Independent Statistics & Analysis
U.S. Energy Information Administration

January 2020

Short-Term Energy Outlook (STEO)

Forecast highlights

- This edition of the *Short-Term Energy Outlook* is the first to include forecasts for 2021.
- EIA forecasts Brent crude oil spot prices will average $65 per barrel (b) in 2020 and $68/b in 2021, compared with an average of $64/b in 2019. EIA expects West Texas Intermediate (WTI) crude oil prices will average about $5.50/b lower than Brent prices through 2020 and 2021, compared with an average WTI discount of about $7.35/b in 2019.
- Global liquid fuels inventories were mostly unchanged in 2019, and EIA expects they will grow by 0.3 million b/d in 2020 and then decline by 0.2 million b/d in 2021.
- On January 1, 2020, the International Maritime Organization (IMO) enacted Annex VI of the International Convention for the Prevention of Pollution from Ships (MARPOL Convention), which lowers the maximum sulfur content of marine fuel oil used in ocean-going vessels from 3.5% of weight to 0.5%. EIA expects this regulation will encourage global refiners to increase refinery runs and maximize upgrading of high-sulfur heavy fuel oil into low-sulfur distillate fuel to create compliant bunker fuels. EIA forecasts that U.S. refinery runs will rise by 3% from 2019 to a record level of 17.5 million b/d in 2020, resulting in refinery utilization rates that average 93% in 2020. EIA expects one of the most significant effects of the regulation will be on diesel wholesale margins, which will rise from an average of 43 cents per gallon (gal) in 2019 to a forecast peak of 53 cents/gal in March 2020 and an annual average of 50 cents/gal in 2020. EIA expects diesel margins to decline to 49 cents/gal in 2021.
- U.S. regular gasoline retail prices averaged $2.60/gal in 2019, and EIA forecasts that they will average $2.63/gal in both 2020 and 2021.
- EIA estimates that U.S. crude oil production averaged 12.2 million b/d in 2019, up 1.3 million b/d from 2018. EIA forecasts U.S. crude oil production will average 13.3 million b/d in 2020 and 13.7 million b/d in 2021. Most of the production growth in the forecast occurs in the Permian region of Texas and New Mexico.
- U.S. net imports of crude oil and petroleum product fell from an average of 2.3 million b/d in 2018 to an average of 0.5 million b/d in 2019, and EIA estimates the United States has exported more total crude oil and petroleum products than it has imported since

September. EIA forecasts that the United States will be a net exporter of total crude oil and petroleum products by 0.8 million b/d in 2020 and by 1.4 million b/d in 2021.

- U.S. dry natural gas production set a new record in 2019, averaging 92.0 billion cubic feet per day (Bcf/d). EIA forecasts dry natural gas production will rise to 94.7 Bcf/d in 2020 and then decline to 94.1 Bcf/d in 2021. Production in the Appalachian region drives the forecast as it shifts from growth in 2020 to declining production in 2021.

- EIA forecasts that Henry Hub natural gas spot prices will average $2.33 per million British thermal units (MMBtu) in 2020, down from $2.57/MMBtu in 2019. EIA expects that natural gas prices will then increase in 2021, reaching an annual average of $2.54/MMBtu.

- EIA forecasts that U.S. coal production will total 597 million short tons (MMst) in 2020, down 93 MMst (14%) from 2019, as a result of declining domestic demand for coal in the electric power sector and lower demand for U.S. exports. EIA expects that coal production will again fall by 16 MMst (3%) in 2021 as export demand stabilizes and declines in U.S. power sector demand slow.

- EIA expects the share of U.S. total utility-scale electricity generation from natural gas-fired power plants will remain relatively steady, it was 37% in 2019, and we forecast it will be 38% in 2020 and 37% in 2021. Electricity generation from renewable energy sources rises from a share of 17% last year to 19% in 2020 and 22% in 2021. The increase in the renewables share is the result of expected additions to wind and solar generating capacity. Coal's forecast share of electricity generation falls from 24% in 2019 to 21% in both 2020 and 2021. The nuclear share of generation, which averaged slightly more than 20% in 2019 will be slightly less than 20% by 2021, consistent with upcoming reactor retirements.

- After decreasing by 2.1% in 2019, EIA forecasts that energy-related carbon dioxide (CO2) emissions will decrease by 2.0% in 2020 and by 1.5% in 2021. Declining emissions reflect forecast declines in total U.S. energy consumption combined with assumptions of relatively normal weather. Energy-related CO2 emissions are sensitive to changes in weather, economic growth, energy prices, and fuel mix.

Global Liquid Fuels

EIA estimates that global oil markets were roughly balanced in 2019, as global oil supply declined slightly and global oil consumption grew at its slowest pace since 2011. Both supply and consumption grow in 2020 in this forecast. EIA expects global oil supply will rise by 1.6 million barrels per day (b/d) in 2020 and global oil consumption will rise by 1.3 million b/d, contributing to global oil inventories rising at a pace of 0.3 million b/d. Supply growth in 2020 is led by countries that are not members of the Organization of the Petroleum Exporting Countries (OPEC), particularly the United States, Norway, Brazil, and Canada. EIA expects non-OPEC producers will increase oil supply by 2.6 million b/d in 2020, which will more than offset forecast supply declines of 1.0 million b/d from OPEC members.

In the first half of 2020, EIA expects global oil inventory builds of 0.5 million b/d will contribute to Brent spot prices falling to an average of $62 per barrel (b) by May from an average of $67/b in January. The relatively weak market balances EIA is forecasting for the first six months of 2020 occur amid market concerns about potential supply disruptions. However, a forecast of inventory growth and OPEC spare capacity of more than 2.0 million b/d could help reduce upward price pressure in the case of a limited disruption to oil supply or transportation. For all of 2020, EIA forecasts that global oil inventories will build by 0.3 million b/d and Brent prices will average $65/b.

Oil balances in EIA's forecast begin to tighten in mid-2020, and in 2021, global oil supply growth slows. Non-OPEC supply growth slows to 0.9 million b/d in 2021, driven by a decelerating pace of growth in U.S. tight oil. EIA expects OPEC supply to add another 0.1 million b/d of growth, bringing total forecast global supply growth for 2021 to 1.0 million b/d. EIA forecasts global oil consumption growth will average 1.4 million b/d in 2021, and with consumption growth outpacing supply growth, EIA expects inventories to draw by 0.2 million b/d. These draws contribute to EIA's forecast that Brent prices will rise to an average of $68/b in 2021.

Global Petroleum and Other Liquid Fuels Consumption. Preliminary data and estimates indicate that global liquid fuels consumption grew by 0.8 million b/d in 2019. EIA forecasts that consumption will rise by 1.3 million b/d in 2020 and by 1.4 million b/d 2021. The expected rise in consumption growth from 2019 results from a forecast of rising global gross domestic product (GDP). Based on forecasts from Oxford Economics, EIA assumes global oil-weighted GDP growth will rise from 1.9% in 2019 to 2.4% in 2020 and 3.0% in 2021.

EIA expects that global liquid fuels consumption will also rise in 2020 because of newly completed petrochemical plants in China, the United States, and Russia that use liquefied petroleum gases (LPG) as feedstock. Additionally, EIA forecasts that demand will further grow further as a result of the new International Maritime Organization (IMO) rules on sulfur content of fuel used by ocean-going vessels. EIA assumes that the switch from residual fuel to less energy-dense marine distillate will likely result in an increase in total liquid fuels consumption of about 0.1 million b/d. This increase in total consumption is the result of ships using less energy-dense fuel that requires some increase in volume to serve

the same level of shipping traffic. Absent the increase in LPG consumption and IMO 2020, EIA's forecast for liquid fuels consumption growth would be lower in 2020.

Countries that are not part of the Organization for Economic Cooperation and Development (OECD) continue to drive demand growth in the forecast. Non-OECD liquid fuels consumption growth accounts for 1.2 million b/d of the forecast global growth in both 2020 and 2021; China and India represent about half of all global growth in the forecast.

EIA forecasts that China's consumption will increase by 0.5 million b/d in both 2020 and 2021. EIA does not expect growth in China's oil consumption to slow as much as slowing GDP growth would imply because a number of new petrochemical plants add more than 0.2 million b/d of consumption in 2020 and almost 0.1 million b/d in 2021. EIA also forecasts that liquid fuels consumption in India will grow by about 0.2 million b/d in both 2020 and 2021, driven by rising gasoline, jet fuel, and hydrocarbon gas liquids consumption.

OECD petroleum and other liquid fuels consumption in the forecast grows by 0.1 million b/d in both 2020 and 2021. The United States is the main contributor to this growth. EIA forecasts that Europe's liquid fuels consumption will decline slightly in 2020 and then remain flat in 2021. Japan is expected to see liquid fuels consumption continue to decline in both years.

Non-OPEC Petroleum and Other Liquid Fuels Supply. EIA estimates that non-OPEC petroleum and other liquid fuels supply increased by 2.0 million b/d in 2019. Production growth of 1.6 million b/d in the United States accounted for more than 80% of the 2019 supply growth, and Brazil, Canada, Russia, and China collectively added an additional 0.6 million b/d. EIA expects non-OPEC petroleum and other liquid fuels production will rise by 2.6 million b/d in 2020 and by 0.9 million b/d in 2021. Forecast growth in the United States contributes 1.7 million b/d and 0.6 million b/d, respectively, in each year. Brazil provides another 0.3 million b/d in 2020 and 0.2 million b/d in 2021. Norway contributes 0.4 million b/d of growth in 2020, and then its production growth slows to less than 0.1 million b/d in 2021.

EIA expects Canada's total liquid fuels production will increase by almost 0.2 million b/d in 2020 and 2021. Canada's production growth will accelerate compared with 2019 as the Alberta Government's production curtailments are reduced and more rail takeaway capacity gives producers an outlet for supplies. However, EIA still expects lower production growth in Canada than experienced during most of the past decade. EIA does not expect any additional production from new oil sands projects to come online during the forecast, and production growth stems from expansions of existing projects.

EIA expects Brazil's total liquid fuels production will grow by more than 0.3 million b/d in 2020 and by 0.2 million b/d in 2021. After a number of delays, the seven floating production, storage, and offloading vessels (FPSOs) that came online in 2018 and 2019 are now producing at maximum or near-maximum capacity. The main driver of growth will continue to be at least four more new FPSOs through 2023. EIA believes the Santos Basin, particularly the Lula and Buzios fields, will produce enough crude oil in the next two years to offset declines in Brazil's more mature onshore and offshore areas.

In Norway, Phase 1 of the Johan Sverdrup field came online in October 2019, and it will drive most of the production growth in Norway in 2020 and 2021. At its peak, Phase 1 will produce 0.4 million b/d.

EIA currently forecasts that Russia's production levels in 2020 and 2021 will be similar to production in 2019 because EIA assumes that the agreement between Russia and OPEC to restrain production will continue throughout the forecast period.

EIA forecasts the largest declines among non-OPEC producers will be in Mexico, though Mexico's production declines slow from 0.2 million b/d in 2019 to less than 0.1 million b/d in 2020 and 2021.

OPEC Petroleum and Other Liquid Fuels Supply. On December 6, 2019, OPEC and a group of other oil producers announced they were deepening the production cuts originally announced in December 2018. The group is now targeting production that is 1.7 b/d lower than in October 2018, compared with the former target reduction of 1.2 million b/d. OPEC announced that the cuts would remain in effect through the end of March 2020. However, EIA assumes that OPEC will limit production through all of 2020 and 2021 to target relatively balanced global oil markets. As a result of production restraint from most OPEC members and continuing production declines in Iran and Venezuela, EIA expects OPEC production will fall in 2020. EIA forecasts that OPEC crude oil production will average 29.2 million b/d in 2020, down 0.6 million b/d from 2019. In 2021, forecast OPEC crude oil production increases by 0.1 million b/d.

EIA estimates that Venezuela's crude oil production for 2019 averaged 0.8 million b/d. EIA expects Venezuela's production will continue recent trends and fall through the forecast period—albeit at a slower overall rate of decline—while the financial situation of the state-owned Petróleos de Venezuela (PdVSA) remains extremely precarious. Venezuela, which relies heavily on oil revenues, has seen its cash income severely constricted because only about half of its crude oil exports generate cash revenues. The rest is used for in-kind loan payments to China, which become less valuable with lower global oil prices. Venezuela's oil revenue is also reduced by ongoing payments to ConocoPhillips following an arbitration agreement about its seized assets and to holders of PdVSA's 2020 bonds.

In OPEC Africa, EIA expects Nigeria's production growth to slow considerably through 2021 following production gains from the Egina field, which was commissioned in early 2019. Nigeria's production growth slows reflecting a lack of investment in exploration and development of new fields and declining production from its older fields. Angola's production declined in 2019 as a result of technical issues at existing fields and underinvestment in field exploration and development. Several marginal expansions of existing fields will offset some of the declines from Angola's mature fields through 2021, resulting in production that will remain roughly unchanged. Libya's production increased in 2019 as a result of the restart and development of new or previously shut-in wells. Libya's 2019 production level was the highest since 2012 and remained relatively stable throughout the year despite the ongoing civil war and some minor field disruptions. However, supply disruptions will remain a significant risk through

2021 because of the tenuous security situation in the country and because of infrastructure that needs upgrades for continued operability.

EIA expects that crude oil production in the Neutral Zone shared between Saudi Arabia and Kuwait, which has been offline since 2014, will begin to return to the market in the second half of 2020 and increase to full production levels in 2021. However, EIA assumes that when the Neutral Zone fields start producing, production at other fields will be reduced, and overall OPEC production will be unaffected.

EIA estimates that OPEC non-crude oil liquids production averaged 5.4 million b/d in 2019. EIA forecasts that it will fall to 5.0 million b/d in 2021 and remain flat in 2021. The decrease in non-crude oil liquids production next year is the result of lower expected condensate output in Iran.

EIA expects that OPEC surplus crude oil production capacity, which averaged 2.0 million b/d in 2019, will increase to 2.4 million b/d in 2020 and then to 2.5 million b/d in 2021. This estimate does not include additional capacity that may be available in Iran but is offline because of U.S. sanctions on Iran's oil sales.

OECD Petroleum Inventories. EIA estimates that OECD commercial crude oil and other liquid fuels inventories were 2.91 billion barrels at the end of 2019, equivalent to about 62 days of consumption. EIA expects OECD inventories rise to 2.95 billion barrels at the end of 2020, staying at about the same level at the end of 2021.

Crude Oil Prices. The spot price of Brent crude oil averaged $67/b in December 2019, up $4/b from the average in November and $10/b higher than in December 2018. Price increases in December partly reflect market expectations that global economic conditions in 2020 will be better than previously anticipated, and the announced first phase of a trade deal between the United States and China to be signed in January. Also putting upward pressure on prices, on December 6, 2019, OPEC and partner countries agreed to deepen production cuts through March 2020. More recently, on January 3, events in Iraq increased uncertainty around potential disruptions to oil production and shipping in the Middle East, adding volatility and an additional risk premium to global oil prices in the short term.

EIA estimates that global liquid fuels inventories fell by less than 0.1 million b/d in 2019, an indication that markets were relatively balanced. EIA expects global oil markets will experience builds in 2020, with forecast inventories rising at a rate of 0.3 million b/d. The combination of continuing crude oil production restraint on the part of OPEC and accelerating global demand growth is expected to be more than offset by growth in non-OPEC production, largely in the United States, Norway, Brazil, and Canada. However, in 2021, EIA expects oil markets will experience inventory draws, as non-OPEC production growth slows, led by decelerating growth in the United States. EIA assumes that OPEC will continue to try to adjust production levels to target relative balance in global oil markets. Based on a forecast of slowing oil supply growth and mostly stable oil demand growth, EIA expects global oil inventories will fall by almost 0.2 million b/d in 2021.

Given the expectation of inventory builds in 2020 and draws in 2021, EIA forecasts Brent prices will average $65/b in 2020 and $68/b in 2021. In the first half of 2020, EIA expects global oil prices to be affected by both the downward price pressures of relatively weak oil market balances and by the upward price pressures of geopolitical risk. This forecast assumes that Brent crude oil prices will decline in early 2020, falling from a January average of $67/b to an average of $62/b in May 2020, as risk premiums slowly fade. EIA does not forecast supply disruptions, and any physical supply disruptions would likely cause prices to be higher than this forecast. Beginning in mid-2020 and into 2021, EIA expects that tightening market fundamentals will be the main driver of upward price pressures, with forecast Brent prices increasing to $69/b at the end of 2021 and averaging $68/b for the year.

Global economic developments and geopolitical events in the coming months could push oil prices higher or lower than the current STEO price forecast. Uncertainty remains regarding the duration of, and adherence to, the current OPEC production cuts. Geopolitical-related disruption risks are always present in the oil market, and—as the attacks on Saudi Arabia's oil infrastructure in September 2019 demonstrate—can bring significant volumes of both current production and spare capacity off the market suddenly. Developments regarding the rate of economic growth and its effect on global oil demand growth further contribute to price uncertainty. Also, although EIA expects that crude oil price impacts from IMO regulations that started in 2020 will be limited, how the global refining and shipping industries will respond and how the actual outcomes of these decisions will affect crude oil prices remain unknown. Finally, the U.S. tight oil sector continues to be dynamic, and quickly evolving trends in this sector could affect both current crude oil prices and expectations for future prices.

