(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distrib

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Subtotals for the industrial and commercial sectors might not equal the sum of the components. The subtotal for the industrial sector includes ethanol consumption that is not shown separately. The subtotal for the commercial sector includes ethanol and hydroelectric consumption that are not shown separately.

(f) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(g) Fuel ethanol and biodiesel, renewable diesel, and other biofuels consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on May 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum Supply*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on May 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on May 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Independent Statistics & Analysis
U.S. Energy Information Administration

June 2022

Short-Term Energy Outlook

Forecast highlights

Global liquid fuels

- The June *Short-Term Energy Outlook* (STEO) is subject to heightened levels of uncertainty resulting from a variety of factors, including Russia's full-scale invasion of Ukraine. Global macroeconomic assumptions in STEO are from Oxford Economics and include global GDP growth of 3.1% in 2022 and 3.4% in 2023, compared with growth of 6.0% in 2021. A range of potential macroeconomic outcomes could affect energy markets in the forecast period. Factors driving energy supply uncertainty include how sanctions affect Russia's oil production, the production decisions of OPEC+, and the rate at which U.S. oil and natural gas producers increase drilling.

- The Brent crude oil spot price averaged $113 per barrel (b) in May. We expect the Brent price will average $108/b in the second half of 2022 (2H22) and then fall to $97/b in 2023. Current oil inventory levels are low, which amplifies the potential for oil price volatility. Actual price outcomes will largely depend on the degree to which existing sanctions imposed on Russia, any potential future sanctions, and independent corporate actions affect Russia's oil production or the sale of Russia's oil in the global market.

- We forecast Russia's production of total liquid fuels will decline from 11.3 million b/d in the first quarter of 2022 (1Q22) to 9.3 million b/d in 4Q23. This STEO incorporates the recently announced EU ban of seaborne crude oil and petroleum product imports from Russia. We assume the crude oil import ban will be imposed in six months and the petroleum product import ban in eight months. This forecast does not reflect restrictions on shipping insurance, as details regarding such restrictions were not available when we finalized this forecast on June 2. The possibility that these sanctions or other potential future sanctions reduce Russia's oil production by more than expected creates upward risks for crude oil prices during the forecast period.

- At its June 2 meeting, OPEC+ announced an upward adjustment of production targets for July and August. We updated our forecast to reflect these targets. We expect OPEC crude oil production to average 29.2 million b/d in 2H22, up 0.8 million b/d from 1H22.

- The U.S. average retail price for regular grade gasoline averaged $4.44 per gallon (gal) in May, and the average retail diesel price was $5.57/gal. Rising prices for gasoline and diesel reflect refining margins for those products that are at or near record highs amid

low inventory levels. We expect the gasoline wholesale margins (the difference between the wholesale gasoline price and Brent crude oil price) to fall from $1.17/gal in May to average 81 cents/gal in 3Q22, and we expect retail gasoline prices to average $4.27/gal in 3Q22. Diesel wholesale margins in the forecast fall from $1.53/gal in May to $1.07/gal in 3Q22, and retail diesel averages $4.78/gal in 3Q22.

- U.S. refinery utilization averages 94% in 3Q22 in our forecast, as a result of high wholesale product margins. Despite our expectation that refinery utilization will be at or near the highest levels in the past five years, operable refinery capacity is about 900,000 b/d less than at the end of 2019, and as a result, we do not expect total refinery output of products to reach its highest level in the past five years. Although we expect high refinery utilization will help bring wholesale margins down from record levels.

Natural gas

- We expect the Henry Hub spot price to average $8.69 per million British thermal units (MMBtu) in 3Q22, up from an average of $8.13/MMBtu in May. Natural gas prices are rising mainly because of three factors: natural gas inventories that are below the five-year average, steady demand for U.S. liquefied natural gas (LNG) exports, and high demand for natural gas from the electric power sector given limited opportunities for natural gas-to-coal switching. In 2023, we expect the Henry Hub price will average $4.74/MMBtu amid rising natural gas production.

- U.S. natural gas inventories ended May at 2.0 trillion cubic feet (Tcf), which is 15% below the five-year average. We forecast that natural gas inventories will end the 2022 injection season (end of October) at just over 3.3 Tcf, which would be 9% below the five-year average.

- We forecast that U.S. LNG exports will average 11.7 billion cubic feet per day (Bcf/d) during 2Q22 and 3Q22 and 11.9 Bcf/d for all of 2022, a 22% increase from 2021, as a result of additional U.S. LNG export capacity that has come online. Since the end of 2021, the EU and the UK imported record-high LNG volumes because of low natural gas inventories. Europe has become the main destination for U.S. LNG exports and accounted for 74% of total U.S. LNG exports during the first four months of 2022. We forecast LNG exports will average 12.6 Bcf/d in 2023. Expected growth in LNG exports in 2023 results from LNG export terminals that came online in mid-2022 being operational for the whole year in 2023.

- U.S. consumption of natural gas in our forecast averages 85.3 Bcf/d in 2022, up 3% from 2021. Rising U.S. natural gas consumption reflects increased consumption across all sectors. In the residential and commercial sectors, increasing consumption results from colder temperatures in 2022 than in 2021, and in the industrial sector, rising economic activity contributes to higher consumption. Limited natural gas-to-coal switching in the

electric power sector, despite high natural gas prices, results in increased consumption of natural gas for power generation. For 2023, we forecast that natural gas consumption will average 85.1 Bcf/d, about the same as 2022.

- We forecast U.S. dry natural gas production to average 95.7 Bcf/d in June and to average 97.9 Bcf/d in 2H22, which would be 2.7 Bcf/d (3%) more than in 2H21. We expect dry natural gas production to average 101.6 Bcf/d in 2023.

Electricity, coal, renewables, and emissions

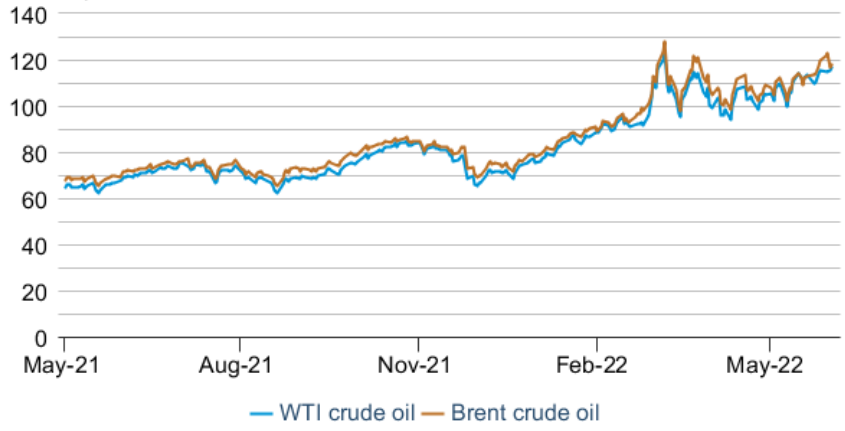
- The largest increases in U.S. electricity generation in the next two years are likely to come from renewable energy sources, driven by expanded generating capacity from these sources. We expect renewable energy will provide 22% of U.S. generation in 2022 and 24% in 2023, up from a share of 20% last year. Solar capacity additions in the electric power sector total 20 gigawatts (GW) for 2022 and 22 GW for 2023. Solar PV installation delays from 2022 to 2023 account for about 1 GW of the expected installed solar capacity. We expect that small-scale (systems less than 1 GW) solar capacity will grow to a total of 39 GW by the end of 2022 and to 46 GW in 2023.We estimate that wind capacity additions in the U.S. electric power sector will total 11 GW in 2022 and 5 GW in 2023.

- The continued retirement of coal-fired generating capacity in the United States contributes to our forecast that the share of electricity generation from coal will decline from 23% in 2021 to 21% in 2022 and to 20% in 2023. The coal fleet has been facing constraints in raising its share of generation despite high natural gas prices. The constraints include limited rail capacity for fuel delivery, low coal stocks at power plants, reduced coal mining capacity, and rising generation from renewable sources.

- Although we expect annual U.S. natural gas fuel costs for electricity generators will increase 59% in 2022, we do not expect a significant decline in generation from natural gas-fired power plants because of the limited ability of coal power plants to act as an alternative source of generation. We forecast the U.S. natural gas generation share will average 37% in 2022, about the same as last year. The forecast natural gas share averages 36% in 2023 as the share of generation from renewable sources increases.

- We forecast the U.S. residential electricity price will average 14.6 cents/kWh between June and August 2022, up 4.8% from summer 2021. The forecast summer commercial sector price averages 12.0 cents/kWh (up 4.7%) and the forecast industrial sector price averages 7.7 cents/kWh (up 3.2%). Higher retail electricity prices largely reflect higher wholesale power prices and higher natural gas prices. We expect the summer increases in retail residential electricity prices will range from an increase of 2.4% in the West South Central region to a 16.1% increase in New England.

- U.S. coal production in the forecast increases by 23 million short tons (MMst) (3.9%) in 2022 to 601 MMst and then declines by 13 MMst (2.1%) to 588 MMst in 2023. The forecast increase occurs despite our expectation that coal use in the electric power sector will decline. We expect rising coal production will replenish electric power sector inventories and contribute to U.S. coal exports.



- We expect energy-related carbon dioxide (CO_2) emissions in the United States to increase 1.3% in 2022 and fall by 0.7% in 2023. Forecast emissions increases in 2022 primarily reflect growth in transportation demand.

Petroleum and Natural Gas Markets Review

Crude oil

Prices: The front-month futures price for Brent crude oil settled at $117.61 per barrel (b) on June 2, 2022, an increase of $10.03/b from the May 2, 2022 price of $107.58/b. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, increased by $11.70/b during the same period, settling at $116.87/b on June 2 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices

eia Data source: CME Group, Intercontinental Exchange, and Bloomberg L.P.
Note: WTI=West Texas Intermediate

The average front-month Brent price in May was $112/b, which was higher than the April average of $106/b and about the same as the March average. Crude oil prices increased at the end of May as COVID-19 restrictions began to ease in Shanghai and Beijing and after the EU announced it will reduce crude oil imports from Russia by 90% by the end of the year. These factors contributed additional upward pressure on prices that have been high because of low inventory levels globally and uncertain supply from Russia following its full-scale invasion of Ukraine.

Many of the key uncertainties that we noted in last month's STEO remain, including:

- The impact of sanctions on Russia in relation to its full-scale invasion of Ukraine and the ongoing effects of current sanctions and private-sector actions
- The potential for new sanctions on Russia, and the pace that the EU implements its partial ban on energy imports from Russia
- The pace of petroleum demand growth through the summer and the potential for demand destruction because of high retail fuel prices
- The volume and timing of new crude oil production that will come online at price levels near or above $100/b
- Renewed concerns over potential resurgences in COVID-19 cases and the nature of individual, business, and government responses
- The ongoing impact of the coordinated release of petroleum supplies from strategic reserves in the United States and in Europe
- Other geopolitical uncertainties related to Libya, the ceasefire in Yemen, or potential new developments on an Iran deal

Although crude oil prices remain high because of low oil inventories and significant geopolitical uncertainty, we estimate that world production of petroleum and other liquids has returned to within 1% of its pre-pandemic level in March 2020. We estimate that U.S. production of crude oil and other liquids averaged 19.9 million b/d in May, which was within 3% of January 2020's record high production of 20.5 million b/d. We also estimate that OPEC crude oil and other liquids production has returned to pre-pandemic levels: May OPEC production was 33.7 million b/d, 1% higher than the first quarter of 2020 (1Q20) OPEC production of 33.4 million b/d. Furthermore, OPEC+ announced on June 2 that they will increase crude oil production targets for July and August. We forecast that OPEC crude oil and total liquid fuels production will increase to 34.6 million b/d in 3Q22, the highest since 2Q19.

After seven consecutive quarters of global oil inventory draws from 3Q20 to 1Q22, we forecast that oil stocks in OECD will generally increase but remain below their five-year average levels until 4Q23. However, in response to the EU ban on seaborne imports of crude oil from Russia and previous sanctions on Russia, we forecast that Russia's oil production will decrease from 11.3 million b/d in 1Q22 to 9.3 million b/d in 4Q23. Our forecast reflects the EU's announcement that that it will impose its crude oil import ban in six months. We assume that about 80% of the crude oil subject to the EU import ban will find alternative buyers, mainly in Asia. Our forecast does not reflect restrictions on shipping insurance, as details regarding such restrictions were not available when we finalized this forecast on June 2. The possibility that these sanctions or other potential future sanctions reduce Russia's oil production by more than expected creates upward risks for crude oil prices during the forecast period. We forecast the Brent crude oil price will average $111/b in 3Q22 and $97/b in 2023.

Ratio of S&P 500 to Brent crude oil: The value of the S&P 500, an equity index of widely traded U.S. public companies, has been decreasing both in nominal value and in terms of its ratio to the price of Brent crude oil. After peaking in April 2020 when the value of the S&P 500 index was 104 times the value of Brent crude oil, the ratio has decreased to 36 in May 2022 **(Figure 2)**.

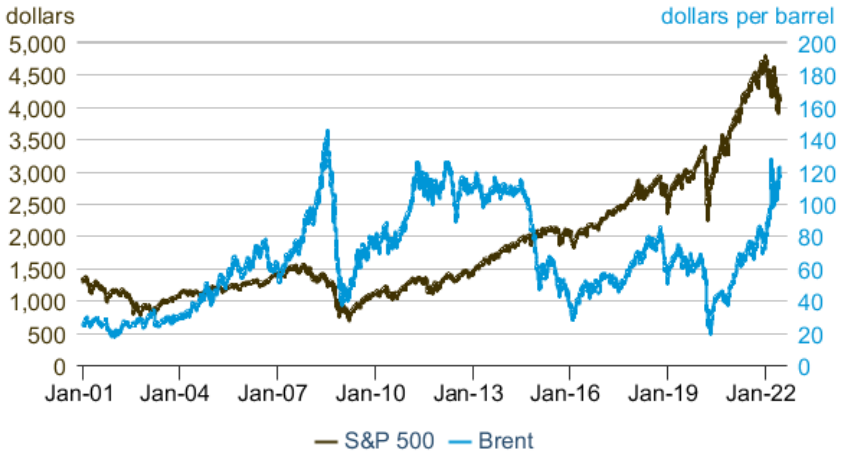


Figure 2. Ratio of S&P 500 to the price of Brent crude oil

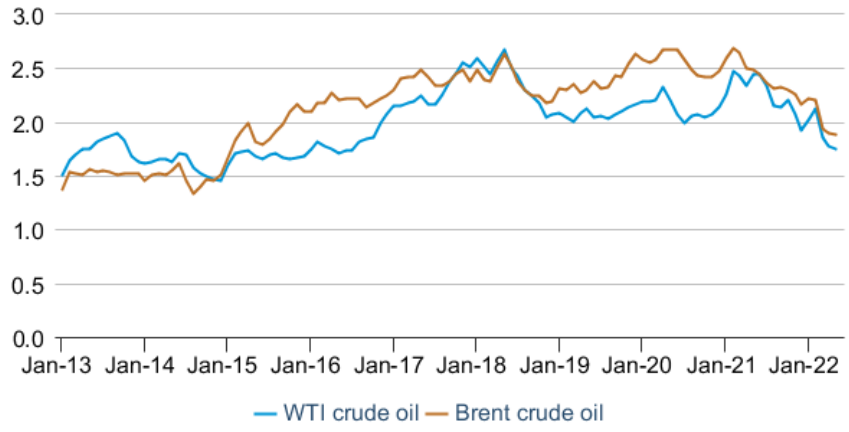
eia Data source: CME Group, Intercontinental Exchange, and Bloomberg L.P.

Historically, the ratio between the S&P 500 and crude oil prices changes when factors specific to oil supply or demand affect oil prices more than general economic growth alone would. Most of the decrease in the ratio since April 2020 can be attributed to increasing crude oil prices. Front-month future prices for Brent crude oil averaged $27/b in April 2020 and averaged $112/b in May 2022 **(Figure 3)**. Although the S&P 500 index has also increased since April 2020, it has decreased in recent months from its December 2021 highs, and this decline explains much of the decrease in the ratio in 2022.

Figure 3. S&P 500 and Brent crude oil prices



eia Data Source: CME Group, Intercontinental Exchange, and Bloomberg L.P

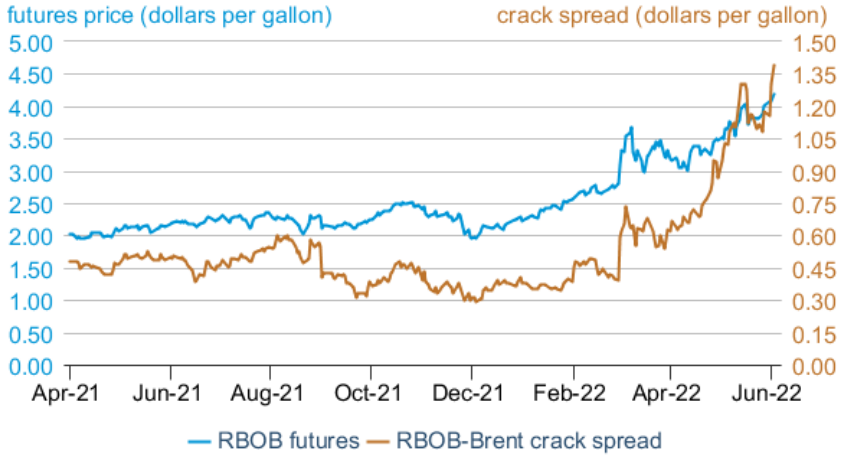
In the second half of 2020 (2H20) and much of 2021, the ratio between the S&P 500 and crude oil prices was stable because economic growth was reflected in rising profitability of companies as well as higher demand and prices for oil. However, recently, crude oil prices have been driven mostly by sector-specific, supply-side restraints that have lingered since the onset of the COVID-19 pandemic and that have become more prominent following Russia's full-scale invasion of Ukraine.

Rising oil prices have contributed to inflation and have increased input costs for companies. Inflation concerns have led the Federal Reserve to increase interest rates, which has further increased company borrowing costs. Higher input costs from inflation combined with increased borrowing costs could lead to lower net income for companies in the S&P 500, a factor that may be contributing to lower equity prices. Aside from some of the companies that produce and refine petroleum, which make up less than 3% of the S&P 500, companies in the S&P 500 have mostly experienced decreasing stock values while crude oil prices remain elevated. The S&P 500 decreased in value by 12% from the January average to May average although the Brent crude oil price has increased 31%.

Open interest: The average daily open interest of Brent and WTI oil futures markets have generally been declining since February 2021. Open interest is a measure of the total outstanding number of contracts for a commodity at a single point in time, and a decreasing open interest indicates that the number of unsettled contracts for the commodity is decreasing because either traders are not opening positions for the commodity or traders are closing positions. The average daily open interest for Brent was 1.88 million contracts in May, the lowest since July 2015, and for WTI was 1.74 million, the lowest since July 2016 **(Figure 4)**.

Figure 4. Average daily open interest in Brent and WTI futures contracts

eia Data source: CME Group, Intercontinental Exchange, and Bloomberg L.P.
Note: WTI=West Texas Intermediate



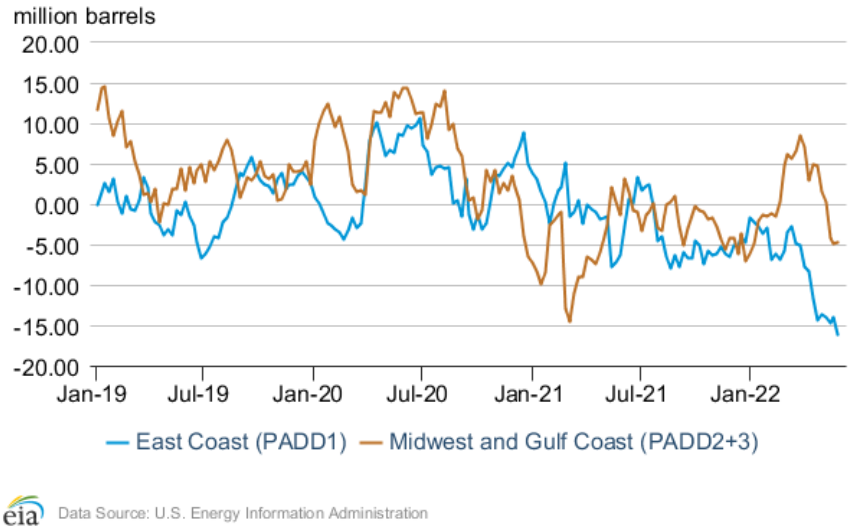
Based on the weekly U.S. Commodity Futures Trading Commission (CFTC) Commitments of Traders data, WTI futures open interest declined from the first week of 2022 to the week ending

May 24 as a result of the closure of long and short positions by Producers and Merchants as well as Swap Dealers. The Producers and Merchants category and Swap Dealers category typically represent participants in the futures market whose primary purpose is risk management in the production or processing of a commodity. Fewer futures contracts held by these traders suggest some producers or end users could be reducing their hedging activity, in part, because higher commodity prices and higher volatility are likely making it more expensive to hedge. In addition, higher interest rates may be increasing the costs of opening a futures position, such as higher margin rates.

Petroleum products

Gasoline prices: The front-month futures price of RBOB (the petroleum component of gasoline used in many parts of the country) settled at $4.19 per gallon (gal) on June 2, up 68 cents/gal from May 2 **(Figure 5)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) settled at $1.39/gal on June 2, up 44 cents/gal during the same period.

Figure 5. Historical RBOB front-month futures prices and crack spreads



Data Source: CME Group, Bloomberg L.P.
Note: RBOB is the petroleum component of gasoline used in many parts of the country.

Rising crude oil prices and the news of the EU's phasing out of crude oil and petroleum product imports from Russia contributed to a rising gasoline wholesale price and crack spread during the first trading days of June. High crack spreads in the middle of the month contributed to monthly average crack spreads of $1.13/gal during May, an increase from $0.73/gal in April. Relatively lower refinery production (compared with pre-COVID levels), lower imports in April, and increasing seasonal demand for gasoline moving into the summer have contributed to lower gasoline inventories in the United States. The low inventories are most pronounced along the East Coast, the highest demand region in the United States, which has in turn contributed to higher gasoline prices in the region, including at New York Harbor (NYH). Far more gasoline is

consumed in the East Coast than is produced, and imports and transfers from other regions in the United States help meet its consumption needs.

In April, low inventories along the East Coast were partially offset by higher inventories along the Gulf Coast and in the Midwest (although capacity to transfer gasoline from the Midwest to the East Coast is more limited than capacity to transfer from the Gulf Coast). By the end of April, gasoline inventories on the East Coast were 14 million barrels below their five-year (2017–2021) average levels **(Figure 6)**. At the same time, combined Gulf Coast and Midwest inventories were almost 2 million barrels above their five-year average level. In May, East Coast gasoline inventories remained low and did not decrease much further, while Midwest and Gulf Coast inventories drew down substantially. On May 27, combined Gulf Coast and Midwest inventories were down by 6 million barrels from their end-April levels while East Coast gasoline inventories were down by almost 1 million barrels. As a result, net inventories in the United States continued to decrease through the month, contributing to increased crack spreads to meet increased demand for gasoline.

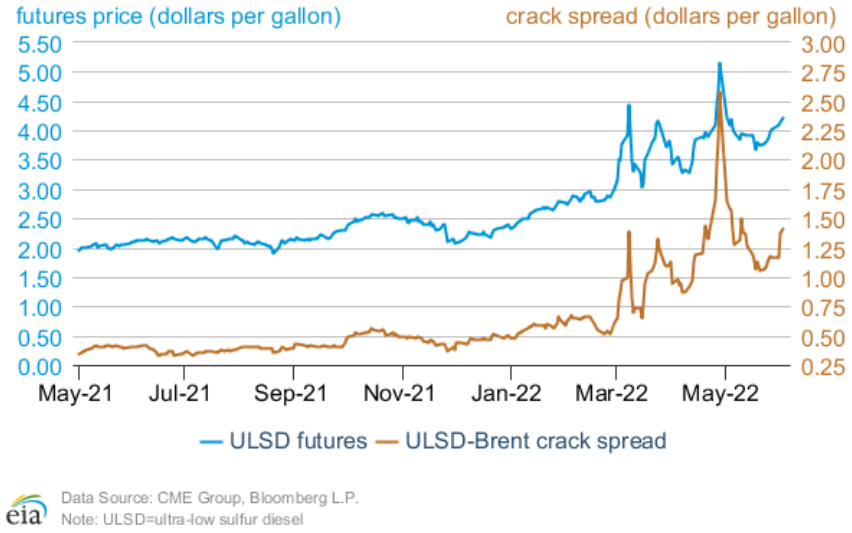


Figure 6. Weekly total gasoline inventory minus rolling 5-year average

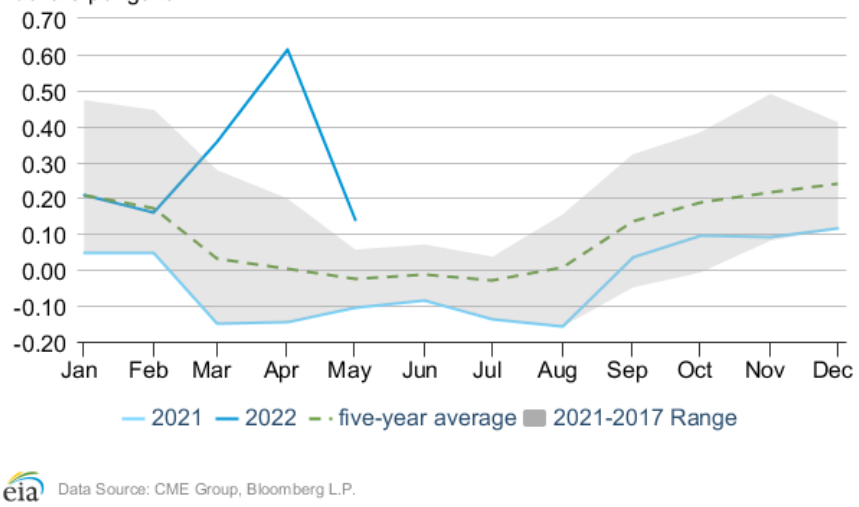
eia Data Source: U.S. Energy Information Administration

Ultra-low sulfur diesel prices: The front-month futures price for ultra-low sulfur diesel (ULSD) for delivery in New York Harbor settled at $4.21/gal on June 2, almost unchanged from May 2 **(Figure 7)**. The ULSD-Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) decreased by 24 cents/gal during the same period and settled at $1.41/gal on June 2.

Figure 7. Historical ULSD front-month futures prices and crack spreads

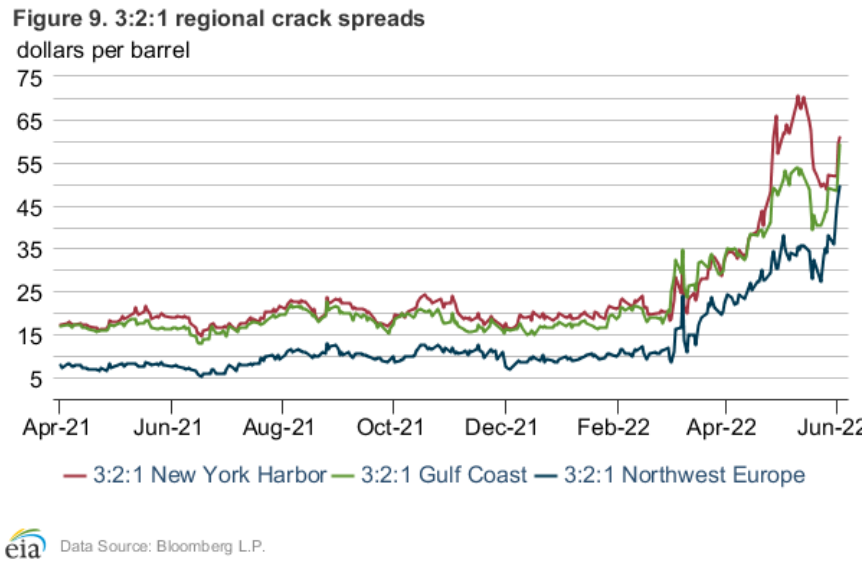
Data Source: CME Group, Bloomberg L.P.
Note: ULSD=ultra-low sulfur diesel



Front-month ULSD prices and crack spreads in May fell from recent record highs at the end of April, albeit to levels much higher than the historical norm. The ULSD-Brent crack spread averaged $1.27/gal during May, 8 cents/gal less than the all-time average high of $1.35/gal during April but still 30 cents/gal higher than the second-highest recorded monthly average of 97 cents/gal in March 2022. In real terms, the last time crack spreads were close to these levels was in May 2008, when the crack spread averaged 86 cents/gal when adjusted to 2022 dollars. The ULSD front-month futures price averaged $3.92/gal during May, 6 cents/gal higher than April.

Tight global distillate markets and low domestic inventories kept ULSD prices high in May. U.S. distillate inventories increased for the first time this year, building by 2.5 million barrels (2.3%) over April. However, inventories remained 25% below the five-year average. We estimate domestic consumption averaged 3.9 million b/d in May, a 2% increase over April and the first time consumption increased from April to May since 2018. We estimate distillate imports, which would normally increase to help rebuild low inventories and moderate prices, were below the five-year average at 145,000 b/d for the four weeks ending May 27. If confirmed in monthly data, this recent decrease in distillate imports would signal that global demand remains strong as markets continue to adjust to sanctions on Russia's exports, reduced export quotas in China, and overall lower global refinery capacity.

ULSD-RBOB future price spreads: Front-month ULSD and RBOB futures typically follow seasonal trends: RBOB trades at a premium in the summer months during the peak summer driving season and ULSD trades at a premium when heating fuel demand is highest in the winter **(Figure 8)**. Gasoline prices usually start trading at a premium to ULSD prices in March when the RBOB futures contract represents the more expensive summer grade of gasoline. However, global demand for distillate and reduced distillate exports from Russia, a major exporter of distillate fuel to Europe, have disrupted this trend. ULSD front-month futures traded at an average

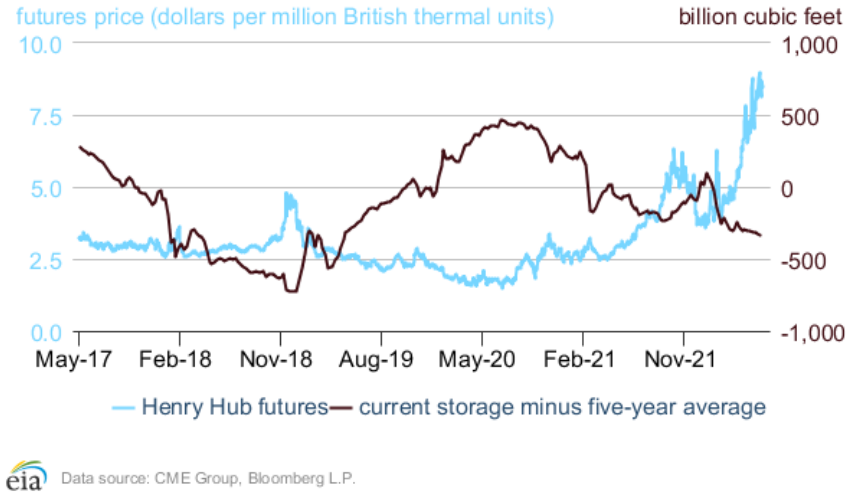


monthly premium to RBOB of 61 cents/gal in April, the highest April premium in real terms in data going back to 2006. Although ULSD has previously traded at a premium during the spring, typically with historically low gasoline prices, RBOB prices in real terms are currently at a nine-year high and RBOB crack spreads are higher than seasonal norms. The ULSD-RBOB spread decreased to 14 cents/gal in May but remains elevated compared with the historical average. ULSD futures prices were relatively flat in May while RBOB futures prices increased by 16% from the start of the month.

Figure 8. ULSD-RBOB front-month futures price spread

eia Data Source: CME Group, Bloomberg L.P.

Regional refinery crack spreads: Inventories for gasoline and diesel in the United States are low at the same time that they are similarly low in Europe and elsewhere in the Atlantic Basin, contributing to broad increases in crack spreads for both products. The reduction in refining capacity along the East Coast appears to have contributed to particularly high product price premiums. The 3:2:1 crack spread (reflecting the price of two barrels of gasoline and one barrel of diesel, minus three barrels of crude oil) at NYH increased far more than the same spread in Europe or along the U.S. Gulf Coast in April and May **(Figure 9)**. The Northwest Europe (NWE) 3:2:1 crack spread is often lower than the U.S. Gulf Coast or NYH crack spreads, which reflects the relatively higher demand for gasoline in the United States and the larger weighting that gasoline has in the 3:2:1 spread calculation. Higher U.S. crack spreads suggest greater market pressure to increase refinery production from U.S. markets than markets in Europe, based on the wholesale prices of gasoline, diesel, and crude oil (although the 3:2:1 crack spread does not account for other factors such as regulatory costs, electricity prices, variations in crude oil input costs, or the value of other refined products).



Initially, the impact of Russia's full-scale invasion of Ukraine coincided with a narrowing difference between North American and European crack spreads. In March 2022, the NYH monthly average 3:2:1 crack spread was 56% higher than NWE, reaching its narrowest point in percentage terms since before the onset of the COVID-19 pandemic. The narrowing likely reflected the impact of higher petroleum product prices in Europe related to concerns that European importers may stop taking gasoline and diesel volumes from Russia. However, the difference between the crack spreads has since widened to 74% in May, reflecting increasing demand and low inventories for diesel and for gasoline, particularly on the U.S. East Coast. We expect crack spreads for gasoline and distillate to decrease in 3Q22 as increasing refinery runs partially reduce prices compared with their current levels. However, the impact of capacity constraints—both in the United States and globally—will continue to limit increases in both production and inventories and will contribute to above-average crack spreads, on top of higher crude oil prices, through the end of 2022.

Natural gas

***Prices*:** On June 2, 2022, the front-month natural gas futures contract for delivery at the Henry Hub settled at $8.49 per million British thermal units (MMBtu), up $1.01/MMBtu from May 2, 2022 **(Figure 10)**. The average closing price for front-month natural gas futures contracts in May was $8.16/MMBtu, the highest May monthly average in real terms since May 2008.

Figure 10. U.S. natural gas front-month futures prices and current storage deviation from five-year average

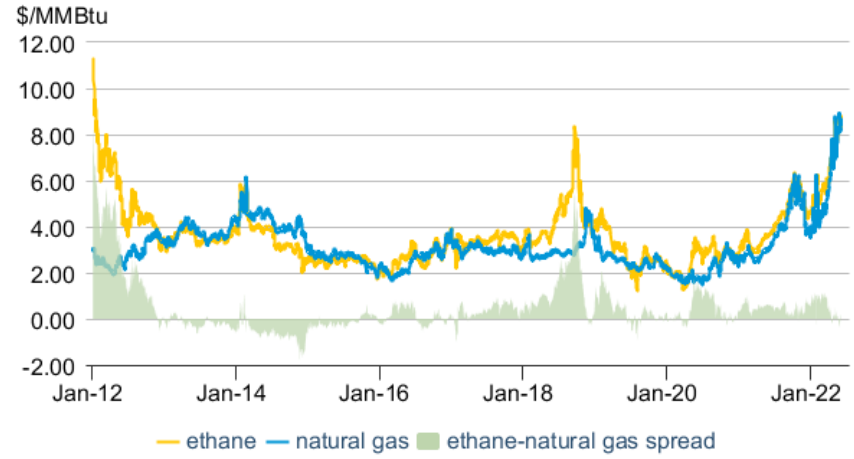
High demand for natural gas in the electric power sector and for U.S. liquefied natural gas (LNG) exports amid relatively flat natural gas production thus far in 2022 has kept U.S. natural gas inventories below the five-year (2017–2021) average and has contributed to high natural gas prices. Natural gas stock builds in May were 386 billion cubic feet (Bcf), compared with the five-year average build of 417 Bcf. At the end of May, natural gas inventories were 1,983 Bcf, which was 351 Bcf (15%) lower than the five-year average. The below-average storage builds at the beginning of this injection season along with our forecast of average storage injections this summer mean that we expect natural gas inventories to begin the winter heating season below average.

Natural gas consumption in the electric power sector averaged 30.2 Bcf/d in May, which was 3.9 Bcf/d higher than last year and 4.2 Bcf/d higher than the five-year average. We estimate U.S. LNG exports averaged 11.6 Bcf/d in May, which was 1.5 Bcf/d higher than last year and 0.2 Bcf/d higher than the average from January through April 2022. High exports are being supported by high international LNG prices, as well as by additional export capacity created by a new U.S. LNG export facility, Calcasieu Pass LNG, which continues to ramp up exports.

***Futures price spreads*:** The natural gas 1st–13th price spread averaged $3.37/MMBtu in May, the highest average monthly backwardation (where near-term contract prices are higher than longer-dated contract prices) on record **(Figure 11)**. Natural gas futures prices have been increasingly backwardated since early March. The 1st–13th price spread averaged $1.28/MMBtu in March and $2.36/MMBtu in April. Often, the 1st–13th price spread increases when natural gas inventories are below the five-year range, and the price spread often decreases when inventories are above the five-year range. Low storage inventories to start the injection season, lower-than-expected production levels compared with late 2021 production levels, continued high demand for U.S. LNG exports, and high demand from the electric power sector are all

contributing to near-term natural gas prices being much higher now compared with natural gas futures prices for delivery next year.

Figure 11. Natural gas 1st – 13th futures price spread



eia Data source: CME Group, Bloomberg L.P.

We expect Henry Hub natural gas prices to remain high throughout the summer, averaging $8.69/MMBtu in 3Q22, because opportunities for natural gas-to-coal switching for power generation have been limited by rail capacity for fuel delivery, low coal stocks in the electric power sector, reduced coal mining capacity, and rising generation form renewable sources. Additionally, we expect U.S. natural gas production increases will take several months to emerge, and continued high levels of LNG exports will contribute to high natural gas demand.

Ethane-natural gas price spread: U.S. production of ethane, a hydrocarbon gas liquid (HGL) produced primarily in natural gas processing plants, has grown rapidly since 2013. Ethane is primarily used in the petrochemical industry, where it is used as a feedstock at ethylene crackers. Ethane is typically priced at a premium to natural gas because it reflects the costs of extracting it from the natural gas production stream and transporting it to a petrochemical facility. The premium of ethane to natural gas averaged 47 cents/MMBtu in 2021 and 86 cents/MMBtu in 1Q22, but it decreased in April and May **(Figure 12)**.

Figure 12. Natural gas futures and ethane spot prices

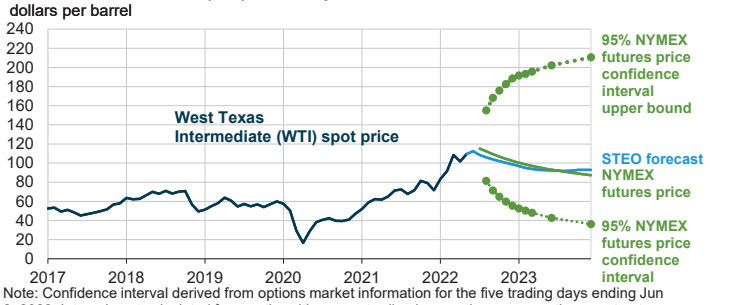
eia Data source: CME Group, Bloomberg L.P.

The monthly premium averaged 17 cents/MMBtu in April, and the price of ethane fell to 1 cent/MMBtu below the price of natural gas in May, as the value of natural gas for use as energy increased. When the price of ethane decreases relative to the price of natural gas, it becomes less economical to extract ethane from natural gas production streams. This situation can lead to more ethane rejection, which is when natural gas processing plant operators choose to leave ethane in the processed natural gas (provided the processed natural gas meets pipeline specifications) and sell it into the natural gas market. More ethane rejection means more ethane will be sold as natural gas, increasing the supply of natural gas. Additionally, because ethane contains more energy than natural gas for the same volume, more ethane rejection increases the energy content of the natural gas stream. More ethane rejection also means a reduction in the amount of ethane supplied to petrochemical facilities or to export facilities. At the same time, rates of ethane rejection are determined by factors other than ethane's price spread with natural gas, such as ethylene margins in the petrochemical sector, individual contract specifications with producers and consumers, and the share of ethane allowed in the natural gas stream by pipeline specification.

Ethane consumption, both domestic and international, grew throughout 2021 We expect U.S. consumption to grow further in 2022 because of additions in U.S. petrochemical capacity, as three new crackers—Baystar and Gulf Coast Growth Ventures in Texas and Shell Chemical Appalachia in Pennsylvania—ramp up production. In addition, a cracker designed to use ethane imported from the United States as a feedstock is expected to come online in China, contributing to our expectation that U.S. ethane exports will increase.

Notable forecast changes

- This STEO incorporates the assumption that the EU will ban seaborne crude oil and petroleum product imports from Russia. We assume the crude oil import ban will be imposed in six months and the petroleum product import ban in eight months. This forecast does not reflect restrictions on shipping insurance, as details regarding such restrictions were not available when we finalized this forecast on June 2. Preliminary estimates for Russia's total liquid fuels production in May show growth of 0.1 million b/d in May compared with April. Our previous forecast was for a 0.5 million b/d month-over-month decline. This change in the May production results in a 0.6 million b/d net increase in Russia's production for May 2022 compared with last month's forecast. We now expect Russia's production to decline by 1.1 million b/d from May 2022 through the end of 2023. In the May STEO, we expected a decline of 0.8 million b/d over that period.
- You can find more information in the detailed table of forecast changes.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The views in this report therefore should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on June 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Average for all sulfur contents.

(b) Average self-service cash price.

(c) Includes fuel oils No. 4, No. 5, No. 6, and topped crude.

- = no data available

Notes: EIA completed modeling and analysis for this report on June 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation; prices exclude taxes unless otherwise noted.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Marketing Monthly* , DOE/EIA-0380; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; and *Monthly Energy Review* , DOE/EIA-0035.

Natural gas Henry Hub and WTI crude oil spot prices from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on June 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on June 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on June 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on June 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

Notes: EIA completed modeling and analysis for this report on June 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on June 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on June 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Total Raw Steel Production (Million short tons per day)	**0.246**	**0.258**	**0.267**	**0.260**	**0.253**	*0.251*	*0.262*	*0.271*	*0.276*	*0.278*	*0.307*	*0.327*	**0.258**	*0.259*	*0.297*
Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.91**	**1.93**	**2.03**	**2.05**	**2.19**	*2.14*	*2.00*	*1.98*	*2.05*	*2.07*	*2.06*	*2.03*	**1.98**	*2.07*	*2.05*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on June 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on June 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on June 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on June 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on June 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on June 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Table 8a. U.S. Renewable Energy Consumption (Quadrillion Btu)

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distrib

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Subtotals for the industrial and commercial sectors might not equal the sum of the components. The subtotal for the industrial sector includes ethanol consumption that is not shown separately. The subtotal for the commercial sector includes ethanol and hydroelectric consumption that are not shown separately.

(f) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(g) Fuel ethanol and biodiesel, renewable diesel, and other biofuels consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on June 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum Supply*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on June 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

- = no data available

SAAR = Seasonally-adjusted annual rate

Notes: EIA completed modeling and analysis for this report on June 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on June 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on June 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Appendix to the June 2022 *Short-Term Energy Outlook*

This appendix is prepared in fulfillment of section 1245(d)(4)(A) of the National Defense Authorization Act (NDAA) for Fiscal Year 2012, as amended. The law requires the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy, to submit to Congress a report on the availability and price of petroleum and petroleum products produced in countries other than Iran in the two-month period preceding the submission of the report. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The data in this appendix, therefore, should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

EIA consulted with the U.S. Department of the Treasury, the U.S. Department of State, and the intelligence community in the process of developing the NDAA report, which was previously published as a stand-alone report. Detailed background and contextual information not repeated here can be found in early editions of the NDAA report.

This appendix is published in the *Short-Term Energy Outlook* in even numbered months.

Table a1. Summary of Estimated Petroleum and Other Liquids Quantities

	Apr 2022	May 2022	Apr 2022 – May 2022 Average	Apr 2021 – May 2021 Average	2019 – 2021 Average
Global Petroleum and Other Liquids (million barrels per day)					
Global Petroleum and Other Liquids Production (a)	98.6	99.1	98.9	94.4	96.5
Global Petroleum and Other Liquids Consumption (b)	97.7	98.6	98.2	95.2	96.7
Biofuels Production (c)	2.5	3.0	2.7	2.8	2.7
Biofuels Consumption (c)	2.6	2.6	2.6	2.6	2.6
Iran Liquid Fuels Production	3.7	3.6	3.6	3.5	3.2
Iran Liquid Fuels Consumption	1.8	2.0	1.9	1.6	1.9
Petroleum and Petroleum Products Produced and Consumed in Countries Other Than Iran (million barrels per day)					
Production (d)	92.4	92.6	92.5	88.1	90.6
Consumption (d)	93.3	94.0	93.7	91.0	92.3
Production minus Consumption	-0.9	-1.4	-1.2	-3.0	-1.6
World Inventory Net Withdrawals Including Iran	-0.9	-0.5	-0.7	0.9	0.1
Estimated OECD Inventory Level (e) (million barrels)	2,627	2,647	2,637	2,913	2,943
Surplus Production Capacity (million barrels per day)					
OPEC Surplus Crude Oil Production Capacity (f)	3.0	3.0	3.0	6.5	4.3

Note: The term "petroleum and other liquids" encompasses crude oil, lease condensate, natural gas liquids, biofuels, coal-to-liquids, gas-to-liquids, and refinery processing gains, which are important to consider in concert due to the inter-related supply, demand, and price dynamics of petroleum, petroleum products, and related fuels.

(a) Production includes crude oil (including lease condensates), natural gas liquids, other liquids, and refinery processing gains.

(b) Consumption of petroleum by the OECD countries is synonymous with "products supplied," defined in the glossary of the EIA Petroleum Supply Monthly, DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel, and loss, and bunkering.

(c) Biofuels production and consumption are based on EIA estimates as published in the International Energy Statistics. Biofuels production in the third quarter tends to be at its highest level in the year as ethanol production in Brazil reaches its seasonal peak and is typically lowest in the first quarter as seasonal production falls in the South/South-Central region of Brazil.

(d) Global production of petroleum and petroleum products outside of Iran is derived by subtracting biofuels production and Iran liquid fuels production from global liquid fuels production. The same method is used to calculate global consumption outside of Iran.

(e) Estimated inventory level is for OECD countries only.

(f) EIA defines surplus oil production capacity as potential oil production that could be brought online within 30 days and sustained for at least 90 days, consistent with sound business practices. This does not include oil production increases that could not be sustained without degrading the future production capacity of a field.

Independent Statistics & Analysis
U.S. Energy Information Administration

July 2022

Short-Term Energy Outlook

Forecast highlights

- The July *Short-Term Energy Outlook* (STEO) is subject to heightened uncertainty resulting from a variety of factors, including Russia's full-scale invasion of Ukraine. The possibility of economic activity being less robust than assumed in our forecast could result in lower-than-forecast energy consumption. Factors driving uncertainty about energy supply include how sanctions affect Russia's oil production, the production decisions of OPEC+, and the rate at which U.S. oil and natural gas production rises.
- The spot price of Brent crude oil averaged $71 per barrel (b) in 2021, and we forecast the Brent price will average $104/b in 2022 and $94/b in 2023.
- Global oil inventories in the forecast rise by 0.8 million barrels per day (b/d) in 2022 and remain unchanged in 2023. Inventory builds in 2022 reflect rising production of liquid fuels in the United States and OPEC, paired with slowing liquid fuels consumption growth.
- We expect global consumption of liquid fuels will grow by 2.2 million b/d in 2022 and by 2.0 million b/d in 2023.
- We forecast that OPEC crude oil production will rise by 2.4 million b/d to average 28.7 million b/d in 2022 and will further increase to 29.3 million b/d in 2023. Crude oil production from OPEC members averaged 26.3 million b/d in 2021.
- U.S. crude oil production in our forecast averages 11.9 million b/d in 2022 and 12.8 million b/d in 2023, which would set a record for most U.S. crude oil production in a year. The current record is 12.3 million b/d, set in 2019.
- U.S. regular gasoline retail prices averaged $4.11 per gallon (gal) in the first half of 2022 (1H22), up from $2.78/gal in 1H21. We forecast gasoline prices will average $4.05/gal in 2022 and $3.57/gal in 2023. U.S. diesel prices averaged $4.91/gal in 1H22, up from $3.06/gal in 1H21. We forecast diesel prices will average $4.73/gal in 2022 and $4.07/gal in 2023.
- U.S. refineries average 94% utilization in the third quarter of 2022 (3Q22) in our forecast, as a result of high wholesale product margins. Although we expect that refinery utilization will be at or near the highest levels in the past five years, operable

U.S. refinery capacity has fallen by about 1 million b/d. As a result, we do not expect U.S. refinery output of products to reach its highest level in the past five years.

- The spot price of natural gas at Henry Hub averaged $6.07 per million British thermal units (MMBtu) in the first half of 2022 (1H22). The average price increased in each month from January through May, when it reached $8.14/MMBtu before declining to $7.70/MMBtu in June. We expect the Henry Hub spot price will average $5.97/MMBtu in 2H22 and average $4.76/MMBtu in 2023.

- We estimate that U.S. liquefied natural gas (LNG) exports averaged 11.2 billion cubic feet per day (Bcf/d) in 1H22, compared with 9.5 Bcf/d in the same period in 2021. We expect LNG exports to average 10.9 Bcf/d in 2022 and 12.7 Bcf/d in 2023. We reduced our forecast for LNG exports in 2H22 as a result of the outage at the Freeport LNG export facility in Texas. Our forecast assumes the facility will return to near full operations in January 2023.

- U.S. dry natural gas production in the forecast averages 96.2 Bcf/d in 2022, up 2.7 Bcf/d (3%) from 2021. We forecast average production will increase to almost 100.0 Bcf/d in 2023.

