GDP estimate contributed to lower crude oil prices relative to March.

In addition to the decrease in monthly average prices in April, crude oil price volatility declined compared with the high level of volatility in March. The Brent crude oil price range in April was $17/b, down from a $42/b range in March. Although narrower than in March, the range in prices remains wider than in any month during 2021. Many of the key uncertainties that we noted in last month's STEO remain, including:

- The impact of sanctions on Russia in relation to its full-scale invasion of Ukraine and the ongoing effect of current sanctions and private sector actions
- The potential for new sanctions on Russia, including the discussion of an EU-wide ban on energy imports from Russia, and the pace of its implementation
- The pace of petroleum demand growth through the summer and the potential for demand destruction because of high retail fuel prices
- The volume of new crude oil production that will come online at price levels near or above $100/b
- The potential for renewed resurgences in COVID-19 cases and the nature of government responses
- The ongoing impact of the coordinated release of petroleum supplies from strategic reserves in the United States and in Europe
- Other geopolitical uncertainties related to Libya, the ceasefire in Yemen, or potential new developments on an Iran deal

In this month's STEO, we expect lower global crude oil and other liquid fuels production in the forecast compared with last month's outlook, contributing to relatively balanced oil markets through the end of 2023. We estimate that OECD commercial liquid inventories in April were 315 million barrels below their five-year (2017–2021) April average, the lowest amount relative to the five-year average in our data going back to 2004. We expect some builds in global oil inventories will allow OECD inventories to move closer to the five-year average, particularly in the second half of 2022, which could contribute to limited downward pressure on crude oil prices. We expect the monthly average Brent price to remain above $100/b for the rest of 2022, but we forecast the Brent crude oil spot price will decrease to an average of $102/b in 4Q22 and $97/b by 4Q23 **(Figure 2)**. Although we forecast some price declines, the possibility for significant crude oil price increases and high volatility remains, given low inventory levels and the wide range of possible outcomes for oil supply, particularly from Russia.

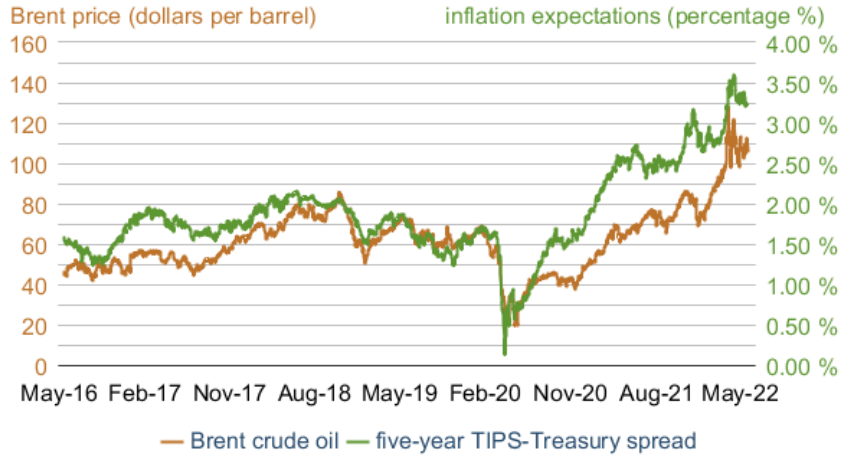


Figure 2. OECD commercial liquid inventories minus five-year average and Brent price