EIA forecasts average West Texas Intermediate (WTI) crude oil prices average about $5.50/b lower than Brent prices in both 2020 and 2021. This price discount is based on the assumption of continued sufficient pipeline capacity from production areas in West Texas and from Cushing, Oklahoma, to refineries and export terminals along the U.S. Gulf Coast. Given recent growth in U.S. crude oil production, volumes in excess of Gulf Coast refinery demand are exported, and WTI prices are set by competition with Brent into the marginal export markets in Asia. EIA's forecast of a $5.50/b price spread between WTI and Brent reflects the additional costs incurred in bringing volumes from Cushing to Asia compared with the costs of shipping from the North Sea to Asia.

The current values of futures and options contracts suggest significant uncertainty in the oil price outlook. WTI futures contracts for April 2020 delivery that were traded during the five-day period ending January 9 averaged $61/b, and implied volatility averaged 28%. These levels established the lower and upper limits of the 95% confidence interval for the market's expectations of monthly average WTI prices in April 2020 at $48/b and $78/b, respectively. The 95% confidence interval for market expectations widens over time; the lower and upper limits for prices in December 2020 are $36/b and $91/b, respectively.

U.S. Liquid Fuels

Consumption. EIA forecasts that total U.S. petroleum and other liquid fuels consumption will average 20.6 million barrels per day (b/d) in 2020, an increase of 160,000 b/d (0.8%) from the 2019 level. Forecast consumption growth slows to 70,000 b/d (0.3%) in 2020. Increased forecast consumption of hydrocarbon gas liquids (HGL) is the primary reason for the growth.

HGL consumption increased by an estimated 150,000 b/d (5.0%) in 2019, and EIA expects that it will increase by 170,000 b/d (5.3%) in 2020 and by 120,000 b/d (3.6%) in 2021. Ethane, used as a petrochemical feedstock, is responsible for most of the forecast growth in HGL consumption. Ethane consumption is expected to increase by 290,000 b/d in 2020 as outages at existing petrochemical steam cracking plants come back online and several new plants ramp up operations. EIA anticipates ethane consumption will increase by 130,000 b/d in 2021 as cracking plants increase their utilization and an additional plant comes online.

Motor gasoline consumption in the United States averaged 9.3 million b/d in 2019. EIA forecasts U.S. gasoline consumption will stay near that level in 2020 and then fall by 50,000 b/d (0.6%) in 2021. In 2020, gasoline consumption is supported by forecast growth in employment and population, but that support is balanced by expected gains in vehicle fuel efficiency. However, as employment growth in the forecast slows in 2021, the effects of vehicle fuel efficiency gains contribute to the forecast decrease in consumption in 2021.

EIA forecasts that distillate fuel consumption in the United States will increase by 40,000 b/d (1.1%) in 2020 and remain flat in 2021. Forecast U.S. distillate fuel consumption will average about 4.1 million b/d in both years. The consumption growth in 2020 is driven by assumed U.S. real gross domestic product (GDP) growth of 2.0% in 2020 and 1.8% in 2021. The flat distillate consumption growth from 2020 to 2021 reflects a decline in heating oil consumption in 2021 that is offset by increased diesel fuel consumption as a result of GDP growth. The diesel fuel consumption growth also reflects a small expected shift to marine diesel for bunkering purposes as a result of the International Maritime Organization (IMO) 2020 change to marine fuel sulfur specifications.

EIA forecasts U.S. jet fuel consumption will grow by 30,000 b/d (1.6%) in 2020 and by 10,000 b/d (0.4%) in 2021, reaching almost 1.8 million b/d. Growth in the demand for air travel is a result, in part, of expectations of rising disposable incomes.

Crude Oil Supply. EIA estimates that annual average U.S. crude oil production reached a new record of 12.2 million b/d in 2019, up 1.3 million b/d from 2018. EIA forecasts U.S. crude oil production to average 13.3 million b/d in 2020 and 13.7 million b/d in 2021. More production from the Lower 48 states' onshore regions, especially the Permian region, drives the forecast increase.

Slowing crude oil production growth in the forecast results from a decline in drilling rigs over the past year that EIA expects will continue into 2020 and 2021. Despite the decline in the number of rigs, EIA forecasts production will continue to grow as rig efficiency and well-level productivity

rises. For 2020, EIA's WTI crude oil price forecast rises by $2 per barrel (b) from 2019 levels to average $59/b for the year. For 2021, EIA expects WTI prices will rise further to an average of $62/b. EIA expects oil prices above $60/b to contribute to rising crude oil production, as producers will be able to fund drilling programs through cash flow and other funding sources, despite a somewhat more restrictive capital market.

EIA estimates that onshore crude oil production in the Lower 48 states averaged 9.9 million b/d in 2019, up from 8.8 million b/d in 2018. In 2020, EIA expects Lower 48 production will increase by almost 1.0 million b/d and rise by another 0.4 million b/d in 2021. Almost all of the Lower 48 production growth can be attributed to production from tight oil formations within the Permian region in Texas and New Mexico, which account for 0.8 million b/d of the Lower 48 production growth expected by EIA in 2020 and almost 0.4 million b/d in 2021. Favorable geology and technological and operational improvements have allowed the Permian region to become one of the most prolific regions for oil production.

EIA expects crude oil production in the Gulf of Mexico will average 2.0 million b/d in 2020, an increase of 0.1 million b/d over 2019 levels. Production in 2021 is expected to stay flat at 2.0 million b/d.

Crude oil production in Alaska in the forecast remains unchanged at 0.5 million b/d during 2020 and 2021.

Hydrocarbon Gas Liquids Supply. EIA forecasts HGL production at natural gas processing plants will increase from an estimated 4.8 million b/d in 2019 to 5.4 million b/d in 2020 and to 5.5 million b/d in 2021. HGLs produced at natural gas plants—ethane, propane, butanes, and natural gasoline—will increase along with growth in natural gas production and natural gas processing plant capacity. EIA expects ethane will contribute more than two-thirds of the 0.7 million b/d HGL production growth between 2019 and 2021. Higher rates of ethane recovery at natural gas processing plants are expected to help meet growing demand for ethane as a petrochemical feedstock in the United States and abroad.

Liquid Biofuels. On December 19, 2019, the U.S. Environmental Protection Agency (EPA) finalized a rule setting Renewable Fuel Standard (RFS) volumes for 2020 and biomass-based diesel volumes for 2021. EIA used these final volumes to develop the forecasts for liquid biofuels for 2020 and 2021. EIA expects that the largest effect of the current RFS targets will continue to be on biomass-based diesel production and net imports, which help to meet multiple RFS targets for biomass-based diesel, advanced biofuel, and total renewable fuel. Biodiesel production fell by nearly 2% from 2018 to 2019, averaging an estimated 119,000 b/d last year. EIA expects biodiesel production will increase by 13% to average 135,000 b/d in 2020 and increase by 17% to average 158,000 b/d in 2021, driven largely by increasing RFS targets and the renewal of the biodiesel production tax credit through 2022.

Net imports of biomass-based diesel increased by 47% to an average 23,000 b/d in 2019, and EIA expects them to increase further to an average 28,000 b/d in 2020 and to 39,000 b/d in 2021. Increased net imports of biomass-based diesel are driven primarily by increased volumes

of renewable diesel imported to meet both California Low Carbon Fuel Standard requirements and the rising RFS targets.

As a result of limited demand growth and oversupply, U.S. ethanol producers experienced weakening operating margins and ethanol production fell for the first time in seven years in 2019, down 2.0% from 2018 levels to an average of 1.03 million b/d. EIA forecasts that limited domestic and global demand growth potential will result in ethanol production staying largely unchanged in 2020 and 2021. Ethanol consumption averaged 951,000 b/d in 2019, and EIA forecasts a slight decrease to an average 947,000 b/d in 2020 and 945,000 b/d in 2021, driven by falling motor gasoline consumption by 2021. This level of consumption results in the ethanol share of total gasoline, which was an estimated 10.1% in 2018 and 10.2% in 2019, remaining largely flat in 2020 and 2021. This stable ethanol share assumes growth in higher-level ethanol blends is limited by a combination of unfavorable blending economics compared with gasoline, depressed Renewable Identification Number (RIN) prices, and limited consumer demand for higher levels of ethanol blending beyond 10% of gasoline (i.e., E10).

Product Prices. EIA expects the retail price of regular gasoline in the United States will average $2.54 per gallon (gal) during the first quarter of 2020, 18 cents/gal higher than at the same time last year, primarily reflecting stronger expected refinery margins despite similar forecast crude oil prices. EIA expects the U.S. monthly regular retail gasoline price will increase from an average of $2.57/gal in January to $2.76/gal in June and July (a 2020 peak) before falling to $2.53/gal in December 2020. The U.S. regular gasoline retail price, which averaged $2.60/gal in 2019, is forecast to average $2.63/gal in both 2020 and 2021.

Regional annual average forecast prices for 2020 range from a low of $2.36/gal in the Gulf Coast region—Petroleum Administration for Defense District (PADD) 3—to a high of $3.24/gal in the West Coast region (PADD 5).

Refinery wholesale gasoline margins in the United States (the difference between the wholesale price of gasoline and the price of Brent crude oil) averaged 15 cents/gal in December 2019. This level was similar to the average in December 2018, but it was 10 cents/gal lower than the five-year (2014–18) average for December. Refinery wholesale gasoline margins averaged 32 cents/gal in 2019, which was 4 cents/gal higher than the 2018 level but 5 cents/gal lower than the five-year average. EIA expects the refinery wholesale gasoline margin will average 33 cents/gal in 2020 and 27 cents/gal in 2021.

The diesel fuel retail price averaged $3.06/gal in 2019, which was 13 cents/gal lower than the average in 2018. EIA forecasts the diesel price will average $3.11/gal in 2020 and $3.12/gal in 2021. The rising prices from 2019 to 2020 primarily reflect the assumption that diesel refinery margins increase because of IMO 2020 regulations, which became effective on January 1. EIA expects that low-sulfur IMO regulations will drive global demand for U.S. ultra-low sulfur diesel volumes and contribute to gradually increasing diesel refinery margins. Diesel refinery margins based on Brent crude oil, which averaged 43 cents/gal in 2019, are expected to average 50 cents/gal in 2020 and 49 cents/gal in 2021.

Natural Gas

Natural Gas Consumption. Total domestic U.S. natural gas consumption averaged an estimated 85.3 billion cubic feet per day (Bcf/d) in 2019, and EIA expects it will increase by 1.4 Bcf/d (1.7%) in 2020 before decreasing by 1.0 Bcf/d (1.2%) in 2021.

The largest natural gas consuming sector in the United States is the electric power sector. EIA estimates that electric generation consumed an average 31.0 Bcf/d in 2019, up 7.0% from 2018 because of new natural gas-fired electric generation capacity and competitive natural gas prices. EIA forecasts growth in power sector consumption of natural gas to slow in 2020, increasing by 1.3% before decreasing by 3.2% in 2021. Declining power sector consumption in 2021 reflects increased competition from renewable sources of electricity generation as a result of continuing renewables capacity additions. Declining natural gas consumption also reflects a forecast of higher natural gas spot prices in 2021 compared with 2020, which would make natural gas less competitive against coal in power markets.

EIA expects combined residential and commercial natural gas consumption will average 23.2 Bcf/d in 2020, down 1.0% from 2019. The lower consumption reflects lower forecast space heating demand. Based on forecasts by the National Oceanic and Atmospheric Administration (NOAA), EIA forecasts 1.8% fewer heating degree days (HDD) in 2020 compared with 2019. Natural gas consumption in the residential and commercial sectors is expected to decline by 0.9% in 2021, based on a forecast decline in HDD of 0.7% in 2021.

EIA forecasts U.S. industrial sector consumption of natural gas to rise by 4.6% in 2020 and then remain flat in 2021. Most of the 2020 increase in the forecast is the result of new chemical projects. Low natural gas prices in recent years have made it economical to increase use of natural gas as feedstock in ammonia for nitrogenous fertilizer and methanol manufacturers. Two methanol plants plan to come online by the end of 2020, including a methanol plant in St. James, Louisiana, which would be the second-largest methanol facility in the United States after a facility in Beaumont, Texas, which entered service in June 2018.

Natural Gas Production and Trade. EIA estimates that dry natural gas production in the United States will average 94.7 Bcf/d in 2020, up 2.9% from 2019. In 2021, EIA's forecast production declines by 0.7% to an average of 94.1 Bcf/d for the year. EIA's expected growth in natural gas production for 2020 is largely in response to improved drilling efficiency and cost reductions, higher associated gas production from oil-directed rigs, and increased takeaway pipeline capacity from the Appalachian and Permian production regions. Forecast natural gas production growth is also supported by planned expansions in liquefied natural gas (LNG) capacity and increased pipeline exports to Mexico. The decline in natural gas production in 2021 is in response to a forecast of low natural gas spot prices in 2020 that reduces drilling activity in the Appalachian Basin.

The United States exported more natural gas than it imported in 2019, with net exports averaging 5.3 Bcf/d, up 2.0 Bcf/d from 2018. EIA forecasts net natural gas exports will rise to average 7.3 Bcf/d in 2020 and 8.9 Bcf/d in 2021. Rising LNG exports and pipeline exports

changed the United States from its long history as net importer of natural gas, which it had been as recently first quarter of 2017. EIA estimates that U.S. LNG exports averaged 5.0 Bcf/d in 2019. EIA expects LNG exports will increase to 6.5 Bcf/d in 2020 and 7.7 Bcf/d in 2021.

In 2020, EIA assumes U.S. LNG export capacity will reach 8.9 Bcf/d by the end of the year as Cameron, Freeport, and Elba Island place their remaining trains in service. Cameron Trains 2 and 3 are expected to begin production in April and July of 2020, respectively, and Freeport Train 3 is set to start in May 2020. Elba Island shipped its first LNG export cargo in December 2019 after placing the first three of its Moveable Modular Liquefaction System (MMLS) units in service. EIA assumes that the remaining Trains 4–10 at Elba Island will be placed in service by the middle of 2020. In 2021, EIA expects the third train at Corpus Christi facility in Texas to come online, bringing the total baseload U.S. liquefaction capacity to 9.5 Bcf/d. The additional capacity will drive continuing growth in LNG exports to an annual average of 7.7 Bcf/d in 2021, as facilities gradually ramp up to full production.

U.S. natural gas exports to Mexico via pipeline have also increased as more infrastructure has been built to transport natural gas both to and within Mexico. U.S. pipeline exports to Mexico through October averaged 5.1 Bcf/d, increasing by 10% in 2019 compared with the same period in 2018. Exports to Mexico should continue to increase as more natural gas-fired power plants come online in Mexico and more pipeline infrastructure within Mexico is built.

U.S. net natural gas pipeline imports from Canada decreased from 2018 to 2019, continuing a trend that began in 2008. This decrease in net imports is expected to continue as Appalachian production growth displaces some of Canada's natural gas imports in the U.S. Midwest markets.

Natural Gas Inventories. As of January 3, 2020, U.S. working gas inventories were 3,148 billion cubic feet (Bcf), 20% higher than the year-ago level and 2% higher than the five-year (2015–19) average level. After beginning 2019 with stocks much lower than the five-year (2014–18) average, record levels of natural gas production led to storage injections exceeding the five-year average throughout 2019.

Based on an assumption of milder winter temperatures in the first quarter of 2020, along with a forecast of growing natural gas production, EIA forecasts that total inventories will be 1,807 Bcf at the end of March, which would be 5% higher than the five-year average for that time of year. For the 2020 storage injection season, EIA expects injections will exceed the five-year average rate as production outpaces consumption and exports from the end of March through October. EIA expects that inventories will reach 4,016 Bcf at the end of October 2020, which would be 7% higher than the previous five-year average for the end of October and 7% higher than at the end of October 2019.

Natural Gas Prices. Henry Hub spot prices averaged $2.57 per million British thermal units (MMBtu) in 2019, down 59 cents/MMBtu from 2018 levels. EIA forecasts that Henry Hub natural gas spot prices will average $2.33/MMBtu in 2020 and $2.54/MMBtu in 2021. EIA expects some upward price pressures to emerge in 2021 because of falling natural gas production that stems

from the low prices forecast in 2020. However, falling demand for natural gas should limit upward price movements.

Coal

Coal Supply. EIA estimates that U.S. coal production declined by 65 million short tons (MMst) (9%) to 690 MMst in 2019. In 2020, EIA expects total U.S. coal production will decline by a further 14% to 597 MMst because of anticipated declines in both exports and domestic consumption in the electric power sector. EIA expects the largest declines in coal production in 2020 will occur in the Western production region. The coal market has undergone significant restructuring in the past year.

EIA expects coal production will fall by an additional 3% in 2021 to 581 MMst. The slowing declines in production for 2021 are based on EIA's expectation of modest increases in demand for U.S. exports offset by continuing, albeit slowing, demand declines in the U.S. electric power sector.

Coal Consumption. EIA estimates that coal consumption for all sectors totaled 596 MMst in 2019. EIA expects total coal consumption will fall by 65 MMst (11%) in 2020 and by 18 MMst (3%) in 2021. The declines in total consumption of coal closely track those in electric power consumption, which accounted for 91% of all coal consumption in 2019. The decrease in power sector coal consumption in 2020 reflects expected coal plant retirements and increasing shares of electricity generation from low priced natural gas and new renewables generating capacity. However, because EIA expects slight rises in natural gas prices in 2021, coal will become slightly more price competitive.