- Compared with the 2021, U.S. natural gas consumption in the forecast will increase by 2.9 Bcf/d (3%) to average 85.9 Bcf/d in 2022 and then fall to 85.4 Bcf/d in 2023.

- We forecast U.S. natural gas inventories will end October 2022, the end of the 2022 storage injection season, at almost 3.5 trillion cubic feet, which would be 6% below the 2017–21 average for the end of October and down 5% from October 2021.

- U.S. consumption of electricity increases in the forecast by 2.3% in 2022, largely because of rising economic activity. Growth in electricity consumption slows to 0.6% in 2023.

- The largest increases in U.S. electricity generation in our forecast come from renewable energy sources, mostly solar and wind. We expect renewable sources will provide 22% of U.S. generation in 2022 and 24% in 2023, up from a share of 20% in 2021.

- We forecast that the cost of natural gas to U.S. power generators will rise from $4.97/MMBtu in 2021 to $6.35/MMBtu in 2022. Despite the increase, we forecast the share of natural gas in U.S. generation will average 37% in 2022, about the same as last year. The similar share of natural gas generation despite higher prices results partly from our forecast that electricity generation from coal will decline from 23% of the total in 2021 to 21% in 2022 and to 20% in 2023, which reflects the continued retirement of coal-fired generating capacity and other coal market constraints.

- We forecast the U.S. residential electricity price will average 14.4 cents per kilowatthour in 2022, up 5.3% from 2021. Higher retail electricity prices largely reflect an increase in

wholesale power prices driven by rising natural gas prices. Annual average wholesale prices for 2022 range from an average of $50 per megawatthour (MWh) in the Southwest Power Pool market to $85/MWh in the ISO New England market.

- We expect energy-related carbon dioxide (CO_2) emissions in the United States to increase by 1.5% in 2022 and remain generally unchanged in 2023.

Global liquid fuels

After more than two years of price volatility in global oil markets stemming from responses to the COVID-19 pandemic, Russia's full-scale invasion of Ukraine has added further uncertainty and volatility to markets in 2022. Global oil consumption has outpaced the global oil supply since mid-2020, which, combined with the increased risk that global oil supply could be constrained, has put significant upward pressure on both crude oil and petroleum product prices. Because production has not kept up with demand, commercial oil inventories in the OECD have fallen outside of their five-year (2017–2021) range and are near their lowest levels since 2014.

Oil consumption outpacing oil production has led to persistent withdrawals from global oil inventories. We estimate that global oil inventories declined for seven consecutive quarters starting in the third quarter of 2020 (3Q20) and continuing through 1Q22. Inventories declined at an average rate of 1.4 million barrels per day (b/d) over that period. The Brent crude oil spot price increased from an average of $43 per barrel (b) in 3Q20 to an average of $114/b in 2Q22.

For 2Q22, we estimate that inventories rose for the first time on a quarterly basis in two years. We expect global oil inventories will rise by an average of 0.8 million b/d in 2022 and be mostly unchanged in 2023. Inventory builds in 2022 generally put downward pressure on crude oil prices. However, we expect prices to stay elevated as inventories remain below their recent five-year average for most of the forecast, which will likely keep crude oil prices volatile. The Brent price averages $104/b in 2022 and $94/b in 2023 in our forecast.

Uncertainty in global oil markets has increased during 2022. On the demand side, the impacts of COVID-19 restrictions on oil consumption have increasingly been centered in China. In addition, given the potential for high fuel prices, inflation, and slowing economic activity, fuel demand might decrease in the coming months. On the supply side, heightened geopolitical risks and uncertainty stemming from Russia's full-scale invasion of Ukraine have increased. The full impact of sanctions against Russia remains uncertain. There is additional uncertainty about whether OPEC+ members will meet their increasing production targets and the responsiveness of new crude oil production to current high prices.

***Global petroleum and other liquid fuels consumption*.** We forecast global consumption of petroleum and other liquid fuels will grow by 2.2 million b/d in 2022. This growth is less than our January STEO forecast 2022 growth of 3.6 million b/d. Our reduced consumption forecast reflects the reduced global GDP forecast and the COVID-related lockdowns in China during the

first half of 2022 (1H22). Our global economic forecasts come from Oxford Economics, which forecasts GDP will increase by 3.2% in 2022 compared with the 4.5% we used in the January STEO. Forecasted GDP grows by 3.3% in 2023, and global consumption of petroleum and other liquid fuels grows by 2.0 million b/d in 2023.

We forecast of OECD oil consumption grows by 1.2 million b/d in 2022, and non-OECD consumption grows by 1.0 million b/d. If realized, 2022 would be the first year growth in oil consumption in the OECD outpaces growth in non-OECD consumption since 1999. Economic growth is the main driver of oil consumption growth throughout the forecast, but how higher oil prices, increasingly tight monetary policy, and a stronger U.S. dollar will affect world oil consumption in 2H22 and 2023 remains uncertain.

Many countries have significantly eased or have eliminated the restrictions on travel, mobility, and economic activity that were imposed to lessen the spread of COVID-19. China has been an exception; the government imposed a strict city-wide lockdown in Shanghai, is conducting mass testing, and is isolating significant portions of the population in an effort to control an outbreak of COVID-19 that occurred in March 2022. The lockdown in Shanghai continued for nearly all of 2Q22 and severely limited mobility and business activity in that city. Many of China's larger cities, including Beijing, also experienced COVID-19 outbreaks in 2Q22 that restricted mobility and business activity, although less so than in Shanghai. The outbreaks of COVID-19 in China and related restrictions lowered China's oil consumption in 2Q22. Although the government began easing restrictions in a number of China's cities in May 2022, some limitations on business activity and mobility continue and are expected to linger into 3Q22. Oil demand in China could fall further than we expect in the event of future outbreaks.

Non-OPEC production of petroleum and other liquid fuels. We expect non-OPEC production will increase by 2.2 million b/d in 2022 and by an additional 0.6 million b/d in 2023. The United States leads production growth among non-OPEC countries in our forecast, and Brazil, Canada, and Norway also contribute significantly to growth. Production increases in these countries more than offset a decline in Russia's driven by sanctions and independent corporate actions.

This forecast reflects the implementation of the European Union's (EU) sixth package of sanctions on Russia, with imposition of a crude oil import ban by early December 2022 and petroleum products import ban by early February 2023. These sanctions will ban most EU crude oil and petroleum product imports from Russia and will prohibit EU companies from providing certain services, including insurance and reinsurance, to ships that carry Russian oil cargoes. We assume that the United Kingdom will implement similar services sanctions, including insurance and reinsurance. However, the EU's sixth package of sanctions does not ban EU-owned and EU-operated tankers from transporting Russian crude oil and products.

Our forecast assumes that although some EU shippers will no longer participate in the trade of Russia's crude oil and petroleum products, sufficient shipping capacity exists to carry Russia's

previous exports to the EU to alternative (non-EU) destinations instead. We expect that about half of these petroleum products will go to countries in Africa and Asia and that most of these crude oil exports could find alternative buyers, mainly in Asia.

We also assume that given the timeline of the implementation of sanctions, tanker owners and operators will be able to secure alternative services, including sovereign guarantees or alternative insurance and reinsurance policies, to replace most of those currently provided by EU and UK companies. Some shippers currently involved in trade with Russia will voluntarily stop shipping Russia's oil.

Our assumptions about the EU import ban and the reduced availability of shippers are reflected in our lower forecast on Russia's crude oil production for 2023. Russia's production will ultimately depend on how markets and trade flows evolve based on these sanctions as well as any other potential future sanctions. We forecast Russia's production of liquid fuels will fall to an average of 10.4 million b/d by 4Q22, down from 11.3 million b/d in 1Q22. We expect that Russia's production will fall to 9.1 million b/d by the end of 2023.

Brazil's liquid fuels production in our forecast increases from 3.7 million b/d in 2021 to 3.9 million b/d in 2022 and to 4.1 million b/d in 2023. Our forecast assumes that production from six new floating production storage and offloading (FPSO) units will ramp up through 2023 and continue to drive growth, notably at the Sepia, Mero, and Buzios fields.

Liquid fuels production in Canada in our forecast rises by 0.2 million b/d in 2022 and by 0.1 million b/d in 2023, bringing production to 5.9 million b/d in 2023. Canada's production growth is driven primarily by oil sands expansion and debottlenecking projects following the expansion of the Enbridge Line 3 pipeline (with a capacity of 760,000 b/d), which became operational in October 2021. The TransMountain pipeline expansion project (with a capacity of 890,000 b/d) is set to begin service at the end of 2023. Additional expansions and optimizations to Enbridge's existing pipeline system, if completed, will add more than 400,000 b/d of export capacity over the forecast period. This new pipeline capacity from Enbridge and other planned pipeline expansions will reduce existing constraints on Canada's crude oil exports by the end of 2023.

We forecast that production of liquid fuels in Norway will remain mostly flat in 2022, but we expect it to increase by 0.3 million b/d in 2023, reaching 2.3 million b/d. Growth largely reflects the completion of phase two of the Johan Sverdrup expansion project, which is scheduled to come online in 4Q22. We expect the combined production from this phase and from phase one to reach 720,000 b/d at full capacity.

The remaining key sources of forecast non-OPEC production growth come from China, Argentina, and Guyana. Notably, Guyana first began producing oil in December 2019. We expect that Guyana will be a source of liquid fuels production growth in 2022 and 2023, driven by new offshore oil resources such as the Liza oil field. We expect oil production in Guyana to increase from an average of 110,000 b/d in 2021 to 240,000 b/d in 2022 and 340,000 b/d in 2023.

We forecast that output from a number of other non-OPEC producers, notably Indonesia and Colombia, will decline in 2022 and 2023.

OPEC production of petroleum and other liquid fuels. At the June 2022 OPEC+ meeting, participants reaffirmed their decision to advance their planned September production increase to July and August and to continue their production agreement through December 2022 to compensate for some under-producing members. Notably, they made no adjustments to reflect reduced crude oil production from Russia as a result of sanctions. Our forecast assumes that OPEC+ member countries will not fully increase production in accordance with their targets in 2022. In addition to less oil from Russia, some countries will be unable to meet their new targets because of limited production capacity, and other countries will limit increases because of uncertainty over the magnitude of Russia's oil losses as well as weakening global oil demand.

OPEC crude oil production averaged 28.3 million b/d in 1H22, up 3.0 million b/d from the same period in 2021. We forecast that average OPEC crude oil production will increase to an average of 29.1 million b/d in 2H22 and then increase to 29.3 million b/d in 2023. Our OPEC crude oil production forecast is subject to considerable uncertainty, driven by a wide range of possible outcomes for country compliance with existing production targets and for future global demand growth.

We expect that surplus OPEC crude oil production capacity will decline from 5.2 million b/d in 2021 to an average of 2.8 million b/d in 2022 as OPEC production increases. We expect it to decline further to an average of 2.6 million b/d in 2023, compared with an average surplus capacity of 2.6 million b/d from 2010 to 2019.

Iran, Libya, and Venezuela are OPEC+ members that are not subject to production targets. Our STEO forecast assumes current U.S. sanctions remain in place for Iran and Venezuela for the entire forecast period. We also expect that OPEC+ will not implement further production cuts to accommodate any potential increases in oil output from Iran or Venezuela.

After five years of declines, Venezuela's crude oil production rose from 0.5 million b/d in 2020 to almost 0.6 million b/d in 2021, driven by increased service company activity and increased access to condensate and other diluents for blending with Venezuela's heavy crude oil. Even though Venezuela's crude oil production increased in 2021, its prospects are limited while sanctions remain. Overall, we expect that Venezuela's crude oil production will decline as long-run operational difficulties, including lack of field and facility maintenance, continue and as sanctions remain in effect.

Libya's crude oil production declined from 1.1 million b/d in February 2022 to less than 700,000 b/d in June. Civil unrest and protests in Libya have disrupted crude oil production and exports since mid-April. Armed militias blockaded several export facilities and large fields in the southwestern region, including Sharara, the country's largest oil field. This political strife continues to affect the oil sector, leading to disruptions in crude oil production and exports. Our

forecast for Libya's crude oil production is subject to heightened uncertainty as a result of the tentative political and security situation in Libya and the lack of a budget to support oil and natural gas infrastructure maintenance and repairs.

OPEC non-crude oil liquids. OPEC production of non-crude oil liquids averaged 5.4 million b/d in 2021, reflecting increases in production of associated liquids as a result of higher OPEC+ production targets. We expect that production of non-crude oil liquids will increase further in 2022 to 5.5 million b/d and remain relatively unchanged in 2023.

Global oil inventories. We estimate that global oil inventories decreased by an average of 1.4 million b/d from 3Q20 through 1Q22. In our forecast, global oil inventories increase by 1.2 million b/d in 2H22. Inventory growth in 2022 largely reflects growth in global oil production paired with slowing growth in oil consumption. However, we expect decelerating production growth will lead to mostly balanced markets in 2023, with inventory levels mostly unchanged next year.

Commercial oil inventories in the OECD totaled 2.6 billion barrels at the end of 2021. We expect oil inventories in the OECD to rise to more than 2.8 billion barrels at the end of 2022 and remain at that level at the end of 2023.

Crude oil prices. The Brent crude oil price has increased from an average of $87/b in January 2022 to $123/b in June. Crude oil prices increased in 1H22 following Russia's full-scale invasion of Ukraine in February. As a result of the invasion, several countries imposed sanctions on imports of crude oil and petroleum products from Russia. In addition, many international oil companies and other firms ended operations in Russia and limited or stopped trading Russia's crude oil and petroleum products. These actions have reduced Russia's oil production and caused crude oil prices to rise. Several OPEC+ members have produced below their targets, which has also put additional upward pressure on oil prices. These factors, along with already low global inventories, have intensified both upward oil price pressures and oil price volatility.

We expect the Brent crude oil price will average $101/b in 2H22 and then fall to $94/b in 2023. The forecast price declines are the result of expected increases in global oil inventories in late 2022. Most of the price declines in our forecast occur in 2H22, with prices falling from $123/b on average in June to $97/b in 4Q22. Although inventories build in our forecast, they are currently lower than in 2019, which may limit some of the downward price pressures associated with rising inventories and raises the potential for continuing volatility. In addition, we expect more balanced markets in 2023. As a result of this balance, crude oil prices in our forecast decline slowly through 2023, falling from $97/b in 4Q22 to $93/b in 4Q23.

Reduced exports of refined petroleum products from Russia as a result of sanctions and less global refining capacity than before 2020 have reduced the available supply of refined petroleum products and have led to higher retail prices for gasoline and diesel fuel. This

situation could persist and may limit the degree to which lower crude oil prices result in lower retail prices for gasoline and diesel.

Actual prices will be based on the degree to which existing sanctions imposed on Russia, any potential future sanctions, and independent corporate actions affect Russia's oil production and the sale of Russia's oil in the global market. Global economic developments will also be critical for oil prices. Our current price path reflects global oil consumption that increases by 2% from 2021 to 2022 and by an additional 2% in 2023. However, the ways that central banks may respond to inflationary concerns could affect economic growth and oil demand during the forecast period. The duration of, and compliance with, the latest OPEC+ production targets also remain uncertain. In addition, international sanctions have limited exports from Russia and global refining capacity has decreased from pre-pandemic levels. These factors have reduced the available global supply of refined petroleum products and led to higher retail prices for gasoline and diesel fuel. If this situation continues, it could limit the degree to which lower crude oil prices result in lower retail prices for gasoline and diesel.

We forecast the West Texas Intermediate (WTI) crude oil price will average about $5/b less than the Brent price in 2H22 before averaging $4/b less than the Brent price through 2023. These price discounts are based on our assumption that the recent discount of WTI to Brent, which averaged less than $3/b in 2021, reflected low global demand for oil exports and relatively low U.S. crude oil production. U.S. crude oil supply increased in early 2Q22, which put downward press on WTI prices relative to Brent prices. At the same time, reduced crude oil supply from Russia into Europe put upward pressure on Brent prices. Together, these two factors caused the WTI discount to widen. We expect the WTI discount to return to $4/b by 2023 as the global oil market adjusts to constraints on production from Russia and as new crude oil trade flows are established.

U.S. liquid fuels

U.S. consumption. We forecast that consumption of petroleum and liquid fuels in the United States will average 20.5 million barrels per day (b/d) in 2022, which would be about the same as in 2019. In 2023, we forecast that consumption will grow to 20.8 million b/d. Our forecast of growth in U.S. consumption of petroleum and liquid fuels is driven by hydrocarbon gas liquids (HGLs) in 2022 and by gasoline in 2023.

We forecast that U.S. consumption of HGLs will increase by 0.2 million b/d in 2022 and by 0.1 million b/d in 2023. We expect all of the growth in HGL consumption in 2022 and 2023 to be from increased use of ethane as a petrochemical feedstock. Domestic ethane consumption increased this year when a new petrochemical cracker came online in the beginning of 2022, and we expect an additional petrochemical cracker to start up during the next two months, both of which will exclusively use ethane as a feedstock.

U.S. gasoline consumption averaged 8.7 million b/d in 1H22, up 0.1 million b/d from the same period in 2021. The April data for vehicle miles traveled (VMT), published by the Federal Highway Administration, is lower than we had forecast in last month's STEO, which possibly reflects the effects of high gasoline prices. As a result of the lower-than-expected VMT, we revised down our forecast VMT for the third quarter of 2022 (3Q22). Following the reduction in forecast VMT, we forecast U.S. gasoline consumption will average 9.0 million b/d in the second half of 2022 (2H22), a slight decline from 2H21. Gasoline consumption declines even though we forecast almost 5 million more jobs in the U.S. economy in 2H22 compared with a year earlier, based on the S&P Global macroeconomic model. However, the effects of high gasoline prices and strong employment on driving habits are uncertain. Employees may now have more flexibility when choosing between commuting to work or working from home, and with high gasoline prices, employees may be choosing to work from home more than before the COVID-19 pandemic. In addition, we expect a 2% increase in overall vehicle fleet fuel efficiency will also limit gasoline consumption growth in 2H22 compared with 2H21.

Distillate fuel consumption in the United States averaged 4.0 million b/d in 1H22, unchanged from the same period in 2021. However, we estimate distillate consumption averaged 3.8 million b/d in 2Q22, which down by 0.1 million b/d from 2Q21. Trade press reports indicate that the spot segment of the trucking market has slowed, which is likely reducing distillate consumption. We expect distillate consumption will average 3.9 million b/d in 2H22 and 4.0 million b/d in 2023.

U.S. jet fuel consumption averaged 1.5 million b/d in 1H22, up 0.3 million b/d from 1H21. Despite this growth, jet fuel consumption in 1H22 remained 12% lower than 1H19 levels, the largest decline on a percentage basis among the major fuel types. We forecast that U.S. consumption of jet fuel will average 1.6 million b/d in 2H22 and in 2023.

U.S. crude oil supply. We estimate U.S. crude oil production averaged 11.6 million b/d in 1H22, up 0.6 million b/d from year-ago levels. Although crude oil prices are high, economic headwinds including inflation, supply chain issues, and labor shortages, and less operator activity than we had forecast at the beginning of this year have limited production growth. We forecast that crude oil production will rise to an average of 12.2 million b/d in 2H22 and to 12.8 million b/d in 2023, which would surpass the previous annual record set in 2019.

During 2022, most of the drilling activity has occurred in the Permian Basin. Favorable geology combined with technological and operational improvements have made the Permian Basin one of the most prolific regions of U.S. crude oil production. We forecast that average annual crude oil production in the Permian Basin will reach 5.3 million b/d in 2022 and 5.7 million b/d in 2023.

However, the increased production of associated natural gas from this region poses a downside risk to Permian crude oil production. If natural gas pipeline constraints are not eased and the proposed 5.0 billion cubic feet per day of pipeline takeaway capacity out of the Permian Basin is not brought online by 2024, drilling activity in areas with high concentration of natural gas might

be reduced. In addition, the capital deployment decisions of producers will be critical for rig deployment and production. Further, production could be less than our forecast if supply chain issues and input cost inflation persist through the forecast period.

We expect that crude oil production from the Gulf of Mexico will average about 1.8 million b/d in both 2022 and 2023. In 2021, seven new projects came online. We expect nine more projects to come online in 2022.

Alaska's crude oil production in the forecast stays near the 2021 level of 0.4 million b/d in both 2022 and 2023.

Hydrocarbon gas liquids supply. We forecast U.S. production of HGLs to increase by 0.5 million b/d in 2022 to an average of 6.5 million b/d and then to increase to an average of 6.8 million b/d in 2023. HGL production will increase as a result of rising production of natural gas in 2022 and 2023, as well as higher rates of natural gas processing plant utilization. Ethane production is the leading contributor to the HGL growth, and we expect it will rise to meet growing demand for ethane as a petrochemical feedstock both in the United States and globally.

Liquid biofuels. Consumption of biofuels has risen in the United States in 2022, and we expect this growth to continue. Increasing demand for transportation fuels, higher 2022 Renewable Fuel Standard (RFS) program targets announced on June 3, and new renewable diesel production capacity coming online all contribute to this growth. Prices for Renewable identification number (RIN) credits—the compliance mechanism used for the Renewable Fuel Standard (RFS) program administered by the U.S. Environmental Protection Agency (EPA)—have increased in 2022 to near record-high prices, which has facilitated growing biofuel consumption. From 1H21 to 1H22, ethanol consumption increased by 24,000 b/d (3%), renewable diesel consumption increased by 32,000 b/d (46%), and other biofuels consumption increased by 6,000 b/d (133%). Biodiesel consumption was unchanged during the same period.

We expect that new renewable diesel production will help meet rising RFS targets. Marathon Petroleum's renewable diesel refinery in Dickinson, North Dakota, became fully operational in 2Q21. It is now the second-largest renewable diesel refinery in the United States and has a production capacity of 12,500 b/d. In 4Q21, Diamond Green Diesel expanded its Norco, Louisiana, refinery, which is now the largest renewable diesel refinery in the United States, with a production capacity of 44,000 b/d. So far in 2022, HollyFrontier's Cheyenne, Wyoming, refinery has come online, and CVR Energy's Wynnewood, Oklahoma, refinery has come partially online. Seven other projects are set to come online by the end of the year, potentially adding as much as 88,000 b/d of capacity, and several more projects will come online in 2023. We forecast renewable diesel consumption of 116,000 b/d in 2022, an increase of 41,000 b/d (53%) from 2021, and we expect renewable diesel consumption to increase further to 164,000 b/d in 2023. This forecast assumes that some of the capacity scheduled to come online in 2022 and 2023 will have delays or be affected by high agricultural feedstock costs.

Because one gallon of renewable diesel produces more RIN credits under the RFS program than biodiesel and also faces no infrastructure or blending constraints, we expect new renewable diesel plants to be brought online to secure scarce oil feedstocks, such as soybean oil, outpacing biodiesel refineries and limiting biodiesel production. We forecast slightly higher biodiesel consumption in 2022 than in 2021. However, we expect U.S. biodiesel consumption to decrease in 2023 as renewable diesel increasingly satisfies RFS requirements. We forecast U.S. biodiesel production in 2022 to fall 8% from 2021 to less than 100,000 b/d, the lowest annual average since 2015.

More fuel ethanol was consumed in the United States in 1H22 than in the same period in 2021, mainly because of more gasoline consumption. We expect similar gasoline and fuel ethanol consumption in 2H22. We forecast that U.S. fuel ethanol consumption will remain around 2022 levels in 2023 and that the ethanol share of U.S. gasoline consumption will be near 10.3%. If favorable blending economics for fuel ethanol, driven by lower relative fuel ethanol prices, and high RIN prices persist, the fuel ethanol share of gasoline consumption could potentially increase.

Product prices. Increased global consumption of liquid fuels during 1H22, combined with constraints on global refining capacity and rising crude oil prices, puts upward pressure on prices for petroleum products. The average U.S. retail price for regular-grade motor gasoline in 1H22 was $4.11 per gallon (gal), an increase of $1.33/gal from 1H21. Retail diesel prices in 1H22 averaged $4.91/gal, an increase of $1.85/gal over 1H21. Russia's full-scale invasion of Ukraine, which began at the end of February, has significantly raised crude oil prices and crack spreads. In 2Q22, retail gasoline averaged $4.50/gal, and diesel averaged $5.49/gal.

Rising crack spreads—the difference in price between wholesale refining products and the crude oil used to make them—have been a major contributor to rising retail fuel prices. Crack spreads have increased sharply as exports of refined products from Russia have decreased in response to sanctions. Even where there are no formal sanctions, some international buyers, particularly European countries who typically purchase Russia's fuel, have chosen to reduce or end imports from Russia.

The gasoline crack spread (calculated as the U.S. refiner gasoline price for resale against Brent crude oil) in 2Q22 increased to an average of $1.05/gal from 52 cents/gal in 2Q21, and the diesel crack spread increased to an average of $1.47/gal during the same period from 40 cents/gal in 2Q21. Increasing crude oil prices often narrow crack spreads as high input costs narrow refining margins; however, the current high crack spreads are the result of decreased refinery capacity both globally and in the United States combined with Russia's reduced product exports.

Refinery Capacity in the United States fell by 0.9 million b/d in 2020 and by 0.2 million b/d in 2021. The lost capacity mainly resulted from low refinery margins brought on by the COVID-19 pandemic, as well as a handful of refinery incidents—including the explosion at Philadelphia

Energy Solutions in 2019 and the flooding of the Phillips 66 Alliance refinery during Hurricane Ida in August 2021— and conversions to biofuels production. Decreasing refinery capacity was not limited to the United States. The IEA reports that global refinery capacity fell by 0.9 million b/d in 2021, which combined with the exclusion of refining capacity in Russia, leaves the global market with less refinery capacity available to meet increasing demand this summer.

Historically high crack spreads have encouraged U.S. refiners to increase refinery utilization, which ran at 92% in 2Q22, in order to meet high demand in the United States. We expect refinery utilization to average 94% in 3Q22, compared with 89% in 3Q21. Refinery utilization is usually higher in the second and third quarters in response to summer demand for fuel. We expect utilization to average 90% in 4Q22 up only slightly over 4Q21, at a time when low product inventories and increasing demand were already providing incentives for refiners to increase refinery runs. Although we expect refinery utilization to remain well above average through the end of the year, less refinery capacity in the United States means that actual refinery inputs and volumetric production of refined products will not exceed pre-pandemic production levels.

As rising refinery production contributes to some increases in refined product inventories, we expect crack spreads to decrease in 2H22 but remain above the five-year average through the end of the forecast. We forecast gasoline crack spreads to average $0.88/gal in 3Q22 and $0.57/gal in 4Q22, or $0.72/gal for the year, before decreasing to an annual average of $0.52/gal in 2023. Similarly, we forecast distillate crack spreads to average $1.11/gal in 3Q22 and $0.91/gal in 4Q22, averaging $1.03/gal in 2022 before dropping to $0.65/gal in 2023. In comparison, the gasoline crack spread in 2019 was $0.33/gal, and the distillate crack spread was $0.43/gal in 2019.

High product crack spreads are encouraging refiners to maximize operations to meet U.S. and global demand although their ability to do so remains subject to several uncertainties. High refinery utilization brings inherently greater risks of operational malfunctions, disruptions, and unplanned turnarounds that can temporarily take units or whole facilities out of commission. Furthermore, the National Oceanic and Atmospheric Administration (NOAA) predicts an above-average hurricane season in 2022. Hurricanes present particular weather-related risks to most of U.S. refining capacity, which is concentrated along the U.S. Gulf Coast, particularly in Texas and Louisiana.

Natural gas

Natural gas consumption. We expect U.S. natural gas consumption will increase by 2.9 billion cubic feet per day (Bcf/d) (3%) to average 85.9 Bcf/d in 2022 and fall to 85.4 Bcf/d in 2023.

We forecast U.S. consumption of natural gas to increase in all sectors in 2022, with the largest increase in the electric power sector. We forecast the U.S. electric power sector will consume an average of 31.9 Bcf/d of natural gas in 2022, which is 3% more than in 2021. Our forecast

increase occurs despite high natural gas prices in 2022, which in the past have typically encouraged more switching from natural gas to coal as an electricity generation source. The electric power sector continues to use high amounts of natural gas because coal-fired power plants are limited in their ability to act as an alternative source of electricity generation. Ongoing coal capacity retirements, limited rail capacity for fuel delivery to coal plants, and lower-than-average stocks at coal plants have all contributed to reduced coal-fired electricity generation. As a result, more natural gas has been used to meet electricity demand. We expect consumption of natural gas in the electric power sector to decline slightly by 0.5 Bcf/d (1%) in 2023 as more electric-generation capacity from renewable energy sources comes online.

Consumption of natural gas in the U.S. industrial sector in our forecast increases by 3% this year, averaging 23.2 Bcf/d in 2022, as demand for industrial goods and economic activity increases. We forecast industrial sector consumption of natural gas will be mostly unchanged in 2023 compared with 2022.

We expect combined U.S. residential and commercial natural gas consumption to average 22.6 Bcf/d in 2022 and 22.4 Bcf/d in 2023, based largely on weather expectations we derive from National Oceanic and Atmospheric Administration (NOAA) forecasts. Our July STEO assumes colder temperatures in 2022 than in 2021 and similar temperatures in 2023. NOAA forecasts 8% more heating degree days (HDDs) across the United States in 2022 compared with 2021.

Natural gas production. We forecast dry natural gas production will average 96.2 Bcf/d in 2022 in the United States, an increase of 2.7 Bcf/d (3%) compared with 2021. Increases in crude oil and domestic natural gas prices, as well as increases in the number of active oil and natural gas rigs, will contribute to an overall increase in drilling activity in 2022 and 2023 that will lead to production growth. In 2023, we expect dry natural gas production to increase by 3.7 Bcf/d (4%) to reach 100.0 Bcf/d. The Haynesville region and the Permian Basin will drive growth in dry natural gas production, supported by increased pipeline takeaway capacity in both regions and high oil production in the Permian Basin that results in greater levels of associated natural gas production.

Natural gas trade. Liquefied natural gas (LNG) exports continued to drive growth in U.S. natural gas exports in the first half of 2022 (1H22). U.S. LNG exports averaged 11.2 Bcf/d during 1H22 and set a monthly record in March 2022, averaging 11.7 Bcf/d. U.S. LNG export capacity is continuing to expand this year with the addition of the Calcasieu Pass LNG export facility, which has been ramping up LNG production ahead of schedule and is expected to be fully operational by the third quarter of 2022 (3Q22).

Strong natural gas demand and high LNG prices in Europe and Asia drove the continued growth in U.S. LNG exports in the first half of this year. During the first five months of 2022, the United States exported 71% of its LNG to Europe, compared with an annual average of 34% last year. In the past, Asia had been the main destination for U.S. LNG exports, accounting for almost half of the total exports in 2020 and 2021. LNG prices in Europe remain high amid supply uncertainties

because of Russia's invasion of Ukraine and the need to replenish Europe's natural gas inventories, which has kept Europe's demand for LNG elevated.

Since December 2021, the EU and the United Kingdom have been importing record volumes of LNG, primarily to fill natural gas storage inventories, which were historically low from fall 2021 through spring 2022. The United States became the largest LNG supplier to the EU and United Kingdom last year, accounting for 26% of total imports. In the first five months of 2022, LNG imports from the United States to the EU and the United Kingdom continued to grow. European natural gas storage inventories filled up rapidly in recent months, and they were 3% below their five-year average (2017–2021) level at the end of June.

For the second half of this year, we expect U.S. LNG exports will decline because of the outage at the Freeport LNG export facility, which we do not expect to return to full service until late 2022. The shutdown of Freeport LNG will reduce U.S. LNG export capacity by approximately 2 Bcf/d, which is about 17% of the total capacity. We forecast U.S. LNG exports to average 10.5 Bcf/d in 2H22, 14% less than the forecast in our June 2022 STEO. We expect LNG exports will continue to grow in 2023, averaging 12.7 Bcf/d on an annual basis, 17% higher than in 2022.

U.S. exports of natural gas by pipeline, almost all of which move natural gas to Mexico, average 8.8 Bcf/d in 2022 in the forecast, up 4% from 2021, and then rise by an additional 4% to reach 9.2 Bcf/d in 2023.

Natural gas inventories. U.S. storage withdrawals in 1Q22 were 27% higher than the five-year average because of colder-than-normal temperatures that led to higher consumption in the residential, commercial, and electric power sectors and because of declines in natural gas production as a result of weather-related freeze-offs in producing regions. Working natural gas inventories ended March 2022 at 1,401 Bcf, which was 17% less than the five-year average for that time of year and the least natural gas held in U.S. underground storage at the end of March (the traditional end of the heating season) since 2019.

As the Freeport LNG outage returns about 2 Bcf/d of natural gas to the domestic market, we expect end-of-October storage will be closer the five-year average than we did in last month's forecast. We expect that inventories will reach 3,468 Bcf at the end of October 2022, which would be 6% less than the five-year average for October and 5% less than the natural gas in U.S. storage at the end of October 2021.

Natural gas prices. The Henry Hub spot price averaged $6.07 per million British thermal units (MMBtu) in 1H22, rising steadily from an average of $4.38/MMBtu in January to $8.14/MMBtu in May. Prices then fell in June, in part, because of the outage at the Freeport LNG export terminal. The increase through May resulted from continued demand for LNG exports, increased demand in electric power generation as a result of limited natural gas-to-coal switching, and decreased production compared with the end of 2021.

Natural gas prices have been volatile in 2022. The 30-day historical volatility of U.S. natural gas prices averaged 179.1% in February compared with the five-year average of 47.7%. Historical volatility measures the magnitude of daily changes in the closing price for a commodity during a specific time in the past. Natural gas price volatility resulted, in large part, from the uncertainty in the global natural gas markets leading up to and following Russia's full-scale invasion of Ukraine on February 24, as well as from weather-related fluctuations in natural gas demand. Uncertainty around production that was relatively flat in 1H22 (and slightly lower than the high levels reached at the end of 2021) has also contributed to price volatility. Natural gas price volatility remained relatively high in 2Q22, averaging 87.2% in June.

We forecast the Henry Hub spot price will average $5.97/MMBtu in 2H22. This price is down from our forecast of $8.58/MMBtu in the June STEO in part because, due to the Freeport LNG facility being offline through late 2022, we expect more natural gas to be injected into storage in 2H22 than in last month's forecast. Although our end-of-October storage forecast is still less than the previous five-year average. However, because of ongoing constraints in the coal market that are limiting the use of coal in the electric power sector, we expect electric power-sector use of natural gas will remain strong, keeping upward pressure on prices, particularly in the case of a significant heat wave. Despite the outage at Freeport LNG, we also expect full utilization at remaining LNG facilities this summer to raise natural gas prices as Europe's demand for LNG from the United States remains high.

The lower natural gas price in our forecast for 2H22 contributes to our lower forecast for production in 2023 compared with the June STEO. Based partly on the lower production forecast, we raised our price forecast for May through December 2023. We expect the Henry Hub spot price will average $4.41/MMBtu during 2H23, up 59 cents/MMBtu from last month's forecast. For all of 2023, we expect the Henry Hub spot price will average $4.76/MMBtu.

Coal

Coal production. U.S. coal production totaled 289 million short tons (MMst) in the first half of 2022 (1H22), up 6 MMst (2%) from 1H21. As coal consumption decreased, increases in production have kept inventories in 1H22 from falling by as much as they did in 1H21.

In 2022, we expect U.S. coal production to rise by 17 MMst (3%) from 2021 to 595 MMst. Our forecast 2022 coal production increases by 15 MMst (5%) in the Western Region and by 1 MMst (1%) in both the Appalachia and Interior regions. We expect U.S. coal production to remain flat in 2023.

Our expectation of increased production in 2022 primarily reflects demand to replenish depleted coal stocks. Electric power sector inventories fell significantly in 2021. We expect more draws through summer 2022. In our forecast, 2022 end-of-year electric power sector coal inventories decline to 77 MMst, 18% less than at the end of 2021.

In 2023, we expect coal production to total 594 MMst, about the same as 2022. Much of the decrease in coal mine capacity that has occurred since 2020 appears to be permanent. Coal producers have experienced labor and capital shortages, which we expect will continue to limit coal supply in the forecast.

Coal consumption. In this forecast, U.S. coal consumption declines to 527 MMst (3%) in 2022 and to 506 MMst (4%) in 2023, compared with 546 MMst in 2021.

We expect the retirement of approximately 22 gigawatts (GW) of coal-fired power plant capacity through 2023, down 10% from 2021. As a result, we forecast electric power sector demand for coal will decrease by 20 MMst (4%) in 2022. Coal plant retirements and lower expected natural gas prices drive our forecast of an additional 23 MMst (5%) decline in 2023.

Increased economic activity following COVID-19 shutdowns and rising natural gas prices relative to coal prices led to increased demand for coal-fired power generation in 2021 compared with 2020. Although natural gas prices remain high in 2022, constraints on coal production from decreased mine capacity and transportation from labor shortages in the railroad industry have led to coal generators taking steps to conserve coal stocks to meet peak electricity demand during the summer, which is limiting coal-fired electricity generation.

Metallurgical coal, also known as coking coal, is an essential component of the steel-making process. We expect demand for coking coal to rise by 8% (1 MMst) from 2021 to 2023, driven by our expectation of more raw steel production in the forecast.

Coal trade. We expect U.S. coal exports to increase 3% to 88 MMst in 2022 from 85 MMst in 2021. It is unclear how much of the U.S. increase in coal exports have been a result of the improved post-pandemic economy and high natural gas prices or a result of sanctions against Russian coal.

Increased exports are driven by a forecast 2% increase in metallurgical coal exports in 2022 to accommodate increased steel production and an even larger 4% increase in steam coal exports as countries increase coal-fired electricity generation relative to natural gas-fired generation to manage costs associated with high natural gas prices. Exports in the forecast fall to 83 MMst in 2023, less than in 2021, as the economy cools down. While metallurgical coal exports remain steady, we expect steam coal exports to fall 12% in 2023 as natural gas prices fall, increasing natural gas-fired generation relative to coal-fired generation.

Although Europe—largest importer of coal from Russia—Japan, and South Korea are expected to eventually end coal imports from Russia, any decline in Russia's coal exports so far have been offset by increases in purchases of coal from Russia by China, India, and Turkey to capitalize on the discounts Russia has offered.

Coal prices. The price of coal delivered to U.S. electricity generators averaged $1.98 per million British thermal units (MMBtu) in 2021. We expect the average delivered coal prices to the

electric power sector to increase to $2.10/MMBtu (6%) in 2022 then fall to $1.99/MMBtu (5%) in 2023.

Electricity

Electricity consumption. We forecast that total consumption of electricity in the United States, including sales to ultimate customers and direct use of electricity by generators, will increase by 2% in 2022 and by 1% in 2023. Sales of electricity to ultimate customers account for about 97% of total U.S. electricity consumption.

Relative outside temperatures, often measured using heating degree days (HDDs) and cooling degree days (CDDs), are the main driver of electricity consumed by the residential sector. We estimate that 2% more electricity was sold to residential customers in the first half of 2022 (1H22) than the same period last year. Although temperatures in January and February were colder than normal, they were relatively similar to temperatures last winter. Likewise, early summer temperatures have been warmer than normal, especially in the South, but have been relatively similar to the same period in 2021.

During 2H22, we expect U.S. residential electricity consumption to be similar to 2H21. We forecast that sales of electricity to residential customers will grow by 1% for all of 2022 and then fall slightly in 2023 as winter and summer temperatures return to more normal levels.

Electricity sales to customers in the U.S. commercial and industrial sectors are growing faster than sales to the residential sector. Commercial electricity use is related both to overall weather patterns and economic trends. We estimate that 5% more electricity was used by the U.S. commercial sector in 1H22 than 1H21. Stronger economic activity than in 2021 drove most of this growth. Nonfarm employment in 1H22 grew by 5% year over year. We expect economic growth to slow somewhat in 2H22, but we still expect commercial electricity use to rise by 3% in 2022. The slower economic growth contributes to our forecast that electricity consumption in the commercial sector will remain relatively unchanged next year.

The U.S. industrial production index for electricity-intensive industries increased year over year by 5% in 1H22, and we expect it to grow at a similar rate in 2H22. As a result, we expect 4% more sales of electricity to the industrial sector in 2022 than in 2021. Our forecast of industrial electricity use grows slightly less at 3% in 2023, reflecting slower overall economic growth.

Electricity generation. We estimate that electricity generation by the U.S. electric power sector during the first half of 2022 grew 4% from 1H21, reflecting warmer-than-normal temperatures in May and June. We expect the U.S. electric power sector will generate 4,055 billion kilowatthours (BkWh) in 2022, which is a 2% increase from 2021. Forecast electric power sector generation remains at about the same level in 2023.

We forecast that most of the increase in U.S. electricity generation through 2023 will come from renewable energy sources as a result of growth in U.S. renewable generating capacity. We

expect renewable energy will provide 22% of U.S. electric power sector generation in 2022 and 24% in 2023, compared with 20% in 2021.

Most of our forecast increase in generation from renewables comes from solar capacity expansions in the electric power sector. We expect solar electricity generation to increase to 145 BkWh in 2022 and 182 BkWh in 2023. Installed capacity of solar photovoltaic (PV) generation continued to grow despite supply chain and commerce issues that affected the industry during the past six months. We forecast that the electric power sector will add 19 gigawatts (GW) of solar capacity in 2022 and an additional 23 GW in 2023. We forecast small-scale solar PV capacity, including systems installed on rooftops, will increase by 6 GW in 2022 and by 7 GW in 2023. More than two-thirds of this additional small-scale solar PV capacity over the next two years will be installed on residential rooftops.

In February, U.S. tariffs on imported crystalline silicon solar products from China were extended, setting an annual tariff-rate quota for solar cells imported from China to 5 GW, with exemption of bifacial panels. In March, the U.S. Department of Commerce (DOC) announced an anti-dumping circumvention investigation of solar cells and modules imported from Cambodia, Malaysia, Thailand, and Vietnam—countries that allegedly use parts made in China that otherwise would be subject to tariffs. DOC is expected to make a decision by the first quarter of 2023. In June, by Executive Order, the President invoked the Defense Production Act to ease import duties for a 24-month period for solar cells and modules imported from Cambodia, Malaysia, Thailand, and Vietnam. Our preliminary data from January to April 2022 indicate that an average of 3.9 GW of PV solar installations reported delays compared with 2.1 GW delayed during the same period last year.

We expect continued growth in solar energy through 2023, in part, because of the solar investment tax credit under the Consolidated Appropriations Act, which offers a 26% tax credit to projects that start in 2022. The credit drops to 22% for projects that start in 2023. States such as Texas and Florida are set to add significant solar PV in the next two years.

We forecast that U.S. electricity generation from wind will increase by 16% in 2022 from 2021 and by 4% in 2023 from 2022. Wind capacity in the electric power sector will grow by 11 GW in 2022 and by an additional 4 GW in 2023, down from the 14 GW added yearly in 2021 and 2020.

We can attribute slower growth in wind capacity, in part, to the phasedown of the production tax credit (PTC) as well as supply chain issues. The PTC, which was extended through the 2022 calendar year, provides a 2.6 cent per kWh benefit for facilities entering service or spending at least 5% of total estimated project cost (securing 5% safe harboring). Producers of safe harbored projects are able to claim the PTC four years after they qualify.

Hydropower contributed 7% of U.S. electric power generation in 2021. In the forecast, the share of hydropower generation will remain around 7% in both 2022 and 2023. Since 2021, the drought affecting the West has constrained electricity generation by hydropower, and California

is one of the most affected states. We published a supplement to the STEO in May 2022, looking at hydropower generation in California across a range of water conditions. In a severe drought case, we expect hydropower generation in California would drop to half of normal levels in 2022.

Economic factors, such as fuel costs and changes in the mix of generating capacity, are likely to affect trends in electricity generation from nonrenewable sources. The price of natural gas, in particular, has traditionally been an important driver of the relative use of natural gas and coal for power generation. Natural gas prices have significantly increased from last year, and we expect they will remain high through the end of 2022.

In the past, high natural gas prices have typically led to more generation from coal-fired power plants. However, the industry continues to retire coal-fired generation capacity. According to the latest information from the Form EIA-860 survey, the United States will have 10%, or nearly 22 GW, less operating coal capacity at the end of 2023 than at the end of 2021. In addition to these capacity retirements, coal-fired power plants have not received sufficient fuel deliveries because of limited rail capacity and reduced coal mine capacity. In some regions of the country, such as the Midcontinent Independent System Operator (MISO) and Southwest Power Pool (SPP) power markets, increased growth in renewables contributes to the forecast decline in coal-fired electricity generation. We expect that coal's share of U.S. total generation will fall from 23% in 2021 to 21% this year and 20% in 2023.

The constraints on coal-fired electricity generation are resulting in more natural gas-fired generation than we would have expected, despite the high fuel costs. We expect natural gas's share of total U.S. generation to average about 37% in 2022, similar to the generation share in 2021, and 36% 2023. Despite higher prices for natural gas, we expect that some regions, particularly in the mid-Atlantic and Southeast, will increase natural gas-fired electricity generation this year. The recent coal-fired power plant retirements and the constraints on coal deliveries are affecting these regions the most.

In May 2022, the Palisades nuclear power plant in Michigan shut down as planned. This retirement of 769 megawatts (MW) of capacity contributes to our expected slight reduction in U.S. nuclear generation in 2022. Two new reactors at the Vogtle plant in Georgia are scheduled to come online in 2023, adding 2.2 GW of nuclear power to the system. We expect the nuclear share of total generation to be 19% in 2022 and 2023, about the same share as last year.

Electricity prices. The large increase in natural gas fuel costs over the past year is also driving up wholesale electricity prices throughout the United States. Increases in wholesale prices during the first half of 2022 ranged from 13% higher than first half 2021 in the Southwest region to 135% higher in the New York ISO region. Average year-to-date prices are lower in the Central/SPP and Texas/ERCOT regions because of extreme price spikes that occurred in February 2021. We expect wholesale electricity prices to remain elevated through the remainder of 2022. Our forecast for a decline in natural gas prices next year contributes to our forecast that

electricity prices will fall in all regions in 2023, ranging from 18% lower in the Mid-Atlantic region's PJM market to 40% lower in the ERCOT market in Texas.

The higher prices of wholesale electricity and generation fuels contributes to our forecast for higher prices for electricity sold to ultimate customers. We forecast the U.S. retail electricity price for the residential sector will average 14.4 cents/kWh in 2022, which is 5% higher than the average retail price in 2021. The forecast increases in residential electricity prices vary by region, ranging from 2% higher in the West South Central states to 14% higher in New England. The forecast commercial sector electricity price averages 11.9 cents/kWh in 2022 (up 5%), and the industrial sector price averages 7.6 cents/kWh (up 5%).

U.S. economic assumptions and energy-related carbon dioxide emissions

U.S. economy. We incorporate the S&P Global macroeconomic forecast model for the United States with our own energy price forecasts to create STEO forecasts.

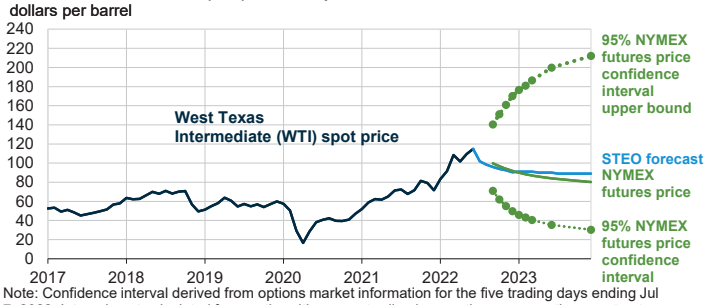
Based on this model, we estimate that U.S. real GDP will grow by 2.4% in 2022 and by 2.5% in 2023. In comparison, real U.S. GDP grew by 5.7% in 2021. Total industrial production will grow at a relatively faster pace, increasing by 6.2% in 2022 and 3.4% in 2023, following a 5.5% increase in 2021. S&P Global estimates that the unemployment rate will fall from 5.4% in 2021 to 3.7% in 2022, but it will increase slightly to 3.9% in 2023. Nonfarm payroll employment will increase by 5.7 million jobs (3.9%) in 2022 and by 1.9 million (1.3%) in 2023. Price levels are elevated in 2022, when the Consumer Price Index (CPI) will rise by 7.4%, but forecast inflation falls to 2.8% in 2023.

Energy-related carbon dioxide emissions. Energy-related carbon dioxide (CO_2) emissions rose by 6.5% in the United States during 2021, and we estimate that they will rise by 1.5% in 2022 and remain flat in 2023. Forecast petroleum-related CO_2 emissions increase by 2.4% in 2022 and by 1.1% in 2023 as transportation demand begins to return to pre-pandemic levels, but this growth is limited by high fuel prices. We expect CO_2 emissions from coal will fall by 3.9% in 2022 and by a further 3.2% in 2023 as coal-fired electricity generation is displaced, primarily by renewable sources. We expect CO_2 emissions from natural gas to rise by 3.6% in 2022, as demand for space heating increases, and to fall by 0.7% in 2023.

Notable forecast changes

- We forecast Russia's liquid fuels production will average 10.7 million b/d in 2H22, up from a forecast of 10.0 million b/d in last month's STEO. The increase reflects our expectation that Russia's production will remain in 3Q22 before EU sanctions take effect at the end of 2022. However, we forecast a larger drop in Russia's production next year, with 2023 production averaging 9.3 million b/d, down by 0.2 million b/d from last month's forecast.