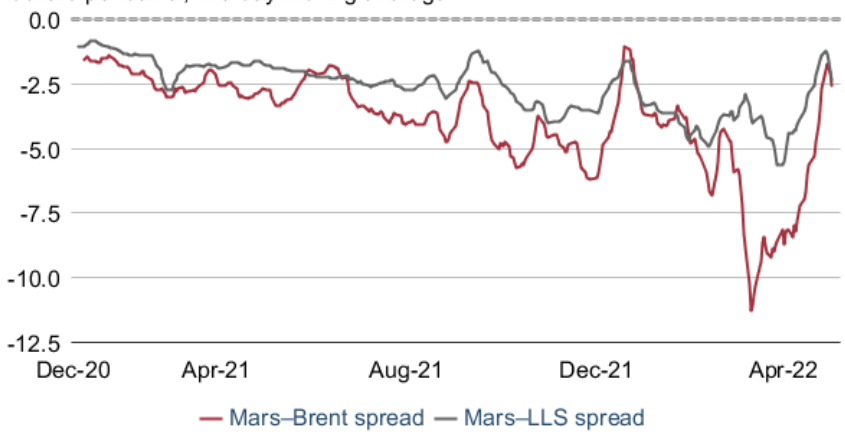
Our Brent crude oil price forecast of $97/b in 2023 is up $5/b compared with our forecast from the April 2022 *Short-Term Energy Outlook*. The higher forecast price reflects our expectation that oil markets will be relatively balanced in the forecast compared with our expectation of inventory builds last month, and we now forecast OECD commercial inventories to remain below their five-year average throughout the forecast period. This downward revision in OECD inventories is a result of our forecast for lower supply growth because we expect production declines in Russia to persist throughout the forecast period. Our forecast for total liquid fuels production in Russia from 2Q22 through the end of 2023 is 0.6 million b/d lower in this month's outlook compared with last month. This forecast assumes existing sanctions as of May 5. Actual price outcomes will be affected by the degree to which existing sanctions imposed on Russia, any potential future sanctions, and independent corporate actions affect Russia's oil production or the sale of Russia's oil in the global market. We expect this supply reduction to only partially be offset by lower consumption expectations in China as well as the effect of lower global economic growth on global oil consumption.

Crude oil and inflation expectations: The spread between five-year treasury bonds and Treasury Inflation-Protected Securities (TIPS) is one indicator of financial market expectations of inflation because it measures the difference in yields between Treasury bonds that adjust their yield with the Consumer Price Index (CPI) and those that do not. In March 2022, the spread reached 3.6%, its highest level since at least 2003, and averaged 3.4% throughout the month **(Figure 3)**.

Figure 3. Crude oil and inflation expectations

Source: Based on data from Bloomberg L.P. and Federal Reserve Bank of St. Louis
Note: TIPS=Treasury Inflation Protected Securities



The spread decreased sharply during the onset of the COVID-19 pandemic in 2020 but has increased since mid-2020 and had risen above pre-COVID levels by the end 1Q21. Inflationary concerns can encourage market participants to invest in commodities and commodity-derived assets, such as crude oil or precious metals, which tend to increase in value in highly inflationary environments. As a result, higher inflationary expectations can contribute to increased demand for crude oil-backed contracts, which can contribute to higher commodity prices and associated securities. At the same time, higher energy prices can contribute to increased inflation and inflationary concerns, either directly—through increased consumer fuel prices—or indirectly—through higher transportation costs for finished goods. These interrelated effects tend to result in a high correlation between crude oil prices and the TIPS-Treasury spread.

The March TIPS-Treasury spread increased by 0.5 percentage points compared with the February monthly average, and like crude oil prices, the TIPS-Treasury spread decreased slightly in April, falling 0.1 percentage points from March to average 3.3%. The April average spread was 0.8 percentage points higher than the April 2021 level and still 0.4 percentage points higher than February 2022. Sustained higher crude oil prices as a result of market fundamentals discussed previously are likely to continue contributing to inflationary concerns. At the same time, the TIPS-Treasury spread and inflationary concerns can also result from other macroeconomic indicators as well as the prices of other staple commodities that comprise a significant share of the CPI.