Coal Trade. In 2019, coal exports decreased 20% from 2018 to 92 MMst. Less favorable market conditions, such as competitive steam coal cargoes from Eastern Europe and high freight costs, contributed to the decline, which was offset somewhat by residual contracts that will expire in 2020. EIA estimates that U.S. coal exports will decrease by 11% in 2020 to 83 MMst and then stabilize near that level in 2021.

Despite EIA's forecast decline in total U.S. coal exports, shipments to top destinations such as India, Japan, and South Korea, are expected to remain stable. Exports to these three countries accounted for 34% (27 MMst) of the coal exported in 2019 through October. Europe received about 36% of U.S. exports during that period. Although U.S. exports to Europe are mostly metallurgical coal and used predominantly for steel production, U.S. steam coal is still used in Germany, Portugal, and the United Kingdom.

U.S. coal exports to North Africa, particularly Egypt and Morocco, rose 5% compared with the same period in 2018, accounting for 9% of total exports. Comparatively, coal exports to North and South America accounted for 8% and 9% of total coal, respectively.

Coal Prices. EIA estimates the delivered coal price to U.S. electricity generators averaged $2.05 per million British thermal units (MMBtu) in 2019, which was down slightly from the 2018 price. EIA forecasts that coal prices will increase to $2.10/MMBtu in both 2020 and 2021.

Electricity

Electricity Consumption. EIA forecasts total U.S. electricity consumption, including direct use of electricity by combined-heat-and-power plants, will decline by 0.4% in 2020 and remain flat in 2021.

The reduced need for air conditioning in the typical household, partly offset by continued growth in the number of retail electricity customers, contributes to EIA's forecast that total retail sales of electricity to the residential sector will decline by 0.5% in 2020. EIA expects the average residential electricity customer will use 1.6% less electricity in 2020 than last year, primarily as a result of milder expected summer temperatures. According to data from the National Oceanic and Atmospheric Administration (NOAA), there were 5% more U.S. cooling degree days (CDD) during 2019 than on average over the previous 10 years. NOAA is projecting that CDDs in 2020 will be about 4% lower than the 10-year average. In 2021, EIA expects total sales of electricity to the residential sector to rise by 0.4%.

Milder expected summer weather in 2020 also affects the forecast for retail sales of electricity to the commercial sector. The reduced need for air conditioning in the commercial sector is generally offset by continued economic growth. As a result, EIA's overall forecast for U.S. commercial sector retail sales of electricity in 2020 is similar to the level in 2019. In 2021, EIA again expects little change in retail electricity sales to the commercial sector.

EIA forecasts that industrial production by electricity-intensive industries will decline by 1.1% in 2020. This decline in industrial production contributes to EIA's forecast that retail sales of electricity to the industrial sector will fall by 1.1% in 2020. In 2021, EIA forecast retail sales of electricity to the industrial sector will fall by 0.9%.

Electricity Generation. EIA expects 1.0% less total U.S. power generation in the electric power sector during 2020 than in 2019. Electric power sector generation in the forecast falls by an additional 0.3% in 2021. Electricity produced by combined-heat-and-power generators in the industrial and commercial sectors will grow by 1.9% in 2020 and 2.9% in 2021.

The share of U.S. electricity generation supplied by natural gas-fired power plants has increased significantly during the past decade, rising from 23% of total generation in 2010 to an estimated 37% in 2019. This increase in the natural gas share of generation has been offset by reduced generation from coal-fired power plants. Coal supplied 46% of U.S. generation in 2010, compared with an estimated 24% in 2019. Much of this change in the generation mix is a result of sustained low prices for natural gas, which have made it competitive.

EIA expects this trend in the U.S. generation mix will continue in the near term. The electric power sector has added or plans to add 11.4 gigawatts (GW) of generating capacity at natural

gas combined-cycle power plants in 2019 and 2020. These additions represent an increase of 4% of the capacity that existed at the end of 2018. In contrast, the industry has retired, or plans to retire, 18.5 GW (8%) of coal-fired capacity in 2019 and 2020. As a result of these changes in generating capacity and fuel prices that continue to favor natural gas, EIA forecasts that the natural gas-fired share of generation will remain fairly steady and close to its 2019 share of 37%, averaging a 38% share in 2020 and 37% in 2021. The forecast share of generation from coal-fired power plants declines to 21% this year, and slightly less than that in 2021.

EIA expects the share of generation from renewable sources will increase from 17% in 2019 to 19% this year and to 22% in 2021. Within the renewables category, hydropower was 7% of total generation in 2019, and EIA forecasts that it will be about that share in 2020 and in 2021. In the forecast, the share of total generation for renewables other than hydropower, which was 10% in 2019, will rise to 12% in 2020 and to 14% in 2021.

According to the latest information about the U.S. inventory of generating capacity, five nuclear reactors are scheduled to retire in either 2020 or 2021. The nuclear share of total electricity generation, which averaged slightly more than 20% in 2019 will be slightly less than 20% by 2021, consistent with upcoming retirements.

Renewables Capacity. EIA forecasts 13 GW of utility-scale solar photovoltaic (PV) capacity will be added in 2020 and 13 GW more will be added in 2021. EIA also expects a total of 11 GW of small-scale solar PV capacity will be installed during 2020 and 2021, mostly in the residential sector. Various state and federal policies support EIA's forecast solar capacity growth, including California's requirement that, beginning in 2020, all new home construction has rooftop solar panels.

Tariffs on PV modules imported into the United States started at 30% in January 2018, but they have declined to 20% in January 2020 and are expected to decline to 15% in 2021 and expire completely after 2021. During 2018 and 2019, increases in U.S. domestic module prices were, to an extent, offset by declines in global module prices. This price decline was in response to reductions in China's domestic PV installation targets and subsequent release of module inventories for global markets. Although global PV module prices showed signs of stabilizing in 2019, the net price impact of the tariffs versus the surplus of modules is uncertain over the short-term forecast.

EIA expects wind capacity will increase from 106 GW at the end of 2019 to 125 GW at the end of 2020 and to 130 GW by the end of 2021. Because wind capacity is often added at the end of the calendar year, increases in generation frequently lag behind increases in capacity for the year they occur in, and they are reflected in the generation for the next year.

In 2019, onshore wind installations grew as many developers worked to meet the deadline on December 31, 2019, to secure the production tax credit (PTC). However, the Taxpayer Certainty and Disaster Tax Relief Act of 2019 that passed in December included a one-year extension to the wind PTC. The legislation extended the PTC through 2020 and restored it to 60% (from 40%) of its full 2.5 cents per kilowatthour (kWh) value for facilities that either enter service or secure

5% safe harboring (spending at least 5% of the total estimated project cost) through the 2020 calendar year. Because of the safe harboring provision, EIA does not expect the extension to have an effect on capacity additions until after the 2021 forecast horizon.

Electricity Prices. EIA expects wholesale electricity prices in many areas of the country in 2020 will be lower than last year, reflecting the lower cost for natural gas as a fuel for power generation. EIA forecasts that wholesale prices in the Southwest will rise 5% this year as a result of the recent retirement of some coal-fired generating units. In 2021, EIA expects wholesale power prices will increase in most areas as a result of an expected 9% increase in the cost of natural gas.

EIA forecasts the U.S. retail electricity price for the residential sector will average 13 cents/kWh in 2020, which is 1.2% higher than the average retail price in 2019. Forecast residential prices increase by an additional 1.2% in 2021.

U.S. Economic Assumptions and Energy-Related Carbon Dioxide Emissions

EIA used the December 2019 version of the IHS Markit macroeconomic model with EIA's energy price forecasts as model inputs to develop the economic forecasts in STEO.

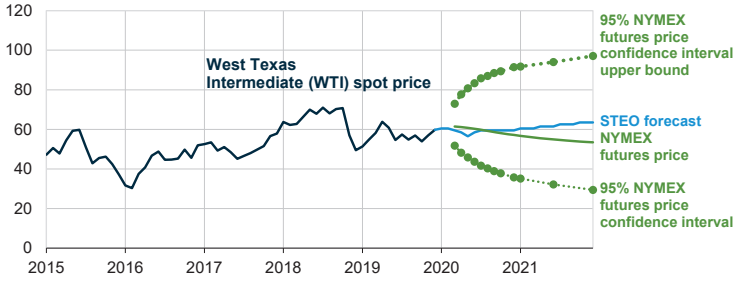
Using the IHS Markit model, EIA forecasts U.S. real gross domestic product (GDP) will grow by 2.0% in 2020 and by 1.8% in 2021, compared with 2.3% in 2019. EIA forecasts that total industrial production will increase 0.3% in 2020 and 0.9% in 2021, compared with 0.8% growth in 2019. EIA forecasts nonfarm employment, which grew by 1.6% in 2019, to increase by 1.1% in 2020 and by 0.6% in 2021.

Using the IHS Markit model, EIA forecasts private real fixed investment will grow by 1.6% in 2020 and by 2.1% in 2021, compared with 1.4% in 2019. EIA forecasts real consumption expenditures, which grew by 2.6% in 2019, to grow by 2.7% in 2020 and by 2.2% in 2021.

Using the IHS Markit model, EIA forecasts U.S. exports will grow by 1.4% in 2020 and by 3.3% in 2021, compared with a decline of 0.3% in 2019. EIA forecasts imports to grow by 2.5% in 2020 and by 4.4% in 2021, compared with 1.3% growth in 2019.

Energy-Related Carbon Dioxide Emissions. After decreasing by 2.1% in 2019, EIA forecasts that energy-related carbon dioxide (CO2) emissions will decrease by 2.0% in 2020 and decrease by 1.5% in 2021. EIA expects CO2 emissions attributable to natural gas alone, which rose by 4.2% in 2019, will rise 1.3% in 2020. However, EIA expects a 1.5% decline in natural gas CO2 in 2021. EIA expects coal-related CO2 will decline by 10.7% in 2020 after declining by 12.7% in 2019. EIA expects an additional decrease of 3.4% in coal-related CO2 in 2021. Energy-related CO2 emissions are sensitive to changes in weather, economic growth, energy prices, and fuel mix.

Notable forecast changes



- For more information, see the detailed table of forecast changes.

This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the United States Government. The views in this report therefore should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

- = no data available

Prices are not adjusted for inflation.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.

EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).

Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

Weather projections from National Oceanic and Atmospheric Administration.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Ecuador, Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Ecuador, Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Libya, and Nigeria (Africa); Ecuador and Venezuela (South America); Iran, Iraq, Kuwait, Saudi Arabia, and the United Arab Emirates (Middle East).

(a) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.
Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

(a) Weighted geometric mean of real indices for various countries with weights equal to each country's share of world oil consumption in the base period. Exchange rate is measured in foreign currency per U.S. dollar. GDP and exchange rate data are from Oxford Economics, and oil consumption data are from EIA.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" inludes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

LNG: liquefied natural gas.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report*, DOE/EIA-0121; and *Electric Power Monthly*, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

Prices are not adjusted for inflation.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Table 7d part 1. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continues on Table 7d part 2*

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distributed solar photovoltaic systems.

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly,* DOE/EIA-0226 and *Renewable Energy Annual,* DOE/EIA-0603; *Petroleum Supply Monthly,* DOE/EIA-0109.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

-- = no data available

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to one megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than one megawatt).

(d) Solar photovoltaic systems smaller than one megawatt, as measured in alternating current.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA-860M database, EIA-826 Solar PV database, and EIA Regional Short-Term Energy Model.

- = no data available

SAAR = Seasonally-adjusted annual rate

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Aviation Administration. Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

- = no data available

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Projections: Macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

Notes: Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National Oceanic and Atmospheric Administration (NOAA).

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Projections: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Independent Statistics & Analysis
U.S. Energy Information Administration

February 2020

Short-Term Energy Outlook (STEO)

Forecast highlights

Global liquid fuels

- EIA expects global petroleum and liquid fuels demand will average 100.3 million barrels per day (b/d) in the first quarter of 2020. This demand level is 0.9 million b/d less than forecast in the January STEO and reflects both the effects of the coronavirus and warmer-than-normal January temperatures across much of the northern hemisphere. EIA now expects global petroleum and liquid fuels demand will rise by 1.0 million b/d in 2020, which is lower than the forecast increase in the January STEO of 1.3 million b/d in 2020, and by 1.5 million b/d in 2021.

- EIA's global petroleum and liquid fuels supply forecast assumes that the Organization of the Petroleum Exporting Countries (OPEC) will reduce crude oil production by 0.5 million b/d from March through May because of lower expected global oil demand in early 2020. This OPEC reduction is in addition to the cuts announced at the group's December 2019 meeting. EIA now forecasts OPEC crude oil production will average 28.9 million b/d in 2020, which is 0.3 million less than forecast in the January STEO. In addition to these production cuts, EIA's lower forecast OPEC production reflects ongoing crude oil production outages in Libya during the first quarter. In general, EIA assumes that OPEC will limit production through all of 2020 and 2021 to target relatively balanced global oil markets.

- Global liquid fuels inventories fell by roughly 0.1 million b/d in 2019, and EIA expects they will grow by 0.2 million b/d in 2020. Although EIA expects inventories to rise overall in 2020, EIA forecasts inventories will build by 0.6 million b/d in the first half of the year because of slow oil demand growth and strong non-OPEC oil supply growth. Firmer demand growth as the global economy strengthens and slower supply growth later in the year contribute to forecast inventory draws of 0.1 million b/d in the second half of 2020. EIA expects global liquid fuels inventories will decline by 0.2 million b/d in 2021.

- Brent crude oil spot prices averaged $64 per barrel (b) in January, down $4/b from December. Brent prices fell steadily through January and into the first week of February, closing at less than $54/b on February 4, the lowest price since December 2018, reflecting market concerns about oil demand. EIA forecasts Brent prices will average $61/b in 2020; with prices averaging $58/b during the first half of the year and $64/b

during the second half of the year. EIA forecasts the average Brent prices will rise to an average of $68/b in 2021.

- EIA forecasts U.S. crude oil production will average 13.2 million b/d in 2020, up 1.0 million b/d from 2019, and then rise to 13.6 million b/d in 2021. Most of the production growth in the forecast occurs in the Permian region of Texas and New Mexico.

Natural gas

- In January, the Henry Hub natural gas spot price averaged $2.02 per million British thermal units (MMBtu), as warm weather contributed to below-average inventory withdrawals and put downward pressure on natural gas prices. As of February 6, the Henry Hub spot price had fallen to $1.86/MMBtu, and EIA expects prices will remain below $2.00/MMBtu in February and March. EIA forecasts that prices will rise in the second quarter of 2020, as U.S. natural gas production declines and natural gas use for power generation increases the demand for gas. EIA expects prices to average $2.36/MMBtu in the third quarter of 2020. EIA forecasts that Henry Hub natural gas spot prices will average $2.21/MMBtu in 2020. EIA expects that natural gas prices will then increase in 2021, reaching an annual average of $2.53/MMBtu.

- U.S. dry natural gas production set a record in 2019, averaging 92.1 billion cubic feet per day (Bcf/d). Although EIA forecasts dry natural gas production will average 94.2 Bcf/d in 2020, a 2% increase from 2019, EIA expects monthly production to generally decline through 2020, falling from an estimated 95.4 Bcf/d in January to 92.5 Bcf/d in December. The falling production mostly occurs in the Appalachian and Permian regions. In the Appalachia region, low natural gas prices are discouraging natural gas-directed drilling, and in the Permian, low oil prices are expected to reduce associated gas output from oil-directed wells. In 2021, EIA forecasts dry natural gas production to stabilize near December 2020 levels at an annual average of 92.6 Bcf/d, a 2% decline from 2020, which would be the first decline in annual average natural gas production since 2016.

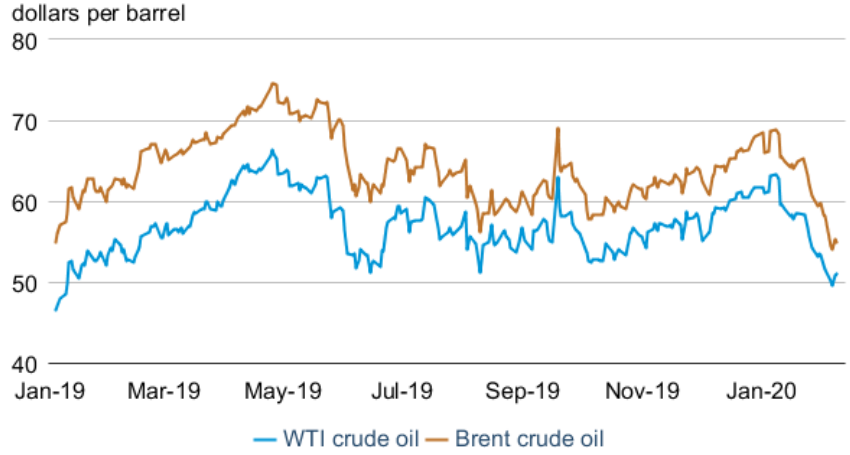
- EIA estimates that U.S. working natural gas inventories ended January at more than 2.6 trillion cubic feet (Tcf), 9% higher than the five-year (2015–19) average. EIA forecasts that total working inventories will end March at almost 2.0 Tcf, 14% higher than the five-year average. In the forecast, inventories rise by a total of 2.1 Tcf during the April through October injection season to reach almost 4.1 Tcf on October 31, which would be the highest end-of-October inventory level on record.