- We expect U.S. LNG exports will decline because of the outage at the Freeport LNG export facility, which we do not expect to return to full service until late 2022. U.S. LNG exports are forecast to average 10.5 Bcf/d in 2H22, 14% lower than in our June STEO.
- We forecast the Henry Hub spot price will average $5.97/MMBtu in 2H22. This price is down from our forecast of $8.58/MMBtu in the June STEO because of an additional 2 Bcf/d of natural gas that will be available in the domestic market as a result of the Freeport LNG facility being offline through the end of the year.
- You can find more information in the detailed table of forecast changes.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. Weather															
U.S. Heating Degree-Days	**2,107**	**472**	**51**	**1,307**	**2,150**	**493**	*75*	*1,529*	*2,112*	*494*	*80*	*1,528*	**3,936**	*4,247*	*4,213*
U.S. Cooling Degree-Days	**50**	**410**	**902**	**127**	**46**	**463**	*853*	*95*	*43*	*387*	*830*	*95*	**1,489**	*1,456*	*1,355*

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

(f) We published the Natural Gas Monthly on Friday July 8, which was after we completed this forecast, and as a result, this forecast does not include final Natural Gas Monthly data for April 2022.

- = no data available

Notes: EIA completed modeling and analysis for this report on July 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on July 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on July 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate, natural gas plant liquids, other liquids, refinery processing gain, and other unaccounted-for liquids.

OPEC = Organization of the Petroleum Exporting Countries: Iran, Iraq, Kuwait, Saudi Arabia, and the United Arab Emirates (Middle East); Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Libya, Nigeria, and Venezuela (Other).

Notes: EIA completed modeling and analysis for this report on July 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Forecasts are not published for individual OPEC countries.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on July 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on July 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

(e) We published the Natural Gas Monthly on Friday July 8, which was after we completed this forecast, and as a result, this forecast does not include final Natural Gas Monthly data for April

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on July 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on July 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.91**	**1.93**	**2.03**	**2.05**	**2.19**	**2.13**	*2.04*	*2.03*	*1.98*	*2.00*	*2.00*	*1.97*	**1.98**	*2.10*	*1.99*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on July 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on July 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on July 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on July 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on July 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distrib

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Subtotals for the industrial and commercial sectors might not equal the sum of the components. The subtotal for the industrial sector includes ethanol consumption that is not shown separately. The subtotal for the commercial sector includes ethanol and hydroelectric consumption that are not shown separately.

(f) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(g) Fuel ethanol and biodiesel, renewable diesel, and other biofuels consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on July 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum Supply*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on July 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.
Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on July 7, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Independent Statistics & Analysis
U.S. Energy Information Administration

August 2022

Short-Term Energy Outlook

Forecast highlights

Global liquid fuels

- The August *Short-Term Energy Outlook* (STEO) is subject to heightened uncertainty resulting from Russia's full-scale invasion of Ukraine, how sanctions affect Russia's oil production, the production decisions of OPEC+, the rate at which U.S. oil and natural gas production rises, and other contributing factors. Less robust economic activity in our forecast could result in lower-than-forecast energy consumption.
- We forecast the spot price of Brent crude oil will average $105 per barrel (b) in 2022 and $95/b in 2023.
- U.S. crude oil production in our forecast averages 11.9 million barrels per day (b/d) in 2022 and 12.7 million b/d in 2023, which would set a record for most U.S. crude oil production in a year. The current record is 12.3 million b/d, set in 2019.
- We estimate that 98.8 million b/d of petroleum and liquid fuels was consumed globally in July 2022, an increase of 0.9 million b/d from July 2021. We forecast that global consumption of petroleum and liquid fuels will average 99.4 million b/d for all of 2022, which is a 2.1 million b/d increase from 2021. We forecast that global consumption of petroleum and liquid fuels will increase by another 2.1 million b/d in 2023 to average 101.5 million b/d.
- The U.S. retail price for regular grade gasoline averaged $4.56 per gallon (gal) in July, and the average retail diesel price was $5.49/gal. We expect retail gasoline prices to average $4.29/gal in the third quarter of 2022 (3Q22) and fall to an average of $3.78/gal in 4Q22. Retail diesel prices in our forecast average $5.02/gal in 3Q22 and $4.39/gal in 4Q22.
- U.S. refineries average 93% utilization in 3Q22 in our forecast, as a result of high wholesale product margins. Elevated prices for gasoline and diesel reflect refining margins for those products that are at or near record highs amid low inventory levels.

Natural gas

- In July, the Henry Hub spot price averaged $7.28 per million British thermal units (MMBtu), down from $7.70/MMBtu in June and $8.14/MMBtu in May. Average natural

gas prices fell over the last two months primarily because of additional supply in the domestic market following the shutdown of the Freeport LNG export terminal on June 8. However, prices increased by almost 50%, from $5.73/MMBtu on July 1 to $8.37/MMBtu on July 29, because of continued high demand for natural gas from the electric power sector. We expect the Henry Hub price to average $7.54/MMBtu in the second half of 2022 and then fall to an average of $5.10/MMBtu in 2023 amid rising natural gas production.

- U.S. natural gas inventories ended July at 2.5 trillion cubic feet (Tcf), which was 12% below the 2017–2021 average. We forecast that natural gas inventories will end the 2022 injection season (end of October) at close to 3.5 Tcf, which would be 6% below the five-year average.

- We forecast that U.S. LNG exports will average 10.0 Bcf/d in 3Q22 and 11.2 Bcf/d for all of 2022, a 14% increase from 2021. This increase is the result of additional U.S. LNG export capacity that has come online and Freeport LNG resuming operations sooner than we had initially expected. In the first half of 2022, the United States became the largest LNG exporter in the world. We forecast LNG exports will average 12.7 Bcf/d in 2023.

- U.S. consumption of natural gas in our forecast averages 85.2 Bcf/d in 2022, up 3% from 2021. Consumption in the electric power sector continues to increase as a result of limited switching from natural gas-fired generators to coal-fired generators for power generation, despite elevated natural gas prices. In addition, rising U.S. natural gas consumption reflects increased consumption in the residential and commercial sectors as a result of colder temperatures on average in 2022 than in 2021. We forecast that natural gas consumption will average 83.8 Bcf/d in 2023, about 1.3 Bcf/d (2%) lower than in 2022.

- We forecast U.S. dry natural gas production to average 97.1 Bcf/d in August and 96.6 Bcf/d during all of 2022, which would be 3.0 Bcf/d (3%) more than in 2021. We expect dry natural gas production to average 100.0 Bcf/d in 2023.

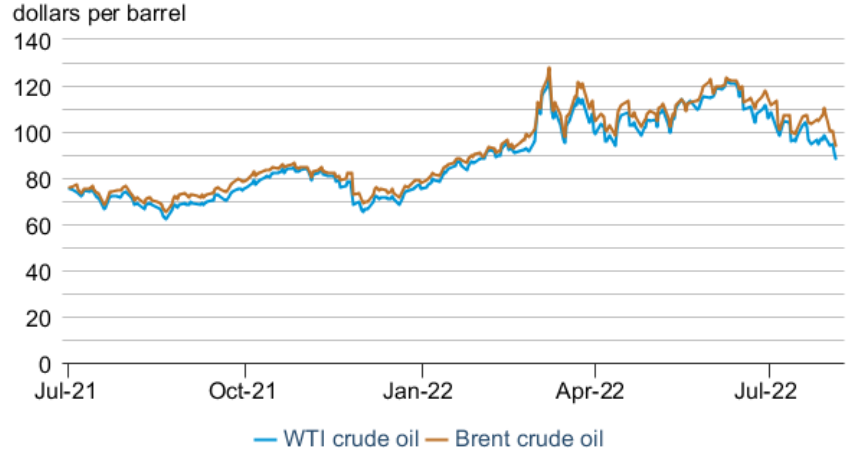
Electricity, coal, renewables, and emissions

- We expect U.S. sales of electricity to ultimate customers to increase in the forecast by 2.5% in 2022, mostly because of rising economic activity but also because of hot summer weather in much of the country. Forecast U.S. sales of electricity decline by 0.3% in 2023.

- The largest increases in U.S. electricity generation in our forecast come from renewable energy sources, mostly solar and wind. We expect renewable sources will provide 22% of U.S. generation in 2022 and 24% in 2023, up from 20% in 2021.

- We forecast the U.S. residential electricity price will average 14.6 cents per kilowatthour (kWh) in 2022, up 6.1% from 2021. Higher retail electricity prices largely reflect an increase in wholesale power prices driven by rising natural gas prices. Annual average wholesale prices for 2022 range from an average of $62 per megawatthour (MWh) in Florida to $95/MWh in the ISO New England and New York ISO markets.

- The U.S. electric power sector added 13 gigawatts (GW) of utility-scale solar photovoltaic (PV) capacity in 2021. Solar capacity additions in the forecast period total 20 GW for 2022 and 24 GW for 2023, and they represent an addition of 31 billion kWh of electric power generation in 2022 and 41 billion kWh in 2023.



- U.S. coal production is forecast to increase by 21 million short tons (MMst) to 599 MMst in 2022 and to 601 MMst in 2023. We expect coal consumption to be slightly lower in 2022 at 541 MMst, relative to 546 MMst in 2021. This forecast decline is a result of constraints on coal generation and mine shutdowns as well as coal transportation limitations. As coal plant shutdowns continue and natural gas prices fall, coal consumption is expected to decline by 9% to 493 MMst in 2023. Coal exports increase from 85 MMst in 2021 to 87 MMst in 2022 and to 98 MMst in 2023.

Petroleum and Natural Gas Markets Review

Crude oil

Prices: The front-month futures price for Brent crude oil settled at $94.12 per barrel (b) on August 4, a decrease of $17.51/b from the July 1 price of $111.63/b. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, decreased by $19.89/b during the same period, settling at $88.54/b on August 4 **(Figure 1)**.

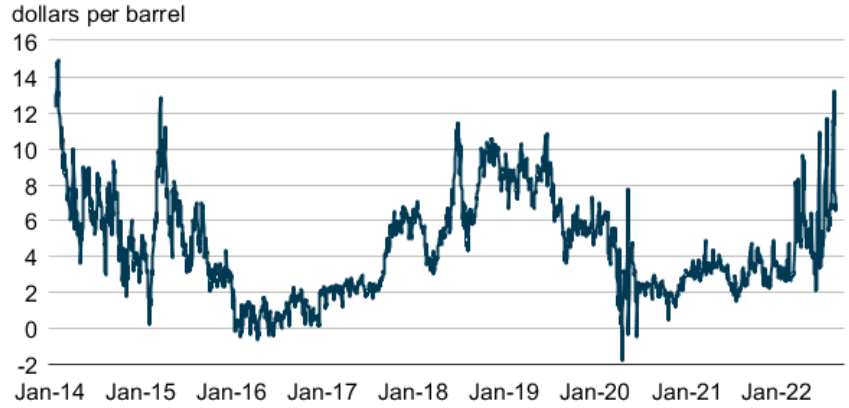


Figure 1. Crude oil front-month futures prices

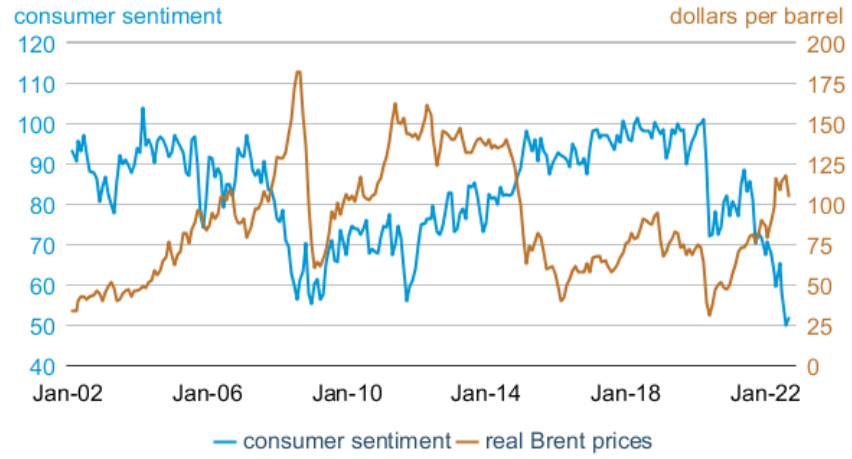
eia Data source: CME Group, Intercontinental Exchange, and Bloomberg L.P.
Note: WTI=West Texas Intermediate

Crude oil prices generally decreased in July, and the price of WTI decreased by more than Brent. The price spread between Brent and WTI increased to a high of $13.26/b on July 29, the highest price spread since January 14, 2014 **(Figure 2)**. This wide Brent-WTI spread, which reflects supply and demand dynamics in Northwest Europe, has come down in the first few trading days of August but remains high.

Figure 2. Brent–WTI futures price spread



Data source: Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate

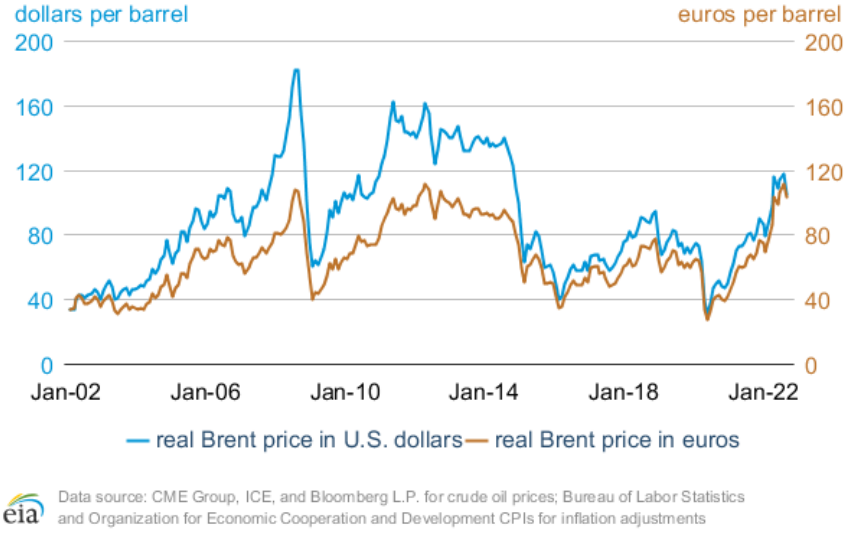
Russia's full-scale invasion of Ukraine has resulted in shifting trade patterns, leaving Europe to find substitutes for Russia's oil. This change has driven up the price of Brent contracts to a level high enough to reduce Asia's imports of Brent crude oil and to retain more oil in Europe. The Brent-WTI spread has also increased enough to attract more imports of crude oil from the United States into Europe. From March through July, the Brent-WTI spread averaged $6.05/b, an almost $2.50/b increase from the first two months of the year. We forecast the Brent-WTI spread will average $6/b in 2023, up $2/b from the July STEO. This high spread will keep exports from Europe to Asia subdued and encourage higher imports from the United States, both of which will likely be necessary as the EU reduces crude oil imports from Russia by 90% by the end of the year.

Although supply disruptions have kept crude oil prices around $100/b, crude oil prices have come down slightly in July as concerns of slower economic growth or a recession become more prevalent. These concerns are reflected in the University of Michigan's survey of consumer sentiment, which recorded its lowest reading on record in June, with data going back to November 1952 **(Figure 3)**. Likewise, consumer sentiment in the Euro Area has decreased, reaching record lows in July.

Figure 3. Consumer sentiment and real Brent crude oil prices

eia Data source: University of Michigan Surveys of Consumers; CME Group, ICE, and Bloomberg L.P.
Note: Real prices were calculated using the Consumer Price Index.

Consumer sentiment has been decreasing as inflation continues to be strong, borrowing costs increase with higher interest rates, and economic growth shows signs of slowing. Data points reflecting these trends include:



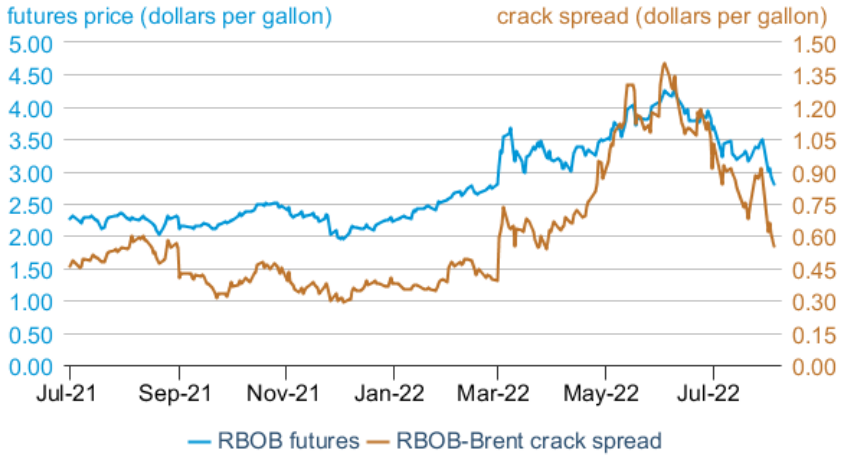
- The Bureau of Labor Statistics' Consumer Price Index in June showed year-over-year inflation of 9.1%, its fastest rate since 1981.
- Inflationary concerns have led to the Federal Reserve increasing interest rates, which increases borrowing costs and could also be affecting consumer sentiment.
- As prices have risen, U.S. manufacturing, as measured by the manufacturing Purchasing Manager Index (PMI), decreased in July to its lowest levels since July 2020.
- The Bureau of Economic Analysis's gross domestic product report released in July showed U.S. real gross domestic product contracting by an estimated 0.9% in 2Q22, making it the second consecutive quarter of economic contraction.

Consumer sentiment has often declined in response to high crude oil prices. This trend likely reflects the effects of higher crude oil prices on consumer budgets. Higher crude oil prices lead directly to increased costs for fuel that consumers purchase for transportation. Additionally, rising crude oil prices can create inflationary pressures throughout the economy by raising input costs of goods. Because inflation has been affecting consumers' budgets for an extended time now, it is likely that some consumers have begun to make lifestyle adjustments that are reducing petroleum product consumption in the third quarter, which we have reflected as reductions in our forecast.

Price of Brent crude oil in U.S. dollars and euros: As U.S. interest rates rise and concerns of a recession increase, demand for U.S. dollars has increased, strengthening its value relative to other currencies. For countries using a currency other than the U.S. dollar, a strengthening

dollar could make the imported cost of a barrel of crude oil more expensive. For example, recently the dollar has been trading close to the euro for the first time since 2002. Whereas the inflation-adjusted price of a barrel of crude oil in U.S. dollars is not as high as the levels seen from 2011–2014 or in 2008, the real price of a barrel of crude oil in euros has surpassed those highs **(Figure 4)**. The relatively higher prices have further contributed to slowing growth in petroleum and other liquids consumption in the second half of 2022 (2H22).

Figure 4. Real Brent crude oil price in U.S. dollars and euros

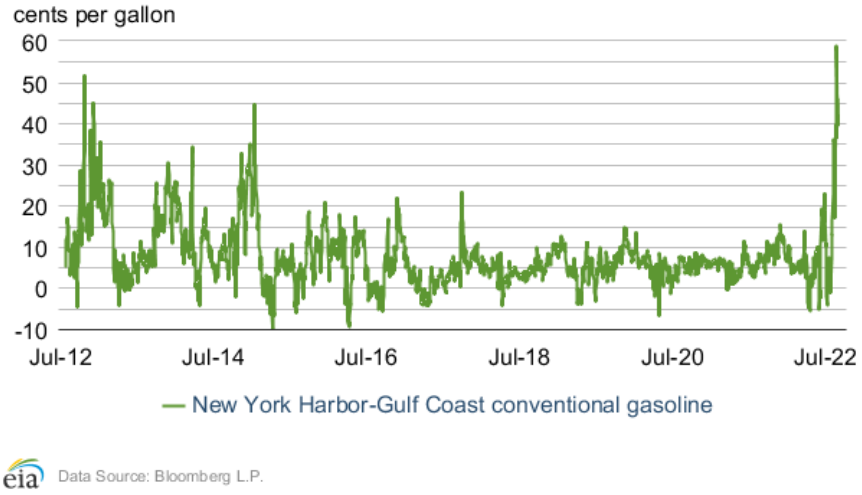


Data source: CME Group, ICE, and Bloomberg L.P. for crude oil prices; Bureau of Labor Statistics and Organization for Economic Cooperation and Development CPIs for inflation adjustments

Petroleum products

Gasoline prices: The front-month futures price of RBOB (the petroleum component of gasoline used in many parts of the country) settled at $2.79 per gallon (gal) on August 4, down 89 cents/gal from July 1 **(Figure 5)**. The RBOB-Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) settled at $0.55/gal on August 4, down 48 cents/gal during the same period.

Figure 5. Historical RBOB front-month futures prices and crack spreads



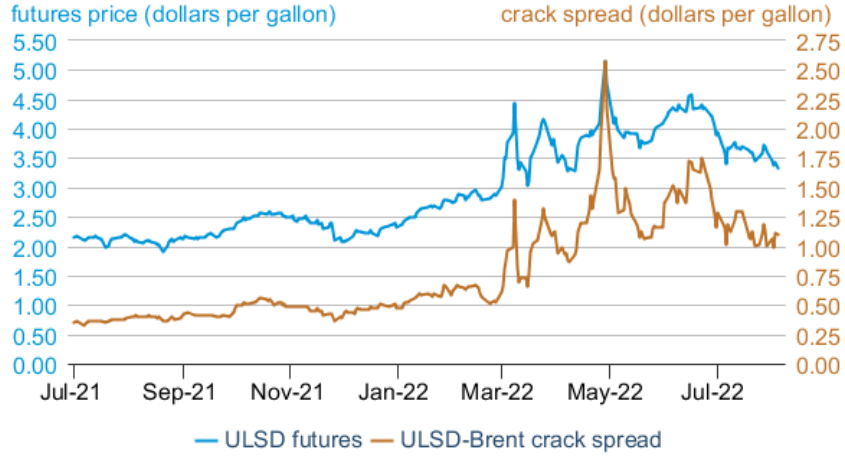
Data source: CME Group and Bloomberg L.P.
Note: RBOB is the petroleum component of gasoline used in many parts of the country.

Lower crude oil prices and a narrowing gasoline crack spread both contributed to an overall decrease in RBOB prices in July. The monthly average RBOB price in July was $3.34/gal, a decrease of 65 cents/gal compared with June. Just over half of this decrease was in the gasoline crack spread, which decreased to a monthly average of 85 cents/gal, down 34 cents/gal compared with June. The gasoline crack spread has remained below $1/gal since July 1.

Gasoline inventories in the United States increased by 7.8 million barrels in July compared with June. Increased gasoline production as a result of high refinery utilization has filled inventories amid relatively lower gasoline demand compared with 2021. We estimate that refinery utilization and gasoline production will rise in August before decreasing in September, in line with normal seasonal trends for fall maintenance. We estimate that less gasoline demand in the fall and winter will partially offset lower refinery production during the fall maintenance season, though this will lead to normal seasonal draws on inventories until November. From September through the end of 2022, we expect end-of-month motor gasoline inventories to be within 10 million barrels of the five-year average. As inventories grow closer to typical seasonal levels, we expect monthly average gasoline prices to continue decreasing. However, unexpected reductions in refinery operations because of unplanned outages—particularly those related to hurricanes on the Gulf Coast—as well as potential increases in driving activity in response to lower retail gasoline prices both present upside risks to gasoline prices and crack spreads.

New York Harbor-Gulf Coast price differential: The price differential for conventional gasoline between the New York Harbor and U.S. Gulf Coast spot markets increased substantially in July. On July 29, the price spread widened to 59 cents/gal, the widest spread in real terms since September 2012 **(Figure 6)**. The average price spread in July was 27 cents/gal, the widest monthly average price spread in real terms since 2014.

Figure 6. New York Harbor-Gulf Coast conventional gasoline spot price differentials



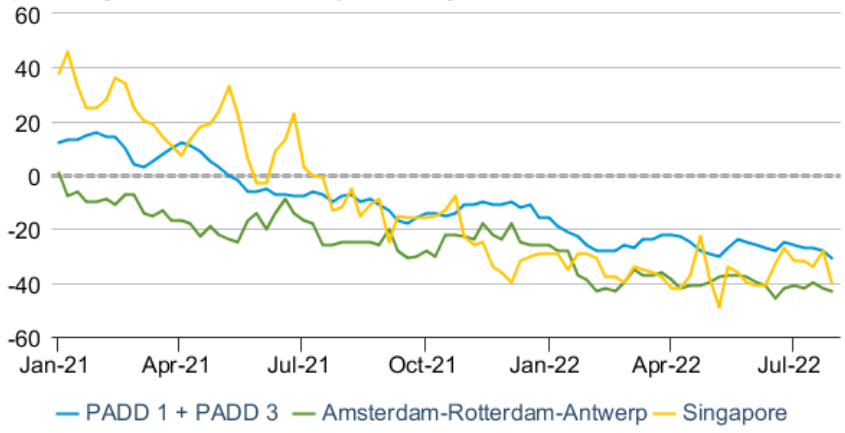
The wide price spread reflects substantially lower gasoline inventories at New York Harbor and along the East Coast than on the Gulf Coast. East Coast weekly motor gasoline inventories have averaged 21% less than the five-year average since May. In contrast, Gulf Coast weekly motor gasoline inventories have averaged slightly more than the five-year average since May. East Coast refineries produce a relatively small share of the overall volume of gasoline that is consumed in the region. The East Coast has historically imported gasoline from Europe and Canada and received transfers from the U.S. Gulf Coast to meet its consumption needs. Lower gasoline inventories along the East Coast reflect the impact of not only reduced imports of gasoline from Europe but also the closure of what had been the East Coast's largest refinery in 2019, as well as the closure of the export-oriented Canadian Come-by-Chance refinery in 2020. With these lost sources of supply, Gulf Coast refiners have increased refinery utilization and gasoline production in response to the high prices, but logistical capacity constraints limit the volume of gasoline that can be moved to East Coast markets, accounting for the wide regional discrepancy in inventory levels.

Trade press reports have suggested that line space along the Colonial Pipeline (the largest petroleum product pipeline connecting the Gulf Coast to the East Coast), which is traded on secondary markets, was pricing at its highest premium to the pipeline's tariff rate since 2015. Gasoline that cannot be moved along the Colonial Pipeline or the smaller Products SE Pipeline must instead be moved from the Gulf Coast to the East Coast by rail or Jones Act compliant tanker. The current level of the regional price spread suggests that even capacity on more expensive modes of transit between the Gulf Coast to the East Coast, such as rail or tanker, are being used to their current capacity. Increased tanker traffic, more available space on rail lines, or even increased long distance trucking traffic to certain regions may become temporarily viable at current price spreads if market participants believe the price spreads will last long enough to justify the diversion of resources.

Ultra-low sulfur diesel prices: The front-month futures price for ultra-low sulfur diesel (ULSD) for delivery in New York Harbor settled at $3.34/gal on August 4, a 60 cents/gal decrease from July 1 **(Figure 7)**. The ULSD-Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) decreased 18 cents/gal during the same period and settled at $1.10/gal on August 4.

Figure 7. Historical ULSD front-month futures prices and crack spreads

Data source: CME Group and Bloomberg L.P.
Note: ULSD=ultra-low sulfur diesel



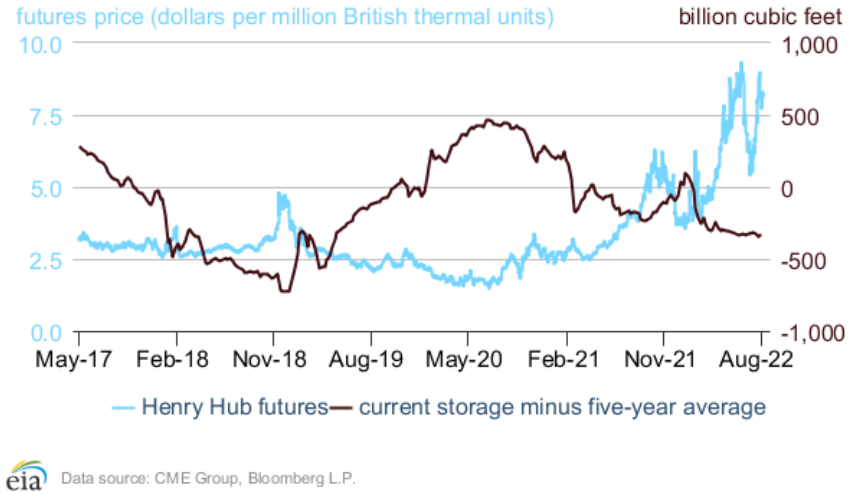
ULSD prices and crack spreads decreased this month to levels not seen since early April, as concerns about a potential recession weighed on the economic outlook. Compared with June, July ULSD prices were 15% lower, and crack spreads were 24% narrower, marking the first decline in ULSD prices since the beginning of the year. However, ULSD prices in July were still 71% higher than in July 2021, and ULSD crack spreads for July were three times wider than in July 2021.

Declining crude oil prices and less domestic consumption of distillate contributed to lower distillate prices. We estimate distillate consumption decreased by 0.2 million b/d (4%) from June to 3.7 million b/d in July. Consumption typically declines in July as stocks rebuild to prepare for higher demand during the fall harvest season and winter heating season. However, we estimate U.S. distillate inventories decreased 1.8 million barrels (2%) in July to reach 109 million barrels, or 26% below the five-year average. We estimate U.S. distillate production averaged 5.1 million b/d in July, slightly below June, which had seen the most production since December 2019. Strong global distillate demand continues to support higher production and, with lower domestic consumption, higher-than-average exports in July. We forecast production will remain above 2021 levels through the rest of the year.

International distillate inventories: Western sanctions against Russia's petroleum product exports following its full-scale invasion of Ukraine in February have been a major driver of global distillate prices this year. Even before the sanctions, however, distillate inventories at all three

major trading hubs (New York Harbor, Amsterdam-Rotterdam-Antwerp, and Singapore) started the year below their respective five-year averages **(Figure 8)**. U.S. distillate inventories increased to record highs in 2020 when the COVID-19 pandemic resulted in historically low consumption of petroleum products. As demand returned, inventory drawdowns began in the United States and followed overseas by the beginning of 2021. As of July 29, 2022, combined distillate inventories in the East Coast and the Gulf Coast (PADD 1 and PADD 3) were 31% below the five-year average, and inventories at Amsterdam-Rotterdam-Antwerp and Singapore were around 40% below their five-year averages. In addition to sanctions on Russia's exports, reduced refinery capacity in the United States and lower quotas for exports from China contributed to distillate inventory draws. Low inventories globally have put sustained upward pressure on distillate prices. We forecast higher-than-average domestic distillate production will begin contributing to building inventories in August with overall domestic stocks reaching 119 million barrels, or 17% short of the five-year average, by the end of this year.

Figure 8. International distillate inventories

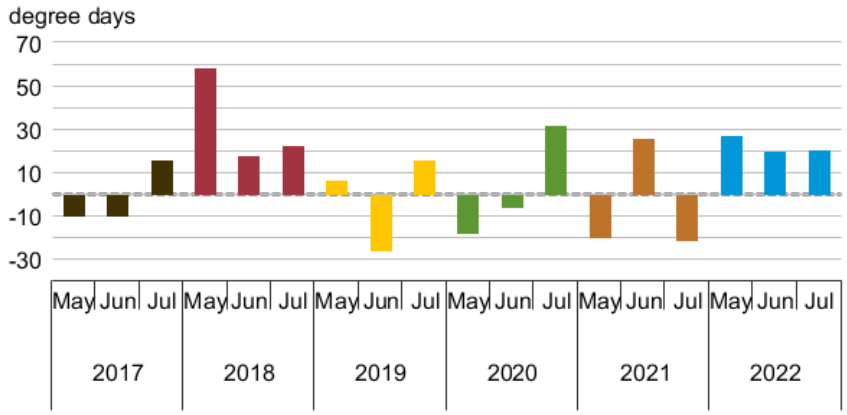


eia Data source: EIA, *Weekly Petroleum Status Report*, and CME Group as compiled by Bloomberg L.P.

Natural gas

Prices: The front-month natural gas futures contract for delivery at the Henry Hub settled at $8.12 per million British thermal units (MMBtu) on August 4, up $2.39/MMBtu from July 1, 2022 **(Figure 9)**. The average price for front-month natural gas futures contracts in July was $7.19/MMBtu, down 41 cents/MMBtu from June's average of $7.60/MMBtu when the front-month natural gas futures price topped $9.00/MMBtu on two days.

Figure 9. U.S. natural gas front-month futures prices and current storage deviation from five-year average



eia Data source: CME Group, Bloomberg L.P.

Natural gas injections into storage in June were 2% higher than the five-year (2017–2021) average. That trend reversed in July as 10% less natural gas was injected into storage than the five-year average. We estimate that storage inventories ended July at 2,493 billion cubic feet (Bcf), 12% less than the five-year average level.

The front-month Henry Hub futures price fell from $9.29/MMBtu on June 7, the day before the outage at Freeport LNG, to $5.42/MMBtu on June 30, likely because of market anticipation that the decrease in natural gas available for export would lead to an increase in natural gas supply available in the U.S. market. With more natural gas supply available, market participants may have anticipated more natural gas injections into storage. However, higher-than-normal temperatures in July increased consumption of natural gas for electric power generation to meet air-conditioning demand. We estimate that an average of 41.8 billion cubic feet per day (Bcf/d) of natural gas was consumed in the electric power sector during July, 2.2 Bcf/d more than the five-year average and 5.0 Bcf/d more than in June. At the same time, we estimate that dry natural gas production averaged 96.4 Bcf/d in July, down 0.6 Bcf/d from June.

Summer space cooling: During May, June, and July, the United States experienced 800 cumulative cooling degree days (CDD), or 69 (9%) more than the prior 10-year (2011–2020) average **(Figure 10),** and the most CDDs for this time period since 2018. Higher-than-normal temperatures led to more consumption of natural gas for electric power generation to meet air-conditioning demand. We estimate that natural gas consumption in the electric power sector averaged 36.2 Bcf/d from May through July, 2.1 Bcf/d more than the same time period in 2021 and 3.4 Bcf/d more than the five-year average. The strong demand has led to lower-than-average injections into natural gas storage for three of the four months so far during this injection season (April–October) and has contributed to the deficit in the storage inventory compared with the five-year average. The sustained lower-than-average storage inventories have put upward pressure on the Henry Hub spot natural gas price.

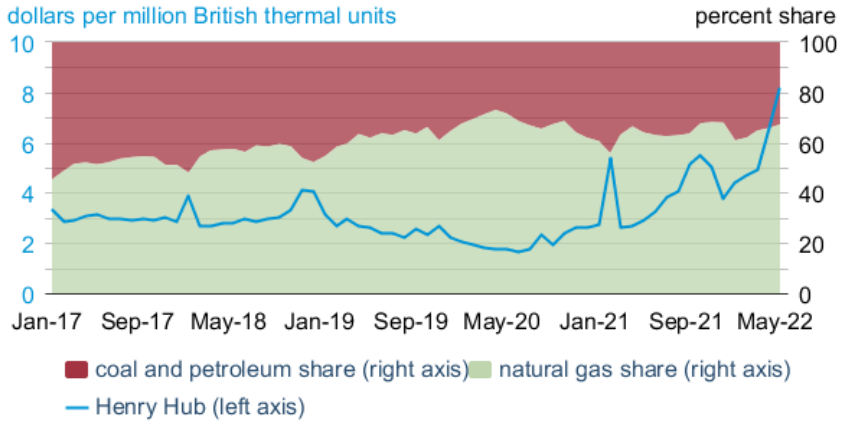


Figure 10. May–July cooling degree days deviation from 10-year average

eia Data source: U.S. Energy Information Administration, Short-Term Energy Outlook

Natural gas share of electricity generation: In recent years, the electric power sector substituted natural gas-fired generation with coal-fired generation when natural gas prices rose. However, in recent months, coal power plants have responded less to price than in the past, most likely as a result of continued coal capacity retirements, constraints in fuel delivery to coal plants, and lower-than-average stocks at coal plants. Additionally, growth in electricity generation capacity from renewable sources is limiting the dispatch of both coal and natural gas. The Henry Hub spot natural gas price has remained elevated since the beginning of the year, but natural gas has maintained a more than 60% share of fossil-fuel sourced electricity generation **(Figure 11)**. The Henry Hub spot price increased $3.76/MMBtu from January to May, but the natural gas share of fossil-fuel sourced electricity generation also increased from 60% in January to 67% in May despite the higher fuel cost.

Figure 11. Shares of fossil-fuel electricity generation in the United States and Henry Hub spot price

Note: Fossil-fuel=natural gas, petroleum liquids, petroleum coke, and coal

Notable forecast changes

- This STEO incorporates our changed forecast for the Brent and WTI crude oil price spread. Changes to sources of Europe's crude oil imports following Russia's full-scale invasion of Ukraine and the EU's subsequent petroleum import ban have contributed to redirections in oil trade flows. European countries are importing more crude oil from the United States and exporting less crude oil to countries in Asia, contributing to the development of a crude oil import price premium in Europe. As a result, we anticipate this trend will maintain a wider price spread between Brent and WTI crude oil of $6/b in 2023, which is $2/b wider than in the July STEO.

- Natural gas prices have risen in recent weeks in response to the sooner-than-expected re-opening of the Freeport LNG export terminal and ongoing hot weather. As a result, we have increased our forecast for natural gas prices. We now forecast that the Henry Hub price will average $7.54/MMBtu during the second half of 2022 compared with a forecast of $5.97/MMBtu in the last STEO. We have also raised our forecast average price for 2023 from $4.76/MMBtu to $5.10/MMBtu.

- We have revised our modeling of electricity supply to better reflect regional differences in fuel costs. This change, along with a higher forecast natural gas price, has contributed to some significant increases in our forecast for wholesale electricity prices, particularly in the Northeast. In the current STEO, we forecast winter wholesale prices in ISO New England will average $176 per megawatthour (MWh) between December and February compared with $57/MWh in the previous STEO. The large increase in forecast prices reflects updates to our assumption about that region's natural gas costs for this winter. We also raised our forecast electricity prices in Texas's ERCOT market.

- You can find more information in the detailed table of forecast changes.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Average for all sulfur contents.

(b) Average self-service cash price.

(c) Includes fuel oils No. 4, No. 5, No. 6, and topped crude.

- = no data available

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation; prices exclude taxes unless otherwise noted.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Marketing Monthly* , DOE/EIA-0380; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; and *Monthly Energy Review* , DOE/EIA-0035.

Natural gas Henry Hub and WTI crude oil spot prices from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate, natural gas plant liquids, other liquids, refinery processing gain, and other unaccounted-for liquids.

OPEC = Organization of the Petroleum Exporting Countries: Iran, Iraq, Kuwait, Saudi Arabia, and the United Arab Emirates (Middle East); Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Libya, Nigeria, and Venezuela (Other).

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Forecasts are not published for individual OPEC countries.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 4a. U.S. Petroleum and Other Liquids Supply, Consumption, and Inventories

Total Commercial Inventory	**1301.7**	**1271.5**	**1240.7**	**1193.8**	**1153.6**	**1192.6**	*1239.8*	*1218.4*	*1222.9*	*1270.6*	*1283.3*	*1256.8*	**1193.8**	*1218.4*	*1256.8*
Crude Oil in SPR	**637.8**	**621.3**	**617.8**	**593.7**	**566.1**	**492.0**	*403.3*	*365.5*	*361.7*	*353.9*	*351.3*	*340.8*	**593.7**	*365.5*	*340.8*

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 7c. U.S. Regional Electricity Prices to Ultimate Customers (Cents per Kilowatthour)

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distrib

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Subtotals for the industrial and commercial sectors might not equal the sum of the components. The subtotal for the industrial sector includes ethanol consumption that is not shown separately. The subtotal for the commercial sector includes ethanol and hydroelectric consumption that are not shown separately.

(f) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(g) Fuel ethanol and biodiesel, renewable diesel, and other biofuels consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum Supply*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.
Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

- = no data available

SAAR = Seasonally-adjusted annual rate

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on August 4, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Appendix to the August 2022 *Short-Term Energy Outlook*

This appendix is prepared in fulfillment of section 1245(d)(4)(A) of the National Defense Authorization Act (NDAA) for Fiscal Year 2012, as amended. The law requires the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy, to submit to Congress a report on the availability and price of petroleum and petroleum products produced in countries other than Iran in the two-month period preceding the submission of the report. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The data in this appendix, therefore, should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

EIA consulted with the U.S. Department of the Treasury, the U.S. Department of State, and the intelligence community in the process of developing the NDAA report, which was previously published as a stand-alone report. Detailed background and contextual information not repeated here can be found in early editions of the NDAA report.

This appendix is published in the *Short-Term Energy Outlook* in even numbered months.

Table a1. Summary of Estimated Petroleum and Other Liquids Quantities

	Jun 2022	Jul 2022	Jun 2022 – Jul 2022 Average	Jun 2021 – Jul 2021 Average	2019 – 2021 Average
Global Petroleum and Other Liquids (million barrels per day)					
Global Petroleum and Other Liquids Production (a)	99.7	100.3	100.0	96.2	96.6
Global Petroleum and Other Liquids Consumption (b)	99.3	98.8	99.1	98.2	96.7
Biofuels Production (c)	3.0	3.1	3.1	3.1	2.7
Biofuels Consumption (c)	2.6	2.6	2.6	2.6	2.6
Iran Liquid Fuels Production	3.6	3.6	3.6	3.6	3.2
Iran Liquid Fuels Consumption	1.8	1.9	1.8	1.8	1.9
Petroleum and Petroleum Products Produced and Consumed in Countries Other Than Iran (million barrels per day)					
Production (d)	93.2	93.5	93.4	89.6	90.7
Consumption (d)	94.9	94.4	94.7	93.8	92.2
Production minus Consumption	-1.8	-0.9	-1.3	-4.2	-1.6
World Inventory Net Withdrawals Including Iran	-0.4	-1.5	-1.0	1.9	0.0
Estimated OECD Inventory Level (e) (million barrels)	2,688	2,728	2,708	2,850	2,943
Surplus Production Capacity (million barrels per day)					
OPEC Surplus Crude Oil Production Capacity (f)	2.5	2.1	2.3	5.2	4.3

Note: The term "petroleum and other liquids" encompasses crude oil, lease condensate, natural gas liquids, biofuels, coal-to-liquids, gas-to-liquids, and refinery processing gains, which are important to consider in concert due to the inter-related supply, demand, and price dynamics of petroleum, petroleum products, and related fuels.

(a) Production includes crude oil (including lease condensates), natural gas liquids, other liquids, and refinery processing gains.

(b) Consumption of petroleum by the OECD countries is synonymous with "products supplied," defined in the glossary of the EIA Petroleum Supply Monthly, DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel, and loss, and bunkering.

(c) Biofuels production and consumption are based on EIA estimates as published in the International Energy Statistics. Biofuels production in the third quarter tends to be at its highest level in the year as ethanol production in Brazil reaches its seasonal peak and is typically lowest in the first quarter as seasonal production falls in the South/South-Central region of Brazil.

(d) Global production of petroleum and petroleum products outside of Iran is derived by subtracting biofuels production and Iran liquid fuels production from global liquid fuels production. The same method is used to calculate global consumption outside of Iran.

(e) Estimated inventory level is for OECD countries only.

(f) EIA defines surplus oil production capacity as potential oil production that could be brought online within 30 days and sustained for at least 90 days, consistent with sound business practices. This does not include oil production increases that could not be sustained without degrading the future production capacity of a field.

Independent Statistics & Analysis
U.S. Energy Information Administration

September 2022

Short-Term Energy Outlook

Forecast highlights

Global liquid fuels

- The Brent crude oil spot price in our forecast averages $98 per barrel (b) in the fourth quarter of 2022 (4Q22) and $97/b in 2023. The possibility of petroleum supply disruptions and slower-than-expected crude oil production growth continues to create the potential for higher oil prices, while the possibility of slower-than-forecast economic growth creates the potential for lower prices.

- U.S. crude oil production in our forecast averages 11.8 million barrels per day (b/d) in 2022 and 12.6 million b/d in 2023, which would set a record for the most U.S. crude oil production during a year. The current record is 12.3 million b/d, set in 2019.

- We estimate that 99.4 million b/d of petroleum and liquid fuels was consumed globally in August 2022, up by 1.6 million b/d from August 2021. We forecast that global consumption will rise by an average of 2.1 million b/d for all of 2022 and by an average of 2.0 million b/d in 2023. As a result of high natural gas prices globally, we increased our forecast for oil consumption in 4Q22 and 1Q23 as electricity providers, particularly in Europe, may switch to oil-based generating fuels.

- We expect retail gasoline prices will average $3.60 per gallon (gal) in 4Q22 and $3.61/gal in 2023. Retail diesel prices in our forecast average $4.90/gal in 4Q22 and $4.28/gal in 2023.

Natural gas

- In August, the Henry Hub spot price averaged $8.80 per million British thermal units (MMBtu), up from $7.28/MMBtu in July. Natural gas prices rose in August because of continued strong demand for natural gas in the electric power sector, which has kept natural gas inventories below their five-year (2017–2021) average. We expect the Henry Hub price to average about $9/MMBtu in 4Q22 and then fall to an average of about $6/MMBtu in 2023 as U.S. natural gas production rises.

- U.S. natural gas inventories ended August at 2.7 trillion cubic feet (Tcf), which was 12% below the five-year average. We forecast that inventories will end the injection season (April through October) at more than 3.4 Tcf, which would be 7% below the five-year average.

- U.S. LNG exports in our forecast average 11.7 billion cubic feet per day (Bcf/d) in 4Q22, up 1.7 Bcf/d from 3Q22. Factors that will affect the volume of LNG exports in the coming months include the planned outage at Cove Point in October and Freeport LNG resuming partial operations by mid- to late-November. We forecast LNG exports will average 12.3 Bcf/d in 2023.

- U.S. consumption of natural gas in our forecast averages 86.6 Bcf/d in 2022, up 3.6 Bcf/d from 2021, driven by increases across all consuming sectors. We expect consumption to fall by 1.9 Bcf/d in 2023 because of declines in consumption in the industrial and electric power sectors.

- Dry natural gas production has been rising relatively steadily since 1Q22, when it averaged 94.6 Bcf/d. We forecast U.S. dry natural gas production to average 99.0 Bcf/d in 4Q22 and then rise to 100.4 Bcf/d for 2023.

Electricity, coal, renewables, and emissions

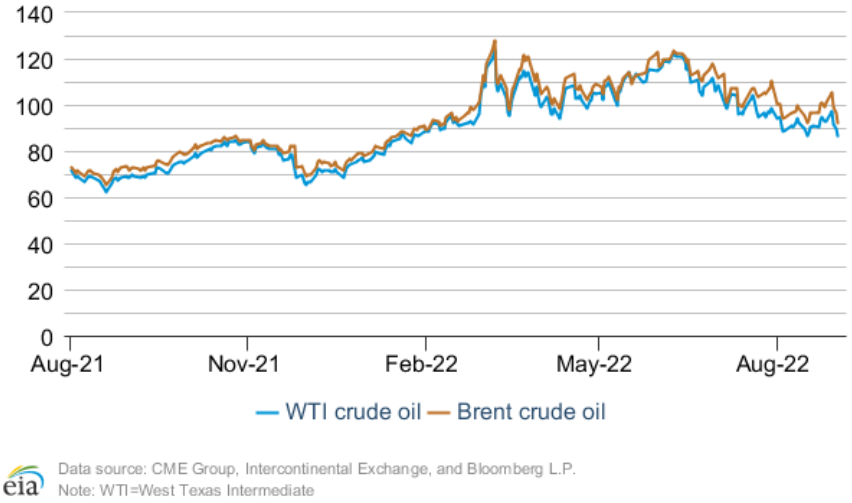
- We expect U.S. sales of electricity to ultimate customers to rise by 2.6% in 2022, mostly because of more economic activity but also because of slightly hotter summer weather in than last year much of the country. We forecast U.S. sales of electricity to fall by 0.4% in 2023.

- The largest increases in U.S. electricity generation in our forecast come from renewable energy sources, mostly solar and wind. We expect renewable sources will provide 22% of U.S. generation in 2022 and 24% in 2023, up from 20% in 2021.

- Natural gas fuels 37% of U.S. electricity generation in 2022, a share similar to 2021, and we forecast it to fall to 36% in 2023. Coal-fired electricity generation in our forecast provides 21% of the U.S. total in 2022 and 19% in 2023. Growing generation from renewable sources limits growth in natural gas generation while coal's generation share declines due to the expected retirement of coal-fired capacity.

- We forecast the U.S. residential price of electricity will average 14.8 cents per kilowatthour in 2022, up 7.5% from 2021. Higher retail electricity prices largely reflect an increase in wholesale power prices driven by rising natural gas prices. The Southwest region has the lowest forecast wholesale prices in 2022, averaging $69 per megawatthour (MWh), up 25% from 2021. The highest forecast wholesale prices are at more than $100/MWh in ISO New England (up 96% from 2021) and New York ISO (up 124% from 2021).

- U.S. coal production in the forecast increases by 22 million short tons (MMst) in 2022 to total 600 MMst for the year. We expect production will total 590 MMst in 2023.



- We expect energy-related carbon dioxide (CO_2) emissions in the United States to increase by 1.7% in 2022 and then to decrease 1.8% back to around 2021 levels in 2023.