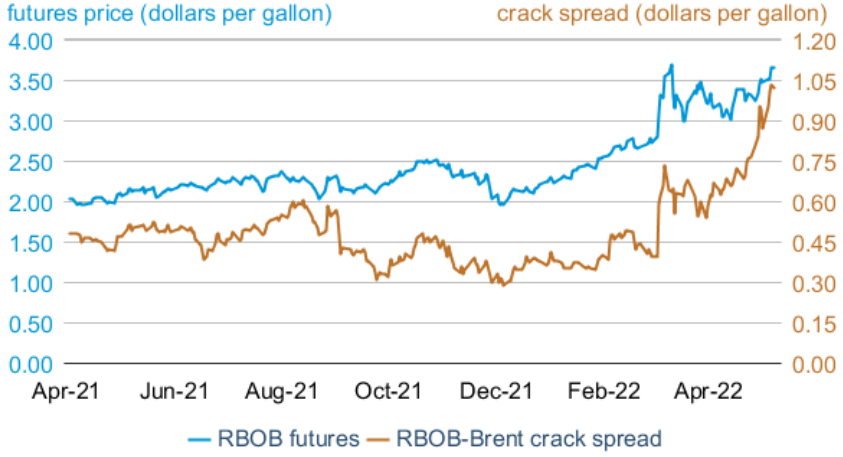
Crude oil price differentials: In April, the differential between crude oil grades with high API gravity and low sulfur content (sweet) and those with medium API gravity and higher sulfur contents (sour) narrowed compared with March **(Figure 4)**. In the crude oil markets review in last month's STEO, we noted the widening of the spread between Houston-based Mars medium sour crude oil prices and the price of Brent and Light Louisiana Sweet (LLS) crude oil grades, despite the impact of sanctions on the availability of Russia's medium sour Urals grade crude oil.

Mars crude oil has an API gravity of 28 and a sulfur content of 1.93%, making it more comparable to Russia's Urals grade (API gravity of 30.6, sulfur content of 1.48%) than LLS (API gravity of 38.5, sulfur content of 0.39) or Brent (API gravity of 37.9, sulfur content of 0.45%). In April, both the Mars-Brent and Mars-LLS spreads have contracted sharply, suggesting that the effect of sanctions and self-sanctioning by many crude oil buyers has contributed to less availability of medium sour crude oil, contributing to higher prices for medium sour grades such as Mars relative to lighter grades such as Brent or LLS.

Figure 4. Mars crude oil price spreads

Source: Based on data from CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: LLS=Light Louisiana Sweet.

In April, the five-day moving average of the Mars-Brent spread narrowed by $3.87/b from April 1 to May 5, while the Mars-LLS spread narrowed by $1.17/b compared with April 1. Both spreads are still wider than they were around the same time last year; the Mars-Brent spread widened by $1.14/b and the Mars-LLS spread widened by $1.34/b compared with May 5, 2021. Although trade press reports indicate Russia's medium sour crude oil grades have been selling at a substantial discount to other benchmark grades because of sanctions and private company boycotts, the increasing shipping prices and associated insurance prices needed to take possession of Russia's crude oil are likely contributing to increased end-user prices for buyers still willing to purchase Russia's crude oil. These increased delivered prices may be mitigating the value of the wholesale discount that is captured by potential buyers. Given the narrowing of light-medium crude oil quality spreads in April, it is unlikely that discounts on Russia's crude oil are effectively pulling down medium sour crude oil prices globally, while higher prices associated with less availability of medium sour crude grades from outside of Russia—such as Mars—are now becoming apparent.



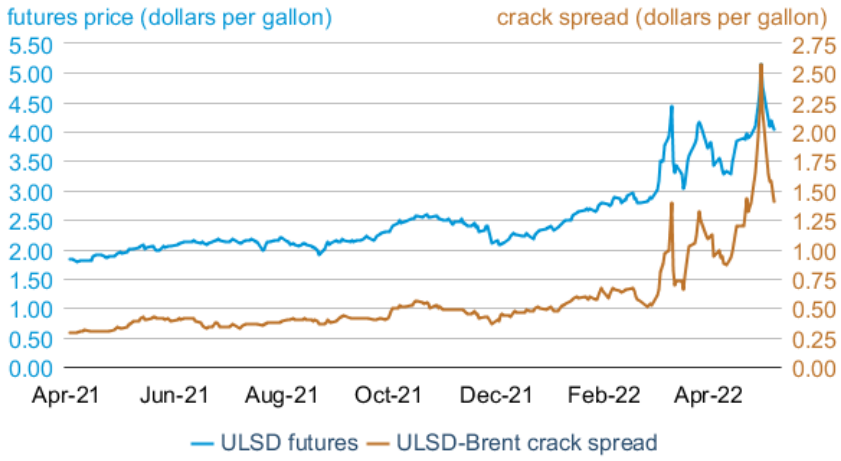
The narrowing Mars-Brent spread also reflects regional effects, primarily a narrowing spread between crude oils from Europe such as Brent with U.S.-based crude oils such as WTI, Mars, and LLS. Although the impact of sanctions on Russia initially manifested predominately in the Brent price—a global benchmark linked geographically to Europe—the call on global crude oil supplies