Electricity, coal, renewables, and emissions

- EIA expects the share of U.S. utility-scale electricity generation from natural gas-fired power plants will remain relatively steady; it was 37% in 2019, and EIA forecasts it will be 38% in 2020 and 37% in 2021. Electricity generation from renewable energy sources will rise from a share of 17% last year to 20% in 2020 and 21% in 2021. The increase in

the renewables share is the result of expected use of additions to wind and solar generating capacity. Coal's forecast share of electricity generation will fall from 24% in 2019 to 21% in both 2020 and 2021. The nuclear share of generation, which averaged slightly more than 20% in 2019 will be slightly lower than 20% by 2021, consistent with upcoming reactor retirements.

- EIA forecasts that U.S. coal production will total 595 million short tons (MMst) in 2020, down 95 MMst (14%) from 2019. Lower production reflects declining demand for coal in the electric power sector and lower demand for U.S. exports. EIA forecasts that electric power sector demand for coal will fall by 81 MMst (15%) in 2020. EIA expects that coal production will stabilize in 2021 as export demand stabilizes and U.S. power sector demand for coal increases because of rising natural gas prices.



- After decreasing by 2.3% in 2019, EIA forecasts that energy-related carbon dioxide (CO2) emissions will decrease by 2.7% in 2020 and by 0.5% in 2021. Declining emissions in 2020 reflect forecast declines in total U.S. energy consumption because of increases in energy efficiency and weather effects, particularly as a result of warmer-than-normal January temperatures. A forecast return to normal temperatures in 2021 results in a slowing decline in emissions. Energy-related CO2 emissions are sensitive to changes in weather, economic growth, energy prices, and fuel mix.

Petroleum and natural gas markets review

Crude oil

Prices: The front-month futures price for Brent crude oil settled at $54.93 per barrel (b) on February 6, 2020, a decrease of $11.32/b from January 2, 2020. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, decreased by $10.23/b during the same period, settling at $50.95/b on February 6 **(Figure 1)**.

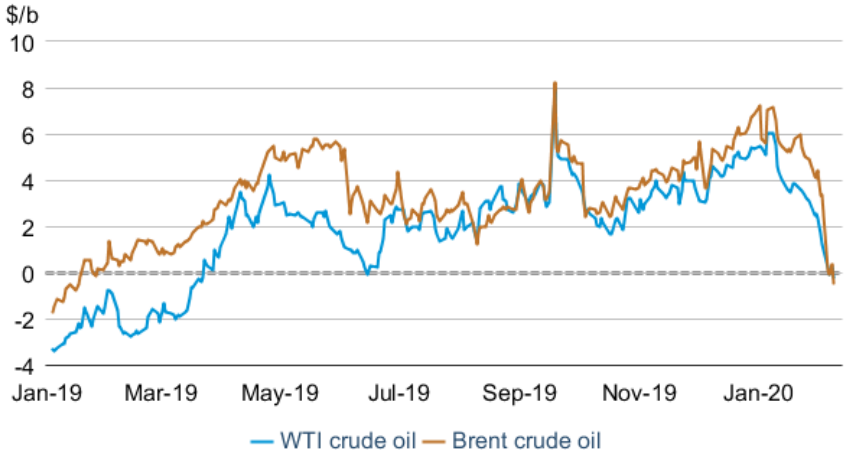
Figure 1. Crude oil front-month futures prices

eia CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.; WTI=West Texas Intermediate

Several events in January contributed to significant uncertainty in crude oil markets and the world economy in general. Early in the month, geopolitical developments drove oil prices. Brent spot prices closed at $70/b on January 6, the highest level since May 2019, following U.S. military operations in Iraq. However, as tensions in the Middle East deescalated and market concerns over any related oil supply disruptions faded, crude oil prices fell. The price declines accelerated with concerns about economic growth as a result of the outbreak of coronavirus. Oil prices declined for five consecutive days starting on January 21. Further reducing demand in January were the warmer-than-normal temperatures across much of the northern hemisphere, which EIA estimates reduced heating oil consumption.

The magnitude and duration of the coronavirus's effects remain highly uncertain, but EIA is reducing its estimates for Chinese and global oil consumption for 2020 as a result of the events. Travel restrictions in China that began in mid-January are disrupting petroleum demand in not only China but also in other countries. EIA expects liquid fuels consumption in China to average 14.8 million barrels per day (b/d) from February through April, when EIA assumes the effects of travel restrictions will be most acute. That level of consumption is 0.4 million b/d less than forecast in last month's STEO. Jet fuel demand is likely to fall because of travel restrictions and demand for other oil products is likely to fall because of lower economic growth.

EIA has also lowered its expected liquid fuels consumption for the rest of Asia (excluding China) by 0.1 million b/d for the February through April period compared with last month's STEO.



In addition to demand disruptions, oil markets faced renewed supply disruptions from Libya, where unrest in the country led to force majeure events at its main export terminals. EIA estimates that the export terminal disruptions caused Libya's crude oil production to average 0.8 million b/d in January, down from 1.2 million b/d in December. The outages became more severe later in the month, and by the first week of February, EIA estimates Libya was producing less than 0.2 million b/d.

EIA acknowledges significant uncertainty in forecasting global oil inventory and crude oil price changes amid both ongoing disruptions in crude oil supply and reductions in oil demand. EIA estimates global inventories increased by 2.5 million b/d in January and will rise by an average of 0.6 million b/d during the first half of 2020, 0.1 million b/d more than expected in last month's STEO. The higher expected inventory builds primarily reflect a downward adjustment to the global liquid fuels consumption forecast. EIA now forecasts consumption will rise by 1.0 million b/d in 2020, compared with forecast growth of 1.3 million b/d in the January STEO. EIA expects that most of the decrease stems from decreased liquid fuels consumption in China during the first half of 2020. EIA expects that some of the effects of lower oil consumption early in 2020 will be offset by reduced production from the Organization of the Petroleum Exporting Countries (OPEC). EIA assumes that OPEC will reduce crude oil production by 0.5 million b/d from March through May in response to concerns over oil demand growth. This cut would be in addition to existing OPEC cuts.

EIA forecasts global oil inventories will begin drawing by the fourth quarter of 2020, which EIA forecasts will provide upward price pressure in the second half of the year. EIA expects the Brent crude oil price will average $58/b in the first half of 2020 before rising to average $64/b during the final six months of the year. Brent crude oil prices are forecast to average $61/b for all of 2020, a decrease of $4/b from the January STEO.

Changes in the shapes of the Brent and WTI futures curves supports EIA's estimates of a looser global oil balance in 2020, reversing the market tightness that developed in the fourth quarter of 2019. Prices for both crude oils now exhibit slight contango (when near-term prices are lower than longer-dated ones) in the 1st–13th month spread. The Brent and WTI 1st–13th spread declined $6.07/b and $5.27/b, respectively, since January 2, 2020. The Brent 1st–13th spread settled at -46 cents/b on February 6, 2020, and the WTI 1st–13th spread settled at -20 cents/b **(Figure 2)**. The contango in the WTI futures curve that developed in January are consistent with increases in U.S. crude oil and other liquids inventories, which—averaging 0.3 million b/d—increased at the fastest pace for the month of January since 2017. In addition, trade press reports a significant decline in China's refinery intake, which is likely contributing to builds in crude oil inventories in Asia.

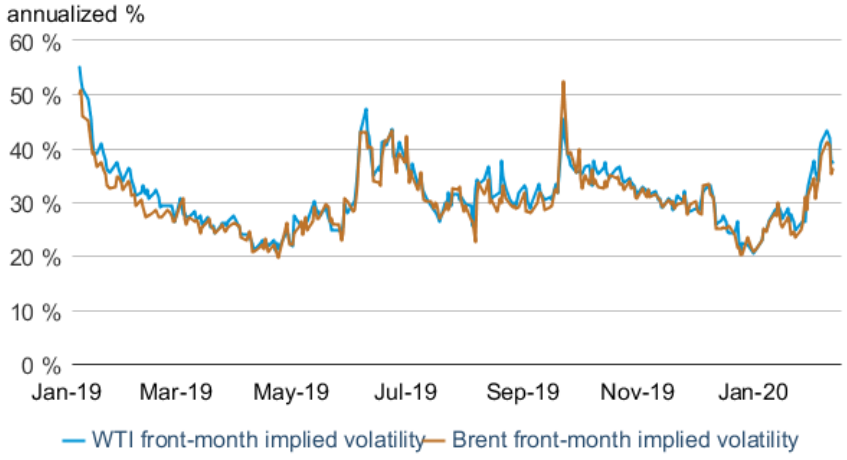


Figure 2. Crude oil front-month to 13th month futures price spread

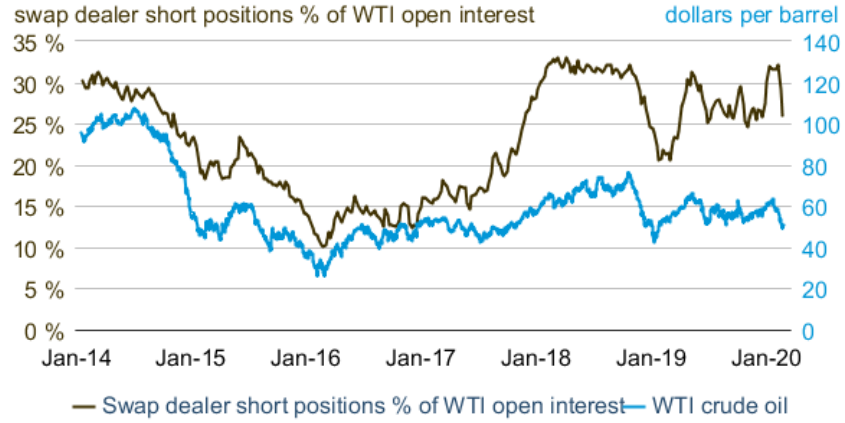
eia CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.; WTI=West Texas Intermediate

Implied volatility: Implied volatility of crude oil prices increased to the highest levels since September 2019 by early February, as illustrated in higher premiums for options contracts amid the uncertainty surrounding global economic growth and supply disruptions in Libya. The implied volatility of Brent prices increased by 9 percentage points from January 2 to settle at 36.0% on February 6. WTI implied volatility increased by 13 percentage points to settle at 37.5% over the same period **(Figure 3)**.

Figure 3. Crude oil implied volatility

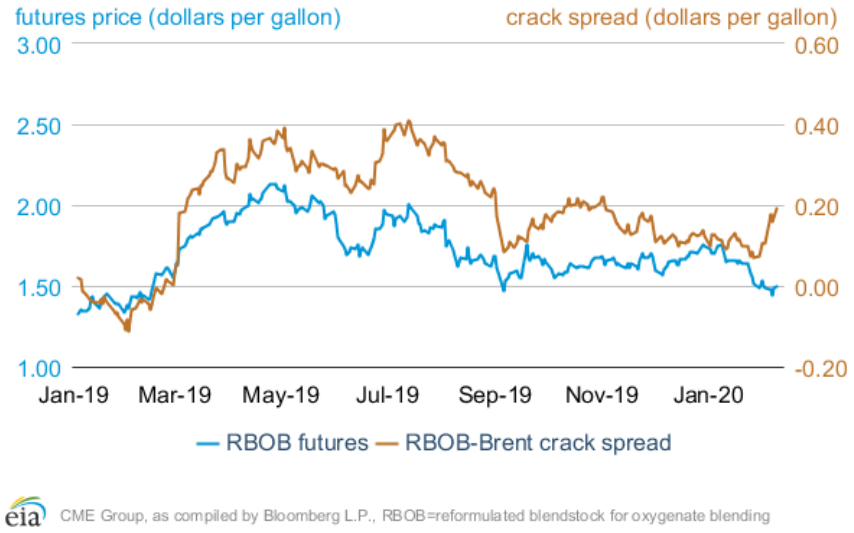


eia CME Group, as compiled by Bloomberg L.P.; WTI=West Texas Intermediate

Swap dealer positions: Short positions held by swap dealers accounted for 32% of the open interest for the WTI futures contract as of January 21, 2020, slightly less than the all-time high of 33%, reached in 2018 **(Figure 4)**. Initiating a short position, or selling a futures contract, enables the holder to lock in a price today for the physical delivery of a commodity at some future date. Oil producers commonly use swap dealers to hedge their future production. Swap dealer short positions increased to 30% of the WTI open interest in mid-December, when WTI prices

increased to more than $60/b. This price level, according to a survey of U.S. exploration and production companies conducted by the Federal Reserve Bank of Dallas, is sufficient to generate enough cash flow from operations for the majority of firms to cover capital expenditures. The increase in swap dealer short may have increased, in part, because U.S. producers hedged some of their expected 2020 production at about $60/b.

Figure 4. Swap dealer short positions as a percentage of total WTI open interest and prices

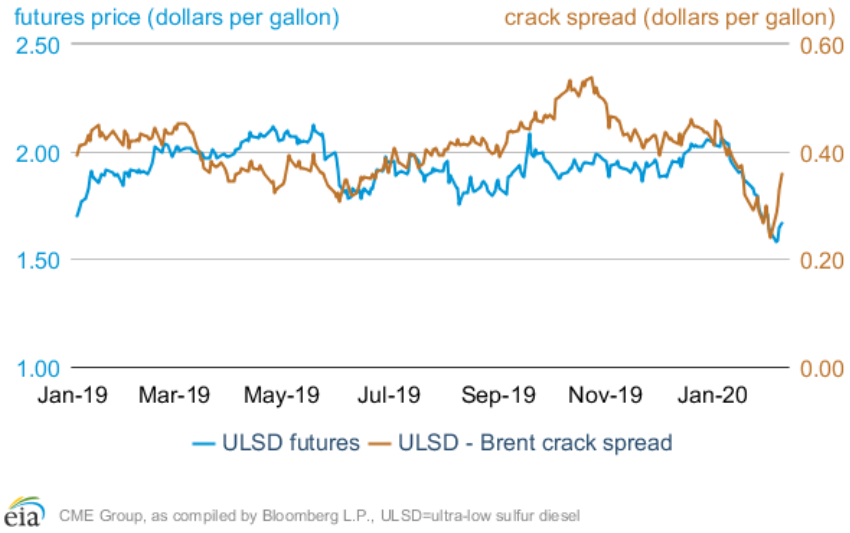


eia CFTC Commitment of Traders Report, CME Group; WTI=West Texas Intermediate

Petroleum products

Gasoline prices: The front-month futures price of reformulated blendstock for oxygenate blending (RBOB, the petroleum component of gasoline used in many parts of the country) settled at $1.50 per gallon (gal) on February 6, down 21 cents/gal from January 2, 2020 **(Figure 5)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) increased by 6 cents/gal to settle at 19 cents/gal during the same period. Almost all of this increase was in the first week of February, when RBOB crack spreads rose after the RBOB and Brent contracts rolled to the next contract month. Despite the recent increase, monthly average RBOB crack spreads were lower in January compared with December, likely because of low U.S. gasoline demand.

Figure 5. Historical RBOB front-month futures prices and crack spread



eia CME Group, as compiled by Bloomberg L.P., RBOB=reformulated blendstock for oxygenate blending

RBOB prices and crack spreads tend to be at their lowest during November and December, and they usually begin increasing in January. However, January 2020 deviated from this trend as monthly average RBOB prices and RBOB crack spreads fell by 5 cents/gal and 2 cents/gal, respectively, relative to December. The decline in RBOB crack spreads is the third consecutive month of month-on-month declines, the longest such streak since November 2018. The downward pressure on prices is supported by record inventory levels. Stocks of motor gasoline for the week ending January 24 reached the highest level ever recorded in EIA weekly data going back to 1990. Both the increase in gasoline inventories and the decline in RBOB prices and crack spreads likely stem from a broader decline in gasoline demand. According to EIA estimates, U.S. consumption of motor gasoline in January declined 5% from the previous month to reach a 36-month low of 8.6 million barrels per day (b/d).

***Ultra-low sulfur diesel prices*:** The ultra-low sulfur diesel (ULSD) front-month futures price settled at $1.67/gal on February 6, 2020, a decrease of 36 cents/gal from January 2, 2020. The ULSD–Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) decreased 9 cents/gal to settle at 36 cents/gal during the same period **(Figure 6)**. The decline in crack spreads likely reflects low heating oil demand because of warmer-than-expected weather and market concerns over global economic growth.