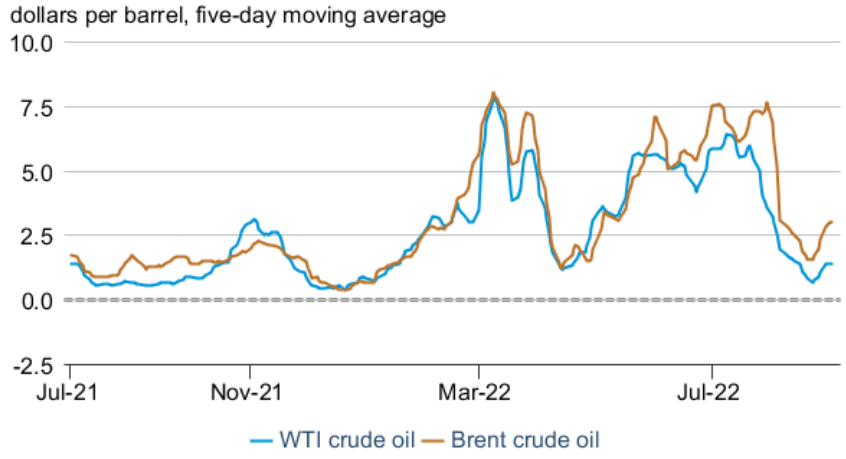
Petroleum and Natural Gas Markets Review

Crude oil

Prices: The front-month futures price for Brent crude oil settled at $92.36 per barrel (b) on September 1, a decrease of $7.67/b from the August 1 price of $100.03/b. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, decreased by $7.28/b during the same period, settling at $86.61/b on September 1 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices

eia Data source: CME Group, Intercontinental Exchange, and Bloomberg L.P.
Note: WTI=West Texas Intermediate



Crude oil prices were lower on average in August than they were in July before ending with a rapid decrease in the week before Labor Day. From August 29 through September 1, the Brent crude oil price decreased $13/b and the WTI price decreased $10/b. The monthly average Brent front-month futures price was $98/b in August, about $7/b lower than in July, and the WTI price was $91/b, $8/b lower than in July. The lower prices in August likely reflected overall increases in global petroleum inventories. The increase in inventories came with ongoing growth in global production of crude oil and other liquid fuels, which we estimate reached 101 million barrels per day (b/d) in August, the highest global production since December 2019.

We estimate that crude oil prices will generally remain near August average levels through the end of 2023. Although we expect average crude oil prices to mostly remain between $90/b–$100/b through next year, the possibility for significant volatility around those averages is high. Recent events contributing to increased uncertainty in the crude oil market and in our forecast include:

- The impact of the recent OPEC decision to reduce crude oil production by 0.1 million b/d in October and whether there will be further production cuts in the future
- The threat of increasing conflict following the outbreak of violent clashes in the Libyan capital of Tripoli
- Uncertainty around the potential expiration of the current coordinated petroleum release from strategic reserves in November
- The potential return to an Iran nuclear deal that could lift sanctions on the country and allow Iran's crude oil exports into the market
- The risk of hurricanes that could result in potential production outages and limited export traffic along the U.S. Gulf Coast

Crude oil front-month to third-month futures price spread: The front-month to third-month crude oil futures price spread (1-3 spread) is a measure of market backwardation, a market environment that encourages crude oil to flow out of inventories and into the market **(Figure 2)**. Backwardation occurs when crude oil futures contract prices in the near term are higher than crude oil prices in the long term. In response to Russia's full-scale invasion of Ukraine in the spring, the 1-3 spread for Brent increased from an average of $1/b in January to nearly $7/b in March. Following a decline in April, it returned to near $7/b levels in July. In August, the spread narrowed to $3/b, the narrowest spread since April. The decrease in backwardation in August suggests that the market call to draw oil from inventories has decreased since midsummer, indicating market conditions that are more balanced between supply and demand than earlier this year.

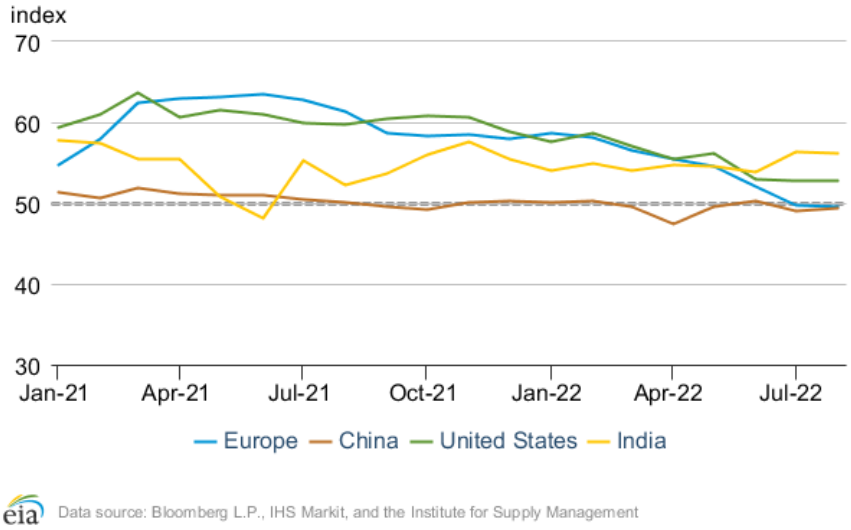


Figure 2. Crude oil front-month to third-month futures price spread

Data sources: CME Group, Intercontinental Exchange, and Bloomberg L.P.
Note: WTI=West Texas Intermediate

Manufacturing Purchasing Managers' Index: Regional Purchasing Managers' Indexes (PMIs) for manufacturing in July decreased in the United States, Europe, and China **(Figure 3**). A PMI serves as an indicator of increasing or decreasing manufacturing activities. An index rating above 50 represents growth in activity while a rating below 50 indicates a contraction. The U.S. manufacturing PMI decreased in July to 52.8, its lowest rating since June 2020, suggesting a slowing rate of growth. In Europe, the PMI value dropped to 49.8, also its lowest rating since June 2020, while the drop below 50 also suggests market contraction. The latest Europe and U.S. PMIs suggest that these conditions have continued into August, contributing to further concerns about economic conditions and petroleum demand. The low PMI signals a weakening economic environment in Europe, further exacerbated by the decreasing value of the euro, which fell to parity with the U.S. dollar in late August.

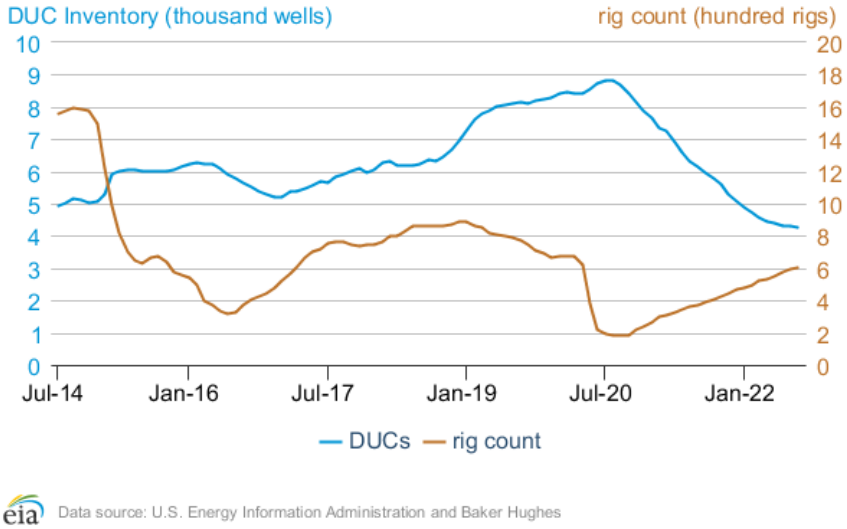

Figure 3. Regional Manufacturing Purchasing Managers' Index (PMI)

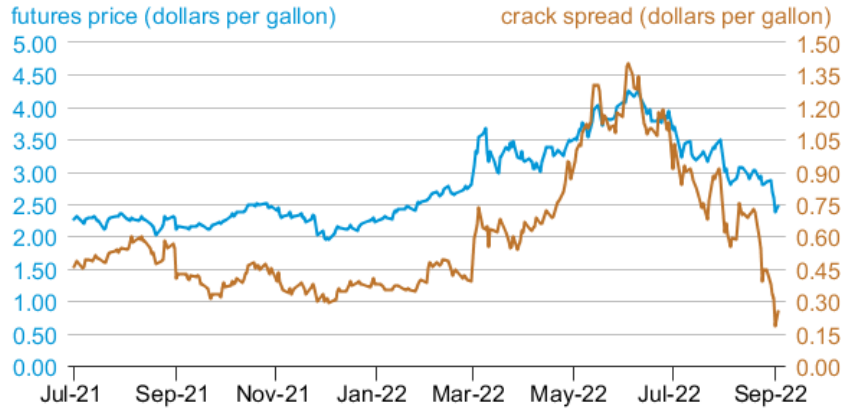
eia Data source: Bloomberg L.P., IHS Markit, and the Institute for Supply Management

U.S. drilled but uncompleted wells and rig count: Since July 2020, the number of U.S. wells that are drilled but uncompleted (DUCs) has been decreasing and has fallen below the number in 2014 (the earliest year in our dataset) in 2022 **(Figure 4)**. DUCs are oil and natural gas wells that have undergone their drilling phase but have not yet undergone casing, cementing, and other procedures that are necessary to establish a fully operational well. Prior to the onset of the COVID-19 pandemic, the number of DUCs had been steadily growing since 2017 in the United States, driven primarily by new production in the Permian Basin. Since July 2020, however, the number of DUCs has been decreasing at a relatively steady pace. At the same time, the Baker Hughes rotary rig count for oil producing wells has been increasing, rising above 600 rigs in July, the highest it has been since March 2020.

Figure 4. U.S. drilled but uncompleted wells (DUC) and rig count

eia Data source: U.S. Energy Information Administration and Baker Hughes

The number of DUCs serves as an indicator of the relative supply of wells that may be transitioned to operational status, and the increasing rig count reflects the higher number of wells being drilled. Growth in crude oil production in the United States since 2021 has largely consisted of completing wells from the available DUCs, while new drilling in response to high crude oil prices appears to be lagging the rate of completion. Continued U.S. production increases are likely to continue drawing on available DUCs that are viable candidates for completion at current prices. Continued increases in rig counts will contribute to more drilled wells, which could soon outpace well completions and increase the number of DUCs. However, on September 2, the latest weekly rig count indicated a decrease in 9 rigs from the previous week, down to 596, the largest week-on-week decrease since September 2021.



Our August *Drilling Productivity Report* showed the smallest monthly percentage decline in DUCs since July 2020. We currently forecast that U.S. crude oil production will increase to 12.2 million b/d in the fourth quarter and will rise to an average of 12.6 million b/d in 2023. This increase would constitute an annual increase of 0.5 million b/d in 2022 and an additional increase of 0.9 million b/d in 2023.

Petroleum products

Gasoline prices: The front-month futures price of RBOB (the petroleum component of gasoline used in many parts of the country) settled at $2.39 per gallon (gal) on September 1, down 61 cents/gal from August 1 **(Figure 5)**. The RBOB-Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) settled at $0.19/gal on September 1, down 43 cents/gal during the same period. The RBOB–Brent crack spread declined by 12 cents/gal on September 1 when the front-month RBOB contract rolled over to October delivery, which reflects winter grade gasoline that is cheaper for refineries to produce. Before the contract roll over, the RBOB–Brent crack spread had already decreased from an average of 85 cents/gal in

July to an average of 58 cents/gal in August, which could be the result of less-than-average seasonal demand and anticipation of the contract roll-over.

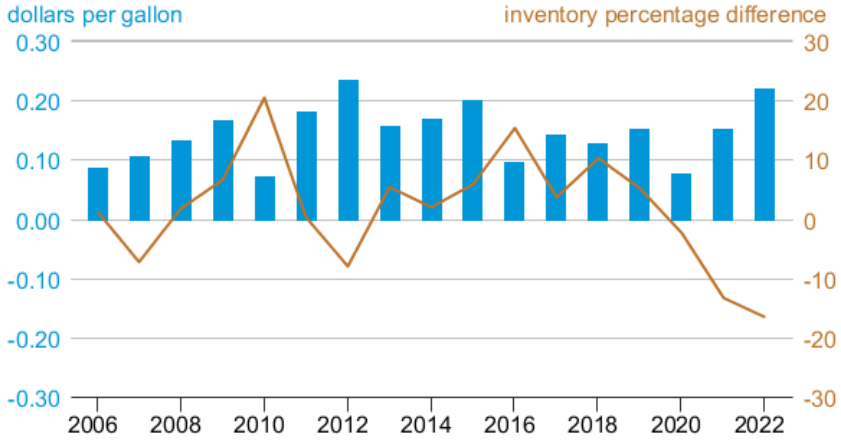


Figure 5. Historical RBOB front-month futures prices and crack spreads

Data source: CME Group and Bloomberg L.P.
Note: RBOB is the petroleum component of gasoline used in many parts of the country.

The front-month RBOB contract for September delivery sold at an average premium of 22 cents/gal to the second-month contract for October delivery during August trading. This price spread was the second-highest inflation-adjusted price spread since 2006, when the RBOB futures contract began trading **(Figure 6)**. Most of this premium was due to the difference between winter and summer grade gasoline, but market fundamentals also affected the spread. Typically, when inventories are lower, this premium is greater because low inventories add more pressure to prices in near-term contracts than long-term contracts. This dynamic occurs because low inventories occur during tight market conditions in which demand must be met from inventories, and, under these conditions, purchasers are willing to pay a premium to secure needed supply. We estimate that gasoline inventories in the East Coast (PADD 1) were 16% below their five-year (2017–2021) average at the end of August. In 2012, the year with the highest average front-month to second-month price spread, inventories were also below their five-year average, albeit by not as much as this year.

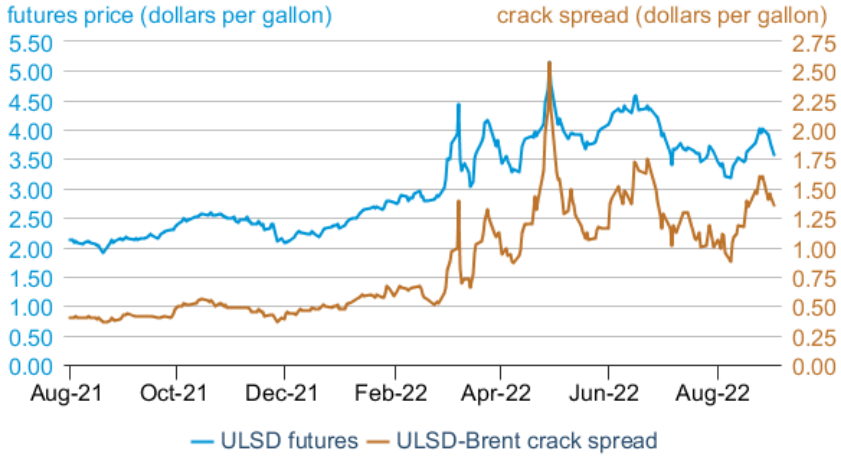

Figure 6. August front-month to 2nd month RBOB price spread and PADD 1 gasoline stocks compared with five-year average

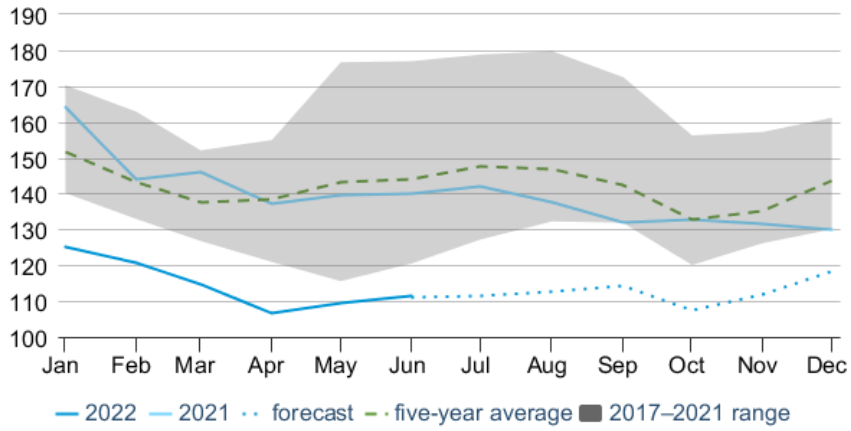
Source: CME Group and Bloomberg L.P.
Note: Prices are based on inflation-adjusted monthly averages. Real prices are adjusted using the CPI.

Ultra-low sulfur diesel prices: The front-month futures price for ultra-low sulfur diesel (ULSD) for delivery in New York Harbor settled at $3.56/gal on September 1, a 12 cents/gal (4%) increase from August 1 **(Figure 7)**. The ULSD-Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) increased 30 cents/gal (29%) during the same period and settled at $1.36/gal on September 1.

Figure 7. Historical ULSD front-month futures prices and crack spreads

Data source: CME Group and Bloomberg L.P.
Note: ULSD=ultra-low sulfur diesel



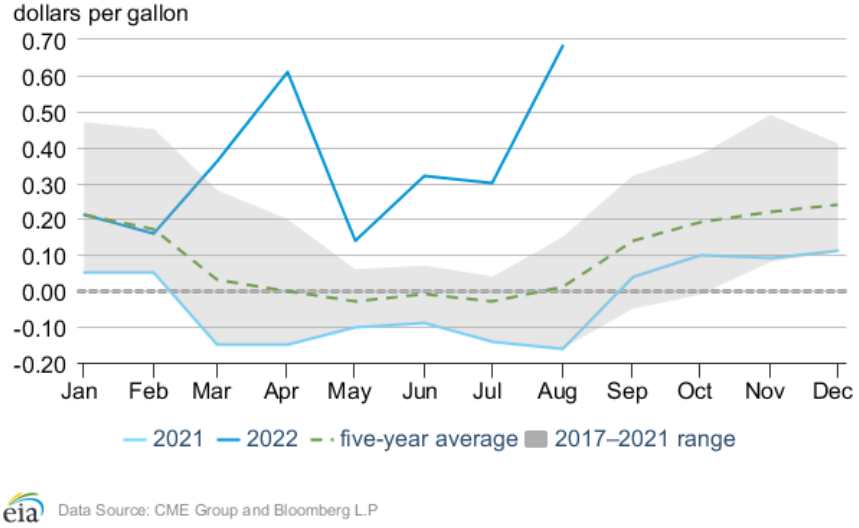
ULSD prices increased this month as rapidly increasing natural gas prices in Europe and Asia increased demand for distillate fuel as a substitute fuel for power generation in those markets amid low distillate stocks globally. From August 8 to August 26, ULSD prices increased by 83 cents/gal (26%). This increase in ULSD prices occurred despite slowing economic and trucking activity in the United States. A recent decline in the American Trucking Association's *Truck Tonnage Index* suggests less consumption of goods, less home construction, and slower

manufacturing activity contributed to a slight decline in diesel fuel demand. Although changes in crude oil prices normally account for most changes in ULSD prices, as crude oil is the single largest input cost for producing ULSD, the Brent crude oil price increased only 4% between August 8 and August 26. Because ULSD prices increased by more than crude oil prices, it resulted in the ULSD-Brent crack spread increasing by 73 cents/gal (83%) over the same period.

ULSD prices rose in August primarily due to increased interest in fuel switching from natural gas to distillate fuel oil caused by rising natural gas prices in Europe. From August 8 to August 26, front-month natural gas prices at the Dutch Title Transfer Facility (TTF) increased by 72%, reaching a record high. High natural gas prices are making it economical for European operators to switch from natural gas to distillate fuel oil in electricity generation. From August 26 to September 1, ULSD prices declined by 45 cents/gal (11%) as natural gas prices declined and concerns around an economic slowdown that could reduce distillate demand regained the focus of the market.

U.S. distillate inventories: Inventories in the United States began the year at 130 million barrels, 14% less than their five-year average **(Figure 8)**. As of June 2022, inventories decreased to 111 million barrels or 23% below the five-year average. We forecast U.S. distillate inventories will build to 118 million barrels or 17% below the five-year average by the end of this year, and will remain below their previous five-year low.

Figure 8. U.S. distillate inventory



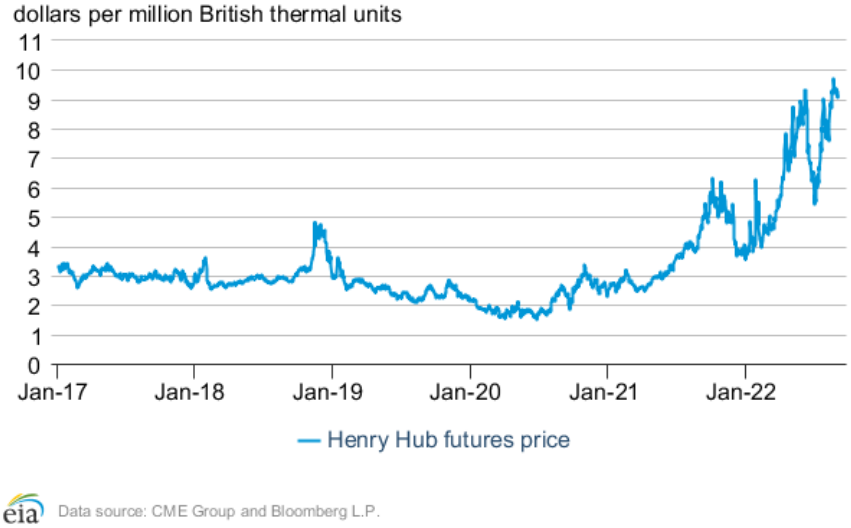
Data source: EIA *Petroleum Supply Monthly* and Short-Term Energy Outlook, September 2022

Western sanctions against Russia's petroleum product exports following its full-scale invasion of Ukraine in February have been a major driver of global distillate markets and subsequent inventory draws this year. Low inventories in New England (PADD 1A), the Central Atlantic (PADD 1B), and the Midwest (PADD 2) suggest both higher and more volatile ULSD prices in the coming months. In the Midwest, where distillate fuel is widely used for harvesting crops, *Weekly Petroleum Status Report* data for the week ending August 26 shows distillate inventories are

17% below the five-year average. In New England and the Central Atlantic, where heating oil is used as a primary source of heat in some homes, inventories are 56% below the five-year average.

ULSD-RBOB future price spread: ULSD front-month futures prices traded at an average monthly premium to RBOB of 68 cents/gal in August, the highest premium in real terms since November 2008 **(Figure 9)**. Although front-month ULSD and RBOB futures typically follow seasonal trends (RBOB trades at a premium in the summer, and ULSD trades at a premium in the winter), global demand for distillate and reduced exports from Russia, a major supplier of distillate fuel and natural gas to Europe, have disrupted this trend. This increased demand for distillate, as well as a concurrent decline in gasoline demand, has encouraged refiners to maximize distillate production. The monthly ULSD-Brent crack spread this August of $1.27/gal is 87 cents/gal (222%) higher than last August while the RBOB-Brent crack spread of 58 cents/gal is only 3 cents/gal (6%) higher compared with last year. Looking forward, we forecast that the combination of the upcoming switch to winter grade gasoline, which is less expensive for refiners to produce, and the typical decline in gasoline demand after the summer driving season will contribute to declining refiner margins for gasoline. We forecast diesel fuel refiner margins will remain above August levels through the end of the year.

Figure 9. ULSD-RBOB front-month futures price spread



eia Data Source: CME Group and Bloomberg L.P

Natural Gas

Prices: The front-month natural gas futures contract for delivery at the Henry Hub closed at $9.26 per million British thermal units (MMBtu) on September 1, 2022, which was up 12% (98 cents/MMBtu) from August 1, 2022 **(Figure 10)**. Closing prices for front-month natural gas futures averaged $8.78/MMBtu during August, the highest August monthly average in real terms since 2008. Natural gas prices remained elevated throughout August as inventories remained below the five-year (2017–2021) average, and consumption in the electric power

sector remained strong. Hotter-than-normal temperatures in much of the country increased demand for air conditioning, and constraints in the coal market limited coal-fired electricity generation, both increasing consumption of natural gas to produce electricity.

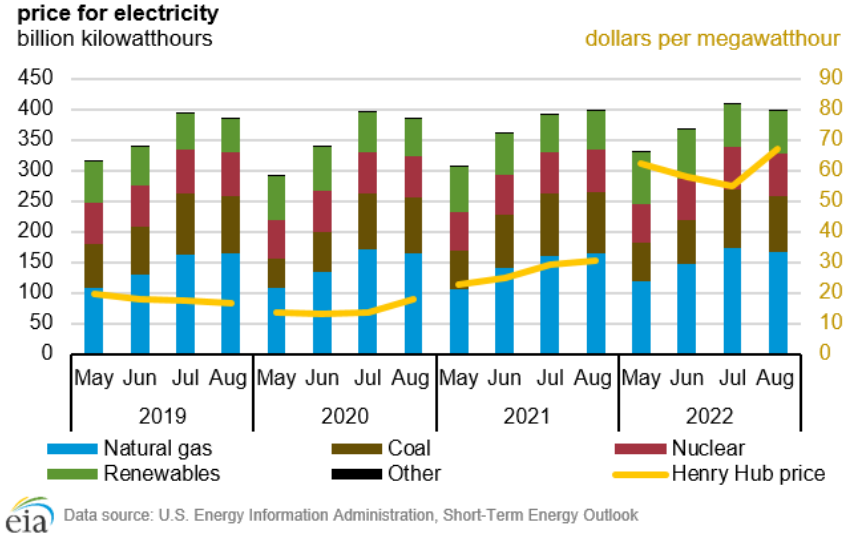


Figure 10. Historical nominal front-month U.S. natural gas prices

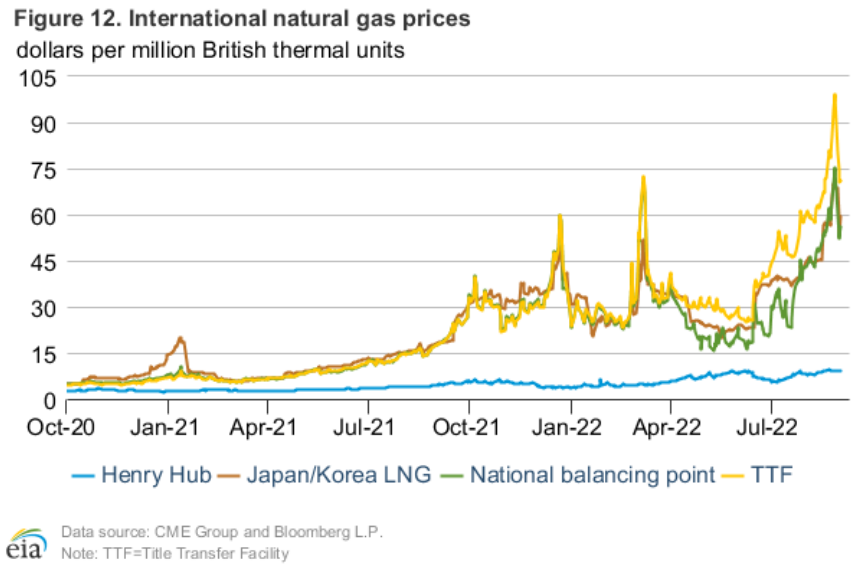
eia Data source: CME Group and Bloomberg L.P.

The United States generates more electricity during the summer compared with other times of the year. This summer, the percentage share of electricity generation from natural gas has been similar to previous years, despite high natural gas prices that have more than doubled from the same time last year **(Figure 11)**. Previously, high natural gas prices would have resulted in more coal-fired electricity generation. However, coal-fired power plants have been limited in their ability to increase power generation due to historically low inventories, constraints in fuel delivery to coal plants, and continued coal capacity retirements. Even as the capacity for renewable electricity generation has increased over recent years, power providers continue to use natural gas-fired electricity generation most often to meet fluctuations in electricity demand.

Figure 11. May-Aug electricity generation by fuel source and natural gas price for electricity



In the United States, natural gas is the most common fuel source used by power providers to quickly increase or decrease power supply to meet electricity demand from moment to moment. This instantaneous balance is crucial in U.S. power markets due to the lack of large-scale electricity storage. Most natural gas-fired turbine power plants can increase or decrease their electricity generation in a matter of minutes. In contrast, other sources of generation, such as nuclear power plants, generally provide a stable amount of electricity at all hours of the day, while renewable sources such as wind turbines and solar power facilities provide a fluctuating amount of electricity based on weather conditions. Natural gas was key to meeting electricity demand peaks throughout the country during the hot July, especially in Texas, where several records were set for daily peak electricity demand.

International natural gas prices: Real prices for natural gas futures for delivery at the Title Transfer Facility (TTF) in the Netherlands set a record high at more than $99/MMBtu in late August **(Figure 12)**. Prices in East Asia reached a record high of more than $69/MMBtu in August. International natural gas prices have been rising since June amid several factors:

- The June shutdown of the Freeport LNG facility in South Texas reduced global supply of liquefied natural gas (LNG) by about 2 billion cubic feet per day (Bcf/d). Prior to the shutdown, LNG exports from Freeport in the first five months of 2022 accounted for approximately 17% of total U.S. LNG exports.

- Natural gas pipeline exports from Russia to Europe have declined in 2022, reaching 1.2 Bcf/d in mid-July, the least in nearly 40 years.

- On August 19, Gazprom announced the Nord Stream 1 pipeline (which delivers natural gas from Russia to Europe) would be offline for three days for unplanned maintenance from August 31 to September 2.

Europe finished the 2021–2022 winter heating season with natural gas inventories at 26% full compared with the five-year average of 34%, according to data from Gas Infrastructure Europe's (GIE) Aggregated Gas Storage Inventory (AGSI+). Because of limitations in and uncertainty about natural gas pipeline imports from Russia, Europe has been importing record amounts of LNG in 2022 to refill inventory before the upcoming winter. The recent supply constraints affecting the global LNG market and the reduced pipeline flows into Europe have contributed to the increase in the TTF futures price and the increase in the price premium for LNG cargoes delivered to Europe relative to LNG cargoes delivered to East Asia.

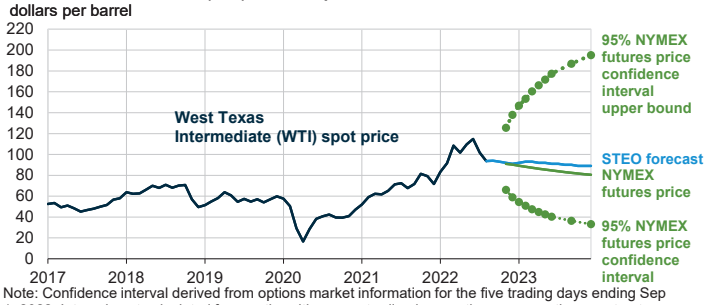
Strong demand for LNG in Europe continues to drive high international natural gas prices. The percentage of U.S. LNG exports to Europe has increased in 2022, averaging 69% in the first half of 2022 compared with 32% in the first half of 2021. U.S. facilities exported LNG at close to their combined capacity in August (excluding the offline Freeport LNG facility), with capacity utilization averaging 93% across all operating facilities.

Notable forecast changes

- We have updated several of the equations in the natural gas model, including those that forecast residential and commercial consumption of natural gas, natural gas pipeline imports and exports, and natural gas production in Alaska. The changes include updating the variables and sample periods on which these regression equations are evaluated. We also updated the liquefied natural gas imports forecast to better reflect recent trends. These changes contributed to 1.4 billion cubic feet per day (Bcf/d) more forecast consumption of natural gas in 2022 and 0.8 Bcf/d more consumption in 2023. In addition, we have increased our forecast for production of natural gas in Alaska by just under 0.1 Bcf/d in both years, and we have lowered our forecast of net exports of

natural gas by 0.7 Bcf/d in 2022 and by 0.5 Bcf/d in 2023, mostly because of more expected pipeline imports.

- You can find more information in the detailed table of forecast changes.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. Weather															
U.S. Heating Degree-Days	**2,107**	**472**	**51**	**1,306**	**2,148**	**492**	*67*	*1,524*	*2,106*	*487*	*78*	*1,532*	**3,936**	*4,231*	*4,202*
U.S. Cooling Degree-Days	**50**	**411**	**904**	**128**	**47**	**466**	*910*	*95*	*43*	*392*	*842*	*93*	**1,493**	*1,518*	*1,370*

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on September 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on September 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on September 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate, natural gas plant liquids, other liquids, refinery processing gain, and other unaccounted-for liquids.

OPEC = Organization of the Petroleum Exporting Countries: Iran, Iraq, Kuwait, Saudi Arabia, and the United Arab Emirates (Middle East); Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Libya, Nigeria, and Venezuela (Other).

Notes: EIA completed modeling and analysis for this report on September 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Forecasts are not published for individual OPEC countries.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on September 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on September 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on September 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on September 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.91**	**1.93**	**2.03**	**2.05**	**2.19**	**2.26**	*2.31*	*2.29*	*2.29*	*2.28*	*2.26*	*2.23*	**1.98**	*2.26*	*2.26*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on September 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on September 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on September 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on September 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on September 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distrib

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Subtotals for the industrial and commercial sectors might not equal the sum of the components. The subtotal for the industrial sector includes ethanol consumption that is not shown separately. The subtotal for the commercial sector includes ethanol and hydroelectric consumption that are not shown separately.

(f) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(g) Fuel ethanol and biodiesel, renewable diesel, and other biofuels consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on September 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum Supply*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on September 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on September 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

U.S. Energy Information Administration

October 2022

Short-Term Energy Outlook

Forecast highlights

Winter Fuels Outlook

- In our *Winter Fuels Outlook*, we forecast that average household expenditures for home heating fuels will increase this winter because of both higher expected fuel costs and higher energy consumption due to colder temperatures. Compared with last winter, in nominal terms, we forecast expenditures for homes that heat with natural gas will rise by 28%, heating oil by 27%, electricity by 10%, and propane 5% from October–March.

Global liquid fuels

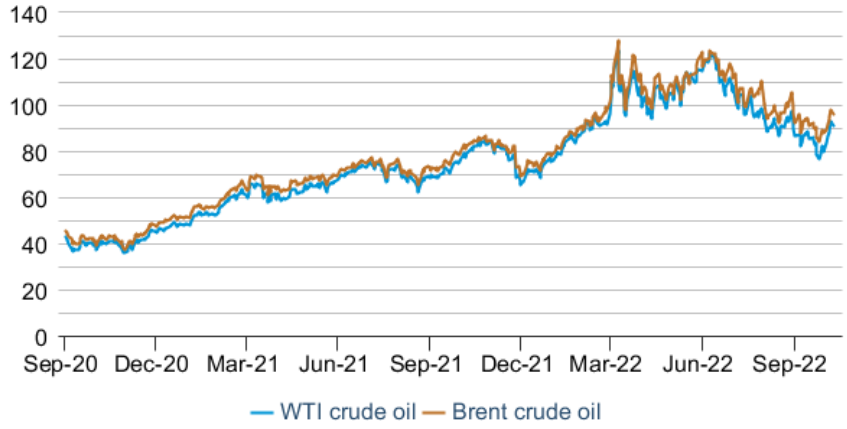
- The Brent crude oil spot price in our forecast averages $93 per barrel (b) in the fourth quarter of 2022 (4Q22) and $95/b in 2023. Potential petroleum supply disruptions and slower-than-expected crude oil production growth could lead to higher oil prices, while the possibility of slower-than-forecast economic growth may contribute to lower prices.
- OPEC+ announced a production cut of 2 million barrels per day (b/d) on October 5. OPEC crude oil production in our forecast falls from an average of 29.6 million barrels per day (b/d) in September to an average of 28.6 million b/d over 4Q22 and 1Q23.
- U.S. crude oil production in our forecast averages 11.7 million b/d in 2022 and 12.4 million b/d in 2023, which would surpass the record high set in 2019.
- We forecast that global consumption of liquid fuels will rise by an average of 2.1 million b/d for all of 2022 and by an average of 1.5 million b/d in 2023.
- U.S. retail gasoline prices in our forecast average $3.80 per gallon (gal) in 4Q22 and $3.57/gal in 2023. Retail diesel prices average $4.86/gal in 4Q22 and $4.29/gal in 2023.
- We expect U.S. gasoline consumption in 2022 to average 8.8 million b/d, down 40,000 b/d from 2021, and we expect it to stay near that level in 2023, with rising fuel efficiency offsetting price- and economy-driven increases in transportation demand.

Natural gas

- We expect the Henry Hub natural gas spot price to average about $7.40 per million British thermal units (MMBtu) in 4Q22 and then fall below $6.00/MMBtu in 2023 as U.S. natural gas production rises.

- We forecast that U.S. natural gas inventories will end the injection season (April–October) at nearly 3.5 Tcf, which would be 6% below the five-year (2017–2021) average.
- U.S. consumption of natural gas will average 87.9 billion cubic feet per day (Bcf/d) in 2022, up 3.9 Bcf/d from 2021, reflecting more consumption across almost all sectors. Consumption falls by 2.6 Bcf/d in the 2023 forecast because of lower consumption in the electric power and industrial sectors.
- In 3Q22, U.S. dry natural gas production averaged 98.5 Bcf/d, up from 95.1 in 1Q22. We forecast natural gas production to average 99.1 Bcf/d in 4Q22 and 99.6 Bcf/d in 2023.

Electricity, coal, renewables, and emissions



- We expect U.S. sales of electricity to ultimate customers to rise by 2.7% in 2022, mostly because of more economic activity but also because of slightly hotter summer weather than last year. We forecast U.S. sales of electricity to fall by 0.9% in 2023.
- Increases in U.S. electricity generation in our forecast come almost entirely from solar and wind. We expect renewable sources will provide 22% of U.S. generation in 2022 and 24% in 2023, up from 20% in 2021.
- Natural gas fuels 38% of U.S. electricity generation in 2022, up from 37% in 2021, but we forecast it to fall back to 36% in 2023. Coal-fired electricity generation falls from 23% of the U.S. total last year to 20% in 2022 and 19% in 2023. Growing generation from renewable sources limits growth in natural gas-fired generation, and coal's generation share declines because of the expected retirement of some coal-fired capacity.
- We forecast that wholesale electricity prices at major power trading hubs will be about 20-60% higher on average this winter. The highest wholesale electricity prices are likely to be in New England because of possible natural gas pipeline constraints, reduced fuel inventories for power generation, and uncertainty regarding LNG shipments given the tight global supply conditions.
- We forecast the U.S. residential price of electricity will average 14.9 cents per kilowatthour in 2022, up 8% from 2021. Higher retail electricity prices largely reflect an increase in wholesale power prices, which are driven by higher natural gas prices.
- U.S. coal production in the forecast increases by 20 million short tons (MMst) in 2022 to total 598 MMst for the year. We expect coal production will fall to 581 MMst in 2023.
- We expect energy-related carbon dioxide emissions in the United States to increase by 1.5% in 2022 and then to decrease 2.3% in 2023 to just under 2021 levels.

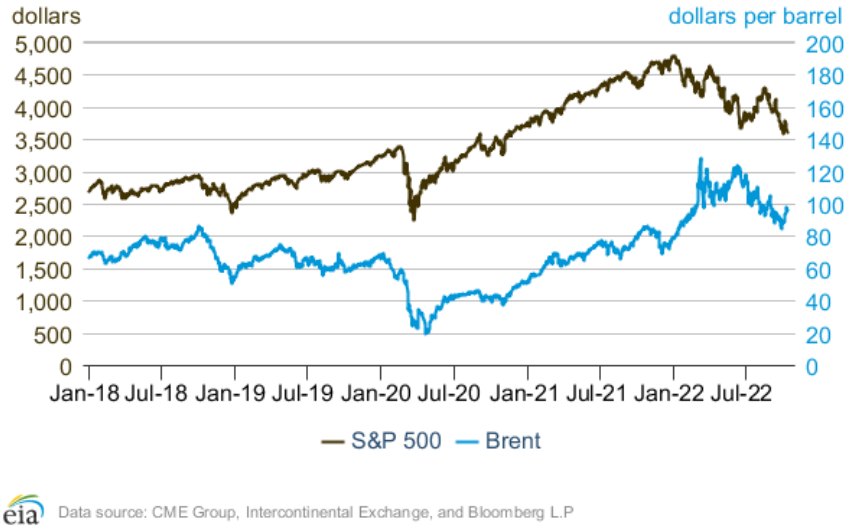
Petroleum and Natural Gas Markets Review

Crude oil

Prices: The front-month futures price for Brent crude oil settled at $94.42 per barrel (b) on October 6, an increase of $2.06/b from the September 1 price of $92.36/b. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, increased by $1.84/b during the same period, settling at $88.45/b on October 6 **(Figure 1)**. These price increases are mostly attributable to expectations around crude oil production cuts by OPEC+ producers, which were announced at 2 million b/d on October 5. From September 30 to October 6, the front-month futures price for Brent crude oil increased by $6.46/b and the front-month futures price for WTI crude oil increased by $8.96/b.

Figure 1. Crude oil front-month futures prices

Data source: CME Group, Intercontinental Exchange, and Bloomberg L.P.
Note: WTI=West Texas Intermediate



Prior to the OPEC+ announcement and the speculation of cuts in the days immediately preceding the announcement, crude oil prices were generally decreasing due to increasing concerns around weakening global economic conditions. In addition, the 180 million barrel Strategic Petroleum Reserve release conducted in recent months may also have relieved supply concerns. The front-month futures price for Brent crude oil averaged $7/b lower in September than in August. September marked the third consecutive month in which the Brent crude oil futures price decreased, bringing the total decrease to $27/b in those three months. These decreases in crude oil prices have not affected all countries evenly, however, because Brent crude oil is priced in U.S. dollars. Investors have increasingly purchased U.S. financial assets as a result of the Federal Reserve raising interest rates to curb inflation and because investors seek out U.S. currency as a safe-haven asset during uncertain economic conditions. This trend has led to the U.S. dollar increasing to its highest value since 2002. For countries using other currencies, including many of the globe's emerging markets, the strengthening U.S. dollar makes it more expensive to convert local currency into the U.S. dollars necessary to import crude oil. A

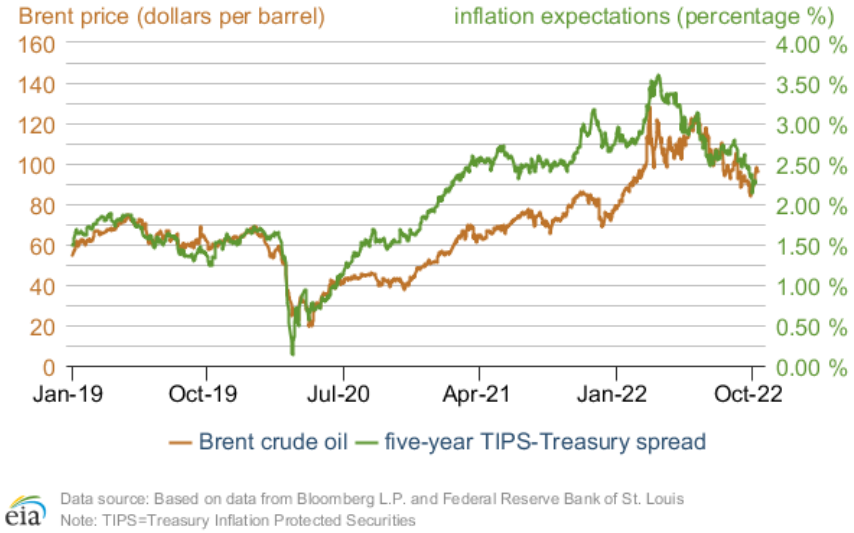
strengthening dollar also creates additional macroeconomic uncertainty by raising debt servicing costs for countries holding U.S. dollar-denominated debt.

With macroeconomic uncertainty rising, Oxford Economics lowered its forecast for global GDP growth to 2.2% for 2023, down from 2.7% last month. We use Oxford Economics' forecast as an input into our global oil demand model. This reduction in forecast GDP led us to lower our forecast for global petroleum demand in 2023 by 0.5 million b/d compared with the September *Short-Term Energy Outlook*.

Brent price and S&P 500: In the past few years, the price of Brent crude oil has often, but not always, moved in the same direction as the value of the S&P 500, an equity index of widely traded U.S. public companies. For example, from the second half of 2020 (2H20) through 2021, the Brent crude oil price and the value of the S&P 500 both increased as economic growth was reflected in the rising profitability of companies as well as in rising demand for oil **(Figure 2)**.

Figure 2. S&P 500 and Brent crude oil prices

eia Data source: CME Group, Intercontinental Exchange, and Bloomberg L.P



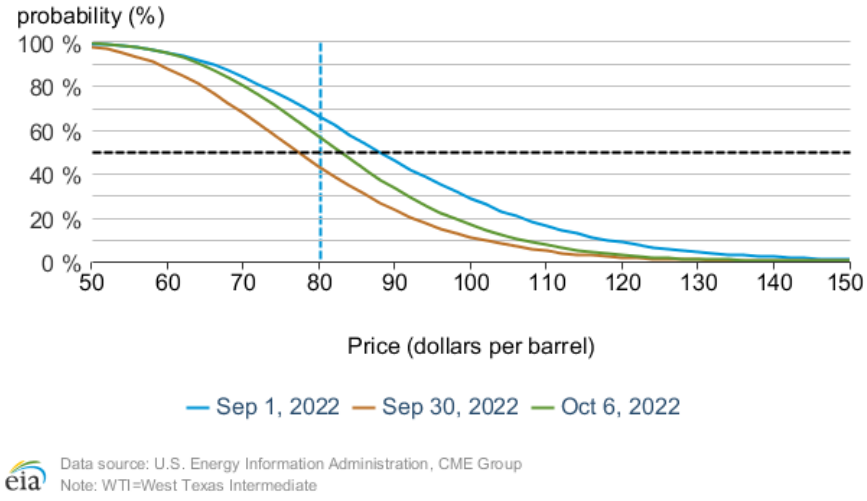
Oil prices and equities began moving in opposite directions in early 2022, when the price of crude oil continued increasing as Russia's full-scale invasion of Ukraine intensified global petroleum supply concerns. These price increases contributed to higher inflation and input costs for companies, leading to a decline in the S&P 500. As the Federal Reserve has increased interest rates to curb inflation, borrowing costs for companies have grown and expectations for economic growth have declined, putting further downward pressure on the S&P 500. However, from July to September 2022, the price of Brent crude oil resumed a positive relationship with equity prices, with both declining as concerns about global economic conditions also reduced expectations of petroleum demand growth, accompanied by pressure from the strong US dollar (discussed above).

Brent price and inflation expectations: Inflation expectations also often move together with crude oil prices. One measure of inflation expectations is the percentage difference between

yields for five-year Treasury Inflation-Protected Securities (TIPS) and U.S. treasury bonds. This spread indicates expectations for what the inflation rate will be in five years. Inflation expectations peaked in March at 3.6% **(Figure 3)**, decreasing in recent months in part due to:

- Inflation, as measured by the U.S. Consumer Price Index, has flattened and slightly decreased recently, in part because energy-sector inflation has slowed down as oil prices have dropped; and
- Expectations for future economic activity, which have also fallen.

Figure 3. Crude oil and inflation expectations

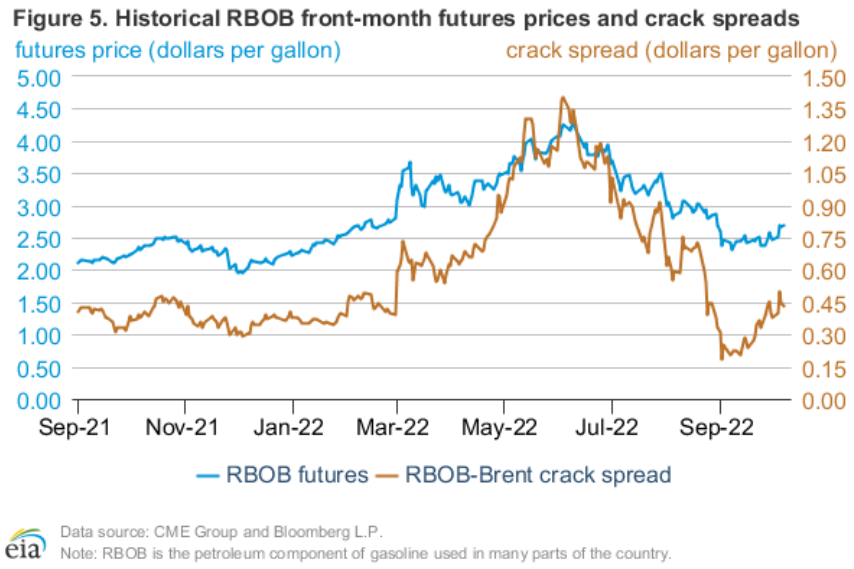


eia Data source: Based on data from Bloomberg L.P. and Federal Reserve Bank of St. Louis
Note: TIPS=Treasury Inflation Protected Securities

Although the price of Brent crude oil continued to increase from April to June when inflation expectations were decreasing, persistent concerns about economic conditions and petroleum demand have contributed to crude oil prices decreasing with inflation expectations from July through September.

Market-derived probabilities: Crude oil prices have been subject to high levels of uncertainty due to geopolitical factors, uncertain OPEC+ production, and concerns that a global recession could reduce crude oil demand. Market-derived price probabilities that are based on futures and options prices reflect this price uncertainty. They also reflect the downward price movements in September and the upward price movements in October. As of September 30, the probability of the December 2022 WTI contract expiring at more than $80/b was 43%, a decrease from 66% on September 1 **(Figure 4)**. The probability of the December 2022 WTI contract expiring above $90/b was 23% on September 30, and the probability of it expiring above $100/b was 11%. Conversely, there was also a 32% chance of the December WTI crude oil contract expiring at or below $70/b as of September 30. But in October, when crude oil prices began to rise in anticipation of OPEC production cuts, higher future crude oil prices became more likely. As of October 6, the probability of WTI expiring above $80/b was 57% and the probability of it expiring above $90/b was 33%, both increases from September 30 but decreases from September 1.