by European refiners has begun to affect other regional markets as global refiners make crude oil purchases and reroute ships. As a result, the difference between the Mars-LLS spread and the Mars-Brent spread, which incorporates this global dynamic, has decreased considerably. As of May 5, the difference between the Mars-Brent spread and the Mars-LLS spread decreased to $1.06/b, compared with a monthly average of $4.67/b in March.

Petroleum products

Gasoline prices: The front-month futures price of RBOB (the petroleum component of gasoline used in many parts of the country) settled at $3.66 per gallon (gal) on May 5, up 51 cents/gal from April 1 **(Figure 5)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) settled at $1.02/gal on May 5, up 35 cents/gal during the same period. The RBOB–Brent crack spread increased by 11 cents/gal (13%) on April 27, the third-highest daily percentage increase in 2022 (March 1 marked the highest increase when the RBOB futures contract rolled to a new month reflecting more expensive summer grade gasoline).

Figure 5. Historical RBOB front-month futures prices and crack spreads



Source: Based on data from CME Group, as compiled by Bloomberg L.P.
Note: RBOB is the petroleum component of gasoline used in many parts of the country.

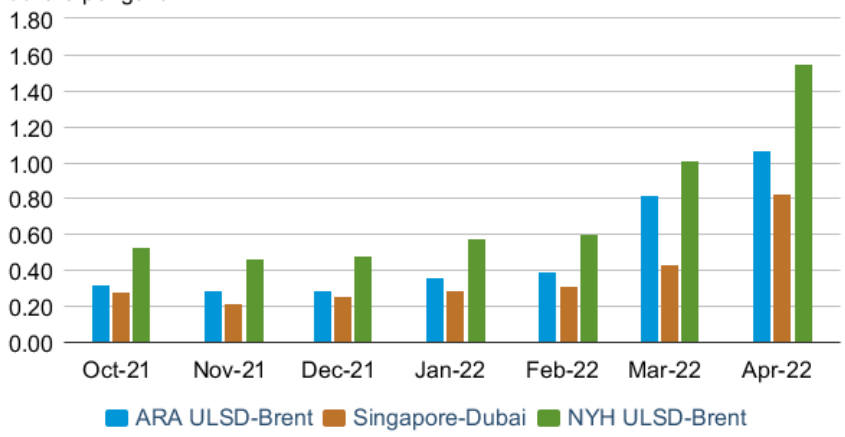
April's increasing RBOB–Brent crack spread was likely due to decreasing gasoline inventories. We estimate that U.S. gasoline inventories decreased from March to April by 8.2 million barrels (3.5%). One reason for this inventory decrease was increased driving. We estimate that gasoline consumption increased to 8.7 million barrels per day (b/d) in April, a 0.1 million b/d (1%) increase from March. Gasoline inventories have been particularly low on the East Coast where, according to our *Weekly Petroleum Status Report* (WPSR), inventories on April 22 were at their lowest levels since November 2014. The RBOB futures contract is for delivery in New York Harbor (NYH), and particularly low inventories in that region could be contributing to higher RBOB-Brent crack spreads. Gasoline inventories in the Northeast (PADD 1A and 1B) were 28 million barrels on April 22, according to WPSR data, the lowest level for April since 2011. Low inventories and high RBOB prices likely supported imports from international markets in late

April. Gasoline imports to the East Coast in the week ending April 29 were 812,000 b/d, the highest since the week ending October 1, 2021, according to WPSR data.

Ultra-low sulfur diesel prices: The front-month futures price for ultra-low sulfur diesel (ULSD) for delivery in New York Harbor settled at $4.04/gal on May 5, a 62 cents/gal increase from April 1 **(Figure 6)**. The ULSD-Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) increased by 46 cents/gal during the same period and settled at $1.40/gal on May 5. The ULSD-Brent average crack spread in April was the highest recorded in real terms in data going back to July 1988. The ULSD front-month futures average price in April was the highest in real terms since February 2013.