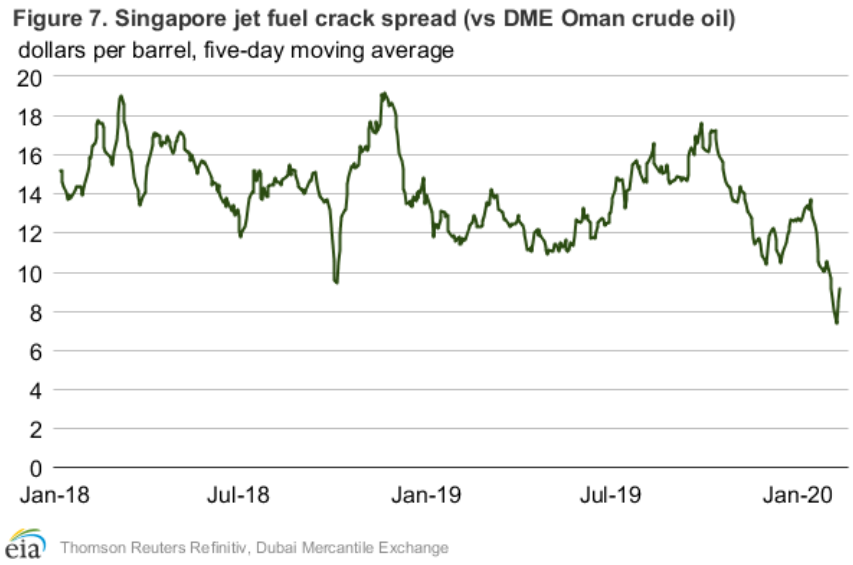


Figure 6. Historical ULSD front-month futures price and crack spread

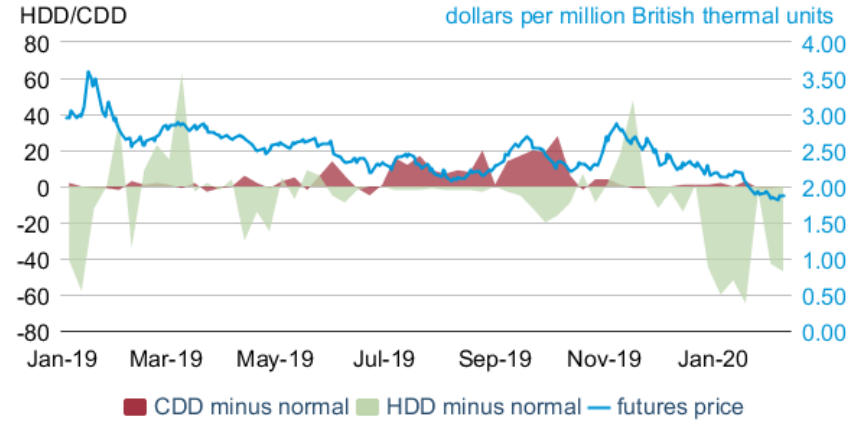
eia CME Group, as compiled by Bloomberg L.P., ULSD=ultra-low sulfur diesel

U.S. distillate inventories recorded a 4.1 million barrel month-on-month increase in January, a rarity for a month in which inventories typically fall. The increase likely reflects the warmer-than-normal U.S. winter. Based on data from the National Oceanic and Atmospheric Administration (NOAA), EIA estimates that U.S. heating degree days (HDD) in January were 18% lower than the 10-year (2010–19) average. However, at 143.2 million barrels, U.S. distillate inventories remain lower than the five-year (2015–19) average of 149.0 million barrels, suggesting some possible tightness in distillate markets. U.S. distillate inventories have not exceeded the previous five-year average since February 2018, and January 2020 retail prices for on-highway diesel fuel were the highest of any January since 2014. EIA, however, forecasts that prices for on-highway diesel fuel will decline by 19 cents/gal in February, following the recent decline in crude oil prices and ULSD crack spreads.

Jet fuel prices: Prices for jet fuel sold in key Asian markets fell sharply in January. The five-day moving average Singapore crack spread for jet fuel against the DME Oman crude oil price declined to $9.11 per barrel (b) on February 6, 2020, a decrease of $3.90/b barrel from January 2, 2020 **(Figure 7)**. The decline in jet fuel crack spreads likely reflects the large increase in flight cancellations in East Asia's economies—most notably China—in the wake of the coronavirus.

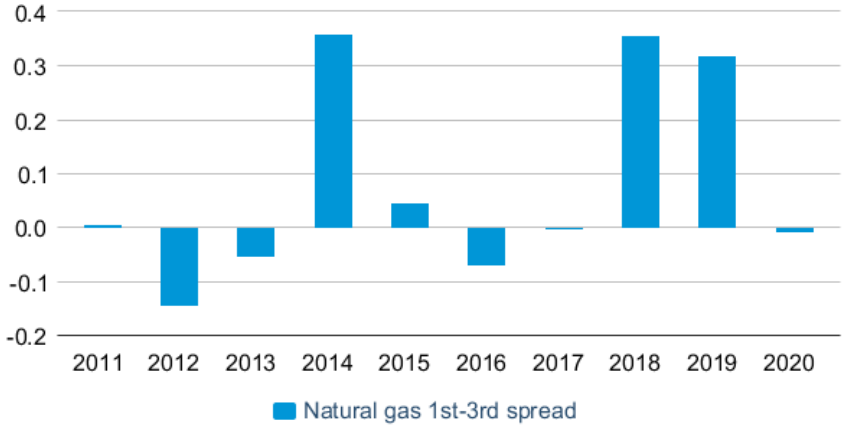


Based on an analysis of publicly available flight data, EIA estimates about 12,000 flights departing from airports located in China, Hong Kong, Taiwan, and Macau were cancelled in January. After factoring in each cancelled flight's distance and adjusting for an estimate of the fuel efficiency of each route's assigned aircraft, EIA estimates that cancellations in these four countries reduced demand for jet fuel by approximately 16,000 b/d during January. According to data from the International Energy Agency, China consumed 860,000 b/d of jet fuel and kerosene in 2019, making this loss equivalent to about 2% of 2019 China's average daily jet fuel consumption. EIA anticipates larger declines during the coming months, assuming the rate of flight cancellations intensifies.

Natural Gas

Prices: The front-month natural gas futures contract for March delivery at the Henry Hub settled at $1.86 per million British thermal units (MMBtu) on February 6, down 26 cents/MMBtu from January 2 **(Figure 8)**. Warmer-than-normal temperatures helped send natural gas front-month futures prices to their lowest level in many years. Typically, January natural gas prices are among the highest of the year. Based on NOAA data, EIA estimates that U.S. heating degree days (HDD) were 18% lower than the 10-year (2010–19) average during January.

Figure 8. Natural gas front-month futures prices and actual minus historical average HDD and CDD



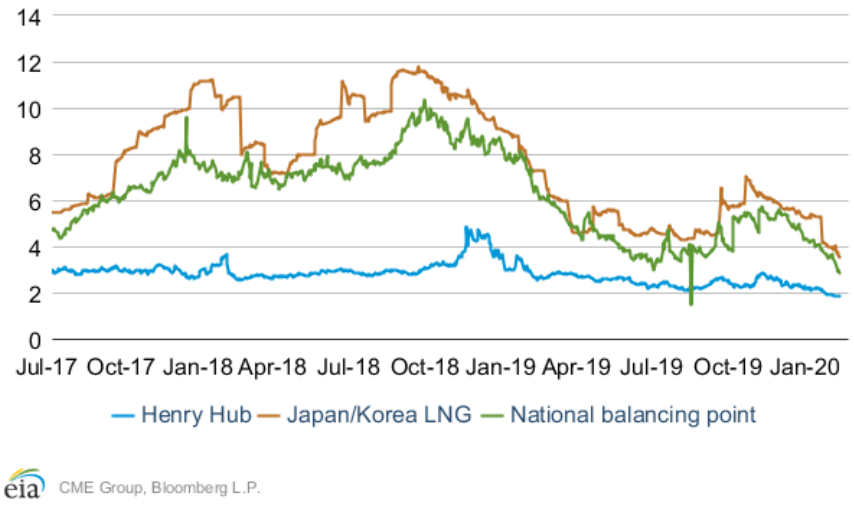
Note: HDD stands for heating degree days, CDD stands for cooling degree days

eia CME Group and National Oceanic and Atmospheric Administration, as compiled by Bloomberg L.P.

Natural gas 1st-3rd spread: The spread between the 1st-month and 3rd-month delivery futures contracts averaged -1 cents/MMBtu in January (**Figure 9**).The spread represents price differences between natural gas delivered in the winter compared with natural gas delivered in the spring, which is typically a seasonally-low consumption period. The spread between the two values can be wide in winters with cold temperatures (as defined by HDD) in January. The difference between the 1st and 3rd month contracts averaged more than 30 cents/MMBtu during January of 2014, 2018, and 2019. Both 2014 and 2018 had more HDD than the 10-year average. However, in years with milder-than-normal weather in January, the spread is generally far smaller or even negative.

Figure 9. Natural gas front-month to third-month average January spread

dollars per million British thermal units



eia U.S. Energy Information Administration; CME Group, as compiled by Bloomberg, L.P.

International natural gas prices: Asia and Europe have also experienced mild temperatures, which has reduced international natural gas and liquefied natural gas (LNG) prices to their lowest average January prices on record in markets like the National Balancing Point in the

United Kingdom and the Japan-Korea Marker (JKM) (**Figure 10**). Likewise, concerns about the effects on economic activity stemming from the current coronavirus outbreak have also likely had a dampening effect on natural gas prices across markets. Lower LNG prices could reduce the competitiveness of U.S. LNG exports if current price levels persist. However, EIA's forecast for LNG exports in 2020 currently remains relatively unchanged from the January STEO.

Figure 10. International natural gas prices

Notable forecast changes

- EIA forecasts Brent crude oil spot prices will average $61 per barrel (b) in 2020 compared with $65/b in the January STEO. The lower price forecast reflects EIA's expectations of slower growth in global petroleum and liquid fuels consumption in 2020. EIA now expects Brent prices to be $7/b lower than previously forecast during the first six months of 2020. During the second half of the year, EIA now expects prices to be $1/b lower than previously forecast.

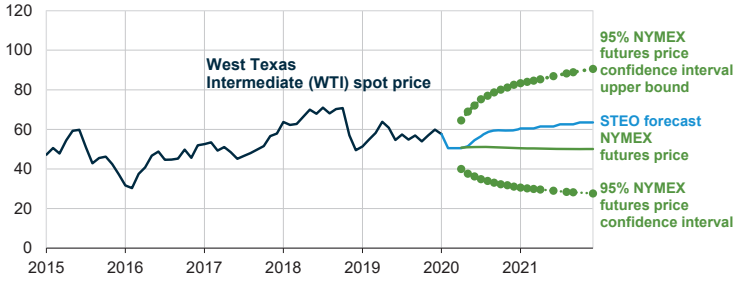
- The global oil consumption growth forecast for 2020 in this month's STEO is 1.0 million barrels per day (b/d), down from a forecast of 1.3 million b/d in the January STEO. The lower global oil demand growth forecast is mostly related to the effects of the coronavirus. EIA expects these oil consumption effects will be concentrated in China but some effects will show up in other countries as well. EIA forecasts that liquid fuels consumption in China will average 14.7 million b/d in the first quarter of 2020 and 15.0 million b/d in the second quarter of 2020, down by 0.3 million b/d and 0.2 million b/d, respectively, from last month's STEO.

- EIA revised diesel fuel wholesale margins downward to reflect recent supply trends and weaker-than-anticipated global diesel demand in tandem with the new International Maritime Organization (IMO) Marine Regulations that were enacted on January 1, 2020.

EIA now forecasts diesel wholesale margins to average 41 cents per gallon (gal) in 2020 (9 cents/gal lower than previously forecast) with a forecast peak of 46 cents/gal in March 2020 (7 cents/gal lower than in the previous forecast). Although diesel wholesale margins began the year much lower than initially forecast, EIA assumes that IMO-driven effects will still put upward pressure on diesel prices in the near future as the global market adjusts to the new regulations and as the more stringent carriage ban on non-compliant marine fuel begins on March 1, 2020.

- Henry Hub natural gas spot prices averaged $2.02 per million British thermal units (MMBtu) in January, which is 16 cents/MMBtu lower than EIA expected in the January STEO. Warmer-than-normal January temperatures reduced space heating demand and left natural gas working inventories 9% higher than the five-year average at the end of the month. With inventories levels expected to remain elevated as the winter heating season winds down, EIA now expects natural gas prices to be lower than previously forecast in the coming months. On average, the EIA forecast Henry Hub spot price will be $2.21/MMBtu in 2020, compared with a forecast of $2.33/MMBtu in the January STEO.

- EIA forecasts U.S. total liquid fuels production will average 21.7 million b/d in 2021, which is 240,000 b/d less than EIA had forecast in the January STEO. The lower forecast liquid fuels production reflects both lower crude oil production and hydrocarbon gas liquids production (HGL). EIA reduced its forecast for U.S. crude oil production in 2021 by 160,000 b/d from the January STEO as a result of lower expected crude oil prices in 2020. There is a lagged effect between changes in crude oil prices and changes in crude oil production. EIA reduced its forecast for U.S. HGL production in 2021 by 80,000 b/d as result of lower expected natural gas prices. Although HGLs are included in the liquid fuels category, their production growth is largely the result of natural gas production.



- For more information, see the detailed table of STEO forecast changes.

- = no data available

Prices are not adjusted for inflation.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.

EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).

Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

Weather projections from National Oceanic and Atmospheric Administration.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Ecuador, Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Ecuador, Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" inludes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

LNG: liquefied natural gas.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report*, DOE/EIA-0121; and *Electric Power Monthly*, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distributed solar photovoltaic systems.

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly,* DOE/EIA-0226 and *Renewable Energy Annual,* DOE/EIA-0603; *Petroleum Supply Monthly,* DOE/EIA-0109.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

-- = no data available

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to one megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than one megawatt).

(d) Solar photovoltaic systems smaller than one megawatt, as measured in alternating current.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA-860M database, EIA-826 Solar PV database, and EIA Regional Short-Term Energy Model.

- = no data available

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Projections: Macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

Notes: Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National Oceanic and Atmospheric Administration (NOAA).

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Projections: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Appendix to the February 2020 *Short-Term Energy Outlook*

This appendix is prepared in fulfillment of section 1245(d)(4)(A) of the National Defense Authorization Act (NDAA) for Fiscal Year 2012, as amended. The law requires the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy, to submit to Congress a report on the availability and price of petroleum and petroleum products produced in countries other than Iran in the two-month period preceding the submission of the report. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The data in this appendix, therefore, should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

EIA consulted with the U.S. Department of the Treasury, the U.S. Department of State, and the intelligence community in the process of developing the NDAA report, which was previously published as a stand-alone report. Detailed background and contextual information not repeated here can be found in early editions of the NDAA report.

This appendix is published in the *Short-Term Energy Outlook* in even numbered months.

Table a1. Summary of Estimated Petroleum and Other Liquids Quantities

	Dec 2019	Jan 2020	Dec 19-Jan 2020 Average	Dec 18-Jan 2019 Average	2016- 2018 Average
Global Petroleum and Other Liquids (million barrels per day)					
Global Petroleum and Other Liquids Production (a)	101.5	101.0	101.2	101.3	98.8
Global Petroleum and Other Liquids Consumption (b)	102.1	98.5	100.3	99.8	98.5
Biofuels Production (c)	2.2	2.0	2.1	2.1	2.4
Biofuels Consumption (c)	2.4	2.3	2.3	2.3	2.3
Iran Liquid Fuels Production	2.6	2.5	2.5	3.6	4.5
Iran Liquid Fuels Consumption	2.1	2.0	2.0	1.9	1.8
Petroleum and Petroleum Products Produced and Consumed in Countries Other Than Iran (million barrels per day)					
Production (d)	96.8	96.5	96.6	95.7	91.9
Consumption (d)	97.6	94.2	95.9	95.7	94.4
Production minus Consumption	-0.8	2.3	0.7	0.0	-2.5
World Inventory Net Withdrawals Including Iran	0.6	-2.5	-1.0	-1.5	-0.4
Estimated OECD Inventory Level (e) (million barrels)	2,894	2,926	2,910	2,867	2,963
Surplus Production Capacity (million barrels per day)					
OPEC Surplus Crude Oil Production Capacity (f)	2.1	2.2	2.1	1.6	1.6

Note: The term “petroleum and other liquids” encompasses crude oil, lease condensate, natural gas liquids, biofuels, coal-to-liquids, gas-to-liquids, and refinery processing gains, which are important to consider in concert due to the inter-related supply, demand, and price dynamics of petroleum, petroleum products, and related fuels.
(a) Production includes crude oil (including lease condensates), natural gas liquids, other liquids, and refinery processing gains.
(b) Consumption of petroleum by the OECD countries is synonymous with “products supplied," defined in the glossary of the EIA Petroleum Supply Monthly, DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel, and loss, and bunkering.
(c) Biofuels production and consumption are based on EIA estimates as published in the International Energy Statistics. Biofuels production in the third quarter tends to be at its highest level in the year as ethanol production in Brazil reaches its seasonal peak and is typically lowest in the first quarter as seasonal production falls in the South/South-Central region of Brazil.
(d) Global production of petroleum and petroleum products outside of Iran is derived by subtracting biofuels production and Iran liquid fuels production from global liquid fuels production. The same method is used to calculate global consumption outside of Iran.
(e) Estimated inventory level is for OECD countries only.
(f) EIA defines surplus oil production capacity as potential oil production that could be brought online within 30 days and sustained for at least 90 days, consistent with sound business practices. This does not include oil production increases that could not be sustained without degrading the future production capacity of a field.

Independent Statistics & Analysis
U.S. Energy Information Administration

March 2020

Short-Term Energy Outlook (STEO)

Forecast highlights

Global liquid fuels

- EIA delayed the release of the March STEO update by one day to incorporate recent significant global oil market developments. On March 9, Brent crude oil front-month futures prices fell below $35/b, a 24% daily decline and the second largest daily price decline on record. Prices fell following the March 6 meeting between members of the Organization of the Petroleum Exporting Countries (OPEC) and its partner countries, which ended without an agreement on production levels amid market expectations for declining global oil demand growth in the coming months. In addition to the following highlights, EIA has provided a short summary of the March STEO forecast in the crude oil section of the *Petroleum and Natural Gas Markets Review* (PNGMR).

- As a result of the outcome of the March 6 OPEC meeting, EIA's forecast assumes that OPEC will target market share instead of a balanced global oil market. EIA forecasts OPEC crude oil production will average 29.2 million barrels per day (b/d) from April through December 2020, up from an average of 28.7 million b/d in the first quarter of 2020. EIA forecasts OPEC crude oil production will rise to an average of 29.4 million b/d in 2021. The OPEC production data in the March STEO include Ecuador, which finalized its withdrawal from OPEC at the March 6 meeting. Beginning with the April 2020 STEO, EIA will include Ecuador's production volumes in non-OPEC data.