Figure 4. Probability of June 2022 WTI futures contracts expiring above different price levels

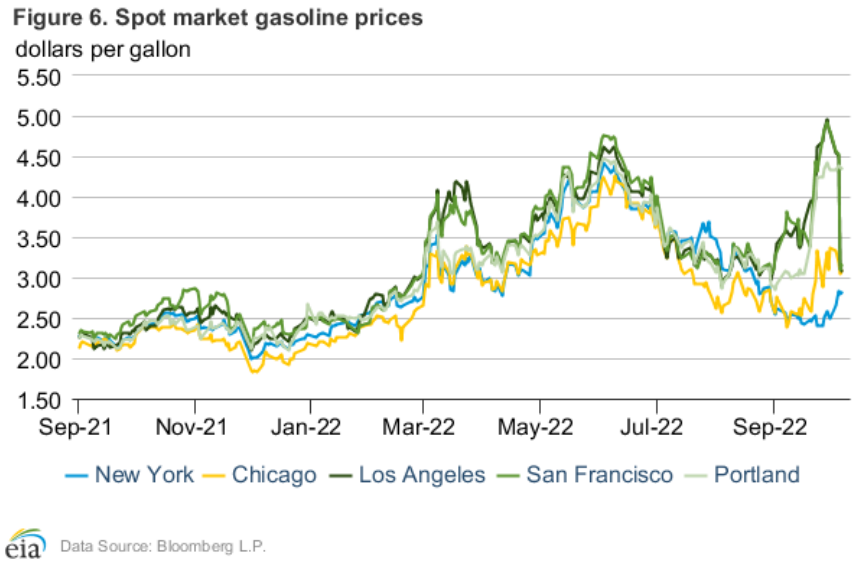


Data source: U.S. Energy Information Administration, CME Group
Note: WTI=West Texas Intermediate

We forecast the WTI crude oil price to be $85/b in December and $87/b in January. We expect the WTI crude oil price to increase to an average of $89/b in 2023, and we expect the Brent crude oil price to be $6/b higher than the WTI price throughout 2023.

We forecast oil prices to generally remain near current levels in 2023 with Brent averaging $95/b. We lowered our price forecast for 2023 by $2/b compared with last month's forecast, which largely reflected a 0.5 million b/d reduction in our forecast for global oil consumption in response to a lower forecast for global GDP from Oxford Economics. Lower oil consumption resulted in us lowering our price forecast in early 2023. We also reduced our forecast for global oil production by 0.6 million b/d in 2023, with the largest downward revision for next year in 4Q23. As a result of lower production at the end of next year, we forecast Brent prices will end 2023 higher than previously expected, despite a lower crude oil price forecast on average for next year. Our forecast had already included a reduction in OPEC+ crude oil production that was largely consistent with the cuts the group announced on October 5. Accounting for these changes, global oil markets are relatively balanced in our 2023 forecast. The possibility of petroleum supply disruptions and slower-than-expected crude oil production growth continues to create the potential for higher oil prices, while the possibility of slower-than-forecast economic growth creates the potential for lower prices.

Petroleum products

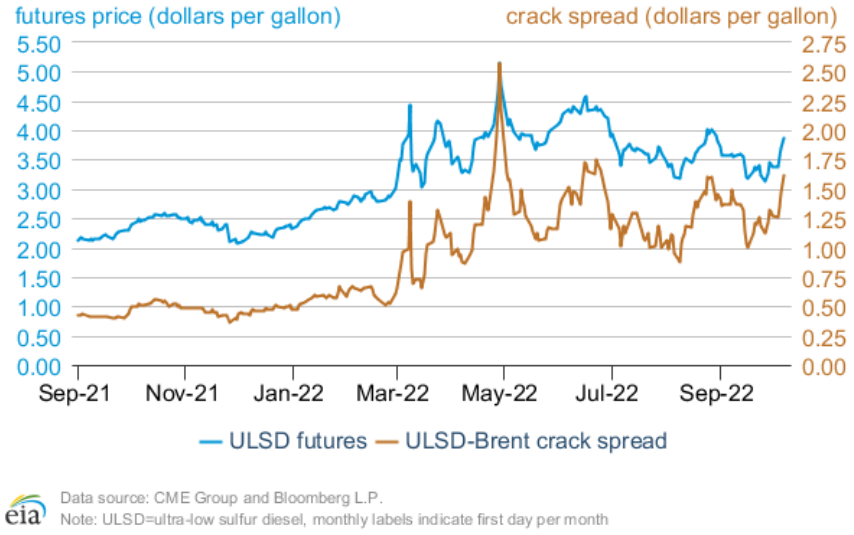


Gasoline prices: The front-month futures price of RBOB (reformulated blendstock for oxygenate blending, the petroleum component of gasoline used in many parts of the country) settled at $2.68 per gallon (gal) on October 6, up 30 cents/gal from September 1 **(Figure 5)**. The RBOB-Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) settled at 43 cents/gal on October 6, up 25 cents/gal since September 1.

RBOB prices started September at their lowest level since January after the RBOB front-month contract rolled over to October delivery, which reflects winter grade gasoline that is cheaper for refiners to produce. Through the end of September, RBOB prices increased by more than crude oil prices as higher gasoline export levels offset lower-than-average domestic gasoline consumption amid low inventory levels. We estimate U.S. gasoline consumption averaged 8.8 million barrels a day (b/d) in September, which is 2% (0.2 million b/d) lower than the five-year (2017–2021) average for that month. U.S. gasoline exports for the four weeks ending September 30 averaged 1.0 million b/d according to EIA's *Weekly Petroleum Status Report* (WPSR). If confirmed in monthly data, this level would be 32% (240,000 b/d) higher than the five-year average export volume for September. We estimate gasoline inventories declined by 3% (7.2 million barrels) to 208 million barrels in September, which is 10% below the five-year average and the lowest end-of-September level since 2012.

Declining crude oil prices contributed to the RBOB-Brent crack spread increasing in September after reaching its lowest level since February 2021 on September 1. The average RBOB-Brent crack spread in September was 30 cents/gal, 29 cents/gal lower than in August but still 7 cents/gal higher than the five-year average for September. From September 30 to October 6, RBOB prices rose by 8%, and Brent crude oil prices increased by 7% over the same period.

Spot market gasoline prices: Although West Coast spot market prices for gasoline are typically priced higher than in other parts of the country, West Coast premiums in late September increased to more than $2/gal on average over New York RBOB prices. In September, spot gasoline prices in Los Angeles, San Francisco, and Portland increased by at least 50% while prices in New York decreased by 4% over the same time period **(Figure 6)**.



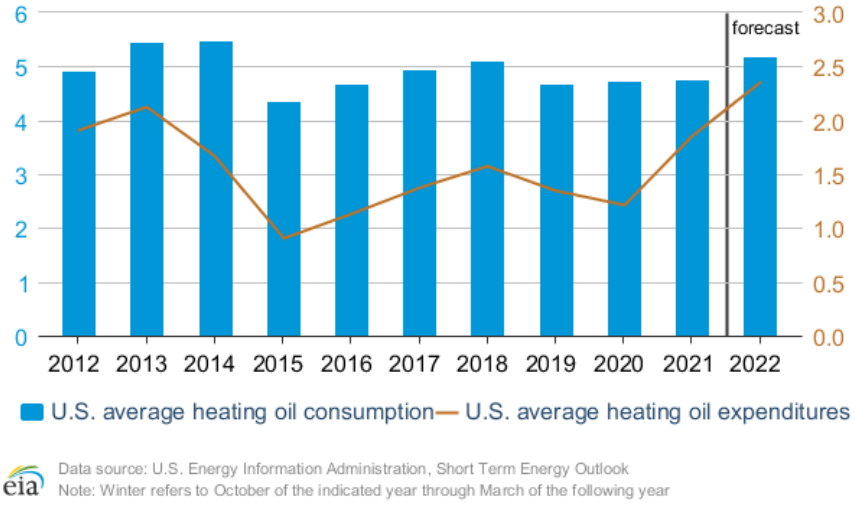
Multiple refinery outages for planned and unplanned maintenance on the West Coast, amid West Coast gasoline inventories at their lowest level since May 2012, contributed to the price increase along with lower imports. Gasoline imports to the West Coast, which have historically increased supplies during past instances of market tightness, did not materialize in a substantial way through the end of September. *WPSR* data show West Coast gasoline imports averaged 30,000 b/d for the four weeks ending September 30, after unusually low import levels in the second half of July and all of August. This lack of imports contributed to an increase in West Coast retail gasoline prices, which rose 17% (84 cents/gal) from September 19 to October 3. The California Air Resources Board issued a notice on September 30 to allow the early sale of winter-blend gasoline to help reduce high prices. From October 4 to October 6, West Coast premiums over New York RBOB declined by 92 cents/gal on average as some refinery capacity came back online in California and expectations rose for an increase in short-term imports.

In the Midwest, a similar situation is developing as unplanned outages at two refineries led to an increase in the Chicago spot gasoline price by 30% in September. Subsequently, Midwest retail gasoline prices increased 6% (20 cents/gal) from September 19 to October 3.

Ultra-low sulfur diesel prices: The front-month futures price for ultra-low sulfur diesel (ULSD) for delivery in New York Harbor settled at $3.86/gal on October 6, a 30 cents/gal increase from September 1 **(Figure 7)**. The ULSD-Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) increased 25 cents/gal during the same period and settled at $1.62/gal on October 6.

Figure 7. Historical ULSD front-month futures prices and crack spreads

Data source: CME Group and Bloomberg L.P.
Note: ULSD=ultra-low sulfur diesel, monthly labels indicate first day per month



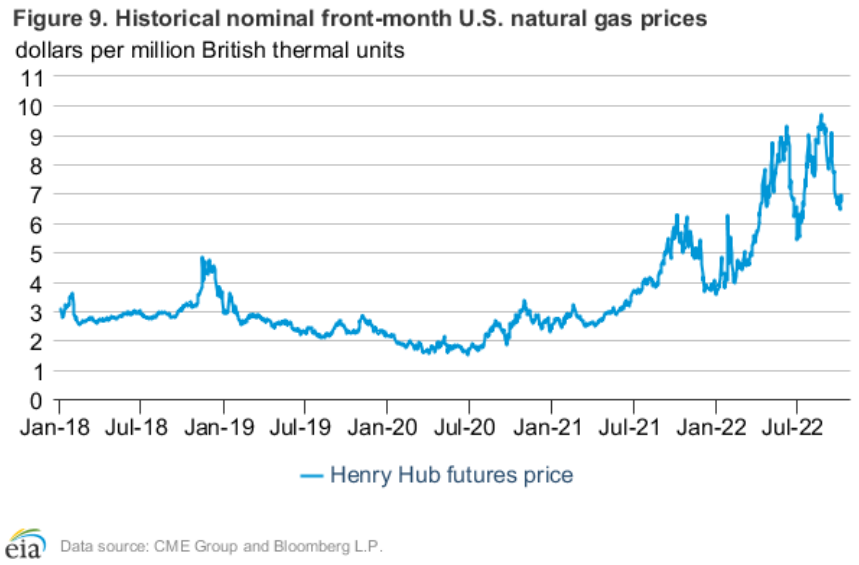
ULSD prices and crack spreads both decreased in September on a monthly average basis in response to lower estimated demand in the United States and broader expectations of wavering economic activity. In addition to lower crude oil prices in September, we estimate monthly average distillate consumption in September was 3.7 million b/d, the lowest consumption so far in 2022, likely because of lower trucking and industrial demand related to decreasing economic expectations. We expect distillate consumption to increase in the fourth quarter of 2022, primarily in response to seasonal factors, including agricultural demand brought on by the fall harvest season and winter demand for distillate heating oil. These seasonal factors along with rising crude oil prices are likely contributing to the sharp increase in distillate prices in early October. Agricultural demand is primarily concentrated in the Midwest, and heating demand for distillate is primarily in the Northeast. Distillate inventories in the Midwest and Northeast have both been below their five-year lows through the summer of 2022, so transport constraints between Gulf Coast producers and these regions present the potential for relatively higher distillate prices in these markets.

We expect downward pressure on distillate prices and crack spreads, related to economic conditions, to continue through the end of 2022 and the first half of 2023, but we still forecast distillate crack spreads to remain well above historical levels through the end of the year. The potential for further low demand related to uncertain economic conditions, as well as potential variability in harvest or heating oil demand, are all significant factors in our forecast. Changes in distillate net exports present an additional source of uncertainty, which could mean fewer distillate imports into the United States (primarily to the East Coast) as well as further calls on U.S. distillate exports (mostly from the Gulf Coast) from international markets.

U.S. heating oil expenditures: In the 2022−2023 winter season (October 2022 through March 2023), we currently estimate U.S. average household heating oil consumption—most of which occurs in the Northeast—will be 519 gallons, which would be the most since the 2014−2015

winter season **(Figure 8)**. High heating oil prices going into this winter, combined with higher forecast consumption result in our expectation that heating oil expenditures will be about $2,350 this winter, for homes in which heating oil is the primary space heating fuel. Expenditures at that level would be the highest since 2013−2014 winter season when adjusted for inflation.

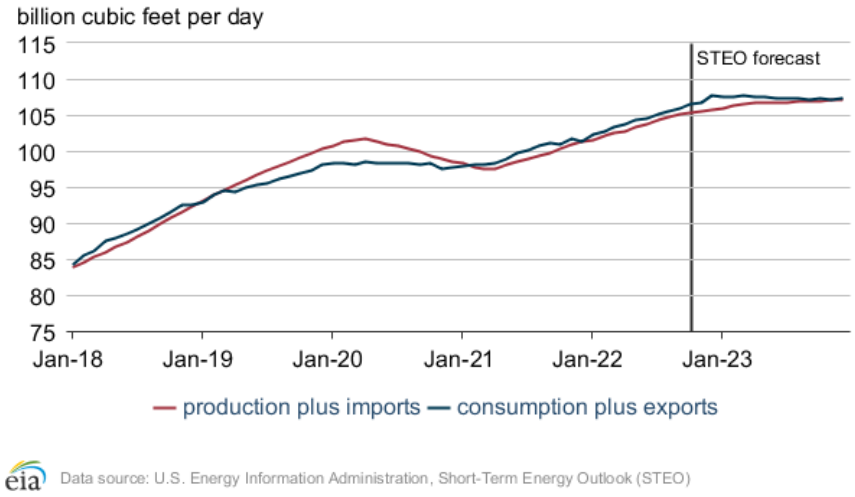
Figure 8. U.S. winter household heating oil consumption and expenditures



Data source: U.S. Energy Information Administration, Short Term Energy Outlook
Note: Winter refers to October of the indicated year through March of the following year

The high estimated consumption this winter is a result of our estimates for higher heating degree days, based on the current winter outlook from the National Oceanic and Atmospheric Administration (NOAA). For more information, please see our *Winter Fuels Outlook*.

Natural Gas

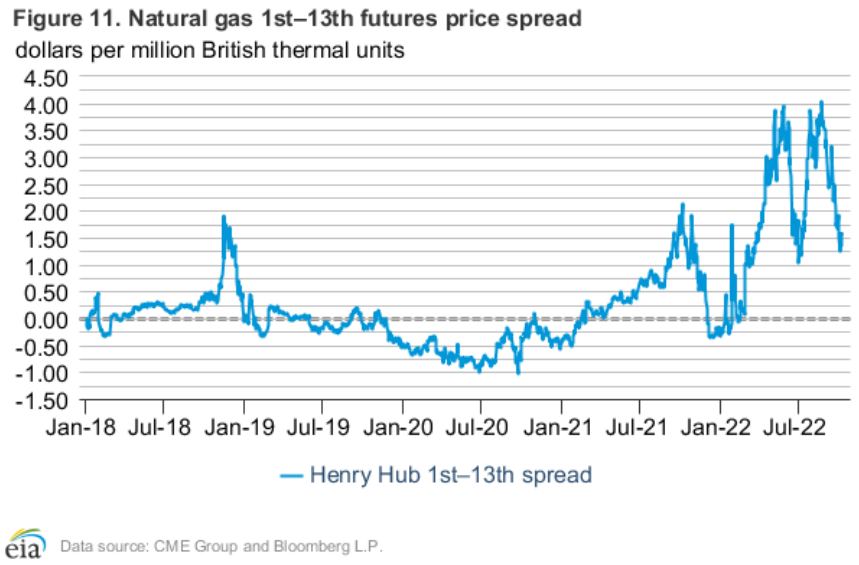


Prices: The front-month natural gas futures contract for delivery at the Henry Hub settled at $6.97 per million British thermal units (MMBtu) on October 6, 2022, down $2.29/MMBtu from September 1, 2022 **(Figure 9)**. The price for front-month natural gas futures contracts averaged $7.76/MMBtu in September, compared with $8.78/MMBtu in August.

We estimate U.S. dry natural gas production in September reached a record-high 98.8 billion cubic feet per day (Bcf/d). The record production contributed to September's natural gas stock builds of 428 Bcf, which were 20% higher than the five-year (2017–2021) average. Despite the above-average builds, natural gas inventories at the end of the month were 3,135 Bcf, which is 8%, or 280 Bcf, below the five-year average. U.S. liquefied natural gas (LNG) exports averaged 10.1 Bcf/d in September, as liquefaction terminals other than the off-line Freeport terminal operated near full capacity.

***Supply and demand balance*:** When natural gas supply (production plus imports) is lower than natural gas demand (consumption plus exports), natural gas prices tend to increase as more natural gas is pulled from storage to meet demand. The 12-month rolling average of natural gas demand has exceeded supply since February 2021 **(Figure 10),** which has contributed to an elevated Henry Hub spot price that doubled between June 2021 and July 2022. Monthly storage inventories have remained below the five-year average since June 2021, except for in December 2021 when unusually warm weather led to lower-than-normal storage withdrawals. We expect the Henry Hub spot price to remain elevated until the second quarter of 2023 when we forecast the 12-month rolling average of supply to rise closer to average demand and inventories to rise above the five-year average.

Figure 10. Natural gas production plus imports and consumption plus exports, 12-month moving average



eia Data source: U.S. Energy Information Administration, Short-Term Energy Outlook (STEO)

As a result of higher forecast natural gas prices and consumption, we expect households that use natural gas as their primary space heating fuel will spend 28% more this winter (October 2022 through March 2023) than they spent last winter. Nearly half of all U.S. households heat primarily with natural gas. We expect average household winter consumption to be 58 thousand cubic feet (Mcf), up 5% from last winter. For more information, please see our *Winter Fuels Outlook*.

We forecast the Henry Hub spot price will start to decline in the first half of 2023 as producers continue to increase supply. In the first three quarters of 2022, U.S. dry natural gas production grew steadily. We forecast dry natural gas production to continue to increase, averaging 99.1 Bcf/d in 4Q22.

***Futures price spreads*:** Natural gas futures contracts allow natural gas to be bought and sold for delivery at specific dates in the future corresponding to the start of each month. The natural gas 1st–13th month spread represents the difference between the price of natural gas sold for delivery 1 month from now compared to natural gas sold for delivery 13 months from now. The natural gas 1st–13th month price spread averaged $2.32/MMBtu in September, down nearly $1.13 from the record-high monthly average of $3.45/MMBtu set in August **(Figure 11).** The 1st–13th price spread has averaged over $2.00/MMBtu every month since April. During that time, natural gas prices have remained elevated, averaging $7.74/MMBtu, and natural gas inventories remained 8% or more below the five-year average.

When the 1st–13th price spread is positive, known as backwardation, near-term contract prices for the current month are higher than longer-dated contract prices for natural gas delivery one year further in the future. This difference reflects a market that puts greater value on natural gas sold for delivery one month from now compared with natural gas sold for delivery at the same time next year, encouraging market participants to sell natural gas from inventories instead of storing for future sales. Often, this situation occurs when natural gas demand is greater than supply, drawing inventories below the five-year range. The high 1st–13th price spread since April 2022 reflects the highest annual natural gas demand on record, driven by the electric power sector and high LNG export levels. High demand is keeping inventories at a deficit to the five-year average. Dry natural gas production has increased since April but not by enough to significantly reduce the storage deficit to the five-year average. As a result, the 1st–13th price spread has remained at its highest monthly levels on record.

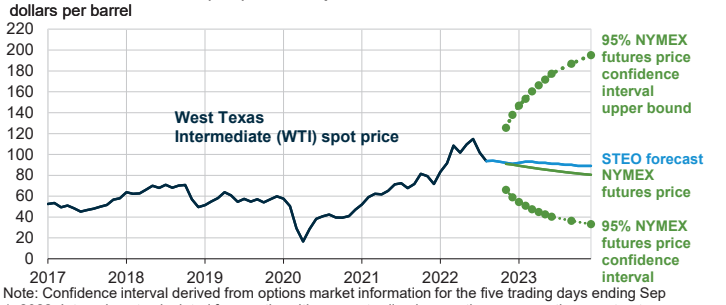
We expect natural gas spot prices to remain elevated in late 2022 before falling in 2023. We forecast the Henry Hub spot price to average about $7.40/MMBtu in 4Q22, then fall below $6.00/MMBtu in 2023 as U.S. natural gas production rises.

Notable forecast changes

- Global oil production for 2023 in our forecast averages 100.7 million barrels per day (b/d). Our production forecast is 0.6 million b/d lower than in the September STEO and reflects announced cuts from OPEC+ as well as lower forecast crude oil production in the United States.
- Our forecast for global oil consumption forecast for 2023 is 101.0 million b/d, which is 0.5 million b/d lower than in the September STEO and reflects Oxford Economics

lowering its forecast for global GDP growth in 2023 to 2.2% this month from 2.7% last month.

- We expect U.S. crude oil production will average 12.4 million b/d in 2023, which is down from a forecast of 12.6 million b/d last month. Lower crude oil production in the forecast reflects lower crude oil prices in 4Q22 than we previously expected.
- Our 2023 forecast for U.S. gasoline consumption was revised down by 0.1 million b/d. The downward revision reflects lower forecast vehicle miles traveled as a result of lower expected employment growth, based on forecasts from S&P Global, next year as well as higher expected growth in vehicle fuel efficiency.
- We forecast the Henry Hub natural gas spot price will average about $7.40 per million British thermal units (MMBtu) in 4Q22, which is about $1.60/MMBtu less than we forecast in the September STEO. The forecast largely reflects price declines in September that lowered the starting point for our forecast, amid slightly higher expectations for U.S. production in late 2022.
- We raised our forecast for electricity generation by natural gas-fired power plants as a result of lower natural gas prices in recent weeks. We forecast natural gas-fired generation will rise by 5% in 2022, compared with expected growth of 3% in the previous STEO. We have also lowered our forecast for coal-fired generation, which is now expected to fall by almost 7% in 2022 compared with a forecast decline of 4% in the previous STEO.
- You can find more information in the detailed table of forecast changes.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The views in this report therefore should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

Note: Winter covers the period October 1 through March 31. Fuel prices are nominal prices. Fuel consumption per household is based only on households that use that fuel as the primary space-heating fuel. Included in fuel consumption is consumption for water heating, appliances, electronics, and lighting (electricity). Per-household consumption based on EIA's 2015 Residential Energy Consumption Surveys corrected for actual and projected heating degree days. Number of households using heating oil includes kerosene.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on October 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on October 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on October 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate, natural gas plant liquids, other liquids, refinery processing gain, and other unaccounted-for liquids.

OPEC = Organization of the Petroleum Exporting Countries: Iran, Iraq, Kuwait, Saudi Arabia, and the United Arab Emirates (Middle East); Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Libya, Nigeria, and Venezuela (Other).

Notes: EIA completed modeling and analysis for this report on October 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Forecasts are not published for individual OPEC countries.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on October 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on October 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on October 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on October 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.91**	**1.93**	**2.03**	**2.05**	**2.19**	**2.26**	**2.58**	*2.53*	*2.53*	*2.50*	*2.48*	*2.45*	**1.98**	*2.39*	*2.49*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on October 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on October 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on October 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on October 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on October 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on October 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distrib

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Subtotals for the industrial and commercial sectors might not equal the sum of the components. The subtotal for the industrial sector includes ethanol consumption that is not shown separately. The subtotal for the commercial sector includes ethanol and hydroelectric consumption that are not shown separately.

(f) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(g) Fuel ethanol and biodiesel, renewable diesel, and other biofuels consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on October 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum Supply*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on October 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.
Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on October 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on October 6, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Appendix to the September 2022 *Short-Term Energy Outlook*

This appendix is prepared in fulfillment of section 1245(d)(4)(A) of the National Defense Authorization Act (NDAA) for Fiscal Year 2012, as amended. The law requires the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy, to submit to Congress a report on the availability and price of petroleum and petroleum products produced in countries other than Iran in the two-month period preceding the submission of the report. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The data in this appendix, therefore, should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

EIA consulted with the U.S. Department of the Treasury, the U.S. Department of State, and the intelligence community in the process of developing the NDAA report, which was previously published as a stand-alone report. Detailed background and contextual information not repeated here can be found in early editions of the NDAA report.

This appendix is published in the *Short-Term Energy Outlook* in even numbered months.

Table a1. Summary of Estimated Petroleum and Other Liquids Quantities

	Aug 2022	Sept 2022	Aug 2022 – Sept 2022 Average	Aug 2021 – Sept 2021 Average	2019 – 2021 Average
Global Petroleum and Other Liquids (million barrels per day)					
Global Petroleum and Other Liquids Production (a)	101.5	101.8	101.6	96.6	96.6
Global Petroleum and Other Liquids Consumption (b)	99.3	99.8	99.5	98.5	96.6
Biofuels Production (c)	3.2	3.1	3.1	3.1	2.7
Biofuels Consumption (c)	2.6	2.6	2.6	2.6	2.6
Iran Liquid Fuels Production	3.6	3.6	3.6	3.5	3.2
Iran Liquid Fuels Consumption	2.0	1.9	1.9	1.8	1.9
Petroleum and Petroleum Products Produced and Consumed in Countries Other Than Iran (million barrels per day)					
Production (d)	94.7	95.1	94.9	90.0	90.7
Consumption (d)	94.8	95.3	95.0	94.2	92.2
Production minus Consumption	-0.1	-0.2	-0.1	-4.2	-1.5
World Inventory Net Withdrawals Including Iran	-2.1	-2.0	-2.1	1.9	0.0
Estimated OECD Inventory Level (e) (million barrels)	2,722	2,751	2,736	2,785	2,946
Surplus Production Capacity (million barrels per day)					
OPEC Surplus Crude Oil Production Capacity (f)	1.5	1.5	1.5	4.5	4.3

Note: The term "petroleum and other liquids" encompasses crude oil, lease condensate, natural gas liquids, biofuels, coal-to-liquids, gas-to-liquids, and refinery processing gains, which are important to consider in concert due to the inter-related supply, demand, and price dynamics of petroleum, petroleum products, and related fuels.

(a) Production includes crude oil (including lease condensates), natural gas liquids, other liquids, and refinery processing gains.

(b) Consumption of petroleum by the OECD countries is synonymous with "products supplied," defined in the glossary of the EIA Petroleum Supply Monthly, DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel, and loss, and bunkering.

(c) Biofuels production and consumption are based on EIA estimates as published in the International Energy Statistics. Biofuels production in the third quarter tends to be at its highest level in the year as ethanol production in Brazil reaches its seasonal peak and is typically lowest in the first quarter as seasonal production falls in the South/South-Central region of Brazil.

(d) Global production of petroleum and petroleum products outside of Iran is derived by subtracting biofuels production and Iran liquid fuels production from global liquid fuels production. The same method is used to calculate global consumption outside of Iran.

(e) Estimated inventory level is for OECD countries only.

(f) EIA defines surplus oil production capacity as potential oil production that could be brought online within 30 days and sustained for at least 90 days, consistent with sound business practices. This does not include oil production increases that could not be sustained without degrading the future production capacity of a field.

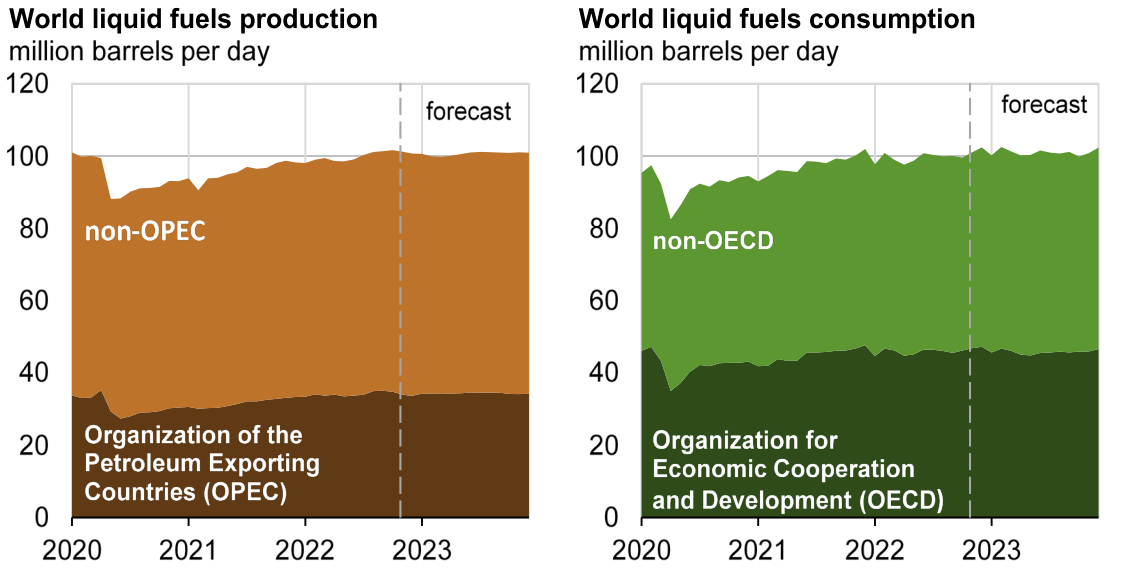
Data source: U.S. Energy Information Administration, *Short-Term Energy Outlook*

- The November 2022 *Short-Term Energy Outlook* (STEO) marks the release of our new text format. We have reconfigured the text to provide readers with discussions and visualizations we think best convey our energy forecast and its key drivers.
- Uncertainty in macroeconomic conditions could significantly affect energy markets in the forecast period. Based on the S&P Global macroeconomic model, we now expect U.S. GDP will fall slightly in 2023, which we forecast will contribute to a drop in total U.S. energy consumption next year.
- We estimate U.S. natural gas inventories ended October 2022 at more than 3.5 trillion cubic feet (Tcf), which is 4% below the five-year average and higher than what we had been forecasting in recent months. They fall in our forecast by 2.1 Tcf this winter to 1.4 Tcf by the end of March 2023. This withdrawal would be similar to the five-year average and result in inventories that are 8% below the five-year average at the end of March 2023.
- Because of higher-than-expected storage levels heading into winter our forecast natural gas spot price at Henry Hub averages about $6 per million British thermal units (MMBtu) across 4Q22 and 1Q23, which is more than $1/MMBtu lower than we forecast in the October STEO. We expect natural gas prices will decline after January as the deficit to the five-year average in inventories decreases.

- We expect renewable sources to provide 22% of U.S. electricity generation in 2022 and 24% in 2023 as generation from natural gas declines from 38% in 2022 to 36% in 2023. The increase in renewables generation comes mostly from solar and wind capacity additions.
- U.S. distillate fuel inventories average 17% below the five-year average in our forecast for 2023. We estimate distillate inventories were 104 million barrels at the end of October, the lowest end-of-October level since 1951.
- Retail heating oil and diesel prices will continue to average more than $5 per gallon for the rest of 4Q22. We expect a slightly contracting U.S. economy will reduce distillate prices in the first half of 2023 (1H23). However, the EU's ban on seaborne imports of petroleum products from Russia creates supply uncertainty for distillate markets in early 2023.
- Higher heating oil prices and consumption, due to colder forecasted temperatures this winter, result in our expectation that the average U.S. home that uses heating oil as its primary space heating fuel will see expenditures increase by 45% compared with last winter. In last month's *Winter Fuels Outlook*, we forecast expenditures would rise 27% over last winter in the baseline.
- We forecast OPEC crude oil production will fall in November and December. Annual OPEC production averages 28.9 million barrels per day (b/d) in 2023, up by 0.3 million b/d from 2022.
- Growth in OPEC and non-OPEC oil production—most notably production in the United States—keeps the Brent crude oil price in our forecast lower on an annual average basis in 2023 than in 2022. However, we expect the Brent crude oil price will begin rising in 2H23.



Notable forecast changes

Current forecast: November 8, 2022; previous forecast: October 12, 2022	**2022**	**2023**
Real gross domestic product (percentage change)	**1.7%**	**-0.1%**
Previous	1.7%	1.3%
Henry Hub spot average (dollars per MMBtu)	**$6.49**	**$5.46**
Previous	$6.88	$5.77
Percentage change	-5.8%	-5.4%
Diesel fuel prices (dollars per gallon)	**$5.09**	**$4.65**
Previous	$4.97	$4.29
Percentage change	2.5%	8.4%

Data source: Energy Information Administration, *Short-Term Energy Outlook*

Global oil markets

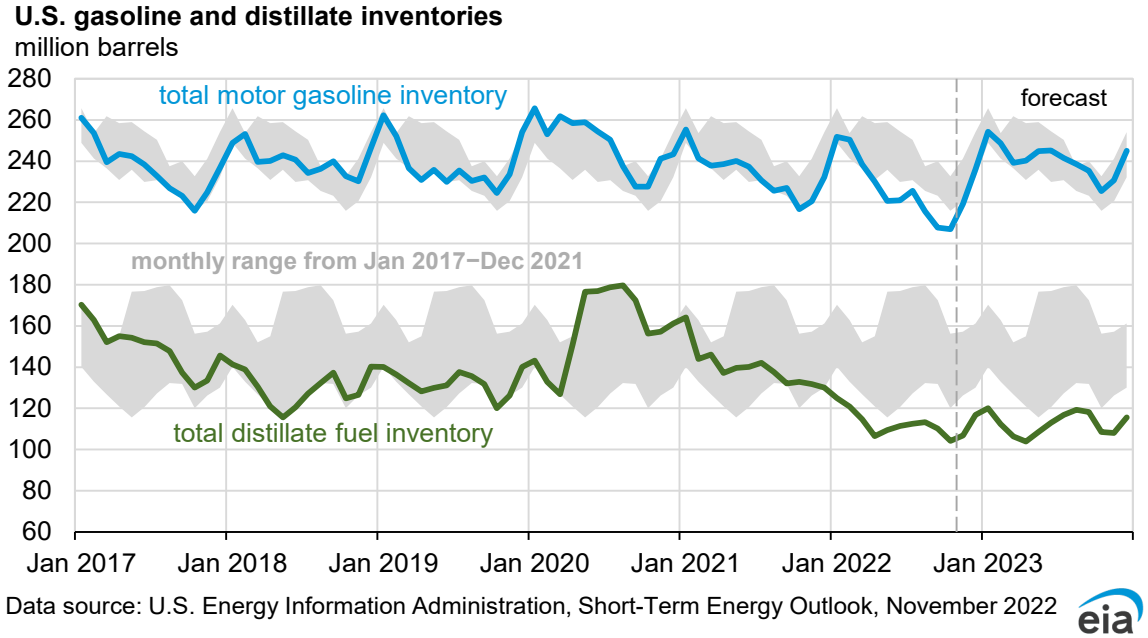
Crude oil production: On October 5, 2022, OPEC+ producers agreed to reduce crude oil production targets by 2.0 million barrels per day (b/d) from their previously stated targets beginning in November 2022. The announcement had a limited effect on our global oil production forecast in the October STEO when the cuts were first incorporated because we had already included an expectation that OPEC+ would not meet the previously stated production targets. We expect that Saudi Arabia, Kuwait, and the United Arab Emirates will account for most of OPEC's share of the cut, while the forecast production for other OPEC members remains largely unchanged from our assessment made before the October 5 announcement. Total OPEC crude oil production in our forecast falls from an average of 29.2 million b/d in the third quarter of 2022 (3Q22) to 28.6 million b/d in 4Q22, largely unchanged from last month's STEO forecast. OPEC crude oil production in the forecast averages 28.9 million b/d in 2023.

Data source: U.S. Energy Information Administration, Short-Term Energy Outlook, November 2022

Among the non-OPEC participants in OPEC+, the majority of the reductions in OPEC+ production will come from Russia, where we expect production declines will materialize as the result of Russia's full-scale invasion of Ukraine and sanctions imposed on Russia, rather than the newly announced production cuts. We expect that Russia's total liquids production will fall from an average of 10.9 million b/d in 3Q22 to 10.8 million b/d in 4Q22, before falling further to an average of 9.3 million b/d for all of 2023. This forecast is subject to significant uncertainty around the extent to which upcoming EU sanctions will impact trade flows and the ability for oil suppliers in Russia to find alternative shipping arrangements and buyers.

We expect global oil inventory levels to begin to fall again in early 2023, after increasing by an estimated 0.8 million b/d in 3Q22. We expect total global oil inventories will decline by 1.2 million b/d in 1Q23,

after a forecast build of 0.2 million b/d in 4Q22. We forecast global oil inventories will fall by 0.3 million b/d in 2023.



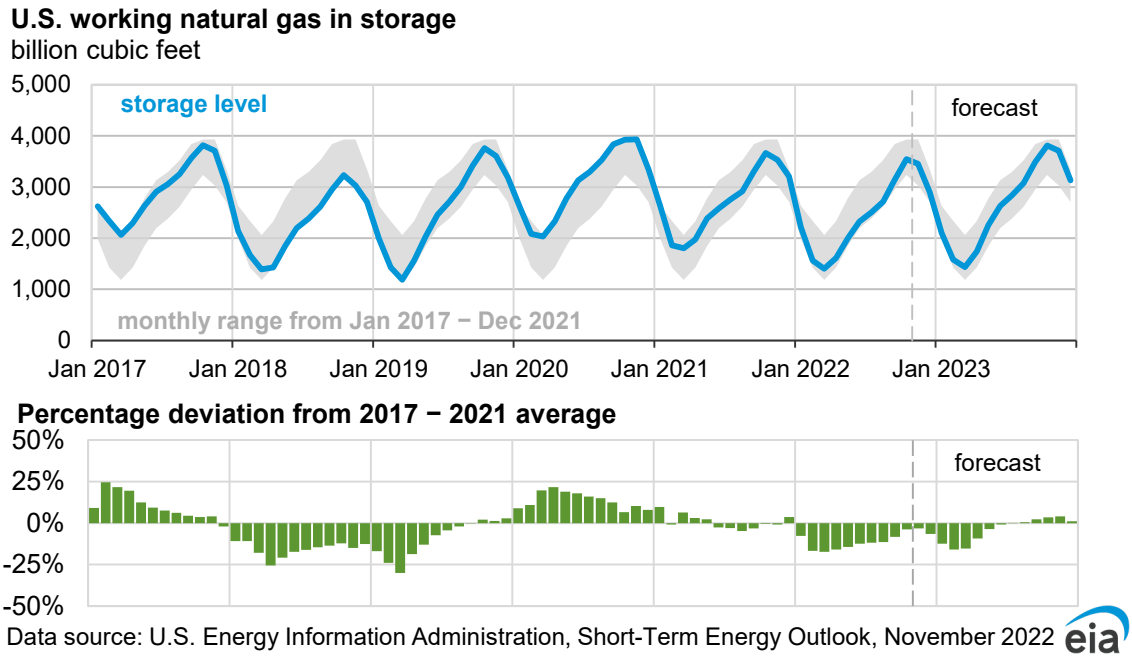
Crude oil prices: The Brent crude oil spot price averaged $93 per barrel (b) in October. We expect the Brent price will average near that price through 1H23. Weakening global economic conditions, which could limit oil demand growth, create the potential for oil prices to end up lower than our forecast. Higher-than-forecast oil prices could stem from supply disruptions resulting from the EU's impending bans on the seaborne import of crude oil and petroleum products from Russia. Despite increasing concerns around weakening global economic conditions, we forecast that global oil consumption will outpace global oil production in 2023, which will contribute to increasing oil prices in 2H23. We forecast the Brent crude oil price will rise from an average of $94/b in 1H23 to an average of $98/b in 4Q23, averaging $95/b for all of 2023.

Petroleum products

Distillate fuel: Distillate inventories have been well below the five-year average through all of 2022 in all major trading regions globally, a situation largely related to reduced distillate exports from Russia and trade dislocations following Russia's full-scale invasion of Ukraine in February. Seasonal increases in demand and refinery closures are now affecting inventories and contributing to price increases. Wholesale diesel fuel prices averaged $4.11 per gallon (gal) in October, an increase of 66 cents/gal (19%) from September and $1.60/gal (64%) from October 2021. Diesel fuel use in the U.S. agricultural sector rises in autumn at the same time the use of heating oil in the residential sectors also begins to rise. This year, widespread refinery strikes in France are further reducing global diesel supplies. In addition, regional production of distillate in the U.S. Northeast has also been less than historical levels since the closures of the Philadelphia Energy Solutions refinery in 2019 and the Come-by-Chance refinery in Newfoundland in 2020, which was a source of imports for the region.

We forecast that distillate prices will rise in November before falling slightly in December as activity at some refineries in Europe increases and U.S. refiners finish their seasonal maintenance. However, we still expect U.S. distillate inventories will remain at or near multiyear lows through the end of our forecast. Ongoing constraints on global refining capacity will continue to limit distillate supplies and inventory builds during this time, although we forecast distillate refinery margins to moderate beginning in early 2023 as seasonal demand for the fuel decreases and refinery production remains greater than usual because of strong refining margins. Low global distillate supplies mean that there is limited potential for distillate imports to supplement U.S. domestic production, particularly after the EU's ban on seaborne refined product imports from Russia beginning in February 2023.

We expect new refinery capacity coming online in the Middle East, China, and the United States through 2023 to contribute to lowering distillate margins. We forecast U.S. distillate refinery margins (calculated as the difference between the wholesale diesel price and the Brent crude oil price) will average $1.14/gal in 2023, compared with $1.34/gal in 2022. Significant sources of uncertainty in our forecast include the potential for future disruptions relating to global refinery outages and unexpected developments linked to EU's ban on refined products from Russia.

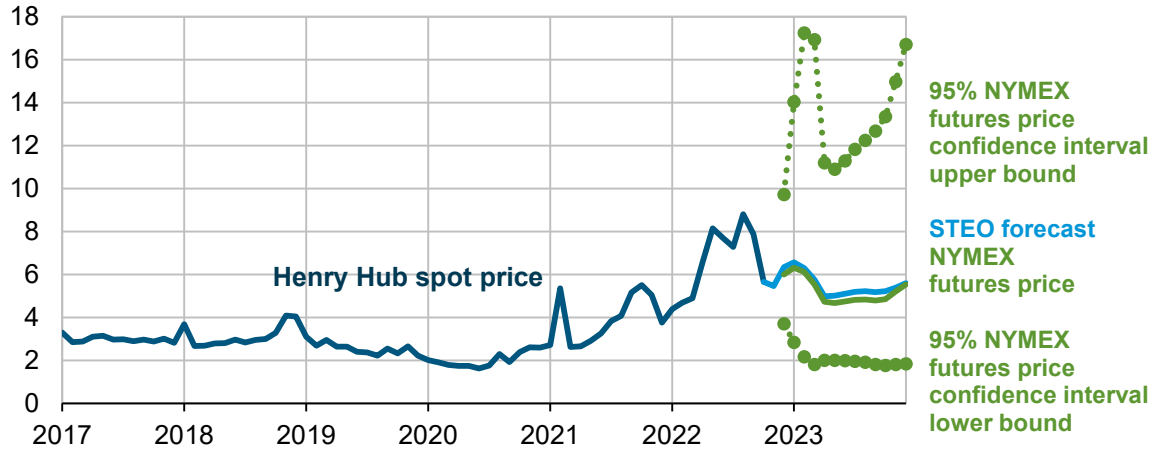


Gasoline: After falling for three straight months, U.S. retail gasoline prices increased in October. We expect gasoline prices to resume their decline in November, as refiners increase production to meet distillate demand and gasoline inventories begin increasing. Rising gasoline production contributes to inventory builds in our forecast that will return gasoline stocks to levels within the five-year range by early 2023. The U.S. average retail price in our forecast falls from $3.82/gal in October 2022 to $3.60/gal in February 2023, with the largest price decrease on the West Coast. Following this decrease, we expect U.S. retail gasoline prices to remain relatively flat for the rest of 2023.

Natural gas

Natural gas storage: At the end of October, typically considered the end of storage injection season (March–October), we estimate working natural gas in storage was 3,544 billion cubic feet (Bcf), 4% below the five-year (2017–2021) average. Higher-than-average injections of natural gas into storage in September and October reduced the deficit of natural gas inventories to the five-year average and contributed to falling natural gas prices. The natural gas spot price at Henry Hub averaged $8.80 per million British thermal units (MMBtu) in August but declined to an average of $5.66/MMBtu in October.

Natural gas inventories play an important role in price formation. Inventory levels below the five-year average are often correlated with higher natural gas prices, while inventory levels above the five-year average are often correlated with lower natural gas prices. We expect natural gas inventories to fall by 2,110 Bcf this winter, which is similar to the five-year average winter withdrawal. We forecast that natural gas inventories will total 1,433 Bcf at the end of March, which is 8% below the five-year average. However, actual inventory outcomes will highly depend on realized temperatures throughout the winter.

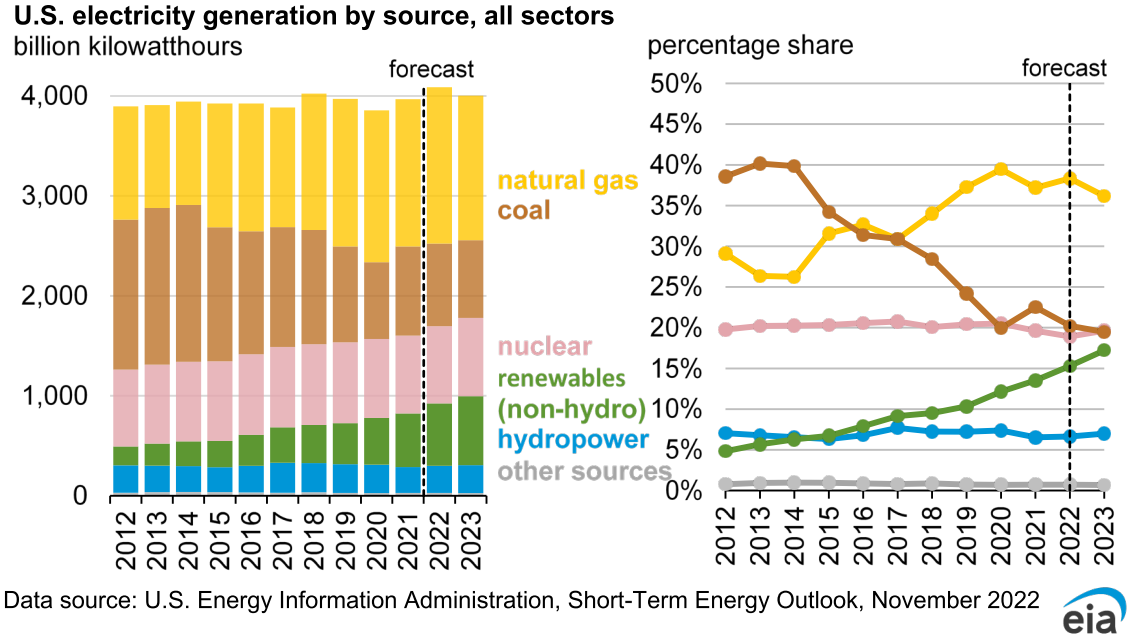


Natural gas production: Natural gas production has increased steadily throughout 2022, and dry natural gas production averages 100.4 billion cubic feet per day (Bcf/d) in our forecast for November. We expect declines in natural gas production during the winter months due to the possibility of extreme weather, which can cause production shut-ins. In addition, natural gas prices for the rest of the forecast remain lower than prices from 2Q22 and 3Q22. We expect that lower prices and some constraints in the pipeline capacity to move natural gas from production fields to consuming markets will reduce drilling activity, and we forecast natural gas production will average 99.7 Bcf/d in 2023, 2% more than in 2022, but down from current monthly average production.

Prices: We expect the benchmark Henry Hub natural gas spot price to average nearly $5.50/MMBtu in November 2022, before rising to more than $6/MMBtu in December and 1Q23. Natural gas prices typically increase in winter months as colder weather increases demand for natural gas for space-heating. Based on the current weather forecast from the National Oceanic and Atmospheric Administration, our forecast assumes colder weather, with 2% more heating degree days (HDD) from November to March compared with the 10-year (2011–2021) average. We expect inventory draws in December and January to outpace the five-year average, driven by a seasonal decline in natural gas production, rising demand for space heating, and increases in liquefied natural gas (LNG) exports that largely result from the return of Freeport LNG. Although any delay in the return of Freeport LNG could contribute to some downward price pressures in the near term, these factors will likely limit any downward price pressures this winter, and the possibility for price spikes and volatility in the case of extremely cold weather is high. Price spikes could affect both Henry Hub and regional pricing hubs, particularly in New England. Price spikes will have a limited effect on retail natural gas prices this winter, as there is typically a delay between changes in wholesale and retail prices for natural gas.

We expect downward pressures on natural gas prices will emerge in 2Q23. In 2023, the combination of natural gas consumption and exports in our forecast falls by more than 1 Bcf/d on average compared with 2022, while combined production and imports rise by a similar amount, leading to strong injections during the 2023 refill season.

Henry Hub natural gas price and NYMEX confidence intervals
dollars per million British thermal units



Data source: U.S. Energy Information Administration, Short-Term Energy Outlook, November 2022, CME Group, and Refinitiv an LSEG Business
Note: Confidence interval derived from options market information for the five trading days ending November 3, 2022. Intervals not calculated for months with sparse trading in near-the-money options contracts.

Electricity, coal, and renewables

Electricity generation: We forecast 2% less U.S. electricity generation in 2023 than in 2022, driven mostly by a decline in air-conditioning use because of cooler forecast temperatures next year, and also by slight economic contraction. Due to less electricity demand, we expect that generation from renewable sources will make up an increasing share of total U.S. electricity generation, rising from 22% this year to 24% in 2023. Without growth in U.S. electricity consumption, strong growth in renewables generating capacity results in lower shares of generation from all other sources next year, most notably natural gas and coal.

Power generators are reporting that they plan to add 15 gigawatts (GW) of utility-scale solar photovoltaic (PV) capacity in 2022 and 30 GW in 2023. Small-scale solar capacity grows by 7 GW in 2022 and by almost 10 GW in 2023. Wind capacity additions in the forecast total 11 GW in 2022 and 5 GW in 2023. Battery additions to total 5 GW in 2022 and 9 GW in 2023.