Figure 6. Historical ULSD front-month futures prices and crack spreads

Source: Based on data from CME Group, as compiled by Bloomberg L.P.
Note: ULSD=ultra-low sulfur diesel



High global demand and low inventories continued to support higher distillate prices and crack spreads in April. Distillate exports from Russia have declined as a result of sanctions. This drop in global supply combined with refinery closures over the past few years has produced a tight U.S. distillate market. U.S. distillate stocks declined by 9.4 million barrels (8%) from March, falling to 24% below the five-year average. Increased trucking activity and increased distillate demand for oil and natural gas drilling could be contributing to higher domestic diesel demand and supporting ULSD prices. In addition, distillate exports are contributing to lower stock levels. Our estimate for April net distillate exports of 1.3 million b/d, if confirmed in monthly data, would be the highest amount of net distillate exports since September 2019.

Front-month ULSD prices increased significantly in the last week of April and may have been the result of reduced liquidity in the expiring May ULSD futures contract. Liquidity in financial markets refers to the ease of buyers and sellers to make trades at stable, transparent prices. During periods of low liquidity, market participants may need to bid at price levels higher or lower than during periods of ample liquidity to transact in the market. From April 25 to April 28, the May ULSD futures contract increased $1.04/gal (26%), and the June ULSD futures contract

increased 35 cents/gal (10%), suggesting low liquidity ahead of expiration may have added price volatility. This volatility was also evident when comparing the May ULSD futures price with Brent crude oil. ULSD futures prices usually follow movements in the underlying price of crude oil because it makes up the largest part of the overall cost to produce diesel fuel. However, between April 25 and April 28 when ULSD futures prices increased by 26%, Brent crude oil futures prices increased by just 5%.

International distillate crack spreads: Global spot distillate crack spreads at the major global trading hubs in Amsterdam, Rotterdam, and Antwerp (ARA); Singapore; and NYH increased substantially in April. The ARA ULSD-Brent crack spread averaged $1.07/gal, the Singapore-Dubai crack spread averaged 83 cents/gal, and the NYH ULSD-Brent crack spread averaged $1.55/gal **(Figure 7)**. On average, inventories in all three trading hubs have been more than 30% below the five-year average since the beginning of the year. However, crack spreads increased more at the Singapore and NYH trading hubs as new dynamics interacted with the already tight global distillate market. In Singapore, lower refinery runs in China as a result of mobility restrictions in response to increased COVID-19 cases as well as lower export quotas constrained regional petroleum trade, leading the crack spread to nearly double from 43 cents/gal in March. In NYH, increasing distillate exports in the U.S. Gulf Coast, fewer imports from Europe, and lower refining capacity in PADD 1 pushed the crack spread to reach its highest level on record. Meanwhile, concerns about replacing Russia's distillate exports to Europe continued to drive ARA crack spreads higher, rising by 25 cents/gal over March.

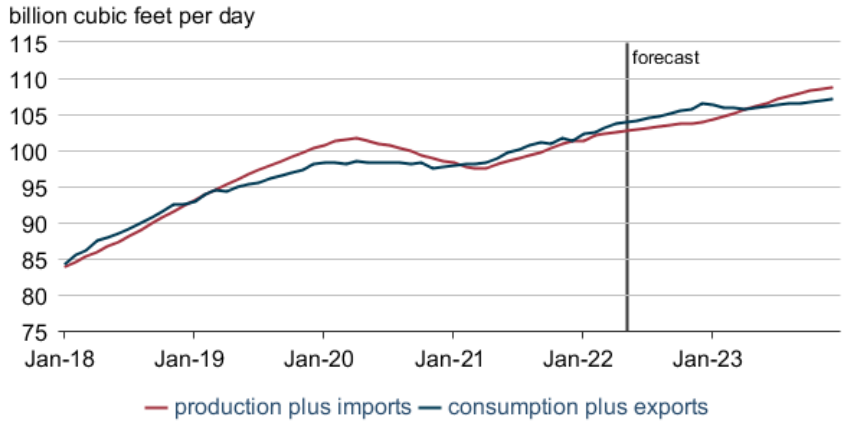
Natural gas

***Prices*:** On May 5, 2022, the front-month natural gas futures contract for delivery at the Henry Hub settled at $8.78 per million British thermal units (MMBtu), which was up $3.06/MMBtu

from April 1, 2022 **(Figure 8)**. The average closing price for front-month natural gas futures contracts in April was $6.70/MMBtu, the highest April monthly average in real terms since 2008.