- EIA expects global petroleum and liquid fuels consumption will average 99.1 million b/d in the first quarter of 2020, a decline of 0.9 million b/d from the same period in 2019. EIA expects global petroleum and liquid fuels demand will rise by less than 0.4 million b/d in 2020 and by 1.7 million b/d in 2021. Lower global oil demand growth for 2020 in the March STEO reflects a reduced assumption for global economic growth along with reduced expected travel globally because of the 2019 novel coronavirus disease (COVID-19).

- EIA expects that global liquid fuels inventories will grow by an average of 1.0 million b/d in 2020 after falling by about 0.1 million b/d in 2019. EIA expects inventory builds will be largest in the first half of 2020, rising at a rate of 1.7 million b/d because of slow oil demand growth. Firmer demand growth as the global economy strengthens and slower supply growth will contribute to balanced markets in the fourth quarter of 2020 and

global oil inventory draws in 2021. EIA expects global liquid fuels inventories will decline by 0.4 million b/d in 2021.

- EIA forecasts Brent crude oil prices will average $43/b in 2020, down from an average of $64/b in 2019. For 2020, EIA expects prices will average $37/b during the second quarter and then rise to $42/b during the second half of the year. EIA forecasts that average Brent prices will rise to an average of $55/b in 2021, as declining global oil inventories put upward pressure on prices.

- EIA forecasts U.S. crude oil production will average 13.0 million b/d in 2020, up 0.8 million b/d from 2019, but then fall to 12.7 million b/d in 2021. The forecast decline in 2021 is in response to lower oil prices and would mark the first annual U.S. crude oil production decline since 2016. EIA models show oil prices affect production after about a six-month lag. Despite forecast annual average growth of 0.8 million b/d in 2020, EIA expects monthly U.S. crude oil production to begin declining around May, with production falling from 13.2 million b/d in May to 12.8 million b/d in December 2020.

- Based on the lower crude oil price forecast, EIA expects U.S. retail prices for regular grade gasoline to average $2.14 per gallon (gal) in 2020, down from $2.60/gal in 2019. EIA expects retail gasoline prices to fall to a monthly average of $1.97/gal in April before rising to an average of $2.13/gal from June through August.

Natural gas

- In February, the Henry Hub natural gas spot price averaged $1.91 per million British thermal units (MMBtu). Warmer-than-normal temperatures in February reduced demand for space heating and put downward pressure on prices. EIA forecasts that prices will begin to rise in the second quarter of 2020 as U.S. natural gas production declines and natural gas use for power generation increases the demand for natural gas. EIA expects prices to average $2.22/MMBtu in the third quarter of 2020. EIA forecasts that Henry Hub natural gas spot prices will average $2.11/MMBtu in 2020. EIA expects that natural gas prices will then increase in 2021, reaching an annual average of $2.51/MMBtu.

- U.S. dry natural gas production set a record in 2019, averaging 92.2 billion cubic feet per day (Bcf/d). Although EIA forecasts dry natural gas production will average 95.3 Bcf/d in 2020, a 3% increase from 2019, EIA expects monthly production to generally decline through 2020, falling from an estimated 96.5 Bcf/d in February to 92.3 Bcf/d in December. The falling production mostly occurs in the Appalachian and Permian regions. In the Appalachian region, low natural gas prices are discouraging producers from engaging in natural gas-directed drilling, and in the Permian region, low oil prices reduce associated gas output from oil-directed wells. In 2021, EIA forecasts dry natural gas production will rise from December 2020 levels in response to higher prices. Forecast dry natural gas production for 2021 averages 92.6 Bcf/d.

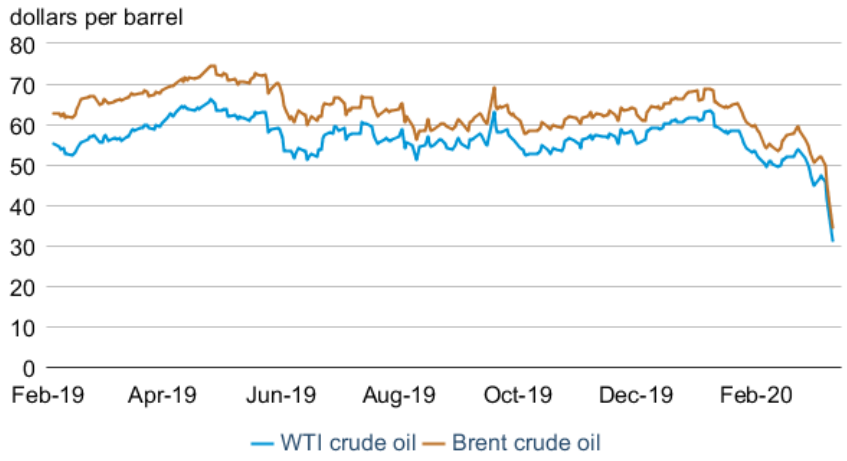
- EIA estimates that total U.S. working natural gas in storage ended February at 2.1 trillion cubic feet (Tcf), 9% more than the five-year (2015–19) average. EIA forecasts that total working inventories will end March at 1.9 Tcf, 12% more than the five-year average. In the forecast, inventories rise by almost 2.1 Tcf during the April through October injection season to reach almost 4.0 Tcf on October 31.

Electricity, coal, renewables, and emissions

- EIA expects the annual share of U.S. utility-scale electricity generation from natural gas-fired power plants will remain relatively steady through the forecast; it was 37% in 2019, and EIA forecasts it will average 39% in 2020 and 37% in 2021. Coal's forecast share of electricity generation falls from 24% in 2019 to 21% in both 2020 and 2021. Electricity generation from renewable energy sources rises from a share of 17% last year to 19% in 2020 and to 21% in 2021. The increase in the renewables share is the result of additions to wind and solar generating capacity. The nuclear share of generation averaged 20% in 2019 and is expected to remain about the same in 2020 and 2021.

- EIA forecasts that U.S. coal production will total 573 million short tons (MMst) in 2020, down 117 MMst (17%) from 2019. Lower production reflects declining demand for coal in the electric power sector and lower demand for U.S. exports. EIA forecasts that electric power sector demand for coal will fall by 86 MMst (16%) in 2020. EIA expects that U.S. coal production will stabilize in 2021 as export demand rises and U.S. power sector demand for coal increases slightly because natural gas prices increase.

- After decreasing by 2.8% in 2019, EIA forecasts that energy-related carbon dioxide (CO2) emissions will decrease by 2.2% in 2020 and by 0.4% in 2021. Declining emissions in 2020 reflect forecast declines in total U.S. energy consumption because of energy efficiency and weather effects, particularly as a result of warmer-than-normal temperatures in January and February. A forecast return to normal temperatures in 2021 results in a slowing decline in emissions. Energy-related CO2 emissions are sensitive to changes in weather, economic growth, energy prices, and fuel mix.



Petroleum and natural gas markets review

Crude oil

Markets for oil, as well as other commodities and equities, have experienced significant volatility and price declines since the final week in February amid concerns over the economic effects of the 2019 novel coronavirus disease (COVID-19). In addition, oil markets, in particular, have responded more recently to the outcome of the OPEC and partners meeting on March 6 with decreased oil prices that affected financial markets.

Brent and West Texas Intermediate (WTI) crude oil prices settled at $34.36 per barrel (b) and $31.13/b on March 9, respectively, declines of $20.09/b and $18.98/b from February 3, 2020 **(Figure 1)**. On March 9, Brent and WTI front-month futures prices declined by 24% and 25%, respectively, the second largest one-day decline in each of their respective futures price histories.

Figure 1. Crude oil front-month futures prices

eia CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.; WTI=West Texas Intermediate

EIA acknowledges significant uncertainty amid a highly volatile market environment. Several recent developments have contributed to significant revisions in EIA's outlook for global oil demand and supply:

- Slowing forecasts for global economic growth, primarily as a result of COVID-19, have led to significant downward revisions in EIA's global oil demand forecast. Reports of new cases of the virus in countries outside of China have led to restrictions on international and domestic travel as well as reduced activity among global manufacturers.
- As a result of the March 6 OPEC and partners meeting, EIA no longer assumes production management from OPEC members or partner countries that were previously voluntarily reducing production. Previously, EIA assumed OPEC would limit production in 2020 and 2021 to target relatively balanced global oil markets.

- Lower forecast crude oil prices lead to lower U.S. crude oil production, as a result of a price-induced reduction in drilling and completion activity.

Demand: Both lower assumed global economic growth and reduced global travel contribute to EIA's forecast of 0.4 million barrels per day (b/d) for global oil demand growth in 2020, a reduction from the January STEO forecast of 1.3 million b/d (EIA's January STEO did not include COVID-19-related demand effects). Most of the reduction is in China, where EIA lowered expected growth for 2020 to 0.1 million b/d, down from a forecast of 0.5 million b/d in the January STEO. EIA also made significant downward revisions to the demand forecasts for Japan, South Korea, and Italy.

The reduced demand forecast has three main drivers: lower assumptions of economic growth, less expected air travel, and other reductions in demand not captured by these two categories. Based on forecasts from Oxford Economics, EIA reduced its assumption for 2020 global oil-weighted growth in gross domestic product (GDP) to 2.1% from the assumption of 2.4% in the January STEO. Updated information on flight cancellations also led EIA to revise its assumptions for the direct loss of jet fuel consumption from reduced air travel in the first and second quarters of 2020. Finally, EIA assumes additional lost oil demand not captured by GDP and air travel. Notable among these factors are more lost demand in China's petrochemical sector and more lost demand from road travel in China. However, these estimates are based on preliminary data, along with assumptions about the severity and duration of effects on oil demand, in the absence of actual data.

This forecast assumes the demand effects from COVID-19 will diminish by the third quarter of 2020, with demand growth resuming its previous trend through the remainder of the forecast.

OPEC supply: The outcome of the March 6 OPEC meeting has caused EIA to revise its OPEC crude oil production forecast. After the March 6 meeting, OPEC and partner countries did not agree to further production cuts beyond those currently expiring March 31, 2020. In contrast to the February STEO, EIA no longer expects active production management to target balanced global oil markets among OPEC members or partner countries. These countries had been limiting production under the Declaration of Cooperation, initially agreed to in December 2016.

EIA expects OPEC crude oil production will average 29.1 million b/d in the second and third quarters 2020, up from 28.7 million b/d in the first quarter of 2020. However, production levels targeted by OPEC amid low oil demand are uncertain, and realized levels will have a significant effect on crude oil prices. Unplanned supply outages in Libya add additional uncertainty to the OPEC forecast. Crude oil production in Libya has declined by 1.0 million b/d since December 2019, and EIA estimates February production in Libya averaged 150,000 b/d.

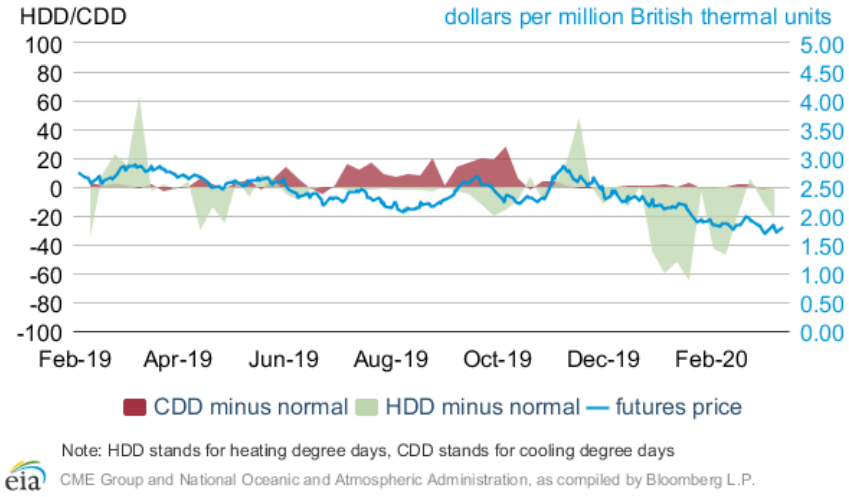
Prices and inventories: EIA forecasts Brent crude oil prices will average $43/b in 2020, down from a forecast of $65/b in the January STEO, and then increase to an average of $55/b in 2021. EIA forecasts the decline in liquid fuels demand combined with an increase in OPEC production during the next two quarters will contribute to significant increases in global liquid fuels

inventories. EIA forecasts global oil inventory builds in the first half of 2020 to average 1.7 million b/d before moving to a balanced market in the fourth quarter.

With demand growth accelerating and U.S. crude oil production declining in 2021, EIA forecasts inventory withdrawals to average 0.4 million b/d for the year. EIA expects these consistent inventory withdrawals will put upward pressure on crude oil prices and bring Brent crude oil prices to $60 by the end of next year. However, the recovery of global oil demand in late 2020 and 2021, the response of U.S. crude oil production to low prices, and the production decisions of OPEC amid these factors are all highly uncertain.

U.S. crude oil production: EIA forecasts U.S. crude oil production will average 13.0 million b/d in 2020 and fall to 12.7 million b/d in 2021. These estimates are 0.3 million b/d and 1.1 million b/d lower than in the January STEO. If realized, a production decline next year would be the first year-on-year decline in production since 2016.

Lower crude oil output in the forecast results from lower crude oil prices leading to a reduction in drilling and completion activity. For 2020, EIA's WTI crude oil price forecast averages $38/b for the year, a decline of $19/b from 2019 levels, and $21/b lower than forecast in the January STEO. EIA models show about a six-month lag between changes in crude oil price and changes in wellhead production. Given that lag, EIA expects recent declines in price to lower production beginning in the third quarter of 2020.



For 2021, EIA expects WTI prices will rise to an average of $50/b, which EIA expects will contribute to U.S. crude oil production rising again by the fourth quarter of 2020.

EIA estimates that onshore crude oil production in the Lower 48 states will average 10.6 million b/d in 2020, an increase of 0.7 million b/d from 2019 levels, and then fall by 0.4 million b/d to average 10.2 million b/d in 2021. In 2020, production growth comes largely from the Permian region. In 2021, the production declines are mostly attributed to the Bakken and Eagle Ford regions, with the Permian region expected to see flat growth.

Natural Gas

Prices: The front-month natural gas futures contract for April delivery at the Henry Hub settled at $1.78 per million British thermal units (MMBtu) on March 9, down 4 cents/MMBtu from February 3 **(Figure 2)**. Warmer-than-normal weather patterns continued to keep prices at historically low levels.

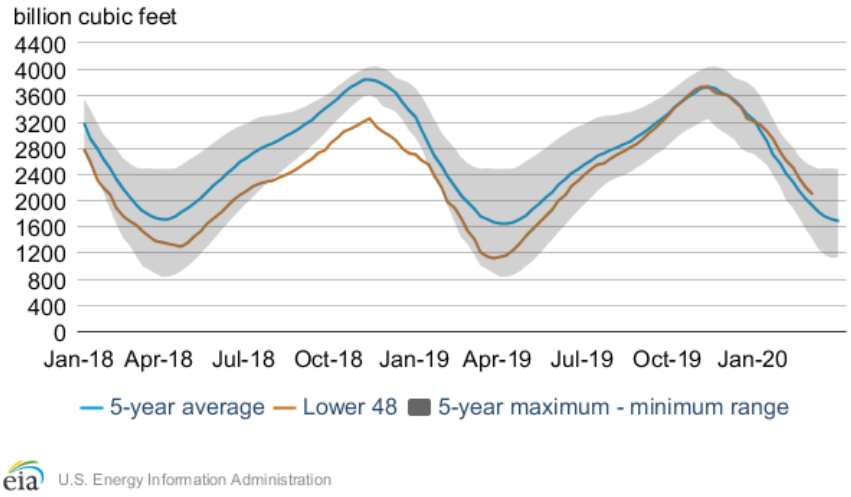


Figure 2. Natural gas front-month futures prices and actual minus historical average HDD and CDD

Note: HDD stands for heating degree days, CDD stands for cooling degree days
CME Group and National Oceanic and Atmospheric Administration, as compiled by Bloomberg L.P.

Natural gas stocks: Despite warmer-than-normal temperatures during February, 5% more natural gas was withdrawn from underground storage during the four weeks ending February 28, 2020 than the five-year (2015–19) average, which likely reflected growth in natural gas consumption for power generation. However, there was more natural gas in underground storage at the end of February than the five-year average (**Figure 3**). This February contrasts with the relatively cold conditions during February 2019, when storage levels at the end of the month fell 24% lower than the five-year (2014–18) average. More natural gas in storage this year relative to both the five-year average and year-ago levels contributed to 78 cents/MMBtu lower Henry Hub spot prices in February 2020 compared with February 2019. EIA expects natural gas in storage to build at a rate close to the five-year average during the upcoming April–October injection season, and forecasts that natural gas in storage will end October at almost 4.0 trillion cubic feet, 6% more than the five-year average. With rising temperatures in the coming months causing increased use of natural gas for power generation, EIA expects Henry Hub prices to rise to an average of $2.22/MMBtu in the third quarter of 2020. Although that level would be an increase from current levels, it would be 16 cents/MMBtu lower than in the third quarter of 2019.