Despite a forecast decline in natural gas prices from this year to next year, we expect the share of generation supplied by natural gas will fall from 38% this year to 36% in 2023 as more renewable generating capacity comes online. We expect the share of generation fueled by coal will fall from 20% this year to 19% in 2023. Generators plan to retire 12 GW of coal-fired capacity in 2022 and 9 GW in 2023, a decline of 10% from the level of capacity operating at the end of 2021.

Coal production: We expect U.S. coal production will total 595 million short tons (MMst) in 2022, up 3% from 2021. The increase reflects strong international demand for U.S. coal and a need among power plant operators to replenish coal stocks. However, the ability of the coal industry to produce more coal has been limited in 2022 by labor shortages at mines and railroads, which constrained the supply and transport of coal requested by customers during the summer months. Limited supply growth has led to higher coal prices, and the average cost of coal for power generators rose to $2.51 per million British thermal units (MMBtu) in August, up 22% from August 2021. In 2023, we forecast that moderating natural gas prices and coal plant retirements will lead to a 4% reduction in coal production. Less demand for coal in 2023 combined with rising coal inventories will result in delivered coal prices to the electric power sector declining below $2.40/MMBtu by the end of 2023.

Coal inventories: On average, monthly U.S. coal inventories through August 2022 were 19% lower compared with the same period in 2021 as production was not sufficient to both replenish stocks and satisfy summer power demand. Although we expect coal production to decrease in 2023, further declines in coal consumption and net exports to lead to an 18% increase in coal inventories during 2023.

Economy, weather, and CO_2

U.S. macroeconomics: Our U.S. macroeconomic forecasts are based on the model produced and maintained by S&P Global (formerly IHS Markit). We incorporate STEO energy price forecasts into the model to obtain the final macroeconomic forecasts. S&P Global forecasts that the U.S. economy will enter a recession starting in 4Q22 and start recovering in 3Q23. On an annual basis, U.S. real GDP falls by 0.1% in 2023 in the forecast.

The forecast recession is primarily driven by a decline in real private fixed investment, which is expected to decline by 4.4% in 2023. A large component of this decline is in residential fixed investment, which

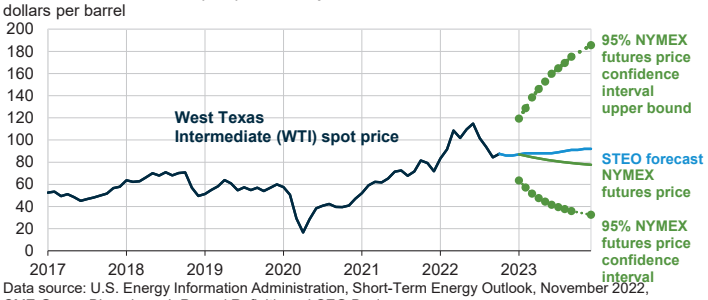
has fallen due to slowing demand for housing. As a result, housing starts are expected to decline by 21.1% in 2023. Demand for housing has fallen as the cost of purchasing a new home and mortgage rates have increased and as the U.S. Federal Reserve has raised interest rates in 2022 to combat inflationary pressures. Annual inflation based on the Consumer Price Index is expected to fall from 8.1% in 2022 to 4.1% in 2023. As the effects of monetary policy slows real economic activity, S&P Global forecasts a corresponding rise in the unemployment rate, peaking at 5.8% at the end of 2023.

Although the decline in economic activity mostly stems from the residential investment sector, other sectors of the economy will also see a decline in activity. In particular, industrial production is expected to fall by 0.1% in 2023, driven by expected declines in several manufacturing industries.

Emissions: We forecast total energy-related CO_2 emissions to increase slightly in 2022 compared with 2021, driven by more consumption of natural gas and petroleum products and offset by less coal consumption. Among fossil fuels, natural gas emissions increase the most in 2022 as a result of strong demand in the electric power sector and constraints in the coal market that have reduced coal-fired generation. Increases in petroleum emissions are attributable to increased travel following the pandemic.

We forecast CO_2 emissions will decrease slightly in 2023 compared with 2022, driven by less U.S. energy consumption resulting from the forecast decline in economic activity. We expect consumption of (and therefore emissions from) coal, petroleum, and natural gas to decline in 2023.

Weather: Based on forecasts from the National Oceanic and Atmospheric Administration, we expect a colder winter (October–March), with 7% more population-weighted HDDs in the United States compared with last winter and 2% more HDDs than the ten-year average.



The U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy (DOE), prepared this report. By law, our data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The views in this report do not represent those of DOE or any other federal agencies.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on November 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on November 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on November 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate, natural gas plant liquids, other liquids, refinery processing gain, and other unaccounted-for liquids.

OPEC = Organization of the Petroleum Exporting Countries: Iran, Iraq, Kuwait, Saudi Arabia, and the United Arab Emirates (Middle East); Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Libya, Nigeria, and Venezuela (Other).

Notes: EIA completed modeling and analysis for this report on November 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Forecasts are not published for individual OPEC countries.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on November 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Total Commercial Inventory	**1310.9**	**1281.4**	**1250.9**	**1198.6**	**1153.6**	**1179.7**	**1216.2**	*1199.5*	*1199.8*	*1249.3*	*1259.6*	*1223.9*	**1198.6**	*1199.5*	*1223.9*
Crude Oil in SPR	**637.8**	**621.3**	**617.8**	**593.7**	**566.1**	**493.3**	**415.3**	*372.7*	*371.5*	*355.9*	*350.7*	*340.2*	**593.7**	*372.7*	*340.2*

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on November 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

Notes: EIA completed modeling and analysis for this report on November 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on November 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on November 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.91**	**1.93**	**2.03**	**2.05**	**2.19**	**2.26**	**2.49**	*2.47*	*2.47*	*2.45*	*2.42*	*2.38*	**1.98**	*2.36*	*2.43*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on November 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on November 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on November 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 7c. U.S. Regional Electricity Prices to Ultimate Customers (Cents per Kilowatthour)

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on November 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on November 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on November 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distrib

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Subtotals for the industrial and commercial sectors might not equal the sum of the components. The subtotal for the industrial sector includes ethanol consumption that is not shown separately. The subtotal for the commercial sector includes ethanol and hydroelectric consumption that are not shown separately.

(f) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(g) Fuel ethanol and biodiesel, renewable diesel, and other biofuels consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on November 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum Supply*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on November 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

- = no data available

SAAR = Seasonally-adjusted annual rate

Notes: EIA completed modeling and analysis for this report on November 3, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.

Short-Term Energy Outlook

Overview

U.S. energy market indicators	2021	2022	2023
Brent crude oil spot price (dollars per barrel)	**$70.89**	**$101.48**	**$92.36**
Retail gasoline price (dollars per gallon)	**$3.02**	**$3.99**	**$3.51**
U.S. crude oil production (million barrels per day)	**11.25**	**11.87**	**12.34**
Natural gas price at Henry Hub (dollars per million British thermal units)	**$3.91**	**$6.48**	**$5.43**
U.S. liquefied natural gas gross exports (billion cubic feet per day)	**9.8**	**10.6**	**12.3**
Shares of U.S. electricity generation			
Natural gas	37%	39%	37%
Coal	23%	20%	19%
Renewables	20%	22%	24%
Nuclear	20%	19%	20%
U.S. GDP (percentage change)	**5.9%**	**1.8%**	**0.1%**
U.S. CO_2 emissions (billion metric tons)	**4.90**	**4.98**	**4.85**

Data source: U.S. Energy Information Administration, *Short-Term Energy Outlook,* December 2022

- Global oil inventories in our forecast fall by 0.2 million barrels per day (b/d) in the first half of 2023 (1H23) before rising by almost 0.7 million b/d in 2H23. This forecast leaves global oil inventories higher at the end of 2023 than we had forecast in the November STEO, which results in our Brent crude oil price forecast averaging $92 per barrel (b) in 2023, $3/b less than we had forecast last month.

- U.S refinery utilization in our forecast remains near its five-year average through 2023. We expect the combination of a slight contraction in the U.S. economy and refinery maximization of distillate fuel production will reduce distillate prices in 1H23. We forecast U.S. diesel refining margins will fall by 19% in 2023 compared with 2022. However, the EU's ban on seaborne imports of petroleum products from Russia creates supply and price uncertainty for distillate markets in early 2023.

- We expect natural gas prices to increase from November levels as a result of both higher winter natural gas demand and rising LNG exports. Our forecast for the Henry Hub spot price averages more than $6.00 per million British thermal units (MMBtu) in 1Q23, up from November's monthly average of about $5.50/MMBtu. We expect natural gas prices will begin declining after January as U.S. storage levels move closer to the previous five-year average, largely as a result of rising U.S. natural gas production. However, the possibility of price volatility remains high.

- We raised our forecast for U.S. natural gas production by almost 1% in 2023 compared with last month's forecast. Although we continue to expect natural gas production in the Permian Basin

to be limited early in 2023 by the lack of pipeline capacity to bring associated natural gas production to market, we expect that these constraints will be resolved earlier than we had previously assumed. This change also contributes to slightly more crude oil production in 2023 than we had previously forecast.

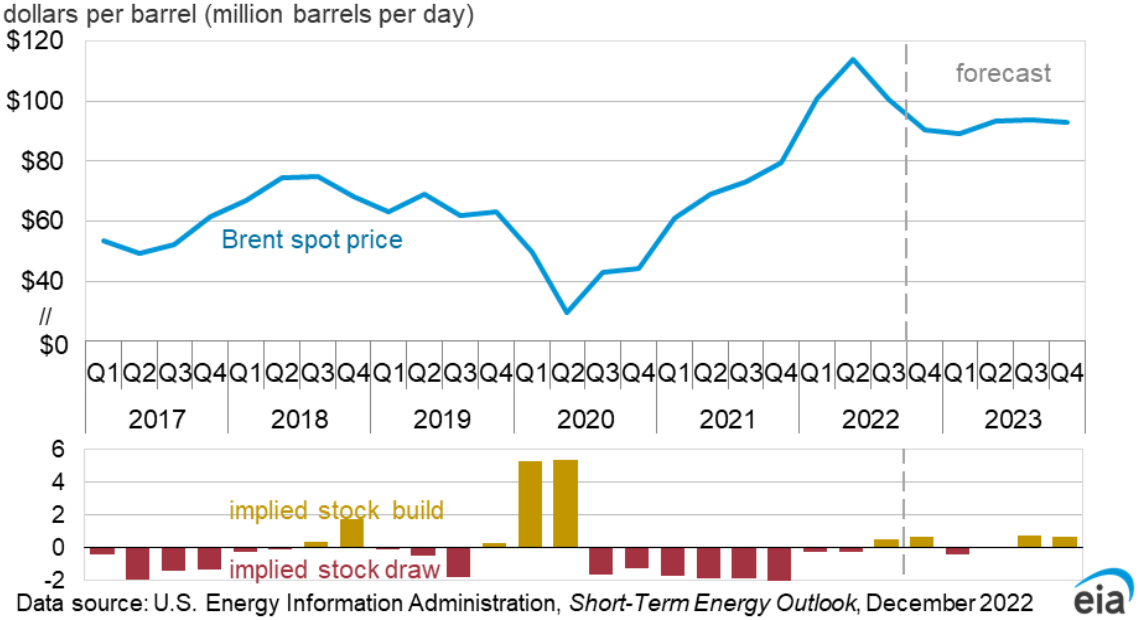
- Freeport LNG announced its export terminal will resume partial operations exporting liquefied natural gas (LNG) in mid-December following an outage that began in June 2022. We expect Freeport LNG will ramp up utilization in the coming months and will reach full capacity by March 2023.

- The highest forecasted electricity prices for this winter are in ISO New England, where we expect on-peak wholesale power prices will average more than $200 per megawatthour in January, up 35% from January 2022. Capacity constraints on pipelines delivering natural gas into New England make it likely that wholesale electricity prices will be set by relatively expensive imported LNG or fuel oil.

- The December STEO includes a contraction in U.S. economic activity in the fourth quarter of 2022 (4Q22) and 1Q23, which represents a slightly shorter and milder period of economic contraction than in last month's STEO. Uncertainty in macroeconomic conditions could significantly affect energy markets in the forecast period. Based on the S&P Global macroeconomic model, we assume U.S. GDP will remain flat in 2023.

Notable forecast changes

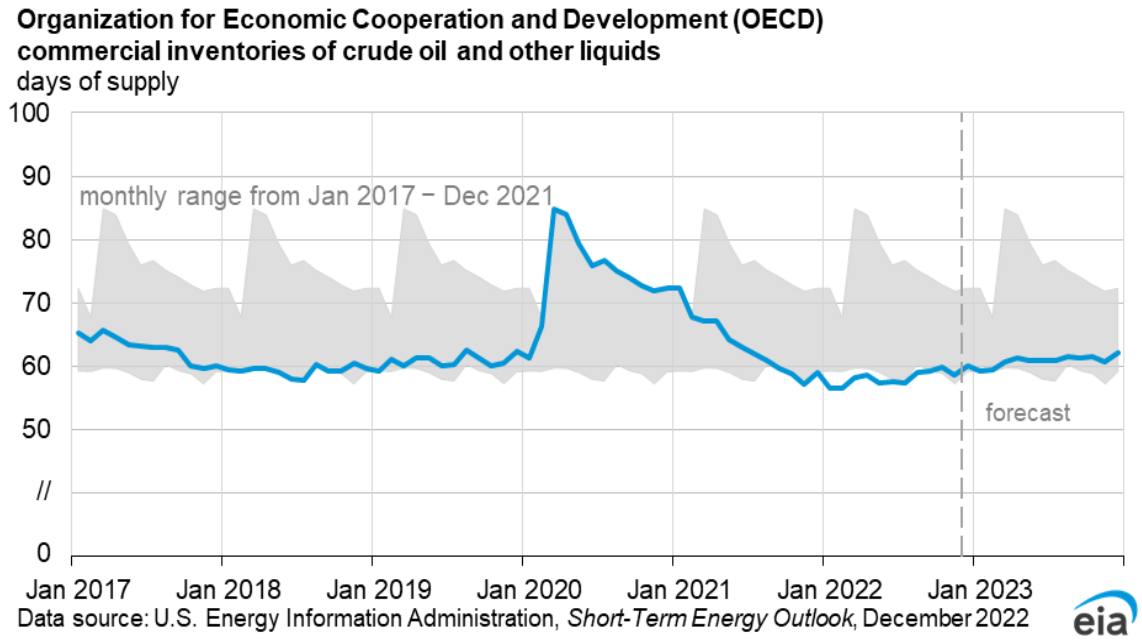
Current forecast: December 6, 2022; previous forecast: November 8, 2022	**2022**	**2023**
Natural gas production (current) (billion cubic feet per day)	**98.1**	**100.4**
Previous forecast	98.1	99.7
Percentage change	0.1%	0.7%
U.S. coal production (current) (million short tons)	**592.7**	**539.2**
Previous forecast	595.3	573.2
Percentage change	-0.4%	-5.9%
Brent spot average (current) (dollars per barrel)	**$101**	**$92**
Previous	$102	$95
Change	-0.6%	-3.1%
Global oil inventory change (current) (million barrels per day)	**0.2**	**0.2**
Previous	0.1	-0.3
Change	0.1	0.5
U.S. Distillate fuel inventories (current) (million barrels)	**122.5**	**123.9**
Previous forecast	116.8	115.6
Percentage change	4.9%	7.2%
Diesel fuel prices (current) (dollars per gallon)	**$5.05**	**$4.48**
Previous forecast	$5.09	$4.65
Percentage change	-0.8%	-3.8%



Data source: Energy Information Administration, *Short-Term Energy Outlook,* December 2022

Global oil markets

Crude oil prices: The spot price of Brent crude oil averaged $91 per barrel (b) in November. Although the average November Brent price was slightly lower than in October, daily spot prices reached almost $100/b on November 7, before ending the month at $86/b. The price declines were largely the result of market concerns about global economic growth, as well as COVID-related lockdowns in China that have reduced China's oil demand. Brent crude oil spot prices are on pace to average $101/b in 2022.



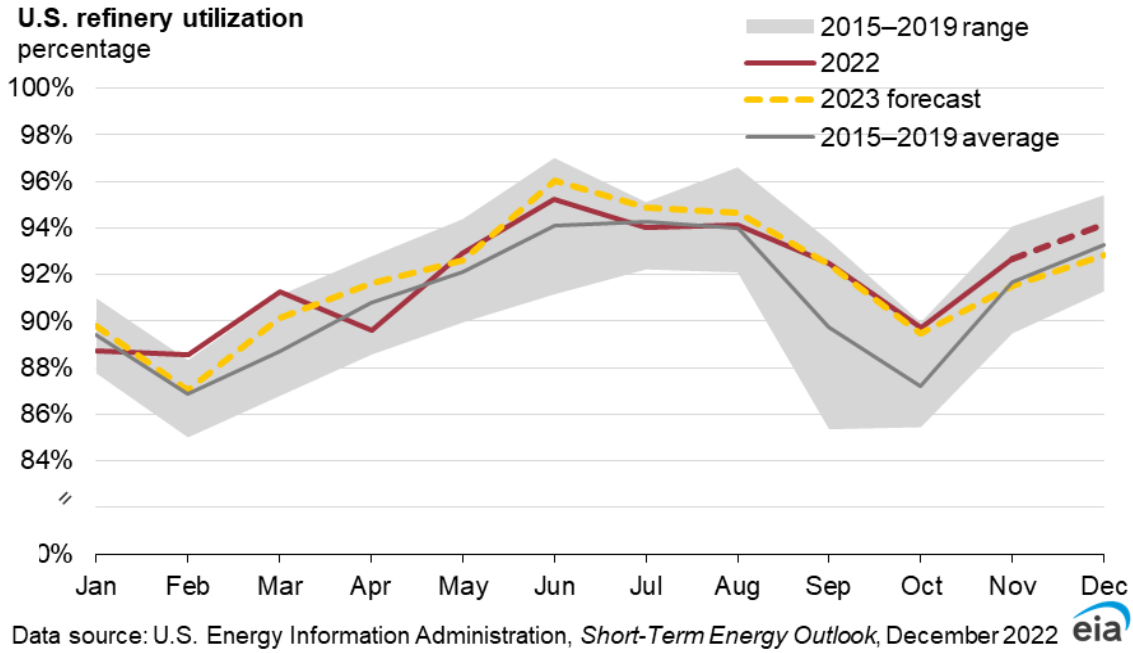
Despite the recent drop in crude oil prices, we still expect that falling global inventories of oil in early 2023 will push Brent prices back above $90/b by the beginning of the second quarter of 2023 (2Q23). Although we expect some downward oil price pressure could emerge in the second half of 2023 (2H23) based on our forecast of rising oil inventories, that pressure will likely be balanced by the ongoing possibility of supply disruptions or production growth that is slower than our forecast. We forecast the Brent crude oil spot price will average $92/b for all of 2023.

Brent crude oil spot price and global inventory changes
dollars per barrel (million barrels per day)

Data source: U.S. Energy Information Administration, *Short-Term Energy Outlook*, December 2022

Total petroleum inventories: Although we estimate that petroleum inventories have increased thus far in 2H22, commercial petroleum inventories in OECD countries spent most of 2022 at their lowest levels in five years on a days-of-supply basis, and we expect that they will remain near the bottom of their recent five-year (2017–2021) range throughout 2023. Given relatively low global petroleum inventories and the necessary time and magnitude of inventory builds needed to replenish them, the market has limited slack during the forecast period, and any unplanned supply disruption has the potential to increase oil prices quickly and significantly.

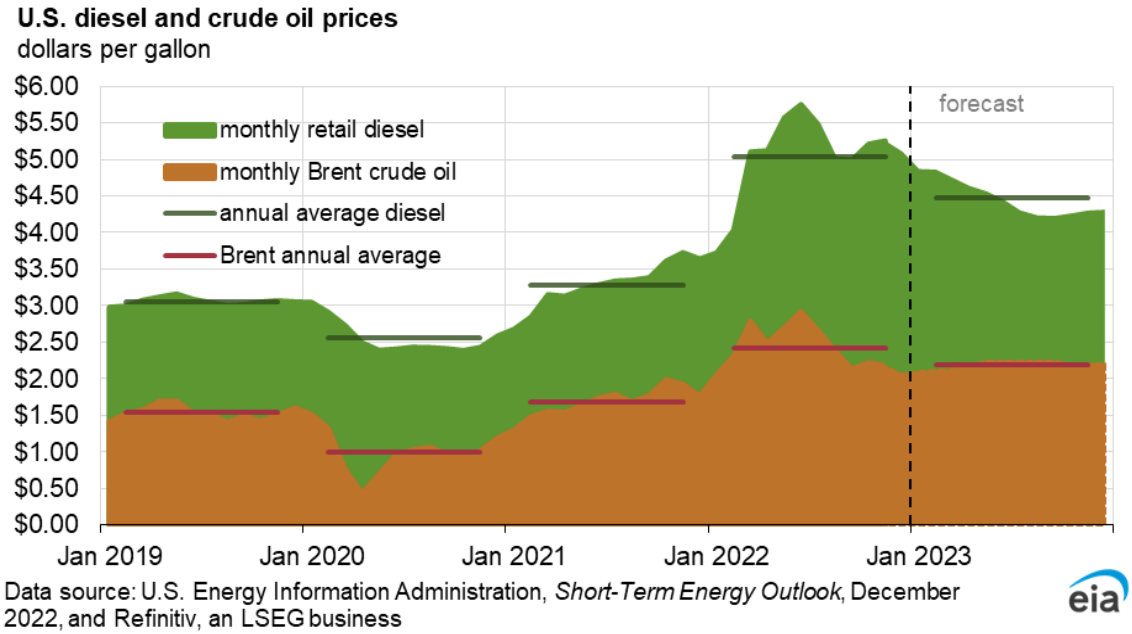
Significant uncertainty remains around the impact that sanctions on Russia will have on global oil prices. The EU ban on seaborne imports of crude oil from Russia took effect on December 5, and the ban on petroleum product imports is set to begin on February 5. The EU and UK have indicated that they will continue to allow non-member countries that participate in the G7's price cap to access EU and UK based shipping insurance to import crude oil and petroleum products from Russia. We expect that most of Russia's crude oil exports that will no longer go to Europe will find a destination elsewhere. However, we expect Russia's oil production will continue to decline in 2023, largely because a number of countries will decrease their imports of crude oil and petroleum products from Russia.



The U.S. Department of the Treasury issued General License (GL) 41 at the end of November, allowing Chevron to resume oil production in Venezuela for export to the United States. This issuance introduces additional uncertainty related to our oil production forecast for Venezuela. Chevron's ability to increase production will depend on the state of production facilities, which have yet to be evaluated. We have raised our outlook for Venezuela's production starting in 1Q23.

Petroleum products

Refinery utilization: On average, U.S. refinery utilization has been higher in 2022 than its pre-pandemic five-year (2015–2019) average, and we estimate that this year's November utilization of 93% was slightly above the pre-pandemic five-year average for the month. According to our *Weekly Petroleum Status Report* (WPSR), refineries on the East Coast (PADD 1) operated at more than 100% of capacity during the last two weeks of October and all of November. The utilization of more than 100% is partially the result of an increase in capacity that was updated in our September PSM but not reflected in WPSR, leading to the reported operable capacity amount to be lower than actual in October and November. Also, our calculation of refinery utilization can briefly exceed 100% because we calculate it as gross inputs of crude oil divided by refinery capacity in barrels per calendar day, which is designed to

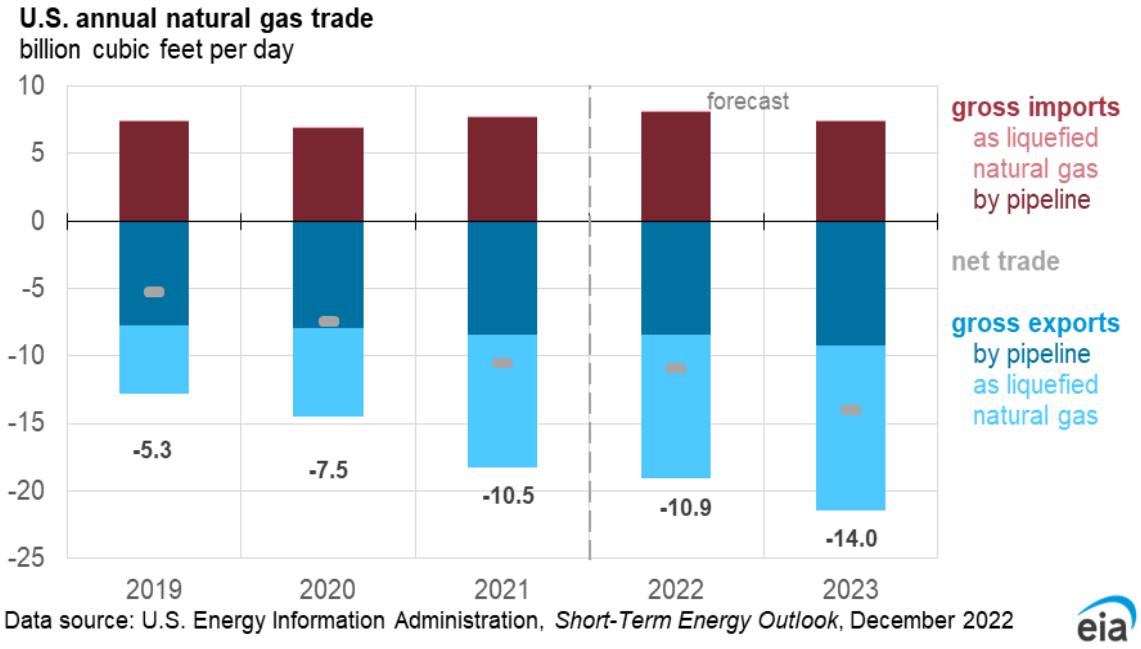


account for realistic operating conditions such as allowing for down time. With refinery utilization back up to pre-pandemic levels and relatively weak demand, product inventories increased in November, contributing to decreasing gasoline and distillate prices.

The United States has less refining capacity than during the pre-pandemic years, which means similar levels of utilization will result in less refinery output than in previous years. We forecast utilization will remain within the pre-pandemic five-year range in 2023, and average near the 2022 utilization of 92%. We also expect new refinery capacity to be added in the first half of 2023 (1H23) with the expansion of ExxonMobil's Beaumont refinery.

Distillate: The retail diesel price on December 5 was $4.97 per gallon (gal), down 35 cents/gal from October 31. We expect that high refinery utilization will allow U.S. retail diesel prices to continue to decrease in December 2022 and to fall further in 1H23, averaging about $4.50/gal next year.

Most of our forecast price decrease from 2022 to 2023 results from lower distillate refinery margins, which moderate beginning in early 2023 based on our expectation that distillate demand will decline in 2023 as production of distillate fuel increases. Although we expect the diesel refinery margin to decrease 19% in 2023 from 2022, we still expect it to be more than double 2021 levels.

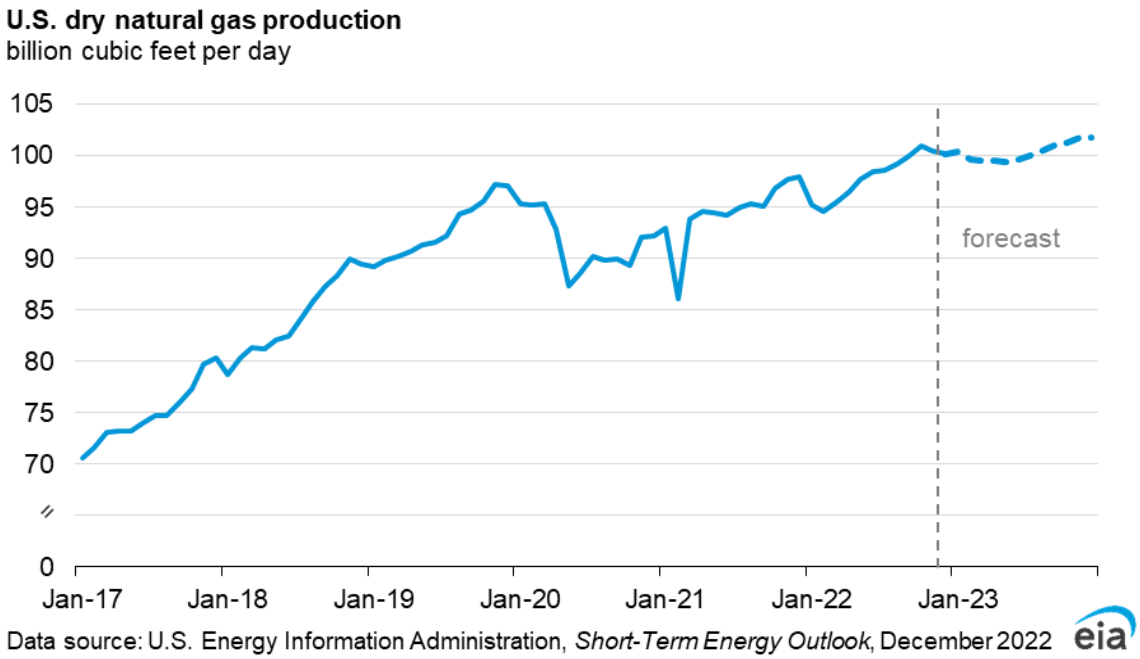


With higher-than-average refinery margins and high crude oil prices, we expect 2023 retail diesel prices to remain relatively high, albeit not as high as in 2022, as U.S. distillate inventories remain at or near multiyear lows through the end of our forecast. Ongoing constraints on global refining capacity will continue to limit distillate supplies and inventory builds during this time. Furthermore, the EU's ban on seaborne refined product imports from Russia beginning in February 2023 will keep supplies particularly tight in the Atlantic Basin.

Gasoline: We forecast U.S. retail gasoline prices will average about $3.50/gal in 2023. U.S. retail gasoline prices finished November at their lowest price since February 2022, as high refinery utilization and falling demand contributed to rising gasoline inventories, which facilitated November's price decreases. As refiners maintain high utilization in response to high distillate margins, we expect this trend to continue and for gasoline inventories to reach five-year average levels in 2023, limiting upward pressure on gasoline prices. We expect high blend rates of fuel ethanol through 2023 as the petroleum component of gasoline remains relatively expensive compared with the price of ethanol, continuing the trend that started this summer.

Natural gas

Natural gas trade: We forecast U.S. natural gas exports to increase in 2023, driven largely by growth in LNG exports. U.S. LNG exports peaked in the first half of 2022 (1H22) as facilities operated close to maximum capacity, and a new facility, Calcasieu Pass, came online and steadily increased output in 2022. However, a fire at Freeport LNG in June resulted in the shutdown of the facility, removing about 2.0 billion cubic feet per day (Bcf/d) of U.S. LNG export capacity in 2H22. The Freeport facility recently announced plans to come back online in December and to increase output to about 2.0 Bcf/d in January 2023. When Freeport LNG resumes, we forecast U.S. LNG exports will establish a new record close to 12.5 Bcf/d in March 2023. We expect LNG exports will then reach 12.7 Bcf/d by the end of 2023.

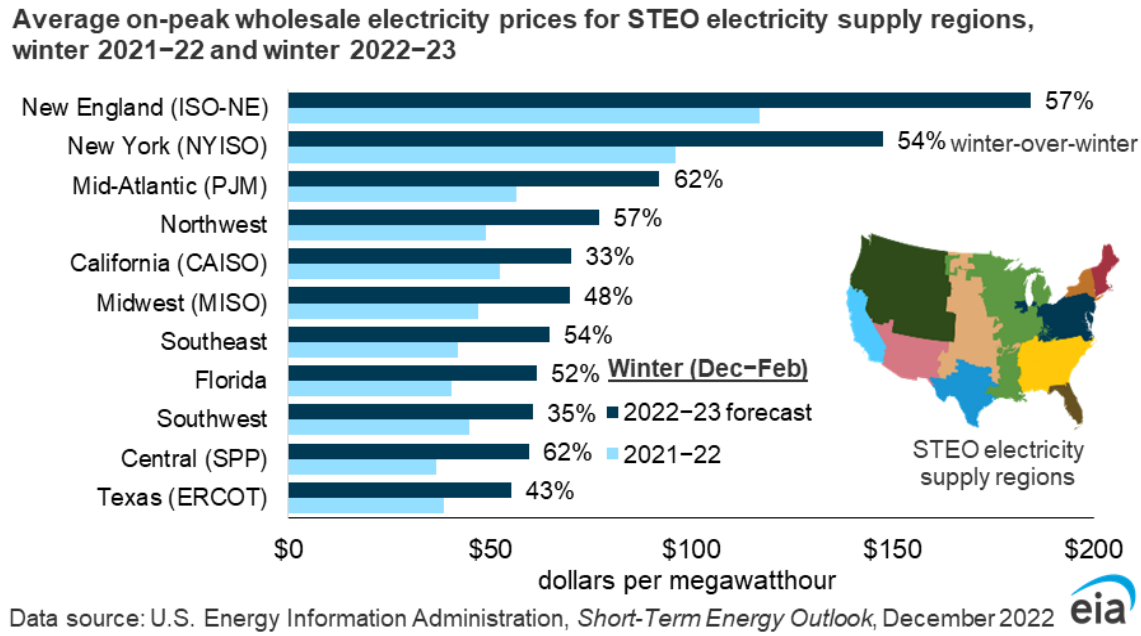


No new U.S. LNG export facilities are scheduled to come online in 2023. We forecast U.S. LNG exports will average 12.3 Bcf/d throughout 2023 as facilities continue to operate close to maximum capacity to meet high demand for natural gas in Europe and Asia.

Natural gas pipeline exports reached almost 9.0 Bcf/d in November, near its previous record. We forecast natural gas pipeline exports will reach record highs between 9.0 Bcf/d and 10.0 Bcf/d through the upcoming winter months. Natural gas pipeline exports from the United States flow to either Canada or Mexico.

Natural gas production: We forecast that U.S. production of dry natural gas will average about 100.0 Bcf/d from December through March, down about 0.5 Bcf/d from November due to weather-related declines, usually caused by freeze-offs and the possibility of extreme winter weather events. Mild weather in key producing regions could prevent those declines.

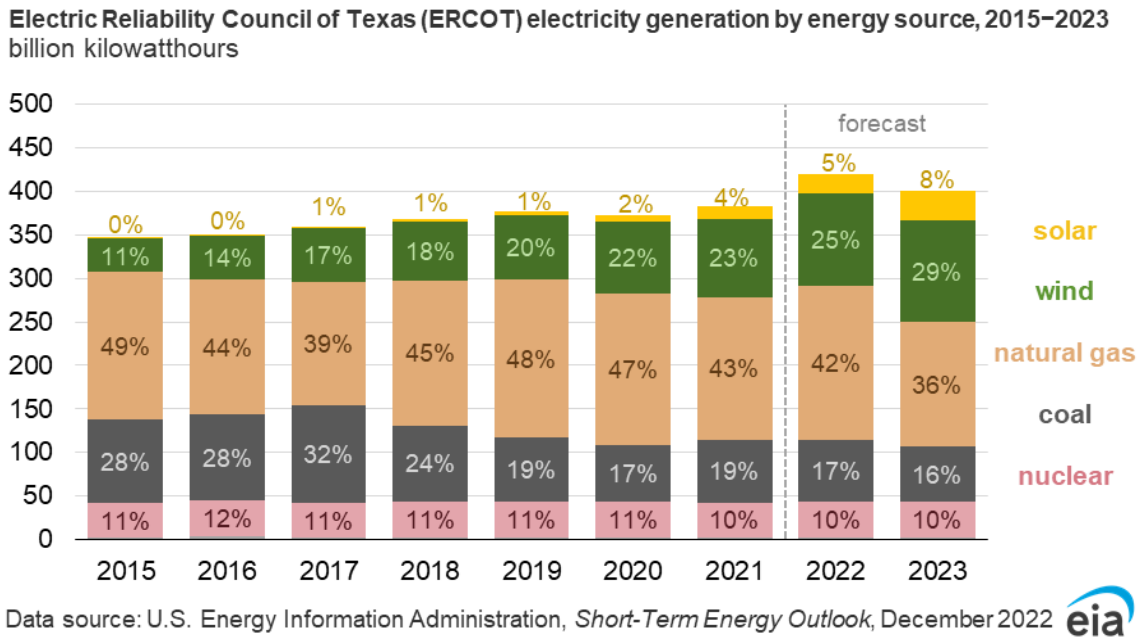
Dry natural gas production has increased during 2022 in the United States, averaging more than 100 Bcf/d in October and November and exceeding pre-pandemic monthly production records from 2019. Growth in natural gas production was driven by increased drilling activity in the Haynesville region in Louisiana and East Texas and in the Permian region in West Texas and Southeast New Mexico. Recent pipeline infrastructure expansions in both these regions facilitated the increases in production.



We forecast production to grow slightly in 2023, averaging between 100 Bcf/d and 101 Bcf/d for the year, about 2% more than in 2022. Production in our forecast for 1H23 is limited by pipeline constraints and declining natural gas prices. In 2H23, more pipeline infrastructure expansion projects are set to come online and contribute to increases in dry natural gas production. The pace at which these projects are completed is a notable uncertainty in our forecast, and delays could result in lower production than we expect.

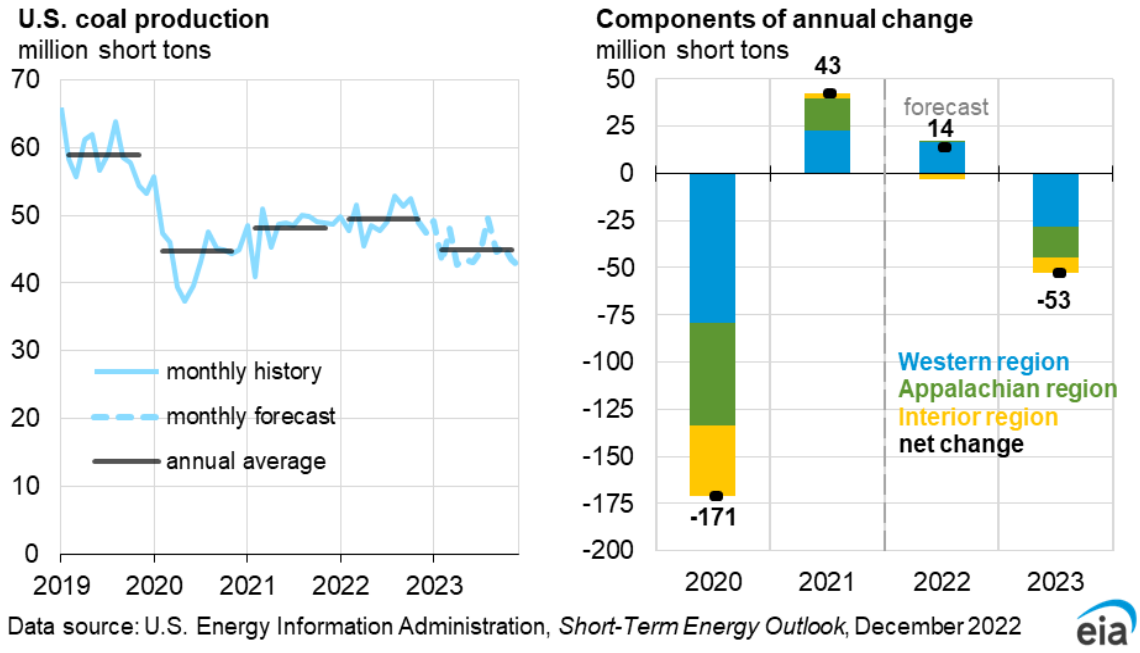
Electricity, coal, and renewables

Electricity prices: We forecast wholesale prices for on-peak power to rise in all areas of the country during the winter months as the weather becomes colder. Increases in wholesale electricity prices this winter (December–February) range from 33% higher than last winter in California (CAISO) to more than 60% higher in the mid-Atlantic (PJM) and central (SPP) regions.



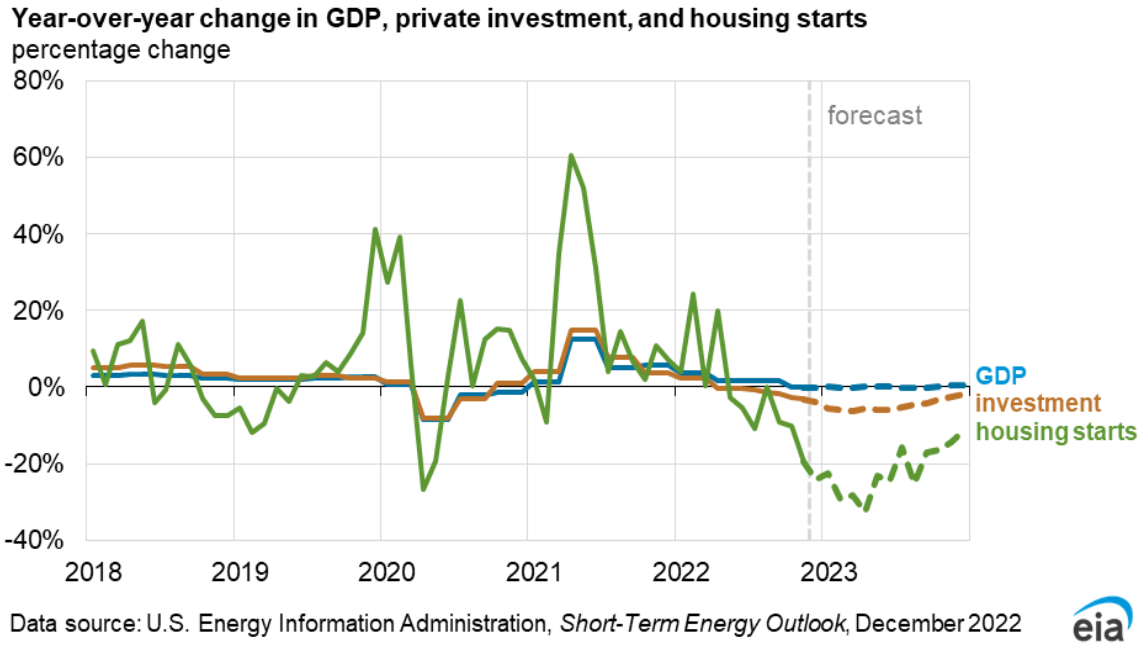
Forecast on-peak wholesale prices for most regions generally average between $60 and $80 per megawatthour (MWh) between December and February. We expect the highest wholesale prices to occur in New England, where prices could average in excess of $180/MWh, with winter peaks of more than $200/MWh. We also expect high prices in New York (NYISO) and in mid-Atlantic (PJM) markets. However, if significant market stressors occur, such as periods of extreme cold weather or fuel supply problems, wholesale prices could be significantly higher than forecast.

We also forecast retail electricity prices to be higher this winter. However, retail prices grow less than wholesale prices because of regulatory and contractual factors that vary widely across the United States. The U.S. residential electricity price in the core winter months from December through February averages 14.5 cents per kilowatthour, which is 6% higher than last winter. Price increases range from almost no change in the West North Central region to 18% in New England.



Electricity generation: Despite our forecast decline in natural gas prices in 2023, we expect the share of U.S. electric power generation supplied by natural gas will fall from 39% this year to 37% in 2023 as more renewable generating capacity comes online. We estimate that wind and solar combined account for 14% of U.S. generation in 2022, and we forecast that share will grow to 16% in 2023. Increasing generation from renewable energy, along with retirements reducing the available capacity of coal-fired power plants, contribute to our forecast that coal's generation share will fall from 20% this year to 19% in 2023.

The Texas region (ERCOT) is likely to experience the largest shift in generation mix in 2023. We expect that the share of electric power generation from wind in ERCOT will grow from 25% in 2022 to 29% in 2023 and that the solar share will grow from 5% to 8%. ERCOT's share of generation from coal in the forecast falls from 17% this year to 16% in 2023. But we expect growing generation from renewables, especially during peak hours, will cause the natural gas share to fall from 42% in 2022 to 36% in 2023.



Coal markets: After increasing in both 2021 and 2022, we expect U.S. coal production to decline by 9% to less than 540 million short tons (MMst) in 2023. The primary reason for the decrease is our forecast of a 7% reduction in coal use by the electric power sector. That decline largely reflects almost 12 gigawatts (GW) of coal-fired capacity retirements in 2022 and another 9 GW in 2023. Those plant closures represent about 10% of the existing U.S. coal-fired generating fleet. Lower natural gas prices and growth in renewable resources also will reduce coal use by the electric power sector.

Economy, weather, and CO_2

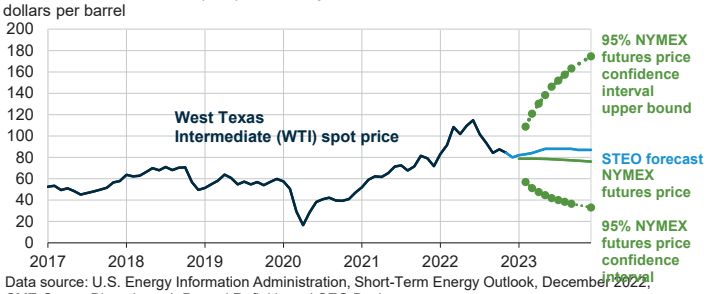
U.S. macroeconomics: We base our U.S. macroeconomic forecasts on S&P Global's macroeconomic model. We incorporate STEO energy price forecasts into the model to obtain the final macroeconomic assumptions.

S&P Global forecasts a milder and shorter contraction in U.S. economic activity compared with last month's forecast. The upward revision in U.S. economic activity reflects the recent GDP data release for 3Q22 and Consumer Price Index inflation in October. On an annual basis, we assume U.S. real GDP will remain relatively flat in 2023 after economic activity declines quarter over quarter between 4Q22 and 1Q23. The forecast is primarily driven by real private fixed investment, which declines by 5% in 2023. A large component of this decline occurs in the residential sector, which has fallen due to slowing demand for housing. As a result, housing starts decline by more than 20% in 2023 in our assumptions, which will limit overall energy consumption growth in the United States in 2023.

Emissions: We forecast energy-related CO_2 emissions have increased slightly in the United States during 2022, driven by more consumption of natural gas and petroleum and partly offset by less coal consumption. Our forecast of natural gas emissions increase the most as a result of rising demand for that fuel in the electric power sector. Increases in CO_2 emissions from petroleum use reflect increased travel following the pandemic as well as increased industrial activity. We expect fossil fuel consumption (and related emissions) to decline in 2023 by almost 3%.

We expect U.S. energy consumption to grow faster than CO_2 emissions in 2022, and to fall more slowly than emissions in 2023. This reflects a decrease in our projected carbon intensity of energy—the emissions output per unit of energy consumed—of around 1% in 2022 and around 2% in 2023.

Weather: In October and November, U.S. population-weighted heating degree days (HDDs) were 13% more than last year and 4% more than the 10-year average. Based on forecasts from the National Oceanic and Atmospheric Administration, we expect the entire winter (October–March) to be colder than last winter, with 7% more HDDs in the United States compared with last winter and 2% more than the 10-year average.



The U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy (DOE), prepared this report. By law, our data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The views in this report do not represent those of DOE or any other federal agencies.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on December 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on December 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on December 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on December 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 4a. U.S. Petroleum and Other Liquids Supply, Consumption, and Inventories

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on December 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on December 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to Petroleum Administration for Defense Districts (PADD).

See "Petroleum for Administration Defense District" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Marketing Monthly* , DOE/EIA-0380; *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on December 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on December 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Total Raw Steel Production (Million short tons per day)	**0.246**	**0.258**	**0.267**	**0.260**	**0.253**	**0.253**	**0.247**	*0.243*	*0.249*	*0.240*	*0.237*	*0.247*	**0.258**	*0.249*	*0.243*
Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.91**	**1.92**	**2.03**	**2.05**	**2.18**	**2.26**	**2.50**	*2.49*	*2.50*	*2.50*	*2.50*	*2.46*	**1.98**	*2.36*	*2.49*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on December 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on December 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on December 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on December 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on December 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distrib

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Subtotals for the industrial and commercial sectors might not equal the sum of the components. The subtotal for the industrial sector includes ethanol consumption that is not shown separately. The subtotal for the commercial sector includes ethanol and hydroelectric consumption that are not shown separately.

(f) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(g) Fuel ethanol and biodiesel, renewable diesel, and other biofuels consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on December 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum Supply*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on December 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Raw Steel Production															
(million short tons per day)	**0.246**	**0.258**	**0.267**	**0.260**	**0.253**	**0.253**	**0.247**	*0.243*	*0.249*	*0.240*	*0.237*	*0.247*	**0.258**	*0.249*	*0.243*
Carbon Dioxide (CO2) Emissions (million metric tons)															
Petroleum	**521**	**562**	**571**	**580**	**562**	**564**	**578**	*576*	*556*	*569*	*573*	*577*	**2,234**	*2,280*	*2,274*
Natural Gas	**493**	**357**	**377**	**430**	**512**	**375**	**399**	*457*	*501*	*359*	*384*	*445*	**1,657**	*1,743*	*1,689*
Coal	**256**	**229**	**307**	**210**	**245**	**216**	**270**	*214*	*223*	*196*	*261*	*199*	**1,002**	*946*	*878*
Total Energy (c)	**1,272**	**1,150**	**1,259**	**1,223**	**1,322**	**1,158**	**1,251**	*1,250*	*1,282*	*1,126*	*1,220*	*1,224*	**4,904**	*4,981*	*4,852*

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

- = no data available

SAAR = Seasonally-adjusted annual rate

Notes: EIA completed modeling and analysis for this report on December 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on December 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on December 1, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Appendix to the December 2022 *Short-Term Energy Outlook*

This appendix is prepared in fulfillment of section 1245(d)(4)(A) of the National Defense Authorization Act (NDAA) for Fiscal Year 2012, as amended. The law requires the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy, to submit to Congress a report on the availability and price of petroleum and petroleum products produced in countries other than Iran in the two-month period preceding the submission of the report. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The data in this appendix, therefore, should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

EIA consulted with the U.S. Department of the Treasury, the U.S. Department of State, and the intelligence community in the process of developing the NDAA report, which was previously published as a stand-alone report. Detailed background and contextual information not repeated here can be found in early editions of the NDAA report.