Figure 8. U.S. natural gas front-month futures prices and current storage deviation from five-year average

eia Source: Based on data from CME Group, as compiled by Bloomberg L.P.



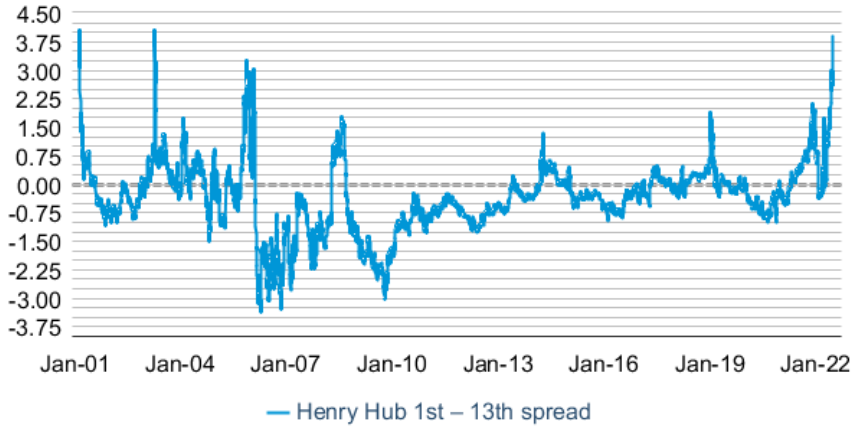
The average front-month natural gas futures price for the month of April increased $1.73/MMBtu from its monthly average in March. Several factors have contributed to the rapid increase in natural gas futures prices:

- Storage inventories below the five-year average
- Steady demand, driven by the high levels of U.S. liquefied natural gas (LNG) exports, a cooler-than-normal spring that contributed to higher levels of residential and commercial demand, and high demand in the electric power sector
- Lower-than-expected increases in dry natural gas production

April's natural gas stock builds were lower than the five-year (2017−2021) average by 33 billion cubic feet (Bcf). At the end of the month, natural gas inventories were at 1,597 Bcf, which is 320 Bcf (17%) below the five-year average. U.S. LNG exports reached a record-high level in March at just under 12.0 Bcf/d, and averaged 11.6 Bcf/d in the first quarter of 2022 (1Q22). We estimate LNG exports averaged 11.6 Bcf/d in April. High export levels are supported by high international LNG prices, as well by additional export capacity created by a new U.S. LNG export facility, Calcasieu Pass LNG, which exported its first LNG cargo on March 1 and continues to ramp up production. U.S. dry natural gas production reached 97.0 Bcf/d in December 2021 before declining to 94.1 Bcf/d in February, partially as a result of freeze-offs in key producing regions. Dry natural gas production has yet to return to its December level and averaged 95.5 Bcf/d in April, partly because of cost increases for key input materials as well as labor shortages that are limiting the ability of producers to use more rigs for increased production.

***Supply and demand balance*:** Comparing overall U.S. production and consumption balances is a helpful indicator in determining the trajectory of natural gas prices. When natural gas supply (production plus imports) is lower than natural gas demand (consumption plus exports), natural gas prices increase because more natural gas is pulled from storage to meet demand. Natural gas demand has exceeded supply since February 2021. We expect this trend to continue through 2022, and we expect the Henry Hub spot price will remain elevated, averaging $8.34/MMBtu from 2Q22 through 4Q22. Limited opportunities for natural gas-to-coal switching for power generation keep the use of natural gas for power generation high in our forecast despite high natural gas prices. This dynamic creates conditions for natural gas prices to rise significantly above forecast levels, particularly if summer temperatures are hotter than assumed in this forecast and lead to higher-than-expected levels of electricity demand. However, we forecast supply to begin outpacing demand by early 2023 as producers steadily increase production in response to higher natural gas prices as well as higher oil prices, and demand stays relatively constant given close to normal weather conditions forecast in 2023 **(Figure 9)**.