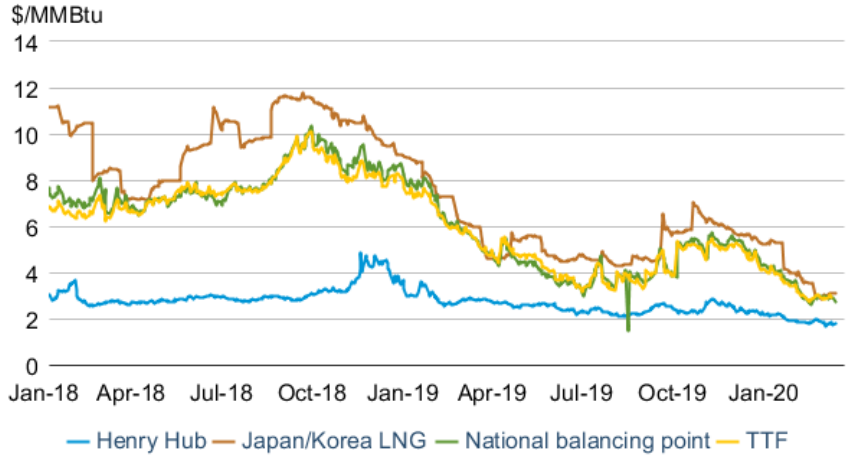

Figure 3. Working gas in underground storage compared with the 5-year maximum and minimum

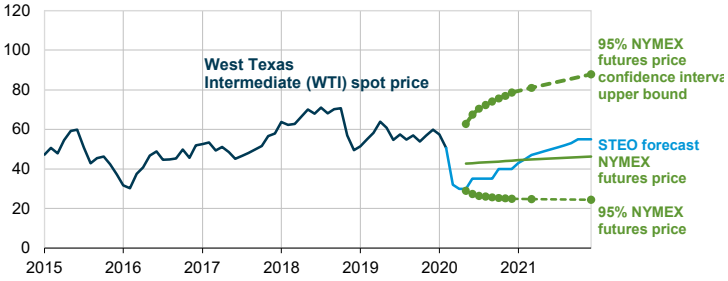
eia U.S. Energy Information Administration

International natural gas prices: Europe and Asia have also experienced warmer-than-normal winter weather. As a result, natural gas benchmarks for Europe (the Title Transfer Facility, or TTF, and the National Balancing Point, or NBP) and Asia (Japan-Korea Marker, or JKM) have followed an even steeper downward trend compared with the Henry Hub contract **(Figure 4).** At the end of February, the JKM price reached near parity with TTF, although it typically trades at a premium. The decline of global natural gas prices and narrowing of spreads between markets likely reflects lower demand levels and reduced need for imports in European and Asian markets. EIA expects U.S. LNG exports will average 5.3 Bcf/d in the second quarter of 2020, down by 0.5 Bcf/d from the February STEO.

Figure 4. International natural gas prices

eia CME Group, Bloomberg L.P.

Notable forecast changes



- EIA significantly revised its short-term outlooks for global oil supply, demand, and prices compared with the February STEO. These updates largely resulted from updated data and assumptions about the effects of the 2019 novel coronavirus disease (COVID-19) on global oil demand and assumptions regarding OPEC's crude oil production following its March 6 meeting. In order to incorporate changed assumptions regarding the OPEC meeting, EIA is releasing this STEO update one day later than scheduled. These changes in global oil assumptions are wide ranging and are summarized in EIA's forecast changes table.
- EIA expects Henry Hub natural gas spot prices to average $2.11 per million British thermal units in 2020, 10 cents/MMBtu lower than last month's forecast.
- EIA forecasts that U.S. liquefied natural gas exports will average 5.3 billion cubic feet per day (Bcf/d) in the second quarter of 2020 and 6.3 Bcf/d in the third quarter of 2020. These forecasts are 0.5 Bcf/d and 0.2 Bcf/d lower, respectively, than forecast in the February STEO because of less expected global demand for natural gas.
- EIA expects U.S. coal exports in 2020 to average 78 million short tons, which is 9% lower than forecast in the February STEO. The lower forecast reflects less expected global demand for U.S. coal in this forecast compared with last month.
- For more information, see the detailed table of STEO forecast changes.

This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the United States Government. The views in this report therefore should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

- = no data available
Prices are not adjusted for inflation.
(a) Includes lease condensate.
(b) Total consumption includes Independent Power Producer (IPP) consumption.
(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.
(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER). Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).
Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.
Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.
Minor discrepancies with published historical data are due to independent rounding.
Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.
Weather projections from National Oceanic and Atmospheric Administration.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Ecuador, Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Ecuador, Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Table 3c. OPEC Crude Oil (excluding condensates) Supply (million barrels per day)

(a) Weighted geometric mean of real indices for various countries with weights equal to each country's share of world oil consumption in the base period. Exchange rate is measured in foreign currency per U.S. dollar. GDP and exchange rate data are from Oxford Economics, and oil consumption data are from EIA.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" inludes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

LNG: liquefied natural gas.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report*, DOE/EIA-0121; and *Electric Power Monthly*, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

Table 8a. U.S. Renewable Energy Consumption (Quadrillion Btu)

- = no data available

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distributed solar photovoltaic systems.

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly,* DOE/EIA-0226 and *Renewable Energy Annual,* DOE/EIA-0603; *Petroleum Supply Monthly,* DOE/EIA-0109.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

-- = no data available

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to one megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than one megawatt).

(d) Solar photovoltaic systems smaller than one megawatt, as measured in alternating current.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA-860M database, EIA-826 Solar PV database, and EIA Regional Short-Term Energy Model.

Total Energy (c)	**1,374**	**1,178**	**1,291**	**1,291**	*1,326*	*1,164*	*1,270*	*1,264*	*1,346*	*1,150*	*1,250*	*1,257*	**5,135**	*5,024*	*5,003*

- = no data available

SAAR = Seasonally-adjusted annual rate

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Aviation Administration. Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

- = no data available

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Projections: Macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

U.S. Energy Information Administration

April 2020

Short-Term Energy Outlook (STEO)

Forecast highlights

Global liquid fuels

- Although all market outlooks are subject to many risks, the April edition of EIA's *Short-Term Energy Outlook* is subject to heightened levels of uncertainty because the impacts of the 2019 novel coronavirus disease (COVID-19) on energy markets are still evolving. The COVID-19 pandemic has caused significant changes in energy fuel supply and demand patterns. Crude oil prices, in particular, have fallen significantly since the beginning of 2020, largely driven by the economic contraction caused by COVID-19 and a sudden increase in crude oil supply following the suspension of previously agreed upon production cuts among the Organization of the Petroleum Exporting Countries (OPEC) and partner countries. Similar uncertainties persist across EIA's outlook for other energy sources, including natural gas and electricity. Despite recent news of OPEC+ emergency meetings within the next few days to discuss production levels, without an agreement actually in place, EIA assumes no re-implementation of an OPEC+ agreement during the forecast period. If there is ultimately an agreement, this forecast will incorporate that information into its ensuing release.

- EIA forecasts that the United States will return to being a net importer of crude oil and petroleum products in the third quarter of 2020 and remain a net importer in most months through the end of the forecast period. This is a result of higher net imports of crude oil and lower net exports of petroleum products. Net crude oil imports are expected to increase because as U.S. crude oil production declines, there will be fewer barrels available for export. On the petroleum product side, net exports will be lowest in the third quarter of 2020, when U.S. refinery runs are expected to decline significantly.

- Brent crude oil prices averaged $32/barrel (b) in March, a decrease of $24/b from the average in February and the lowest monthly average since January 2016. EIA forecasts Brent crude oil prices will average $33/b in 2020, $10/b lower than in last month's STEO and down from an average of $64/b in 2019. EIA expects prices will average $23/b during the second quarter of 2020 before increasing to $30/b during the second half of the year. EIA forecasts that average Brent prices will rise to an average of $46/b in 2021, $10/b lower than forecast last month, as a return to declining global oil inventories puts upward pressure on prices.

- EIA estimates global petroleum and liquid fuels consumption averaged 94.4 million barrels per day (b/d) in the first quarter of 2020, a decline of 5.6 million b/d from the same period in 2019. EIA expects global petroleum and liquid fuels demand will decrease by 5.2 million b/d in 2020 from an average of 100.7 million b/d last year before increasing by 6.4 million b/d in 2021. Lower global oil demand growth for 2020 in the April STEO reflects growing evidence of significant disruptions to global economic activity along with reduced expected travel globally because of COVID-19.

- EIA expects that global liquid fuels inventories will grow by an average of 3.9 million b/d in 2020 after falling by about 0.2 million b/d in 2019. EIA expects inventory builds will be largest in the first half of 2020, rising at a rate of 5.7 million b/d in the first quarter and increasing to builds of 11.4 million b/d in the second quarter as a result of widespread travel limitations and sharp reductions in economic activity. Firmer demand growth as the global economy begins to recover and slower supply growth will contribute to global oil inventory draws beginning in the fourth quarter of 2020. EIA expects global liquid fuels inventories will decline by 1.7 million b/d in 2021.

- EIA forecasts significant decreases in U.S. liquid fuels demand during the first half of 2020 as a result of COVID-19 travel restrictions and significant disruptions to business and economic activity. EIA expects that the largest impacts will occur in the second quarter of 2020, before gradually dissipating over the course of the next 18 months. EIA expects U.S. motor gasoline consumption to fall by 1.7 million b/d from the first quarter of 2020 to an average of 7.1 million b/d in the second quarter, before gradually increasing to 8.9 million b/d in the second half of the year. U.S. jet fuel consumption will fall by 0.4 million b/d from the first quarter of 2020 to average 1.2 million b/d in the second quarter. U.S. distillate fuel oil consumption would see a smaller decline, falling by 0.2 million b/d to average 3.8 million b/d over the same period. In 2020, EIA forecasts that U.S. motor gasoline consumption will average 8.4 million b/d, a decrease of 9% compared with 2019, while jet fuel and distillate fuel oil consumption will fall by 10% and 5%, respectively over the same period.

- For the April–September 2020 summer driving season, EIA forecasts U.S. regular gasoline retail prices will average $1.58 per gallon (gal), down from an average of $2.72/gal last summer (*Summer Fuels Outlook*). The lower forecast gasoline prices reflect lower forecast crude oil prices and significantly lower gasoline demand in the second quarter of 2020 driven by COVID-19 travel restrictions and disruptions to domestic economic activity. For all of 2020, EIA expects U.S. regular gasoline retail prices to average $1.86/gal and gasoline retail prices for all grades to average $1.97/gal.

- EIA has revised its current forecast of domestic crude oil production down from the March STEO, as a result of lower crude oil prices. EIA forecasts U.S. crude oil production will average 11.8 million b/d in 2020, down 0.5 million b/d from 2019. In 2021, EIA expects U.S. crude production to decline further by 0.7 million b/d. If realized, the 2020 production decline would mark the first annual decline since 2016. Typically, price

changes impact production after about a six-month lag. However, current market conditions, combined with the COVID-19 pandemic, will likely reduce this lag as many producers have already announced plans to reduce capital spending and drilling levels.

Natural gas

- In March, the Henry Hub natural gas spot price averaged $1.74 per million British thermal units (MMBtu). Warmer-than-normal temperatures in March reduced demand for space heating and put downward pressure on prices. EIA forecasts that prices will begin to rise at the end of the second quarter of 2020 as U.S. natural gas production declines and natural gas use for power generation increases the demand for natural gas. EIA forecasts that Henry Hub natural gas spot prices will average $2.11/MMBtu in 2020 and then increase in 2021, reaching an annual average of $2.98/MMBtu because of lower natural gas production compared to 2020.

- EIA expects residential consumption of natural gas to average 12.9 billion cubic feet per day (Bcf/d) in 2020, down 5.8% from the 2019 average primarily because of warmer-than-normal weather in the first quarter. Similarly, EIA expects commercial consumption of natural gas to average 9.0 Bcf/d in 2020, a decrease of 7.1%, as a result of warm weather and the slowing economy. EIA forecasts industrial natural gas consumption to average 22.9 Bcf/d in 2020, about the same as in 2019. The industrial forecast is down from the previously expected 6.5% growth in the March STEO, as less manufacturing activity in 2020 weakens the growth potential for industrial natural gas consumption.

- U.S. dry natural gas production set a record in 2019, averaging 92.2 Bcf/d. EIA forecasts dry natural gas production will average 91.7 Bcf/d in 2020, with monthly production falling from an estimated 94.4 Bcf/d in March to 87.5 Bcf/d in December. Natural gas production declines the most in the Appalachian and Permian regions. In the Appalachian region, low natural gas prices are discouraging producers from engaging in natural gas-directed drilling, and in the Permian region, low oil prices reduce associated gas output from oil-directed wells. In 2021, forecast dry natural gas production averages 87.5 Bcf/d, rising in the second half of 2021 in response to higher prices.

- EIA estimates that total U.S. working natural gas in storage ended March at 2.0 trillion cubic feet (Tcf), 17% more than the five-year (2015–19) average. In the forecast, inventories rise by 1.9 Tcf during the April through October injection season to reach almost 3.9 Tcf on October 31.

- EIA forecasts that U.S. liquefied natural gas exports will average 6.6 billion cubic feet per day (Bcf/d) in the second quarter of 2020 and 6.0 Bcf/d in the third quarter of 2020. Liquefied natural gas exports in the third quarter 2020 are 0.3 bcf/d lower compared with the March STEO forecast because of lower expected global demand for natural gas.

Electricity, coal, renewables, and emissions

- The economic slowdown and stay-at-home orders are likely to affect U.S. electricity consumption over the next few months. EIA expects the largest impact will occur in the commercial sector where forecast retail sales of electricity fall by 4.7% in 2020 due to the closure of many businesses. Similarly, EIA expects retail sales of electricity to the industrial sector will fall by 4.2% in 2020 as many factories cut back production. Forecast U.S. sales of electricity to the residential sector fall by 0.8% in 2020, as reduced power usage resulting from milder winter and summer weather is offset by increased household electricity consumption as much of the population stays at home.

- EIA forecasts that total U.S. electric power sector generation will decline by 3% in 2020. Renewable energy sources account for the largest proportion of new generating capacity in 2020, driving EIA's forecast that renewable generation by the electric power sector will grow by 11% this year. Renewable energy is typically dispatched whenever it is available because of its low operating cost. The forecast for lower overall electricity demand leads to an expected decline in fossil-fuel generation, especially at coal-fired power plants. EIA expects that coal generation will fall by 20% in 2020. Forecast natural gas generation rises by 1% this year, reflecting favorable fuel costs and the addition of new generating capacity.

- Although EIA expects renewable energy to be the fastest growing source of electricity generation in 2020, the effects of COVID-19 and the resulting economic slowdown are likely to have an impact on new generating capacity builds over the next few months. EIA expects that the electric power sector will add 19.4 gigawatts of new wind capacity and 12.6 gigawatts of utility-scale solar capacity in 2020. These annual wind and solar capacity additions are 5% and 10% lower, respectively, than expected in the previous STEO.

- EIA forecasts that U.S. coal production will total 537 million short tons (MMst) in 2020, down 153 MMst (22%) from 2019. Lower production reflects declining demand for coal in the electric power sector, lower demand for U.S. exports, and a number of coal mines that have been idled for extended periods as a result of COVID-19. EIA forecasts that total coal consumption will decrease by 19% in 2020, driven primarily by electric power sector demand, which will fall by 107 MMst (20%) in 2020. Total coal exports also decline, as European demand is affected by economic slowdown.

- After decreasing by 2.7% in 2019, EIA forecasts that energy-related carbon dioxide (CO2) emissions will decrease by 7.5% in 2020 as the result of the slowing economy and restrictions on business and travel activity related to COVID-19. In 2021, EIA forecasts that energy-related CO2 emissions will increase by 3.6%. Energy-related CO2 emissions are sensitive to changes in weather, economic growth, energy prices, and fuel mix.

Forecast Assumptions

Because of the heightened uncertainty surrounding this month's STEO, we have included some of the driving assumptions that affected our forecast this month.

Global Liquid Fuels

Global Petroleum and Other Liquid Fuels Consumption

In the April STEO, EIA's 2020 global oil consumption forecast has undergone major revisions to reflect the most up-to-date information available.

Similar to the March STEO, EIA analyzed reductions in oil demand by evaluating three main drivers: lower economic growth, less air travel, and other reductions in demand not captured by these two categories. In the March STEO, reductions in gross domestic product (GDP) and oil consumption were primarily limited to China, South Korea, Japan, and Italy. As a result of more government lockdowns across most of Europe, the United States, India, and other countries, the oil consumption effects now span a significantly larger segment of the world's population.

According to some estimates, about 40% of the world's population is currently advised to stay home to limit the spread of COVID-19. The shutdown orders have contributed to significant contractions in service industries—including travel, tourism, and restaurants, among others—leading to a rapid increase in layoffs and unemployment. Although governments introduced fiscal and monetary responses, the effects of this stimulus on oil demand could be minimal given the significant restrictions on travel. The outlook for global economic growth is highly uncertain, and the high level of volatility in the markets presents considerable challenges in forecasting oil prices and the level of global oil consumption in the coming months.

Non-OPEC Petroleum and Other Liquid Fuels Supply

EIA assumes that non-OPEC petroleum and other liquid fuels supply will decline slightly in 2020, because of the impacts of COVID-19 and low oil prices that started in March 2020. Production increases in Norway and Brazil will be more than offset by declines from the United States, India, and other non-OPEC countries.

EIA expects non-OPEC petroleum and other liquid fuels production to increase slightly in 2021, when supply growth, mainly in Brazil and Canada, is expected to offset production declines in the United States and other non-OPEC countries.