This appendix is published in the *Short-Term Energy Outlook* in even numbered months.

Table a1. Summary of Estimated Petroleum and Other Liquids Quantities

	Oct 2022	Nov 2022	Oct 2022 – Nov 2022 Average	Oct 2021 – Nov 2021 Average	2019 – 2021 Average
Global Petroleum and Other Liquids (million barrels per day)					
Global Petroleum and Other Liquids Production (a)	101.2	101.6	101.4	98.4	96.6
Global Petroleum and Other Liquids Consumption (b)	99.4	100.2	99.8	99.6	96.8
Biofuels Production (c)	2.8	2.5	2.7	2.6	2.7
Biofuels Consumption (c)	2.6	2.6	2.6	2.6	2.6
Iran Liquid Fuels Production	3.6	3.6	3.6	3.5	3.2
Iran Liquid Fuels Consumption	1.9	2.1	2.0	2.0	2.0
Petroleum and Petroleum Products Produced and Consumed in Countries Other Than Iran (million barrels per day)					
Production (d)	94.8	95.4	95.1	92.3	90.7
Consumption (d)	94.9	95.6	95.2	95.0	92.2
Production minus Consumption	-0.1	-0.2	-0.1	-2.7	-1.5
World Inventory Net Withdrawals Including Iran	-1.8	-1.4	-1.6	1.2	0.1
Estimated OECD Inventory Level (e) (million barrels)	2,764	2,771	2,768	2,742	2,946
Surplus Production Capacity (million barrels per day)					
OPEC Surplus Crude Oil Production Capacity (f)	2.0	2.4	2.2	3.9	4.3

Note: The term "petroleum and other liquids" encompasses crude oil, lease condensate, natural gas liquids, biofuels, coal-to-liquids, gas-to-liquids, and refinery processing gains, which are important to consider in concert due to the inter-related supply, demand, and price dynamics of petroleum, petroleum products, and related fuels.

(a) Production includes crude oil (including lease condensates), natural gas liquids, other liquids, and refinery processing gains.

(b) Consumption of petroleum by the OECD countries is synonymous with "products supplied," defined in the glossary of the EIA Petroleum Supply Monthly, DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel, and loss, and bunkering.

(c) Biofuels production and consumption are based on EIA estimates as published in the International Energy Statistics. Biofuels production in the third quarter tends to be at its highest level in the year as ethanol production in Brazil reaches its seasonal peak and is typically lowest in the first quarter as seasonal production falls in the South/South-Central region of Brazil.

(d) Global production of petroleum and petroleum products outside of Iran is derived by subtracting biofuels production and Iran liquid fuels production from global liquid fuels production. The same method is used to calculate global consumption outside of Iran.

(e) Estimated inventory level is for OECD countries only.

(f) EIA defines surplus oil production capacity as potential oil production that could be brought online within 30 days and sustained for at least 90 days, consistent with sound business practices. This does not include oil production increases that could not be sustained without degrading the future production capacity of a field.

Short-Term Energy Outlook

STEO

January 2023

Overview

U.S. energy market indicators	2022	2023	2024
Brent crude oil spot price (dollars per barrel)	**$100.94**	**$83.10**	**$77.57**
Retail gasoline price (dollars per gallon)	**$3.97**	**$3.32**	**$3.09**
U.S. crude oil production (million barrels per day)	**11.86**	**12.41**	**12.81**
Natural gas price at Henry Hub (dollars per million British thermal units)	**$6.42**	**$4.90**	**$4.80**
U.S. liquefied natural gas gross exports (billion cubic feet per day)	**10.7**	**12.1**	**12.6**
Shares of U.S. electricity generation			
Natural gas	39%	38%	37%
Coal	20%	18%	17%
Renewables	21%	24%	26%
Nuclear	19%	19%	19%
U.S. GDP (percentage change)	**1.9%**	**0.5%**	**1.9%**
U.S. CO_2 emissions (billion metric tons)	**4.99**	**4.83**	**4.81**

Data source: U.S. Energy Information Administration, *Short-Term Energy Outlook,* January 2023

- This edition of STEO is the first to include forecasts for 2024.
- **U.S. GDP growth.** Based on the S&P Global macroeconomic model, we expect U.S. real GDP to grow by 0.5% in 2023, with economic growth returning after contraction in the first quarter of 2023 (1Q23) and 2Q23. In 2024, real GDP grows by 1.9%, driven primarily by an increase in household consumption. Relatively flat economic growth in 2023 results in total U.S. energy consumption falling by 0.9% in our forecast. Total energy consumption then rises by 1.0% in 2024.
- **Global liquid fuels markets.** Global production of liquid fuels in our forecast reaches an average of 102.8 million barrels per day (b/d) in 2024, up from 100.0 million b/d in 2022, driven by large growth in non-OPEC production. However, uncertainty over Russia's oil supply will persist, particularly in early 2023. We expect that global consumption of liquid fuels will increase from an average of 99.4 million b/d in 2022 to 102.2 million b/d in 2024. Ongoing concerns about global economic conditions as well as the easing COVID-19 restrictions in China, however, increase the uncertainty of the outcomes of our demand forecasts. With more global oil production than consumption in our forecast, we expect global oil inventories will increase over the next two years.
- **Crude oil prices.** We forecast that the Brent crude oil price will average $83 per barrel (b) in 2023, down 18% from 2022, and continue to fall to $78/b in 2024 as global oil inventories build, putting downward pressure on crude oil prices.

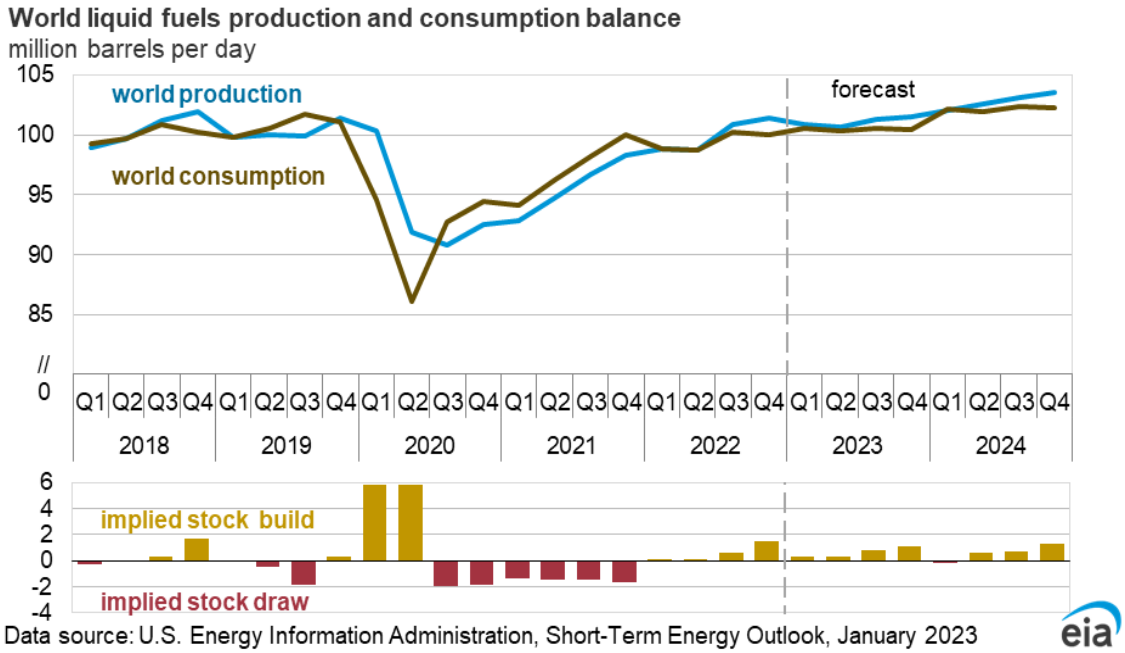
- **Gasoline prices.** Gasoline prices decline in our forecast as both wholesale refining margins and crude oil prices fall. We forecast U.S. gasoline refining margins will fall by 29% in 2023 and fall by 14% in 2024, leading to retail gasoline prices averaging around $3.30 per gallon (gal) in 2023 and $3.10/gal in 2024.

- **Diesel prices.** We forecast that U.S. refining margins for diesel will fall by 20% in 2023 and by 38% in 2024. We expect retail diesel prices to average about $4.20/gal in 2023, down 16% from 2022. In 2024, we expect prices to continue to fall, and average near $3.70/gal.

- **Natural gas prices.** The Henry Hub natural gas spot price averages slightly less than $5.00 per million British thermal units (MMBtu) in 2023 in our forecast—down close to 25% from last year—as domestic consumption declines and liquefied natural gas (LNG) exports remain relatively flat. In 2024, we expect natural gas prices to again average slightly below $5.00/MMBtu, as dry natural gas production outpaces an increase in LNG exports that results from rising LNG export capacity.

- **Natural gas production.** We expect natural gas production in both the Permian and Haynesville regions to grow with the completion of pipeline infrastructure expansions in 2023 and 2024.

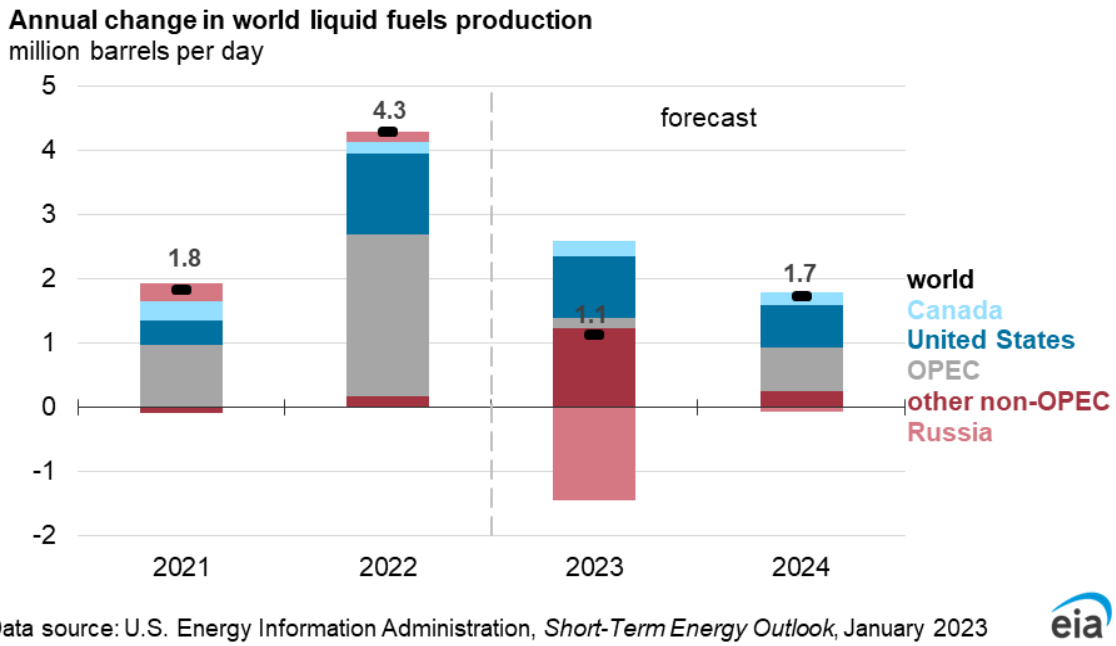
- **Electricity generation.** We expect that the share of electricity generation from coal will fall from 20% in 2022 to 18% in 2023 and 17% in 2024. This decline will be partially offset by an increase in the forecast share of combined utility-scale solar and wind generation from 16% in 2023 to 18% in 2024.



Notable forecast changes

Current forecast: January 10, 2023; previous forecast: December 6, 2022	**2023**	**2024**
Brent spot average (current) (dollars per barrel)	**$83**	**$78**
Previous forecast	$92	---
Percentage change	-10.0%	---
Natural gas price at Henry Hub (current) (dollars per MMBtu)	**$4.90**	**$4.80**
Previous forecast	$5.43	---
Percentage change	-9.8%	---
Gasoline retail prices (current) (dollars per gallon)	**$3.32**	**$3.09**
Previous forecast	$3.51	---
Percentage change	-5.5%	---
U.S. distillate fuel inventories (current) (million barrels)	**127.0**	**125.2**
Previous forecast	123.9	---
Percentage change	2.5%	---
Diesel fuel prices (current) (dollars per gallon)	**$4.22**	**$3.69**
Previous forecast	$4.48	---
Percentage change	-5.7%	---

Data source: U.S. Energy Information Administration, *Short-Term Energy Outlook,* January 2023



Global oil markets

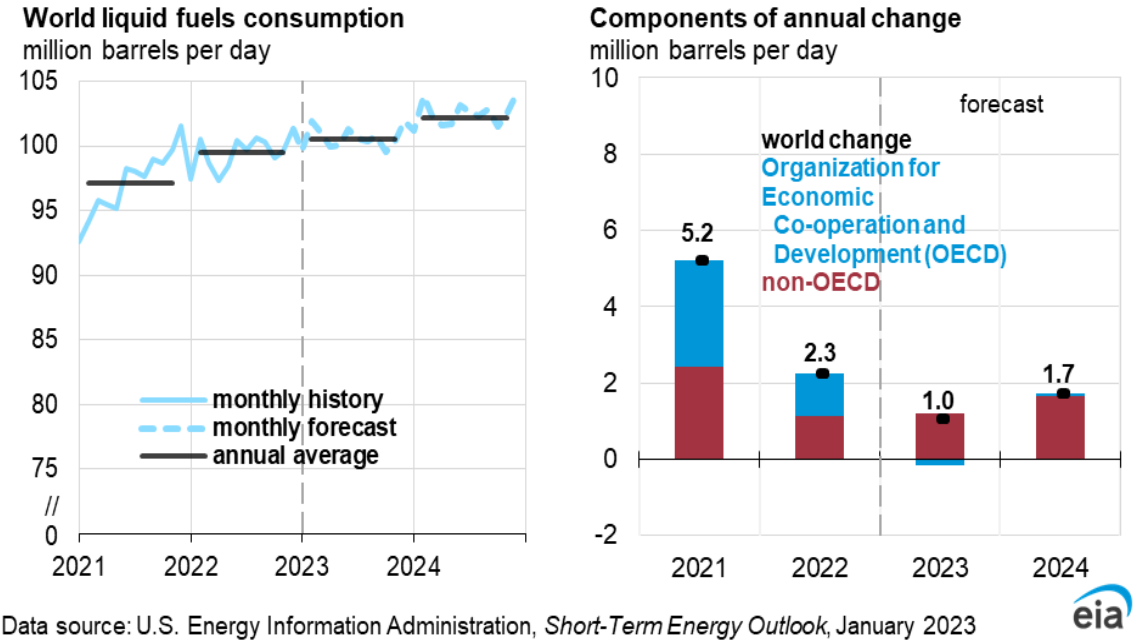
Crude oil prices: We forecast that Brent crude oil prices will average $83 per barrel (b) in 2023 and $78/b in 2024. Our inaugural edition of *STEO Between the Lines* provides an in-depth summary of our Brent crude oil price assumptions and major risks to our forecast. *Between the Lines* is a new product that will periodically accompany STEO to provide in-depth analysis of issues in our forecast.

Global liquid fuels production: We forecast that world production of petroleum and other liquid fuels will increase by 1.1 million barrels per day (b/d) in 2023 and 1.7 million b/d in 2024. This increase reflects large growth in several non-OPEC countries and in OPEC output that more than offset 1.5 million b/d of declines in Russia's production over the forecast period.

We forecast that the United States and other non-OPEC producers outside of Russia will add 2.4 million b/d of oil production in 2023 and an additional 1.1 million b/d in 2024. The largest source of non-OPEC production growth over the forecast period is the United States, which contributes 40% of growth in 2023 and 60% of growth in 2024. U.S. growth is driven by increases in crude oil production in the Lower 48 states—mostly in the Permian region—as well as a combination of increases to production of hydrocarbon gas liquids and biofuels, which together account for about 40% of U.S. liquid fuels production growth in 2023 and 2024.

Outside of the United States, other major sources of growth in non-OPEC liquid fuels production come from Canada, Brazil, Guyana, and Norway. We expect that increases in Canada's production will be driven by projects to improve distribution bottlenecks, including the start-up of the TransMountain pipeline expansion project. Brazil's increases are driven by new floating production, storage, and offloading (FPSO) deepwater rigs.

A noteworthy new source of world oil supply is Guyana, which first began producing oil in 2019 after the discovery of the new offshore deepwater Liza oil field. Critical investment and new production vessels helped Guyana's oil production increase to an average of 260,000 b/d in 2022. We expect further ramp-ups in output and the development of new oil resources over the next two years, helping oil production in Guyana increase to an average of 540,000 b/d by 4Q24.



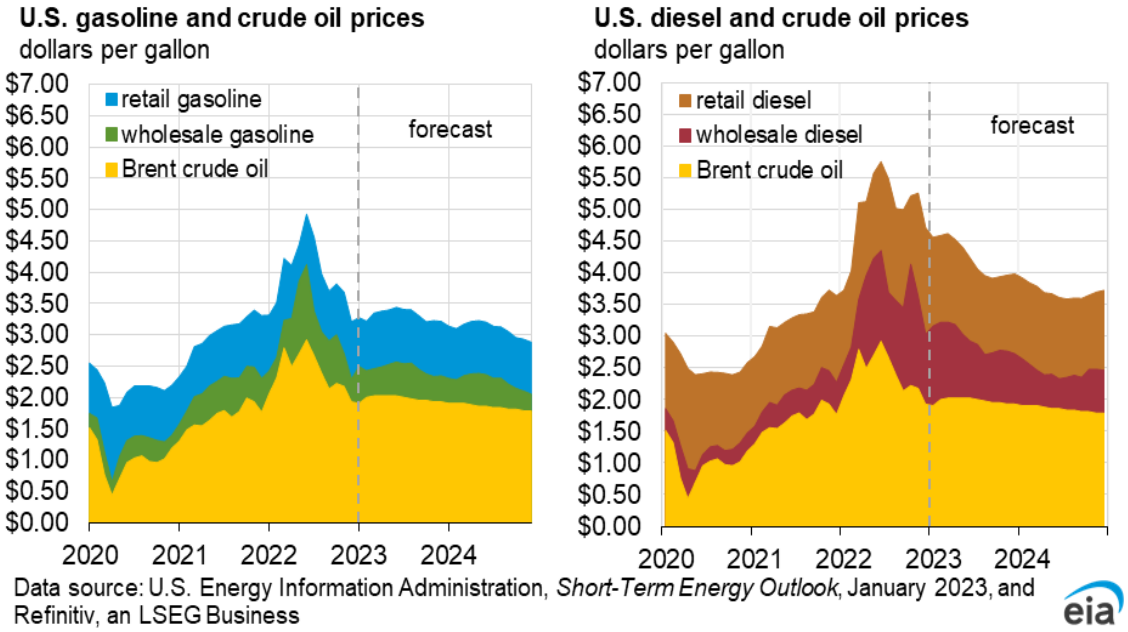
Growth in Norway's oil output in 2023 stems from the recent start-up of the offshore Johan Sverdrup Phase 2 expansion project, which will result in Norway's liquid fuels production rising by more than 500,000 b/d over the forecast to reach almost 2.5 million b/d in 2024.

We expect that these sources of growth in non-OPEC liquid fuels supply will offset declines in Russia's oil production. We forecast that Russia's petroleum and other liquid fuels production will decline to 9.5 million b/d in 2023, from 10.9 million b/d in 2022, and then average 9.4 million b/d in 2024. The extent to which European Union sanctions, other sanctions, and the G7 price cap will affect Russia's crude oil and petroleum product exports and production remains uncertain.

We expect that most crude oil exports from Russia will continue to find buyers. But we expect the sanctions on petroleum products will cause greater disruptions to Russia's oil production and exports because finding alternative buyers as well as transportation and other services to reach those buyers is likely to be more challenging than for crude oil.

OPEC crude oil production in our forecast averages 29.5 million b/d in 2024, up 0.8 million b/d from 2022. Part of this growth is driven by Venezuela. Following the U.S. Department of the Treasury issuing General License (GL) 41 at the end of November, Chevron is resuming oil production in Venezuela for export to the United States. Our OPEC production forecast is subject to considerable uncertainty, driven by a combination of possible outcomes for country compliance to existing OPEC+ production targets and changes to existing OPEC+ targets, as well as ongoing developments in Iran, Libya, and Venezuela.

Global liquid fuels consumption: Forecast global consumption of liquid fuels reaches 102.2 million b/d in 2024, driven primarily by growth in non-OECD countries, such as India and China. Trends in oil consumption largely reflect trends in economic activity. We forecast growth in global demand for oil will slow in 2023 before picking up in 2024, as global GDP growth (based on forecasts from Oxford Economics) rises from 1.8% in 2023 to 3.3% in 2024. Although we forecast global oil consumption to increase, our demand forecast remains uncertain as a result of ongoing concerns around global economic conditions and the impact of the easing COVID-19 restrictions and rising case counts in China.

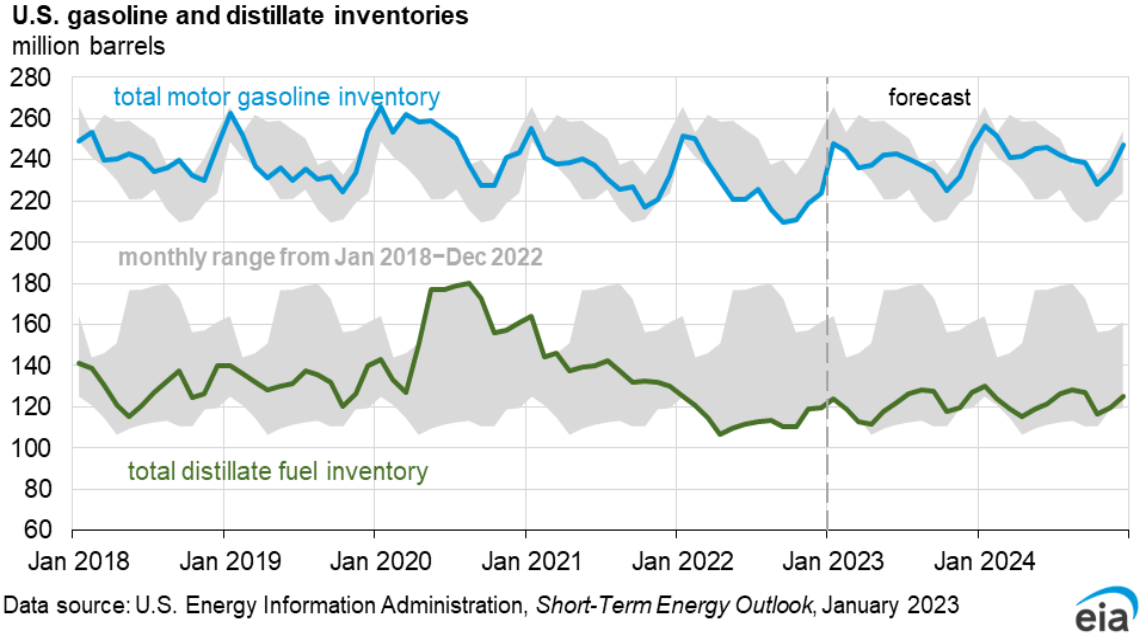


Data source: U.S. Energy Information Administration, *Short-Term Energy Outlook*, January 2023

Petroleum products

Gasoline and diesel prices: Gasoline and diesel prices in our forecast generally decline as wholesale refining margins and crude oil prices fall. In December 2022, the U.S. retail price for regular-grade gasoline averaged $3.21 per gallon (gal), and the retail diesel price averaged $4.71/gal. Both December prices were the lowest since the beginning of Russia's full-scale invasion of Ukraine in February. In our forecast for 2023 and 2024, U.S. refinery runs and gasoline and diesel production are higher than in 2022, which along with increasing global refinery capacity, will contribute to narrowing U.S. refining margins in 2023 and 2024.

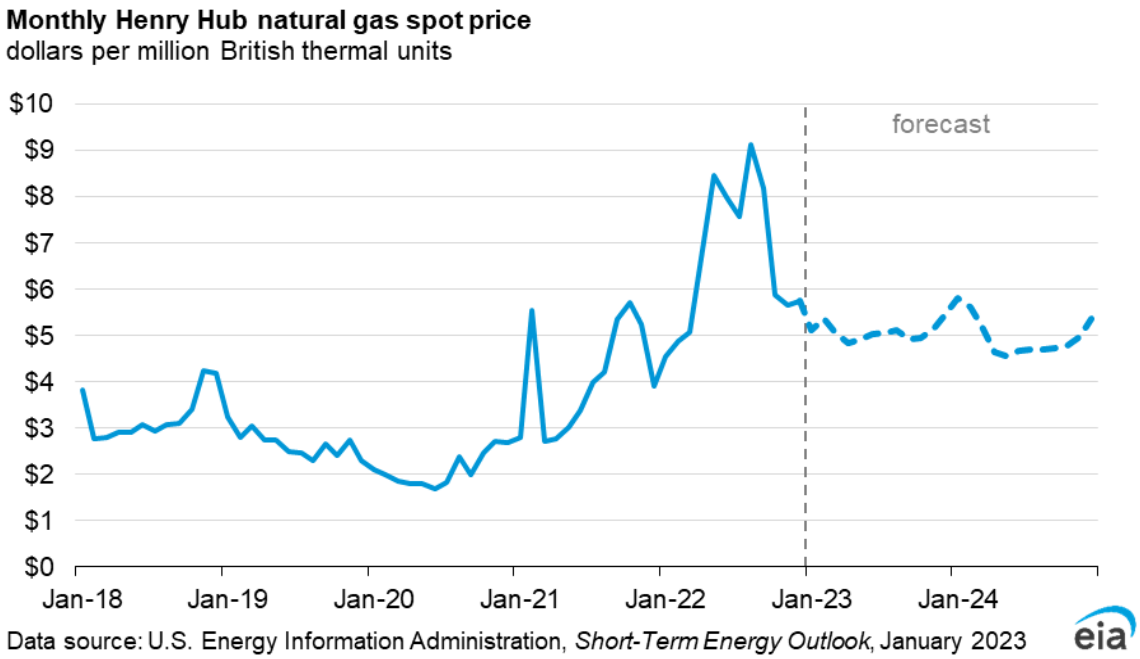
We forecast retail gasoline prices will remain close to current levels and average about $3.30/gal in 2023. In 2024, we forecast retail gasoline prices will average about $3.10/gal and fall below $3.00/gal by



the end of the year. We forecast retail diesel prices to average about $4.20/gal in 2023 and near $3.70/gal in 2024. Diesel prices will remain higher than gasoline prices as the market continues to adjust to disruptions largely related to responses to Russia's full-scale invasion of Ukraine. Russia had been a major supplier of diesel fuel to Europe, which is now importing more diesel from the Middle East and India.

Gasoline and distillate inventories: In 2022, both gasoline and distillate inventories in the United States were below their previous five-year (2017–2021) averages for the entire year because of reduced refinery capacity, less-than-average imports, and expanding exports. Higher refinery runs and less consumption contributed to distillate fuel inventories increasing during 4Q22 by more than the previous five-year average. We estimate that 5.1 million barrels per day (b/d) of distillate was produced in the United States during 4Q22, up 5% from a year earlier, as refiners increased production in response to high crack spreads—the difference between the price at which refiners sell fuel and the price of crude oil.

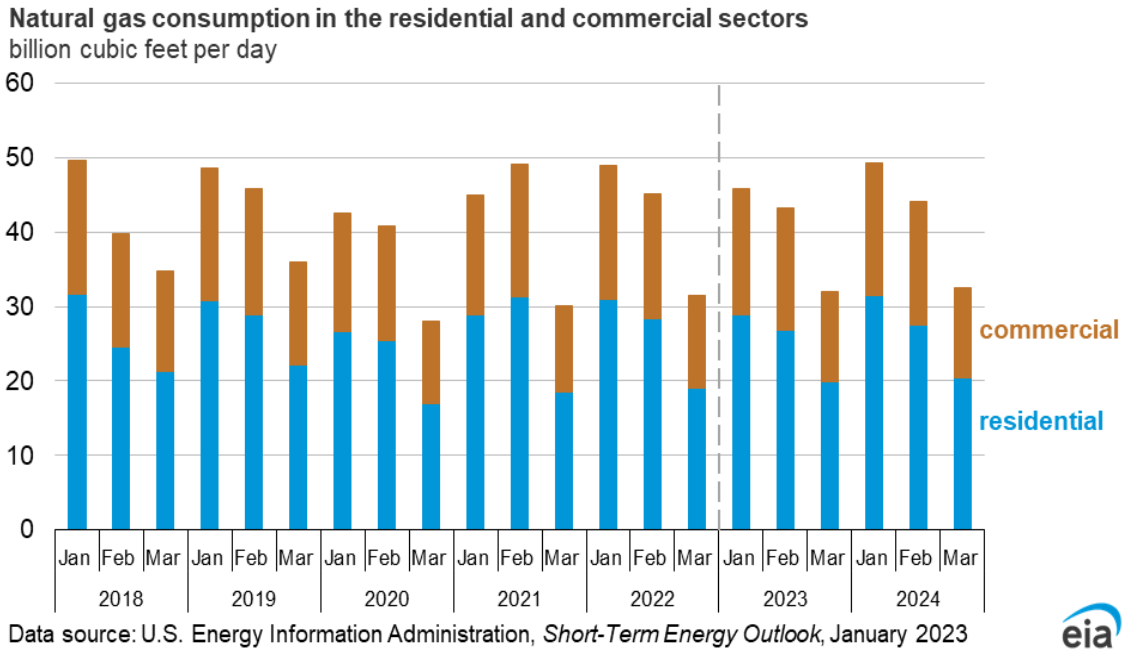
We expect U.S. distillate inventories will increase in 2023 due to increasing refinery runs as refiners capitalize on high distillate crack spreads. Refiners have a limited ability to shift their product yields, so we also expect gasoline production to increase in 2023 alongside distillate production. As a result, we forecast gasoline inventories will rise above their previous five-year average from May 2023 through the end of the year. Although net U.S. exports of gasoline will increase in 2023, we expect these volumes will come from increased gasoline production. We forecast almost no change in U.S. gasoline consumption over the next two years. Our expectation of relatively flat gasoline consumption stems from increases in vehicle miles traveled being offset by increases in the fuel efficiency of the vehicle fleet.



Declining freight activity and declining manufacturing activity in distillate-intensive industries led to decreased U.S. distillate consumption at the end of 2022. Our 4Q22 estimate for U.S. distillate consumption of 3.9 million b/d was the lowest for a fourth quarter since 2015. In our forecast, U.S. distillate consumption declines slightly in 2023. However, we expect distillate consumption will pick up in 2024 as the rate of economic growth increases.

Natural gas

Natural gas prices: We expect the Henry Hub natural gas spot price to average near $5.00 per million British thermal units (MMBtu) in 1Q23. The Henry Hub price began January below $4.00/MMBtu as a result of warmer-than-normal temperatures across much of the country. However, we expect that prices will rise back above $5.00/MMBtu in late-January and stay above that in February as temperatures in our forecast fall and liquefied natural gas (LNG) exports from Freeport LNG resume, increasing demand for natural gas.

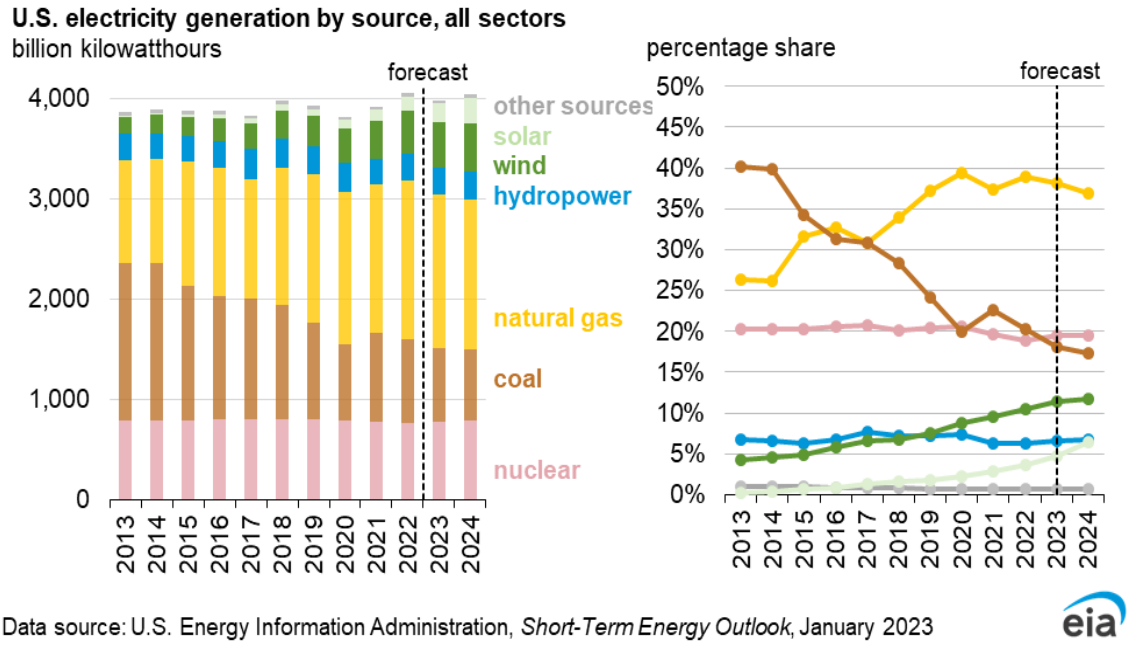


Extreme weather events can cause price spikes and volatility at both the Henry Hub and in regional markets. Spot prices reached more than $50.00/MMBtu in some western markets in December, and potential natural gas supply constraints in New England could cause large price increases if extreme cold weather hits the region. Based on the most recent press release from Freeport LNG, we expect the facility to resume partial operations in January, which will increase U.S. LNG exports and put upward pressure on prices. However, any additional delays to the restart of Freeport, which was originally scheduled to restart partial operations in November, will contribute to downward pressure on prices in the near term.

Once heating demand subsides this winter, we expect prices to average near $5.00/MMBtu for the last three quarters of 2023. Increases in U.S. natural gas production, relatively flat LNG exports, and declining domestic consumption in the electric power and industrial sectors will limit upward pressure on prices in 2023.

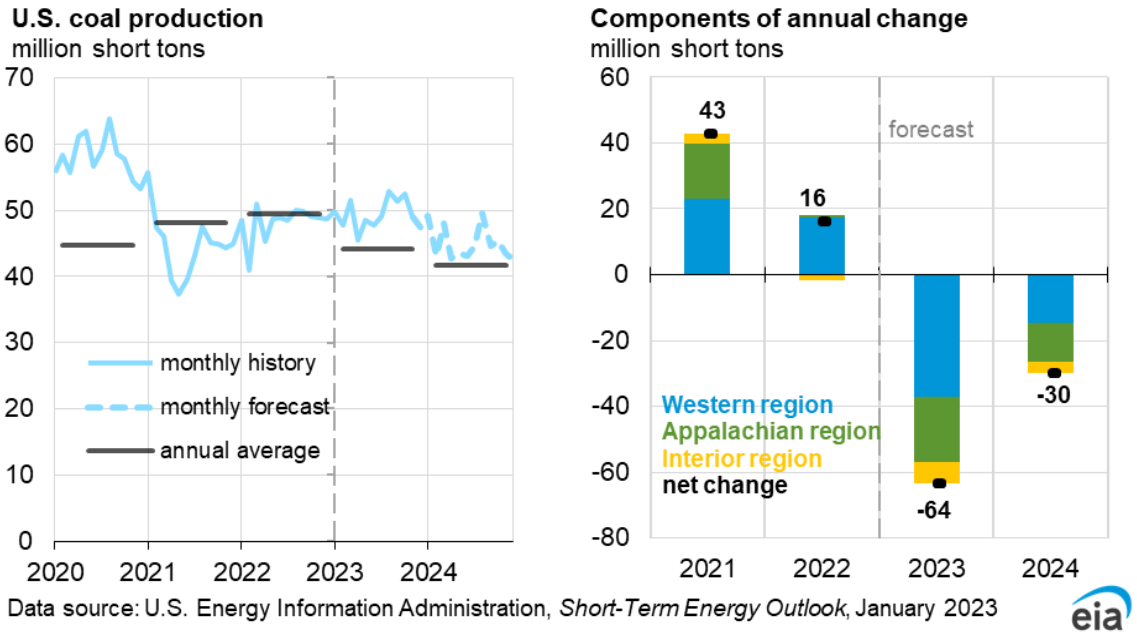
Despite our expectation that new LNG export facilities and expansion projects will come online in 2024 we expect natural gas prices to be relatively flat—with the possibility of lower prices—due to continued increases in U.S. natural gas production. We expect production in both the Permian region in West Texas and Southeast New Mexico and in the Haynesville region in Louisiana and East Texas to continue to grow with the completion of new pipeline infrastructure expansions in 2023 and 2024.

Natural gas consumption: During the winter months in the United States, the residential and commercial sectors are large drivers of natural gas consumption because natural gas is used for space heating in homes and commercial buildings and demand for heating rises as the weather gets colder. We expect natural gas consumption in the U.S. residential and commercial sectors to average about 46 billion cubic feet per day (Bcf/d) in January, which is slightly less than the five-year (2018–2022) average. Less-than-average January consumption reflects a relatively mild start to the month across much of the country that reduced space heating demand for natural gas. We expect U.S. residential and commercial natural gas consumption to average 43 Bcf/d in February, which is also less than the five-year average, as forecasts from the National Oceanic and Atmospheric Administration indicate above normal temperatures for February in the eastern part of the United States. Residential and commercial natural gas consumption can be highly variable in winter months due to extreme weather events, such as in February 2021 when extreme cold weather across much of the United States led to increased residential and commercial natural gas consumption.



Electricity, coal, and renewables

Electricity consumption: We forecast that total consumption of electricity in the United States will remain fairly stable, falling by 1% in 2023 and then growing by just over 1% in 2024. We estimate that electricity consumption grew by 3% in 2022.

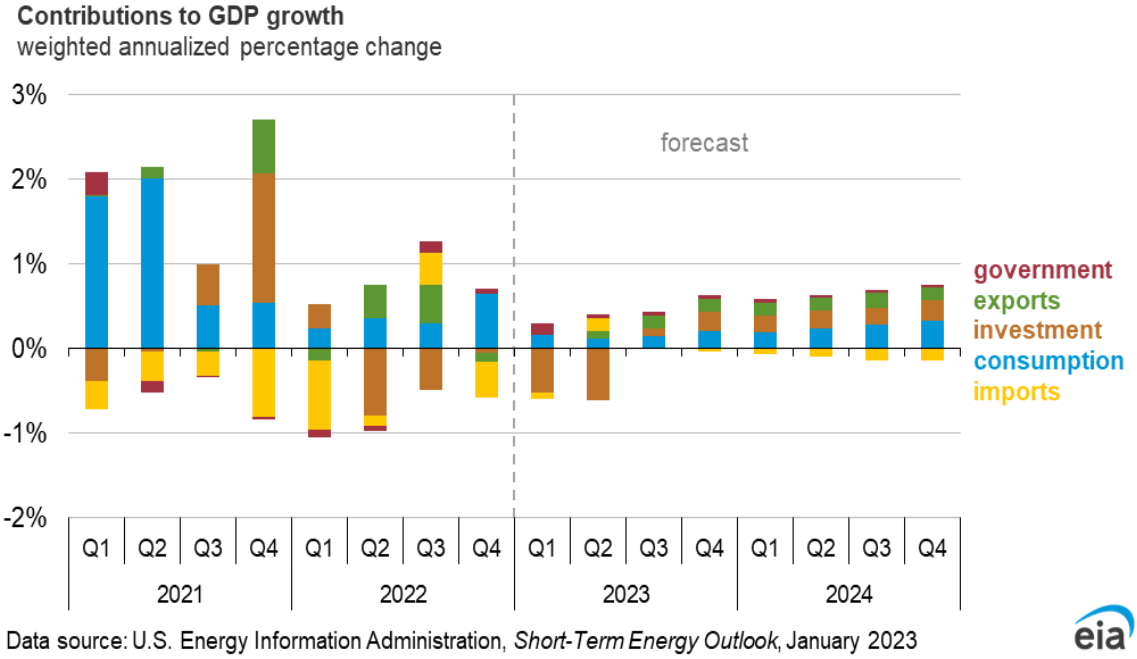


Most of our expected change in U.S. electricity demand occurs in the residential sector, where we expect retail sales will fall as a result of a milder summer in 2023 compared with 2022 with about 10% fewer cooling degree days. Residential electricity sales grow in 2024 because we expect 5% more heating degree days in 1Q24 compared with 1Q23. The forecast also reflects trends in the housing stock. Our forecast assumes the U.S. housing starts resume growing in 2024 after a sharp decline in growth in 2023.

Electricity generation: U.S. generation in our forecast largely follows consumption, declining in 2023 then rising in 2024. Generation from renewable sources is the main contributor of growth in U.S. electricity generation. The forecast share of U.S. renewables generation rises from 21% in 2022 to 24% in 2023 and to 26% in 2024. About two-thirds of this forecast increase in renewables generation comes from new utility-scale solar photovoltaic capacity, and most of the rest is from new wind projects. We expect the share of electricity generation supplied by natural gas to decrease from 39% in 2022 to 38% in 2023 and 37% 2024 while the share of electricity generated by coal will fall from 20% in 2022 to 18% in 2023 and 17% in 2024. The share of nuclear power generation remains close to 19% over the next two years.

Power generators plan to add 32 gigawatts (GW) of utility-scale solar photovoltaic (PV) in 2023 and another estimated 32 GW in 2024. We forecast that small-scale solar capacity will grow by 9 GW in 2023 and by 12 GW in 2024. Wind capacity increases by 6 GW in both 2023 and 2024. Battery storage additions to capacity in our forecast are 10 GW in 2023 and 9 GW in 2024.

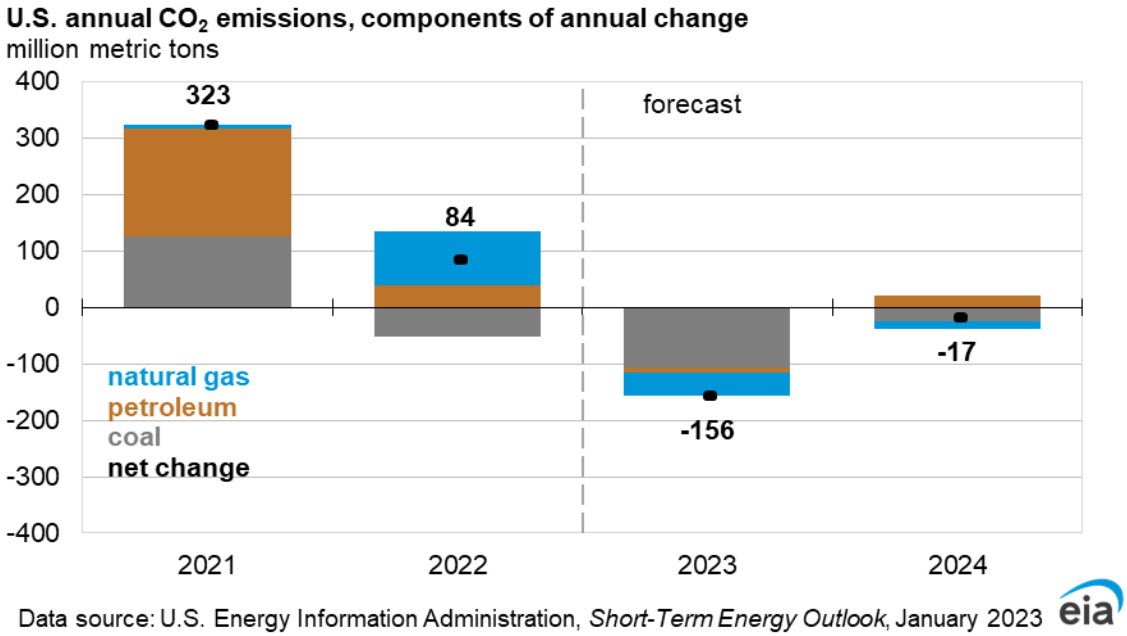
Coal Markets: After increasing in both 2021 and 2022, we expect U.S. coal production to decline by 11% to about 530 million short tons (MMst) in 2023, and a further 6% to 500 MMst in 2024. The primary reason for the decrease is our forecast of an 11% reduction in coal consumption in the electric power sector in 2023 followed by a 3% reduction in 2024. That decline largely reflects almost 10 GW of coal-fired capacity retirements in 2023 and another 4 GW in 2024. At the same time, renewable generation increases by 20% between 2022 and 2024, reducing coal-fired generation.



Economy, weather, and CO_2

U.S. macroeconomics: We incorporate STEO energy price forecasts into our S&P Global macroeconomic model to obtain the final U.S. macroeconomic outlook for our forecast,

S&P Global is forecasting a mild recession, starting in 1Q23. As a result, we forecast GDP to grow by 0.5% in 2023, with the economy recovering from the recession and returning to positive GDP growth in 3Q23. In 1Q23, real GDP contracts at an annual rate of 0.7%, mostly due to a decline in residential fixed investment and private business inventories of goods. We expect the recovery to be led by net exports and personal consumption expenditures in 2Q23, with the entire economy returning to growth later in the year.



We expect personal consumption expenditures to grow through 2024, despite an increase in consumer savings from historically low levels. Throughout 2023, we expect the labor market to weaken, with the unemployment rate reaching a peak of 5.2% in 4Q23.

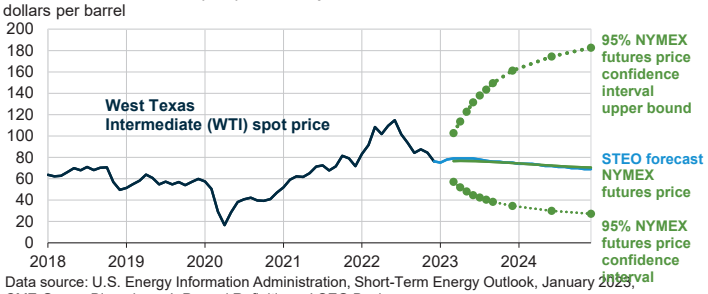
Emissions: We forecast total energy-related carbon dioxide (CO_2) emissions to decrease in the United States by more than 3% in 2023. Relatively flat economic growth and an increase in electricity generation from renewable sources decreases fossil fuel consumption, and therefore emissions. Among the major fossil fuel categories, CO_2 emissions from coal decline the most in the United States at around 11%, mostly from decreasing coal-fired electricity generation. More renewable generation contributes to decreases in natural gas-fired electricity generation, which in turn decreases CO_2 emissions from natural gas by 2%. We expect petroleum emissions to remain about the same.

U.S. energy-related CO_2 emissions in 2024 remain unchanged from 2023 in our forecast because increasing emissions from petroleum products offsets decreasing emissions from natural gas. Petroleum CO_2 emissions increase slightly as a result of increases in air and road travel, as well as increasing

hydrocarbon gas liquid consumption, particularly propane. More consumption of propane arises from increased industrial activity, as propane is used as a petrochemical feedstock.

Data source: U.S. Energy Information Administration, *Short-Term Energy Outlook*, January 2023

Weather: In December, the United States experienced 27% more population-weighted heating degree days (HDDs) than last year and 9% more than the 10-year average. Based on forecasts from the National Oceanic and Atmospheric Administration, we expect 1Q23 to be milder than last winter, with 5% fewer HDDs in the United States compared with 1Q22 and 4% fewer than the 10-year average. We have updated our expectations for winter heating fuel expenditures based on the most recent temperature and price forecasts.



The U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy (DOE), prepared this report. By law, our data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The views in this report do not represent those of DOE or any other federal agencies.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on January 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on January 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on January 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on January 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on January 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

Notes: EIA completed modeling and analysis for this report on January 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on January 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on January 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on January 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on January 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on January 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 7c. U.S. Regional Electricity Prices to Ultimate Customers (Cents per Kilowatthour)

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on January 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on January 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on January 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Table 8a. U.S. Renewable Energy Consumption (Quadrillion Btu)

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distrib

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Subtotals for the industrial and commercial sectors might not equal the sum of the components. The subtotal for the industrial sector includes ethanol consumption that is not shown separately. The subtotal for the commercial sector includes ethanol and hydroelectric consumption that are not shown separately.

(f) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(g) Fuel ethanol and biodiesel, renewable diesel, and other biofuels consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on January 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum Supply*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on January 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.
Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

- = no data available

SAAR = Seasonally-adjusted annual rate

Notes: EIA completed modeling and analysis for this report on January 5, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.

Short-Term Energy Outlook

Overview

U.S. energy market indicators	2022	2023	2024
Brent crude oil spot price (dollars per barrel)	**$101**	**$84**	**$78**
Retail gasoline price (dollars per gallon)	**$3.97**	**$3.39**	**$3.10**
U.S. crude oil production (million barrels per day)	**11.90**	**12.49**	**12.65**
Natural gas price at Henry Hub (dollars per million British thermal units)	**$6.42**	**$3.40**	**$4.04**
U.S. liquefied natural gas gross exports (billion cubic feet per day)	**10.6**	**11.8**	**12.6**
Shares of U.S. electricity generation			
Natural gas	39%	39%	37%
Coal	20%	17%	17%
Renewables	22%	24%	26%
Nuclear	19%	20%	19%
U.S. GDP (percentage change)	**2.0%**	**0.8%**	**2.1%**
U.S. CO_2 emissions (billion metric tons)	**4.97**	**4.78**	**4.79**

Data source: U.S. Energy Information Administration, *Short-Term Energy Outlook,* February 2023

- **Natural gas prices.** We forecast that the Henry Hub natural gas spot price will average $3.40 per million British thermal units (MMBtu) in 2023, down almost 50% from last year and about 30% from our January *Short-Term Energy Outlook* (STEO) forecast. We revised our outlook for Henry Hub prices as a result of significantly warmer-than-normal weather in January that led to less-than-normal consumption of natural gas for space heating and pushed inventories above the five-year average.