Figure 9. Natural gas production plus imports and consumption plus exports, 12-month moving average



Source: U.S. Energy Information Administration

***Futures price spreads*:** The natural gas 1st–13th price spread averaged $2.36/MMBtu in April, the highest backwardation (where near-term contract prices are higher than longer-dated contract prices) since October 2005, when it averaged $2.50/MMBtu **(Figure 10)**. Often, the 1st–13th price spread increases when natural gas inventories are below the five-year range, and the price spread often decreases when inventories are above the five-year range. With inventories starting the injection season below the five-year average, high demand for natural gas is pushing prices up in the short term. The combination of low storage inventories to start the injection season, high demand for U.S. LNG exports, and lower-than-expected production levels are all contributing to near-term natural gas prices being much higher now compared with natural gas for delivery next year. We expect natural gas prices to remain high throughout the summer because opportunities for natural gas-to-coal switching for power generation are limited,

production increases will take several months to emerge, and continued high levels of LNG exports will contribute to high demand.

Notable forecast changes

- Russia's liquid fuels production in the May STEO averages 10.0 million barrels per day (b/d) in 2022, which is 0.4 million b/d less than we forecast in the April STEO. Our forecast for Russia's production averages 9.1 million b/d in 2023, which is 0.6 million b/d less than we forecast in the April STEO. The updated forecast reflects a larger drop in production during April than we had expected, lowering the starting point for our forecast.

- We have reevaluated our modeling of electricity generation to better account for the current constraints on the deliveries of coal and inventories at coal-fired power plants. Coal-fired power plants have been running more selectively in recent months as a result of low coal inventory levels and reduced abilities to replenish those inventories because of mine closures, rail capacity constraints, and labor market tightness. Coal plants have been running at high levels during peak demand periods in the winter and summer, but scaling-back operations during the shoulder months to conserve coal supply. These changes contributed to a shift toward natural gas generation and away from coal compared with our forecast in the April STEO, despite higher natural gas prices in this forecast. We now forecast coal generation in 2022 will decline by 30 billion kilowatthours (kWh) (3%) compared with a forecast increase of 27 billion (3%) kWh in the last STEO. Conversely, forecast natural gas generation rises by 13 billion kWh (1%) in this STEO compared with a forecast decline of 66 billion kWh (5%) in last month's outlook.

- The Henry Hub spot price in our forecast averages $7.42 million British thermal units (MMBtu) in 2022, which is $2.19/MMBtu higher than our forecast in the April STEO. The higher forecast is mostly the result of updates to our power generation model to better account for coal market constraints.
- We expect natural gas inventories will end October at almost 3.4 trillion cubic feet, which is 9% below the five-year average, compared with our forecast of 4% below the five-year average in last month's STEO. The lower storage levels largely reflect higher expected power generation this summer compared with last month's forecast.
- U.S. coal production in our forecast totals 598 million short tons in 2022, up 3% from 2021. In last month's forecast, we expected coal production to rise 7% from 2021. The updated forecast reflects adjustments to our power generation model that resulted in lower coal demand than previously forecast.
- You can find more information in the detailed table of forecast changes.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on May 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Average for all sulfur contents.

(b) Average self-service cash price.

(c) Includes fuel oils No. 4, No. 5, No. 6, and topped crude.

- = no data available

Notes: EIA completed modeling and analysis for this report on May 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation; prices exclude taxes unless otherwise noted.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Marketing Monthly* , DOE/EIA-0380; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; and *Monthly Energy Review* , DOE/EIA-0035.

Natural gas Henry Hub and WTI crude oil spot prices from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on May 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on May 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on May 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on May 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

Notes: EIA completed modeling and analysis for this report on May 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on May 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on May 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on May 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on May 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on May 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on May 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on May 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on May 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Table 8a. U.S. Renewable Energy Consumption (Quadrillion Btu)