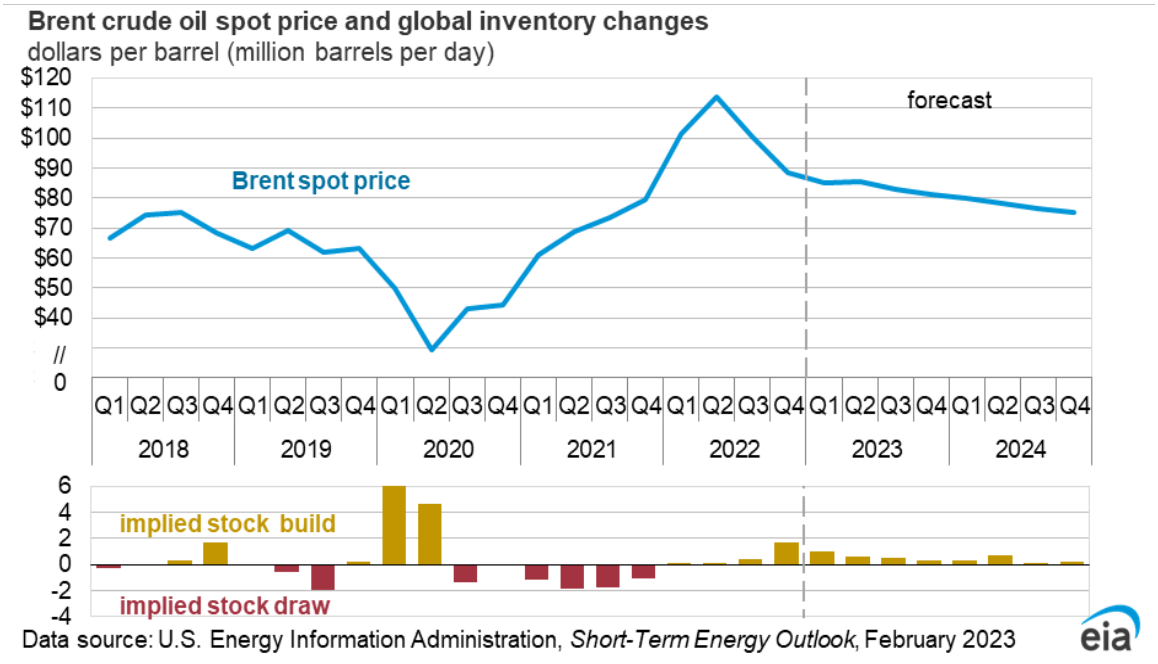
- **Natural gas storage.** As a result of less-than-normal natural gas consumption in January, natural gas inventories ended the month above their five-year (2018–2022) average. We now expect inventories will close the withdrawal season at the end of March at more than 1.8 trillion cubic feet, 16% more than the five-year average.

- **Global liquid fuels consumption.** We expect global liquid fuels consumption to increase by 1.1 million barrels per day (b/d) in 2023 and by 1.8 million b/d in 2024, driven primarily by growth in China and other non-OECD countries. The outcomes of our demand forecast remain uncertain as China shifts away from its zero-COVID-19 policy and global economic conditions evolve.

- **Global liquid fuels production.** We expect oil production in Russia to average 9.9 million b/d in 2023, down 1.1 million b/d from 2022. Our forecast for Russia's 2023 production is 0.4 million b/d more than in the January STEO because crude oil liftings data suggest that Russia's exports have remained higher than we expected following the EU's ban on seaborne imports of crude oil from Russia that began on December 5. However, we still forecast Russia's oil production to fall

in the coming months, as we expect the EU's ban on seaborne petroleum products from Russia that began February 5 will cause refineries in Russia to reduce crude oil inputs, which will disrupt crude oil production.

- **Electricity generation.** Electricity generation in our forecast falls by 2% in 2023 and then rises by 2% 2024. The generation mix continues to shift away from coal. The share of U.S. electricity generated from coal falls from 20% in 2022 to 17% in 2024. As the share of coal declines, it will be offset by increases in the share of generation from renewable sources of energy, which rises from 22% in 2022 to 26% in 2024.



- **U.S. GDP growth.** Based on the S&P Global macroeconomic model, we assume U.S. real GDP will contract slightly in the first half of 2023 (1H23), partly resulting from a decline in residential fixed investment. GDP growth picks up in 2H23 and reaches an annual average of 2.1% in 2024.

Notable forecast changes

Current forecast: February 7, 2023; previous forecast: January 10, 2022	**2023**	**2024**
Natural gas price at Henry Hub (current) (dollars per million British thermal units)	**$3.40**	**$4.04**
Previous forecast	$4.90	$4.80
Percentage change	-30.5%	-15.8%
U.S. coal exports (current) (million short tons)	**88.1**	**96.0**
Previous forecast	83.3	92.6
Percentage change	5.7%	3.7%
Jet fuel margin (current) (dollars per gallon)	**$1.02**	**$0.49**
Previous forecast	$0.86	$0.49
Percentage change	18.7%	0.6%
U.S. crude oil production (current) (million barrels)	**12.5**	**12.6**
Previous forecast	12.4	12.8
Percentage change	0.6%	-1.2%
Russia petroleum and liquid fuels production (current) (million barrels per day)	**9.9**	**9.8**
Previous forecast	9.5	9.4
Percentage change	3.9%	3.8%
China petroleum and liquid fuels consumption (current) (million barrels per day)	**15.8**	**16.2**
Previous forecast	15.7	16.1
Percentage change	1.0%	1.0%
U.S. heating degree days (current)	**4,083**	**4,201**
Previous forecast	4,158	4,265
Percentage change	-1.8%	-1.5%

Data source: U.S. Energy Information Administration, *Short-Term Energy Outlook,* February 2023

Global oil markets

Crude oil prices: The Brent crude oil spot price averaged $82 per barrel (b) in January, about $2/b higher than the average in December 2022. Oil prices rose during January in part because of the expectation of increasing oil demand as a result of relaxing COVID-19 restrictions and increasing mobility in China. Perceptions of a less severe recession and some improving macroeconomic conditions also likely contributed to rising crude oil prices over the past month.

Last month, we highlighted oil demand in China and oil production in Russia as two of the main uncertainties in the oil market this year, and we have revised our outlook for both in this month's forecast. The revisions result from China relaxing COVID restrictions, which have increased our forecast of oil demand growth. At the same time, more oil was produced in Russia than we anticipated during January, and we raised our forecast for Russia's oil production through the end of 2024. We have also lowered our forecast for oil production in OPEC because of rising global oil inventories. These changes have largely offset each other in our forecast global balances, and beyond the first quarter of 2023, we have left our crude oil price forecast largely unchanged from last month's outlook.

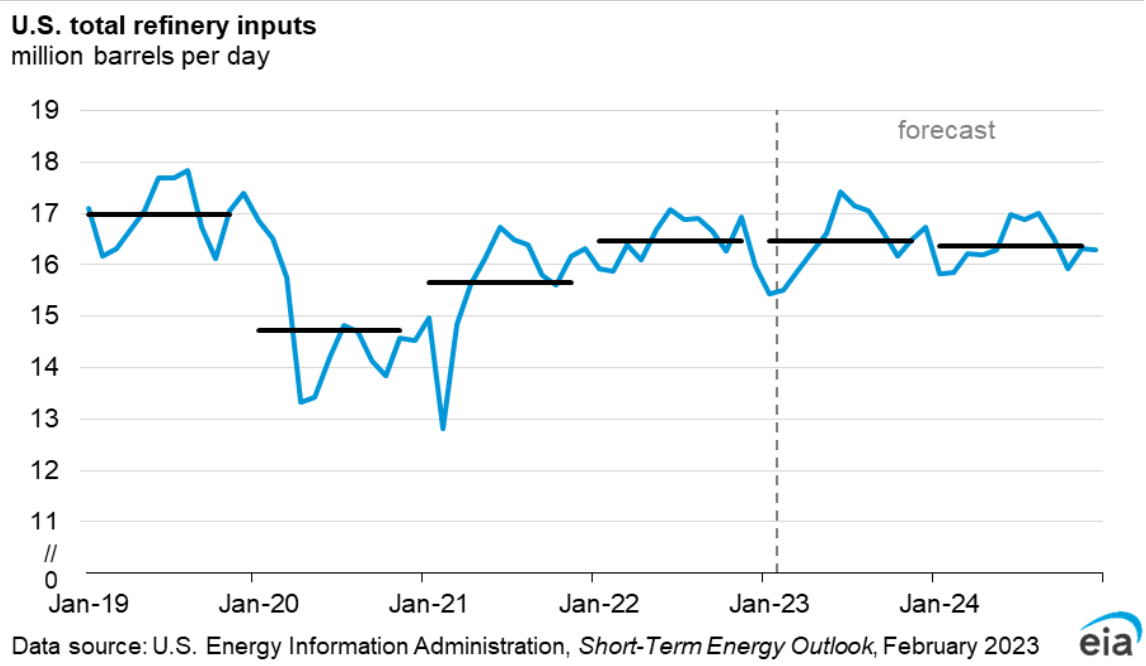
We expect that the Brent spot price will average $85/b in the first half of 2023 (1H23). However, we expect global oil production to continue to outpace demand over the forecast period, leading to persistent global oil inventory builds through 2024 and falling oil prices. After increasing by an average of 0.6 million b/d in 2022, we expect global oil inventories to also build by an average of 0.6 million b/d in 2023, with builds moderating to 0.4 million b/d in 2024. Correspondingly, our forecast spot price of Brent crude oil falls to an average of $82/b in 2H23 and $78/b in 2024.

Global oil demand: Global liquids fuel consumption in the forecast increases from an average of 99.4 million barrels per day (b/d) in 2022 to 102.3 million b/d in 2024, driven primarily by growth in China and other non-OECD countries. However, significant uncertainty around our demand forecast remains

based on possible outcomes for the evolving global economic conditions and China's pivot away from a zero-COVID strategy. We forecast that the reversal of restrictions will contribute to oil demand in China increasing by 0.7 million b/d in 2023 and by 0.4 million b/d in 2024. We expect OECD oil demand to remain largely flat over the forecast period, as inflationary economic pressures continue to limit GDP and oil demand growth and as the oil intensity of OECD economies declines.

Global oil supply: Global liquid fuels production averaged about 100.0 million b/d in 2022, and we forecast it will increase by an average of 1.1 million b/d in 2023 and 1.5 million b/d in 2024. Growth in non-OPEC production in both 2023 and 2024, as well as increases in OPEC output in 2024, will mostly offset an approximately 1.1 million b/d decline in Russia's production over the forecast period.

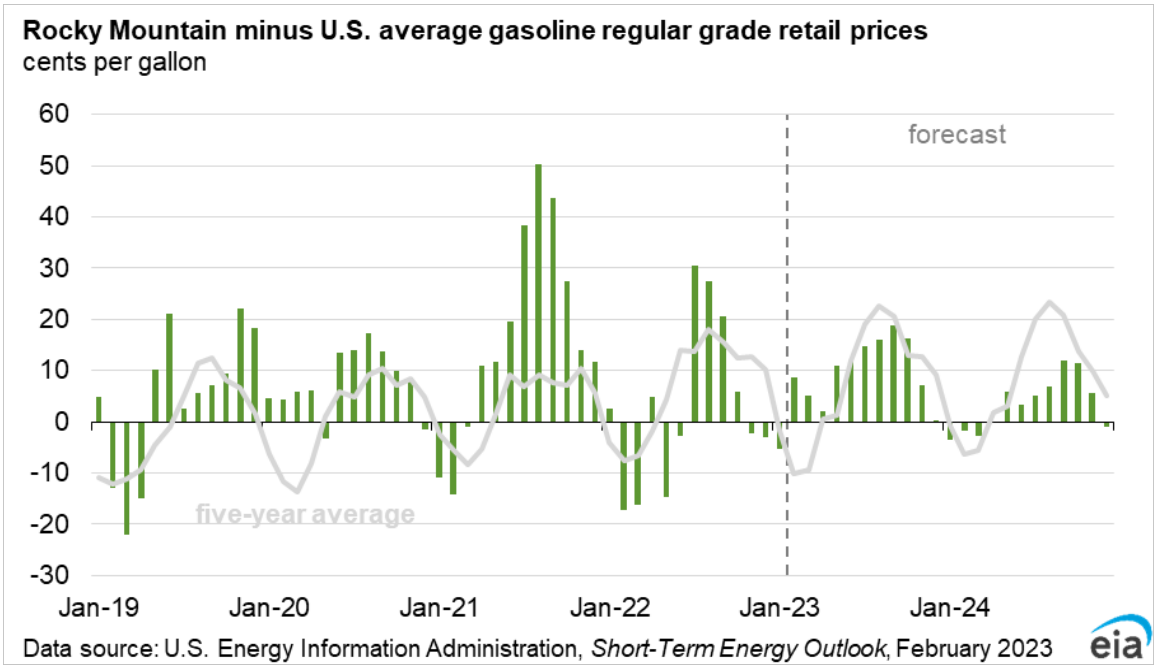
We forecast Russia's production of petroleum and other liquids to decline to 9.9 million b/d in 2023 from more than 10.9 million b/d in 2022 and then average 9.8 million b/d in 2024. For both 2023 and 2024, we forecast about 0.4 million b/d more production in Russia than in last month's STEO. We had previously forecast that the majority of Russia's crude oil exports subject to EU sanctions implemented on December 5 would find new markets, but that the sanctions would lead to some decline in production. However, we assess that Russia's crude oil exports rose in January after a brief decline in December and have since begun to surpass November totals, with little impact to Russia's crude oil production.



The EU ban on seaborne imports of petroleum products from Russia that began on February 5 could be more disruptive than the ban on crude oil imports implemented in December. We assume Russia will be able to reroute some of its petroleum exports subject to EU sanctions. But we do not expect all of its refined product exports will find new destinations because of limited clean tanker availability, which will cause refiners in Russia to reduce crude oil inputs and for Russia's crude oil production to decline.

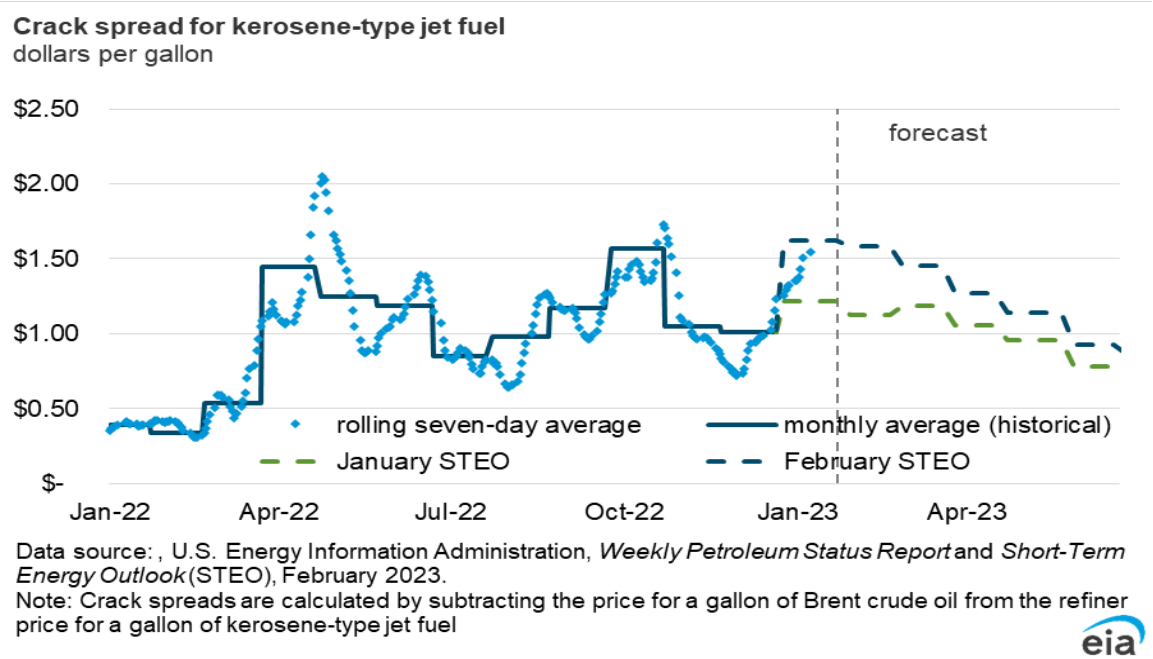
Petroleum products

U.S. refinery utilization: We forecast domestic refinery maintenance will contribute to reduced refinery utilization in the United States through April. Refinery utilization dropped because of severe cold weather that swept through the midcontinent in late December, contributing to partial unit shutdowns, reductions in run rates, and a few instances of unit damage. December refinery inputs fell below 16 million barrels per day (b/d), marking the largest month-over-month decline in two years when significant cold weather disrupted refinery operations in February 2021.



In 2022, many refiners postponed planned maintenance during the spring and fall as low product inventories and high refining margins encouraged refiners to maximize utilization. Although refining margins remain above normal levels, we expect more refiners will undergo deferred maintenance this season. We forecast U.S. distillation inputs will be less than 16 million b/d until April. Utilization remains below 90% until May, which we forecast will keep refining margins for gasoline and diesel above year-ago levels during February and March. However, we expect refinery inputs and utilization to increase after maintenance is completed, and 2023 inputs will likely be similar to 2022 inputs, leading to falling refining margins beginning in the second quarter of 2023. ExxonMobil's planned startup of a 250,000 b/d capacity expansion at its Beaumont refinery in the first half of this year will contribute to the

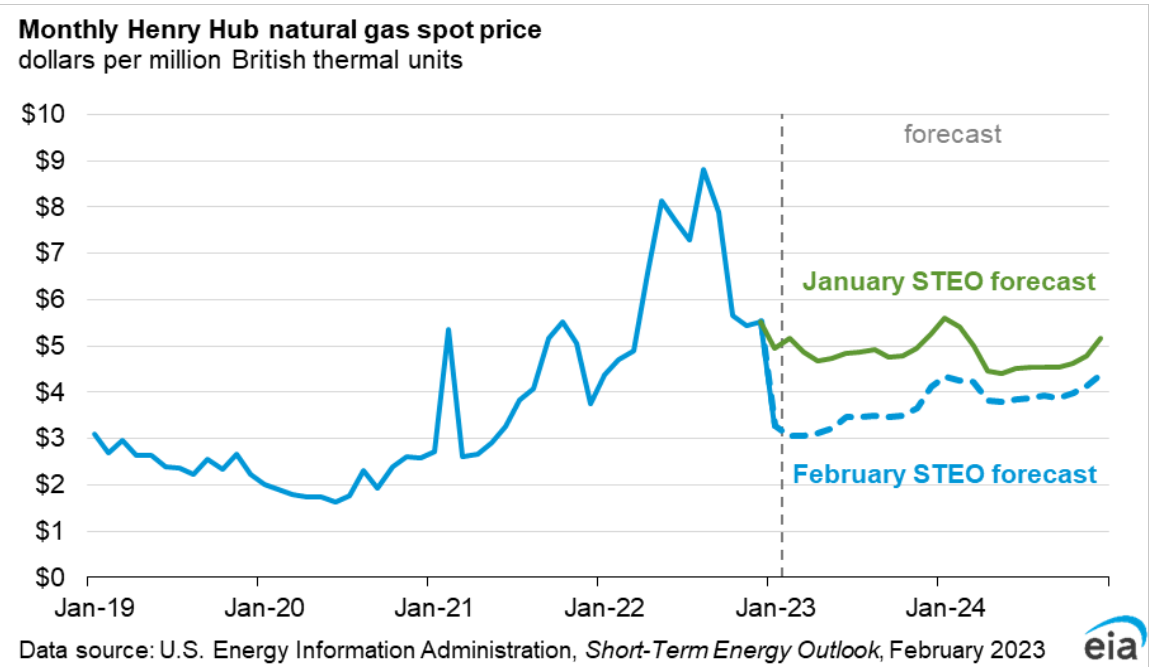
increase. We expect slightly less 2024 refinery inputs compared with 2023, partly due to the expected closure of LyondellBasell's Houston refinery at the end of 2023.



Rocky Mountain retail prices: On December 24, Suncor began repairing its 103,000 b/d Commerce City refinery in Colorado following unit damage related to cold weather. We expect this Colorado refinery will be unavailable until late in the first quarter. This outage will contribute to reduced refinery utilization and gasoline production in the Rocky Mountain region (PADD 4) through March, which we expect will lead to higher retail fuel prices.

We forecast retail gasoline prices in the Rocky Mountains will reach $3.58 per gallon (gal) in February, up from $3.18/gal in December. This increase is more than our forecast increase for the U.S. average retail gasoline price, which rises from $3.21/gal in December to $3.49/gal in February. Rocky Mountain retail fuel prices are normally lower than the U.S. average during the winter months; however, we estimate that they will be at a premium in February and March, compared with averaging a nearly 10 cent/gal discount over the past five years. Although Colorado is more connected to the Midwest and Gulf Coast regions than other parts of the Rocky Mountains, the potential for prolonged refinery outage at the Commerce City refinery could contribute to wider changes in regional retail prices.

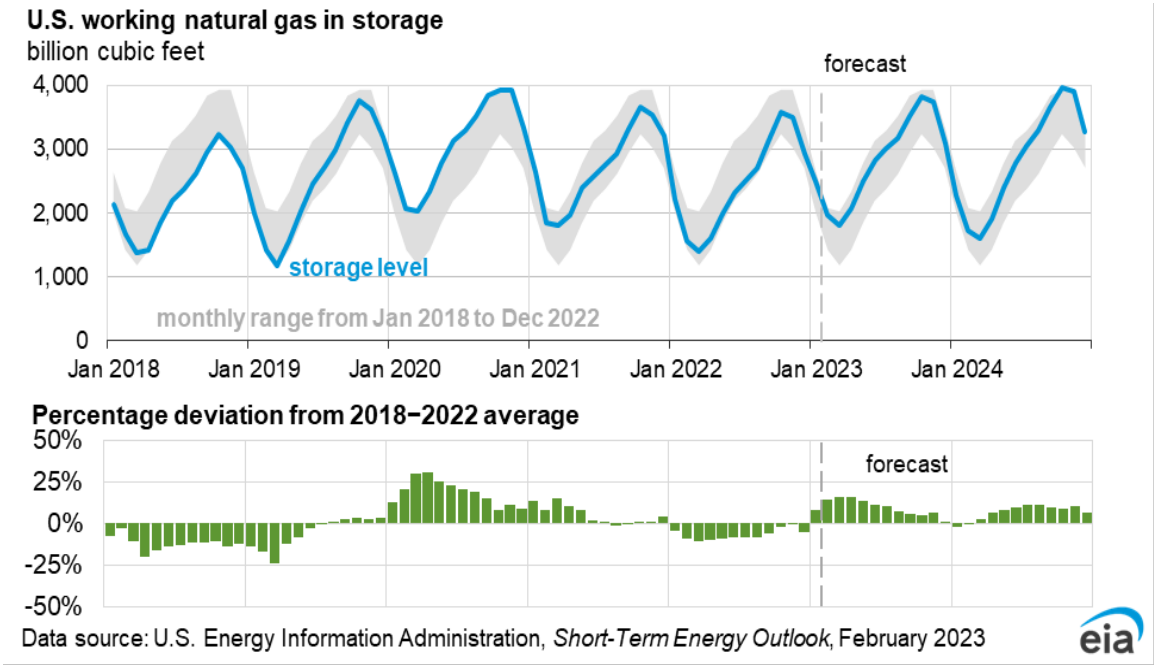
Jet fuel prices: The jet fuel crack spread increased significantly in January, leading us to revise our February STEO forecast compared with our January STEO. The increased jet fuel price is a response to low inventories, less refinery production related to recent weather, and increasing international demand. Jet fuel prices increased sharply at several times in 2022, moving in sync with similar increases in the price of distillate fuel. However, distillate fuel prices in January did not increase as much as jet fuel prices, probably because very mild weather limited demand for heating oil (a type of distillate fuel). As China lessens COVID restrictions, leading to increasing jet fuel demand, we expect jet fuel refining margins will be higher than we previously forecast in the coming months.



Natural gas

Natural gas prices: Temperatures across the United States in January were the mildest since 2006, which reduced consumption of natural gas for space heating and significantly changed our forecast for natural gas markets in the coming months. The Henry Hub spot price averaged $3.27 per million British thermal units (MMBtu) in January, down more than $2/MMBtu from December. In the United States, there were 16% fewer heating degree days (HDDs) in January than the 10-year average and 9% fewer than forecast in the January STEO. With less-than-expected consumption of natural gas, U.S. stocks of natural gas ended January above our previous forecast.

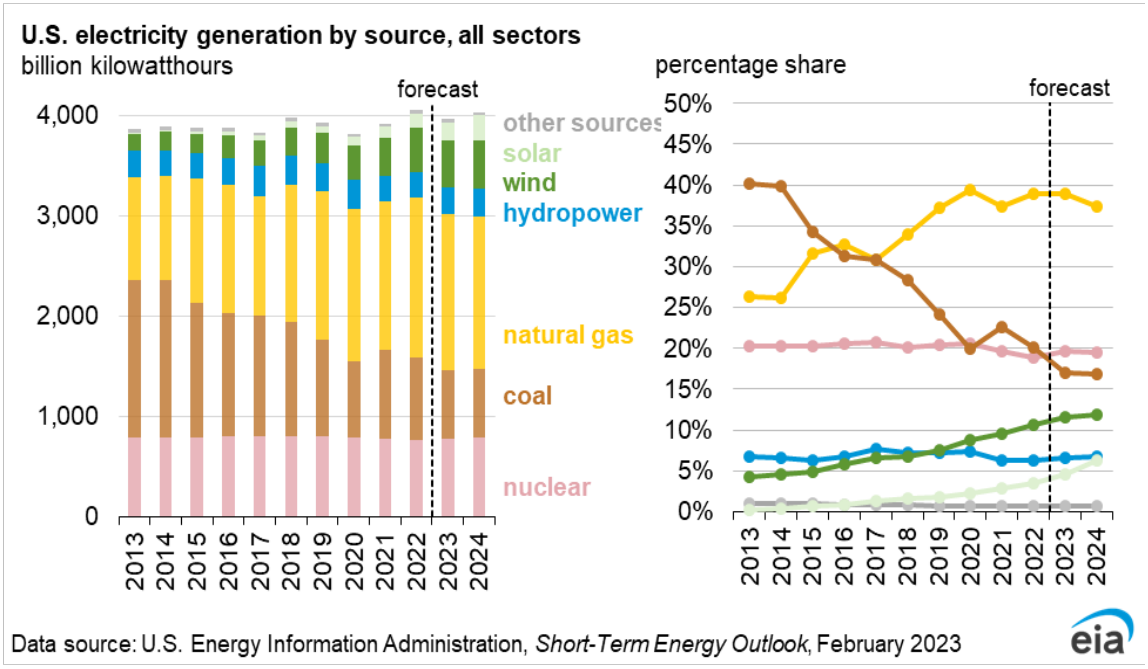
These developments in January contributed to significant changes in our outlook for the February STEO. We now forecast Henry Hub natural gas prices to average about $3.40/MMBtu for 2023 and to stay below $4.00/MMBtu until December. Our forecast in the January STEO was for Henry Hub prices to average almost $5.00/MMBtu in 2023.



Natural gas prices remain very volatile. Extreme weather events and production freeze-offs could still potentially cause price spikes at both the Henry Hub and in regional markets, but that potential diminishes as spring approaches, particularly now that inventories have moved back above the five-year (2018–2022) average. Although we expect close-to-normal weather for February and March, colder temperatures than expected could put upward pressure on prices. The Freeport LNG export facility, which went offline in June due to a fire, is expected to come back online in the first quarter of 2023 and will likely add over 2 billion cubic feet per day (Bcf/d) of natural gas demand to the U.S. market once fully operational.

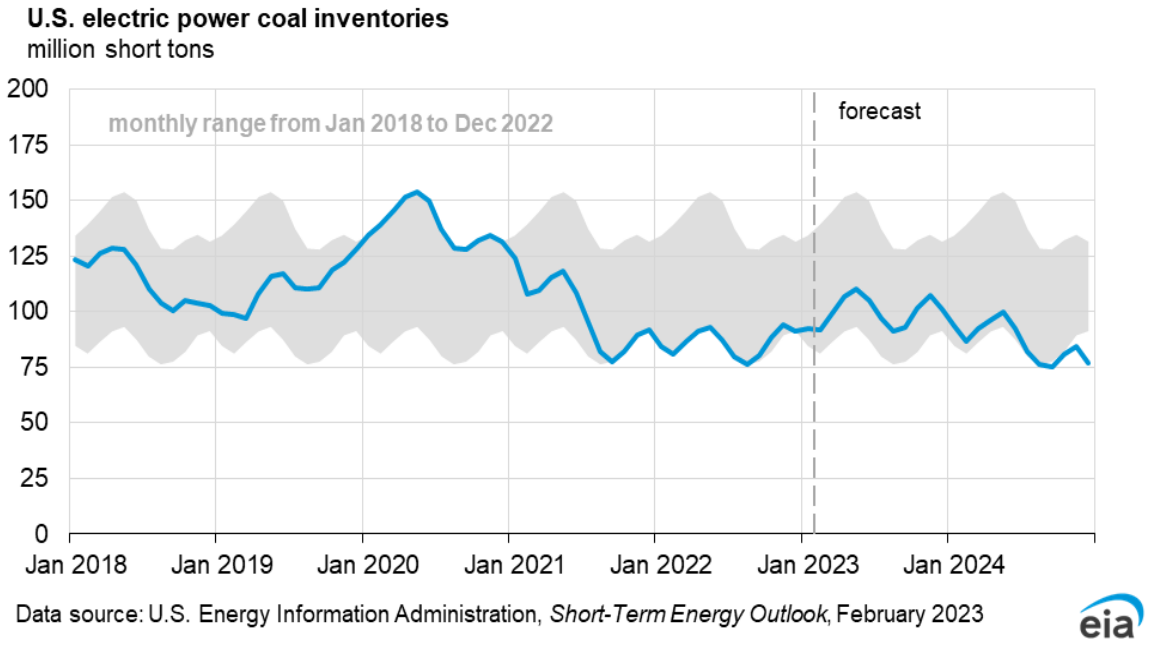
Natural gas markets: U.S. natural gas production growth has been outpacing demand growth the past several months, helping reduce natural gas prices. We estimate that dry natural gas production in the United States averaged 100.2 Bcf/d in January. We forecast dry natural gas production to continue to

hover around 100 Bcf/d for most of this year; overall, we expect dry natural gas production to average between 100 Bcf/d and 101 Bcf/d in 2023. U.S. consumption of natural gas was below average in January because very mild weather reduced demand for space heating. We expect less demand for natural gas than last year for most of 2023 due to decreased demand in the electric power sector as more renewable electric generation sources come online throughout the year and due to decreased demand in the industrial sector as a result of an expected drop in manufacturing activity. We expect utilization at U.S. liquefied natural gas (LNG) export facilities to be slightly lower in the next few months compared with our previous forecast because of high natural gas stock levels in Europe. But U.S. LNG exports in our forecast rise once the Freeport facility is back online, and LNG exports increase by 11% (1.2 Bcf/d) on an annual basis in 2023 compared with 2022.



Natural gas storage: We forecast that natural gas storage inventories will end the withdrawal season (November through March) at more than 1.8 trillion cubic feet (Tcf), which would be 16% above the five-year average and 19% more than we had forecast in the January STEO. The warmer-than-normal January temperatures reduced natural gas storage withdrawals below average, causing storage inventories to rise above the five-year (2018–2022) average at the end of January. We expect above-average storage inventories to reduce natural gas prices in 2023 from 2022, when end-of-March storage inventories were 1.4 Tcf, 17% below the previous five-year (2017–2021) average.

Electricity, coal, and renewables



Electricity generation: We expect U.S. electric power generation to decline by 2% in 2023 before rising by a similar amount in 2024. At the same time, the makeup of the power generation mix will slightly shift. In our forecast, electricity produced from renewable sources rises from 22% of total generation in 2022 to 24% in 2023 and to 26% in 2024. The gains in the share of renewable energy generation will be driven by about 63 gigawatts (GW) of utility-scale solar generating capacity that

developers have scheduled to enter service by the end of 2024 and about 13 GW of wind capacity that will come online during the same two years. We expect the new generating capacity from renewable sources to reduce output from fossil fuel-fired power plants. The combined share of U.S. generation provided by natural gas and coal in our forecast falls from 59% in 2022 to 54% in 2024. Coal generation declines the most; coal's share falls from 20% in 2022 to 17% in 2024. Natural gas-fired generation's share drops from 39% in 2022 to 37% in 2024.

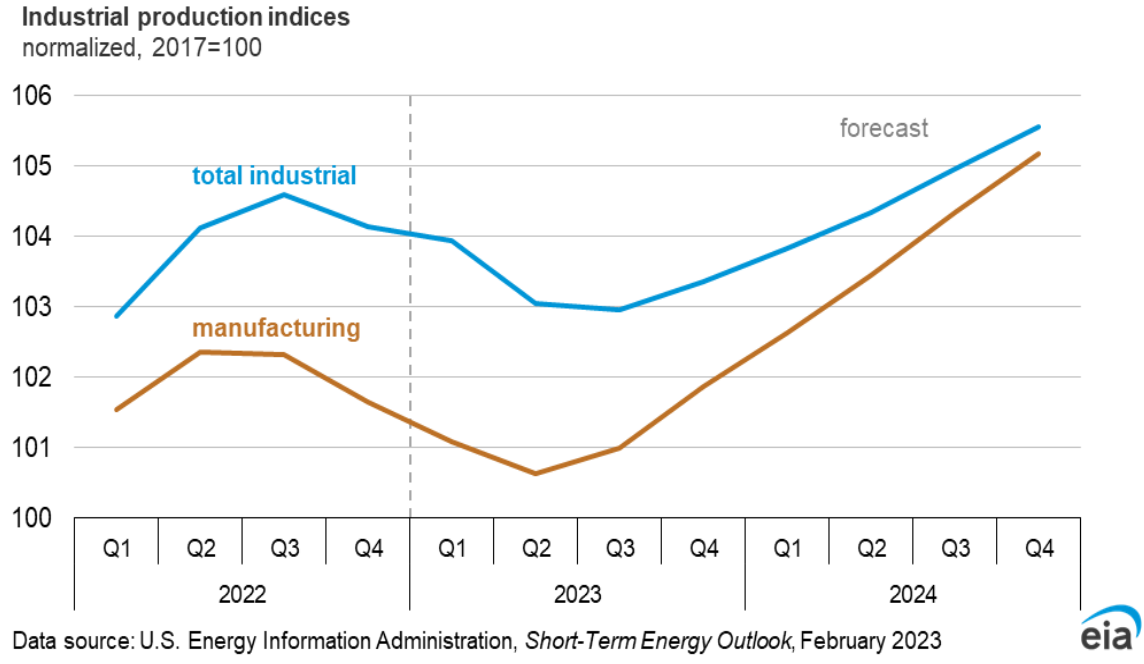
More volatility in fuel costs creates uncertainty around how natural gas and coal-fired generation will respond to increased renewable generating capacity. After lowering our February forecast for near-term natural gas prices, the forecast share of natural gas generation for 2023 is now 39%, up from a forecast 2023 share of 38% in the previous STEO. Upcoming renewable capacity additions will limit the variation in natural gas generation to changes in fuel cost.

Coal Markets: Coal stocks increased 4% in January 2023 with less coal-fired electricity generation after warmer-than-average temperatures reduced overall electricity generation and falling natural gas prices increased natural gas-fired electricity generation. At the same time, monthly coal production rose in late 2022.

We expect U.S. coal production to decline by 13% to 518 million short tons (MMst) in 2023, after increasing in both 2021 and 2022, with a further 5% decline to 494 MMst in 2024. Primarily, we forecast a 16% reduction in coal consumption by the electric power sector in 2023 followed by flat consumption in 2024. That decline largely reflects almost 9.6 GW of coal-fired capacity retirements in 2023, followed by another 2.8 GW closing in 2024. Two other factors will be the lower natural gas prices and 19% increase in renewable generation over those two years. Consequently, coal imports in our forecast decline by 47% from 2022 to less than 4 MMst in 2024.

Exports of steam coal in our forecast increase from 39 MMst in 2022 to 45 MMst in 2024, due largely to greater demand in Europe. Coal from the United States is helping supply Europe following the EU's ban of coal imports from Russia. U.S. coal exports also fulfill demand in Asia.

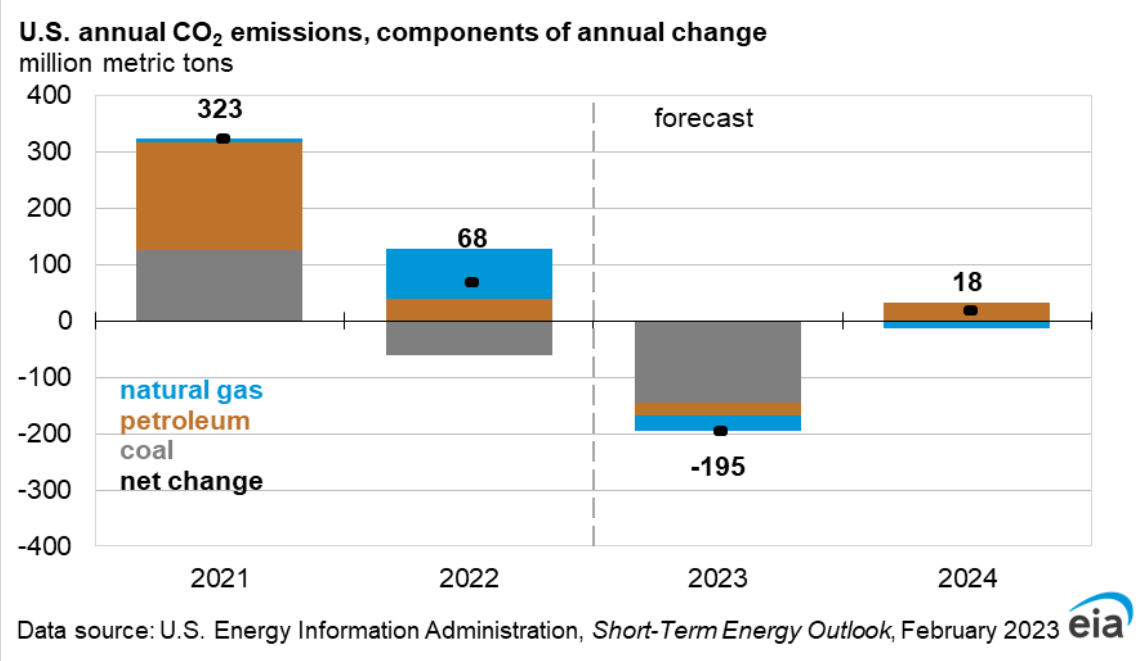
Economy, weather, and CO_2



U.S. macroeconomics: Our U.S. macroeconomic forecasts are based on S&P Global's macroeconomic model. We incorporate STEO energy price forecasts into the model to obtain the final macroeconomic assumptions.

S&P Global continues to forecast a mild recession starting in the first quarter of 2023 (1Q23) through 2Q23. Real U.S. GDP in the forecast contracts at an annualized rate of 1.3% in 1Q23 and 0.3% in 2Q23, mostly due to a decline in residential fixed investment, private business inventories of goods, and industrial production. However, we revised our forecast of 2023 real GDP upward by 0.3 percentage points from the January STEO and 2023 GDP growth now averages 0.8%.

U.S. manufacturing production contracted in November 2022. As a result, the 4Q22 estimate of the Manufacturing Production Index was revised lower by 1.0%. The slowing of manufacturing activity is



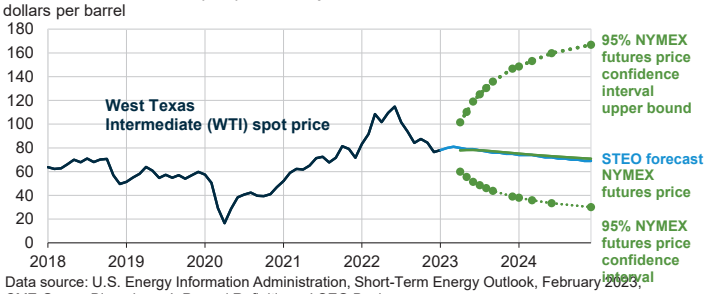
likely the result of a shift in consumer spending away from goods toward services and resulting in a reduction in diesel fuel consumption in our forecast.

S&P Global expects U.S. GDP to grow by 2.1% in 2024 as the economy shifts out of recession and returns to positive GDP growth beginning in 3Q23. In addition, GDP growth is expected to be led by net exports and personal consumption expenditures in 2Q23, with a more broad-based increase occurring later in the year.

Emissions: We expect U.S. energy-related carbon dioxide (CO_2) emissions to decrease slightly more than previously forecast, declining by almost 4% in 2023. The decrease is driven by slow economic growth and a continuing increase in electricity generation from renewable sources, which reduces fossil fuel-fired generation and associated CO_2 emissions. Among the major fossil fuel categories, CO_2 emissions from coal decline by around 15%, mostly from decreasing coal-fired electricity generation. We forecast natural gas emissions to decrease by around 1% as natural gas-fired electricity generation also decreases. Renewable sources displace generation from both fuels. We expect petroleum emissions to fall by 1% in 2023 compared with 2022.

We expect U.S. energy-related CO_2 emissions in 2024 to remain almost unchanged from 2023. Petroleum CO_2 emissions increase slightly as a result of increases in air and road travel. Coal emissions remain flat as coal-fired electricity generation continues to decrease. Natural gas emissions fall slightly. Although natural gas consumption will likely decrease in the industrial and electric power sectors in 2024, it will be partly offset by an increase in the residential and commercial sectors, driven by our expectation of increased demand for space heating.

Weather: In January, weather in the United States was very mild, with 16% fewer population-weighted HDDs than the 10-year average; the mildest January since 2006. Based on forecasts from the National Oceanic and Atmospheric Administration, in 1Q23 we expect 8% fewer HDDs in the United States compared with 1Q22 and 7% fewer than the 10-year average. We have updated our expectations for winter heating fuel expenditures based on the most recent temperature and price forecasts.



The U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy (DOE), prepared this report. By law, our data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The views in this report do not represent those of DOE or any other federal agencies.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on February 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on February 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on February 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on February 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on February 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to Petroleum Administration for Defense Districts (PADD).

See "Petroleum for Administration Defense District" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Marketing Monthly* , DOE/EIA-0380; *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on February 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on February 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Coal Market Indicators															
Coal Miner Productivity (Tons per hour)	**6.05**	**6.05**	**6.05**	**6.05**	*5.98*	*5.98*	*5.98*	*5.98*	*5.80*	*5.80*	*5.80*	*5.80*	**6.05**	*5.98*	*5.80*
Total Raw Steel Production (Million short tons per day)	**0.253**	**0.253**	**0.247**	**0.235**	*0.237*	*0.235*	*0.235*	*0.239*	*0.245*	*0.241*	*0.244*	*0.247*	**0.247**	*0.236*	*0.244*
Cost of Coal to Electric Utilities (Dollars per million Btu)	**2.18**	**2.26**	**2.50**	**2.48**	*2.50*	*2.50*	*2.49*	*2.46*	*2.48*	*2.49*	*2.49*	*2.46*	**2.36**	*2.49*	*2.48*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on February 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on February 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on February 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on February 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 7d part 1. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continues on Table 7d part 2*

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on February 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distrib

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Subtotals for the industrial and commercial sectors might not equal the sum of the components. The subtotal for the industrial sector includes ethanol consumption that is not shown separately. The subtotal for the commercial sector includes ethanol and hydroelectric consumption that are not shown separately.

(f) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(g) Fuel ethanol and biodiesel, renewable diesel, and other biofuels consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on February 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum Supply*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on February 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.
Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Total Energy (c)	**1,321**	**1,157**	**1,248**	**1,244**	*1,233*	*1,118*	*1,209*	*1,216*	*1,278*	*1,101*	*1,199*	*1,215*	**4,971**	*4,776*	*4,794*

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

- = no data available

SAAR = Seasonally-adjusted annual rate

Notes: EIA completed modeling and analysis for this report on February 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the S&P Global model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on February 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on February 2, 2022.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Appendix to the February 2022 *Short-Term Energy Outlook*

This appendix is prepared in fulfillment of section 1245(d)(4)(A) of the National Defense Authorization Act (NDAA) for Fiscal Year 2012, as amended. The law requires the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy, to submit to Congress a report on the availability and price of petroleum and petroleum products produced in countries other than Iran in the two-month period preceding the submission of the report. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The data in this appendix, therefore, should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

EIA consulted with the U.S. Department of the Treasury, the U.S. Department of State, and the intelligence community in the process of developing the NDAA report, which was previously published as a stand-alone report. Detailed background and contextual information not repeated here can be found in early editions of the NDAA report.

This appendix is published in the *Short-Term Energy Outlook* in even numbered months.

Table a1. Summary of Estimated Petroleum and Other Liquids Quantities

	Dec 2022	Jan 2023	Dec 2022 – Jan 2023 Average	Dec 2021 – Jan 2022 Average	2019 – 2021 Average
Global Petroleum and Other Liquids (million barrels per day)					
Global Petroleum and Other Liquids Production (a)	101.3	101.0	101.1	98.1	96.6
Global Petroleum and Other Liquids Consumption (b)	100.7	98.3	99.5	99.0	96.5
Biofuels Production (c)	2.3	2.3	2.3	2.3	2.7
Biofuels Consumption (c)	2.6	2.6	2.6	2.6	2.6
Iran Liquid Fuels Production	3.8	3.8	3.8	3.5	3.2
Iran Liquid Fuels Consumption	2.3	2.6	2.4	2.0	2.0
Petroleum and Petroleum Products Produced and Consumed in Countries Other Than Iran (million barrels per day)					
Production (d)	95.2	94.9	95.0	92.3	90.7
Consumption (d)	95.9	93.2	94.6	94.4	92.0
Production minus Consumption	-0.7	1.7	0.5	-2.1	-1.3
World Inventory Net Withdrawals Including Iran	-0.5	-2.6	-1.6	0.9	-0.1
Estimated OECD Inventory Level (e) (million barrels)	2,783	2,831	2,807	2,643	2,946
Surplus Production Capacity (million barrels per day)					
OPEC Surplus Crude Oil Production Capacity (f)	2.4	3.3	2.9	3.5	4.3

Note: The term "petroleum and other liquids" encompasses crude oil, lease condensate, natural gas liquids, biofuels, coal-to-liquids, gas-to-liquids, and refinery processing gains, which are important to consider in concert due to the inter-related supply, demand, and price dynamics of petroleum, petroleum products, and related fuels.

(a) Production includes crude oil (including lease condensates), natural gas liquids, other liquids, and refinery processing gains.

(b) Consumption of petroleum by the OECD countries is synonymous with "products supplied," defined in the glossary of the EIA Petroleum Supply Monthly, DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel, and loss, and bunkering.

(c) Biofuels production and consumption are based on EIA estimates as published in the International Energy Statistics. Biofuels production in the third quarter tends to be at its highest level in the year as ethanol production in Brazil reaches its seasonal peak and is typically lowest in the first quarter as seasonal production falls in the South/South-Central region of Brazil.

(d) Global production of petroleum and petroleum products outside of Iran is derived by subtracting biofuels production and Iran liquid fuels production from global liquid fuels production. The same method is used to calculate global consumption outside of Iran.

(e) Estimated inventory level is for OECD countries only.

(f) EIA defines surplus oil production capacity as potential oil production that could be brought online within 30 days and sustained for at least 90 days, consistent with sound business practices. This does not include oil production increases that could not be sustained without degrading the future production capacity of a field.

Table a2. Crude Oil and Petroleum Product Price Data

Item	Dec 2022	Jan 2023	Dec 2022 – Jan 2023 Average	Dec 2021 – Jan 2022 Average	2019 – 2021 Average
Brent Front Month Futures Price ($ per barrel)	81.34	83.91	82.59	79.93	59.44
WTI Front Month Futures Price ($ per barrel)	76.52	78.16	77.32	77.07	54.82
Dubai Front Month Futures Price ($ per barrel)	77.36	80.94	79.11	78.42	58.86
Brent 1st - 13th Month Futures Spread ($ per barrel)	2.94	4.22	3.56	6.21	1.80
WTI 1st - 13th Month Futures Spread ($ per barrel)	2.50	2.89	2.69	6.77	1.37
RBOB Front Month Futures Price ($ per gallon)	2.23	2.48	2.35	2.26	1.67
Heating Oil Front Month Futures Price ($ per gallon)	3.12	3.23	3.17	2.42	1.75
RBOB - Brent Futures Crack Spread ($ per gallon)	0.29	0.49	0.39	0.36	0.25
Heating Oil - Brent Futures Crack Spread ($ per gallon)	1.19	1.23	1.21	0.52	0.34

(a) Brent refers to Brent crude oil traded on the Intercontinental Exchange (ICE).
(b) WTI refers to West Texas Intermediate crude oil traded on the New York Mercantile Exchange (NYMEX), owned by Chicago Mercantile Exchange (CME) Group.
(c) RBOB refers to r*eformulated blendstock for oxygenate blending traded on the NYMEX.*
Data source: U.S. Energy Information Administration, based on Chicago Mercantile Exchange (CME), Intercontinental Exchange (ICE), and Dubai Mercantile Exchange (DME).