EIA expects Canada's total liquid fuels production to fall by 0.1 million barrels per day (b/d) in 2020 instead of the previously forecast supply growth. This decrease is a result of 2019 government-ordered production cuts in Alberta, continued pipeline constraints, and economic shut-ins because of the effect of low oil prices and falling demand for oil exports. In 2021, EIA expects Canada's production to increase after new pipeline capacity is available but by less than previously forecast. EIA does not expect any additional production from new upstream projects to come online during the forecast period, only expansions of existing projects.

EIA expects Brazil's petroleum and other liquid fuels production to grow more slowly than previously forecast. Near the end of March, Brazil's national oil company Petroleo Brasileiro, S.A. (Petrobras) announced a 100,000 b/d production cut for the remainder of 2020. Petrobras will idle some shallow-water platforms with higher production costs in the Sergipe, Rio Grande do Norte, and Ceará states to achieve these cuts. Additionally, production volumes from the P-70 floating, production, storage, and offloading vessel (FPSO) will be delayed until 2021. The P-70 was damaged in a storm in February 2020, and was originally scheduled to begin producing in the first half of 2020. The main driver for Brazil's production growth in 2021 will be the start-up of P-70 and two other FPSOs in 2021 that EIA does not expect will be affected by events in 2020 at this time.

EIA expects Asia, China and India to shut in about 250,000 b/d of production during the next few months as a result of immediate COVID-19 impacts on labor mobility and other logistics. In addition, the significantly lower oil price environment will reduce capital expenditure of upstream investors and shutter production at higher production cost fields, such as China's tight oil plays in the north central and northwest of the country and the mature fields that require enhanced oil recovery. Crude oil production projections for both China and India are lower than in last month's STEO, and EIA expects declines to deepen in 2020 and 2021. India plans to begin oil production from the deepwater KG-DWN-98/2 oil and natural gas project in early 2021, which will offset some production declines from mature basins in 2021.

OPEC Petroleum and Other Liquid Fuels Supply

The Organization of the Petroleum Exporting Countries (OPEC) and partner countries (OPEC+) suspended agreed-upon production cuts in March 2020. Despite the resulting oversupply in markets and recent news of OPEC+ emergency meetings to discuss production levels, EIA assumes no re-implementation of an OPEC+ agreement during the forecast period. Instead, EIA assumes that OPEC members with surplus production capacity will increase their production in an effort to gain additional market share. EIA assumes that although production in some oil fields will be affected by COVID-19, OPEC countries will try to increase production as long as they can find buyers in this weaker demand environment.

EIA assumes that Saudi Arabia will ramp up its crude oil production to near full capacity in the second quarter of 2020. Saudi Arabia will keep its production above recent production levels throughout the forecast in an attempt to regain global market share as higher-cost production declines elsewhere.

EIA assumes that sanctions on both Iran and Venezuela remain in place throughout the forecast period and that both countries' production will be lower compared with the March STEO.

Venezuela's production declines further as a result of additional sanctions that took effect in mid-February on Rosneft Trading, which had been a principal distributor of Venezuela's oil. These new sanctions, coupled with low global oil demand will make it more difficult for Venezuela to find buyers for its oil.

After reaching production levels of 1.2 million b/d in late 2019, Libya's crude oil output averaged 100,000 b/d in March 2020, after most of the country's export ports closed and several oil fields

were shut-in, including El Sharara and El Feel, in January 2020. With the ongoing civil war in Libya, EIA does not expect production to increase until late 2020. Once currently shuttered export terminals and oil fields reopen, EIA expects that Libya will boost production to near-capacity despite low oil prices.

In Nigeria and Angola, EIA expects new projects that have not yet reached the final investment decision (FID) stage will be delayed beyond 2021. In addition, growth from fields recently brought online will be flat for 2020. Lower production for the forecast period is driven by decreased demand as a result of COVID-19 as well as the expected surge in global crude oil supply resulting from the OPEC+ production cuts that were suspended.

EIA expects that OPEC surplus crude oil production capacity, which averaged 2.5 million b/d in and 3 million b/d in the first quarter of 2020, will decline to 1.5 million b/d in the second quarter of 2020. This is a result of Saudi Arabia ramping up its production to near full capacity during the second quarter of 2020, following the suspension of OPEC+ agreed-upon production cuts in March 2020. This decline will occur despite the Neutral Zone production ramp up that will start in May.

OECD Petroleum Inventories

An unprecedented drop in global oil demand in 2020, combined with the breakdown of the OPEC+ agreement to restrict oil production, leads EIA to forecast a global oil inventory build more than twice as large as the largest annual inventory build (1.8 million b/d in 1998) over the 40 years that EIA has tracked international data. EIA estimates that the 2020 build could add 1.6 billion barrels to global inventories, which would fill them at or near their estimated full storage capacity levels. Because of storage constraints, EIA believes the 2021 global oil market will need to be mostly balanced or inventory withdrawals will occur simply because there will be no room to store additional large inventory builds.

Crude Oil Prices

EIA assumes that the sharp reductions in global crude oil prices, which occurred during March 2020 as a result of COVID-19, will persist through the second quarter before prices begin gradually increasing through the end of the forecast. EIA expects that considerable decreases in liquid fuel consumption will result from containment measures and economic disruptions related to COVID-19, which will affect U.S. refinery activity and, consequently, demand for crude oil. However, crude oil supply will increase in the short term as a result of agreed production cuts among OPEC+ that were suspended. EIA assumes that these two factors will keep global crude oil prices at multi-year low averages through the first half of 2020. Only gradual increases in crude oil prices are expected through all of 2020 as these factors persist, which could lead to record levels of expected global oil inventory builds in the first half of 2020.

U.S. Liquid Fuels

Consumption

EIA assumes significantly lower levels of U.S. liquid fuels consumption during much of 2020 as a result of the disruptions to economic and business activity because of COVID-19 and the strict containment measures that have dramatically reduced all forms of travel. These impacts are expected to be most pronounced during the second quarter of 2020, when most containment measures and wide-scale reductions in business activity are assumed to be in place. EIA expects these impacts to persist through most of 2020, but in the second half of 2020, EIA expects liquid fuels consumption will gradually increase from these low levels as some business activity resumes and stay-at-home orders gradually ease. EIA forecasts these travel disruptions will have the largest impacts on gasoline and jet fuel consumption in 2020, but expects distillate fuel oil consumption to be affected less because of assumed increases in trucking activity both for distribution and expected increases in personal deliveries of goods and food services. The rise in U.S. liquid fuels consumption in the second half of 2020 drives the United States to return to being a net importer of crude oil and petroleum products in the third quarter of 2020 and remaining a net importer in most months through the end of the forecast period.

EIA forecasts that U.S. annual average hydrocarbon gas liquids consumption will decline by 1.6% in 2020 and then increase by 12% in 2021. This 2020 decline is mainly the result of the expected slowdown in manufacturing, which would keep ethane demand as a petrochemical feedstock below 2019 levels for the remainder of this year. Ethane consumption begins to rise in the second quarter of 2021 as manufacturing begins to recover, and both new and existing ethane-fed petrochemical plants increase utilization.

Crude Oil Supply

EIA's model for Lower 48 production includes structural parameters that reduce the forecast for rigs and wells when WTI price falls below $45/b or the Henry Hub price falls below $2/MMBtu, based on historical trends in each region. In addition to this model-based drop, EIA assumes a further 15% reduction in activity on average in the second quarter of 2020 and a 12% reduction in the third quarter of 2020 to account for the unprecedented effects of COVID-19 on the level of drilling activity as many producers have already announced plans to reduce capital spending and drilling levels. The decline in U.S. crude oil production in the second half of 2020 and 2021, combined with rising U.S. liquid fuels consumption, results in the United States returning to being a net importer of crude oil and petroleum products in the third quarter of 2020 and remaining a net importer in most months through the end of the forecast period.

EIA assumes that all oil stripper wells are shut in. These wells are characterized as producing no more than 15 barrels of oil equivalent per day (BOE/d) during a 12-month period.

In addition, even though some companies operating in the Permian Basin have asked for a hearing with the Texas Railroad Commission to determine mandatory crude oil production cuts for Permian producers, EIA assume no such proration of production in the model until the Texas Railroad Commission actually orders production cuts.

Product Prices

EIA expects that COVID-19 will drive sharp reductions in crude oil prices and U.S. liquid fuels demand during the second quarter of 2020, which will significantly reduce prices for gasoline and diesel fuel during the same period. Significant reductions in personal travel, both for normal commuting and vacation travel typical for the summer driving season, will decrease gasoline prices more dramatically than diesel fuel prices.

The shock to gasoline demand and EIA's corresponding expectation of near-term oversupply has been reflected in forecast U.S. refinery wholesale margins. In late March 2020, refinery wholesale margins for gasoline fell to near-zero levels in some regions, while diesel fuel margins remained relatively strong. EIA expects that stronger refinery wholesale margins for diesel fuel relative to gasoline will not only encourage refiners to maximize distillate production while reducing gasoline production, but in some cases, to idle some production units, which will drive refinery utilization rates to some of their lowest levels since the 2008 recession.

As a result, EIA forecasts that U.S. gasoline retail prices will reach some of their lowest levels in 20 years in the second quarter of 2020, before gradually increasing throughout the year as travel and business activity slowly recovers. Comparatively, diesel fuel prices only see minor decreases during the forecast period as increased demand for diesel fuel to meet expected near-term increases in long haul trucking and last-mile delivery activity.

Natural Gas

Natural Gas Consumption

The April STEO assumes minor shifts in space heating demand in March and April as more people stay at home rather than go to work or shop at retail establishments as a result of the COVID-19 pandemic. This shift increases residential natural gas demand while decreasing commercial natural gas demand. Commercial natural gas demand sees further reductions in the near term under the assumption that restaurants and other food establishments, which use more natural gas for cooking food and for hot water heating, compared with other segments of the commercial sector, will see a particularly high number of closings.

EIA forecasts that industrial demand for natural gas will decrease significantly because of the weakening economic outlook, leading to a lower forecast natural gas-weighted manufacturing index that declines through September 2020.

The April STEO forecast assumes that a combination of lower global natural gas demand as a result of the COVID-19 pandemic and an unfavorable liquefied natural gas (LNG) pricing environment will lower U.S. LNG exports, primarily in the third quarter of 2020.

Natural Gas Supply

EIA's model for Lower 48 production includes structural parameters that reduce the forecast for rigs and wells when the WTI price falls below $45/b or the Henry Hub price falls below $2/MMBtu, based on historical trends. In addition to this model-based drop, EIA assumes a further 15% reduction in activity on average in the second quarter of 2020 and a 12% reduction

in the third quarter of 2020 to account for the unprecedented effects of COVID-19 on the level of drilling activity as many producers have already announced plans to reduce capital spending and drilling levels.

EIA assumes that natural gas stripper wells remain economic, on average, and thus continue to produce through the forecast. These wells are characterized as producing no more than 90 thousand cubic feet per day during a 12-month period.

In addition, even though some companies operating in the Permian Basin have asked for a hearing with the Texas Railroad Commission to determine mandatory production cuts for Permian producers, EIA will assume no such proration of production in the model until the Texas Railroad Commission actually orders production cuts.

Natural Gas Inventories

EIA's natural gas storage forecast assumes a summer (March through October) storage build that is slightly below average because of strong natural gas consumption for power generation in 2020, combined with declining production in the second half of 2020. Less production in the first half of 2021 compared with recent years also puts downward pressure on storage in 2021.

Natural Gas Prices

The April STEO assumes that the Henry Hub spot price will remain low compared with historical levels in the near term as reduced business activity and higher-than-average storage levels entering the summer injection season contribute to keeping prices low. In the third quarter of 2020, slowing natural gas production, combined with increasing industrial demand and higher winter demand for space heating, encourage increases in the natural gas price.

Coal

Coal Supply

Many coal mines across the United States have shut down or idled, citing public health concerns. Some large producers have stipulated that their mines will be shut down or idled for two-weeks, while others have not implied a date to resume normal operations. EIA expects that these decreases in overall production will have a noticeable effect on supply, contributing to a steeper decline than would have occurred had these measures not been put into place.

Coal Consumption

Coal consumption is closely related to overall electricity generation demand, which is trending downward. Secondary stocks (at power plants) are high, and even with decreased production, coal plants do not expect shortfalls in the next few months. EIA projects that industrial consumption will also decline as coal coke demand is slowed by unfavorable market conditions and decreased raw steel production.

Coal Trade

EIA estimates that U.S. coal exports will decrease through 2020. Atlantic markets, which are the primary outlet for U.S. coal exports, are showing significantly decreased demand because of the global economic slowdown. India, the top destination for U.S. exports, had maintained near-normal consumption of steam coal during the first two months of 2020. Other important U.S. coal export destinations, such as South Korea and Japan, have seen economic effects already in 2020 and thus, have not been strong. Health-related lockdowns affecting large seaborne market suppliers, including South Africa, Indonesia, and Australia, have dampened global supply, providing some support to international prices but not enough to overcome the overarching shortfalls in demand.

Coal Prices

EIA estimates the delivered coal price to U.S. electricity generators averaged $2.02 per million British thermal units (MMBtu) in 2019, which was 4 cents/MMBtu lower than in 2018. EIA forecasts that coal prices will decrease in 2020 to $2.00 and increase in 2021 to $2.04/MMBtu.

Electricity

The COVID-19 pandemic and its associated economic effects also create a high level of uncertainty regarding EIA's short-term outlook for U.S. electricity markets. EIA has developed some initial assumptions about potential effects. As EIA receives new survey data over the coming weeks, future STEO forecasts will incorporate this information.

Electricity Consumption

Many states have implemented stay-at-home orders or similar restrictions, which have caused a significant number of commercial businesses and industrial facilities to stop operating. In addition, many commercial employees are now working from home instead of going into the office. The current STEO forecast incorporates new macroeconomic projections, which lead to declines in forecast retail sales of electricity to the commercial and industrial sectors. However, EIA also assumes the unique aspects of the stay-at-home orders will depress industrial and commercial electricity demand more than the impact of the slowing economy.

As a result of the stay-at-home orders, weather-adjusted electricity consumption by the residential sector is likely to increase in the near term, in contrast to the effects on the commercial and industrial sectors. EIA assumes, in particular, that household usage of electronic equipment such as computers and televisions will increase. Other uses of electricity, such as for cooking and for heating water, may also rise. Household use of air conditioning during the summer months is also likely to be higher than normal as more people stay home during the daytime.

Electricity Generation

The effects on electricity supply are also very uncertain because of rapidly changing economic conditions. In terms of building new generating capacity, component supply chains and the construction workforce is likely to be affected in the near term in many areas of the country.

Most of the generating capacity that had been scheduled to come online in 2020 is fueled by renewable energy sources—including solar and wind—and by natural gas.

To represent these impacts on electricity supply, EIA assumes in the current STEO that half of the generating capacity previously expected to enter service in the second quarter of 2020 will be postponed to sometime beyond the STEO forecast period, as will one-quarter of the capacity expected for the third quarter of 2020. As EIA continues to collect updates for project development activities reported on our surveys, we will revise these assumptions in future STEO forecasts.

Electricity Prices

The forecast reduction in overall electricity demand resulting from the economic slowdown, along with lower expected natural gas fuel costs for power generation, drives EIA's expectation that wholesale electricity prices will be lower in 2020 throughout the country. The lower costs of electricity supply will likely not affect retail electricity prices in the near term but may be reflected in lower retail prices in the future as utilities make adjustments to their electric rates over the coming months.

U.S. Economic Assumptions and Energy-Related Carbon Dioxide Emissions

Recent Economic Indicators

The STEO is based on macroeconomic projections by Oxford Economics (for countries other than the United States) and by IHS Markit (for the United States). Given the tremendous uncertainty in both the spread and severity of COVID-19 and in the policy responses, these forecasts are significantly more uncertain than normal.

The Oxford forecast projects that global GDP will contract by 2% in the first quarter of 2020 and by 0.4% in in the second quarter. However, this contraction is followed by a rapid recovery in the second half of 2020, leading to flat global GDP growth for the year.

For the United States, EIA used the March 20, 2020 version of the IHS Markit macroeconomic model with EIA's energy prices. The resulting U.S. economic forecast, which is used in this STEO, reflects a return to growth in the fourth quarter of 2020, and an expectation that employment does not return to pre-pandemic levels by the end of the STEO forecast period.

Energy-Related Carbon Dioxide Emissions.

EIA estimates energy-related carbon dioxide (CO_2) emissions based on energy consumption and carbon factors, the amounts of CO_2 that are released when fuels are burned, are unique to each fuel. Total CO_2 emissions depend on total energy consumption and the fuel mix of the energy consumed. Coal has the highest carbon factor of the major fossil fuels. However, because more petroleum products (such as motor gasoline) are consumed than coal, petroleum is the largest source of CO_2 emissions in the United States. Natural gas is the least carbon-intensive fossil fuel, but in recent years, because of its increasing consumption, it generates more U.S. CO_2 emissions

than coal. Non-fossil fuels, such as nuclear power and renewable generation sources, emit no direct CO2. As these noncarbon generation sources enter the fuel mix, energy demands can be met without proportional increases in energy-related CO2.

Notable forecast changes

Petroleum and natural gas markets review

Crude oil

Prices: The front-month futures price for Brent crude oil settled at $29.94 per barrel (b) on April 2, 2020, down $21.96/b from March 2. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, decreased by $21.43 /b during the same period, settling at $25.32/b on April 2 **(Figure 1)**.

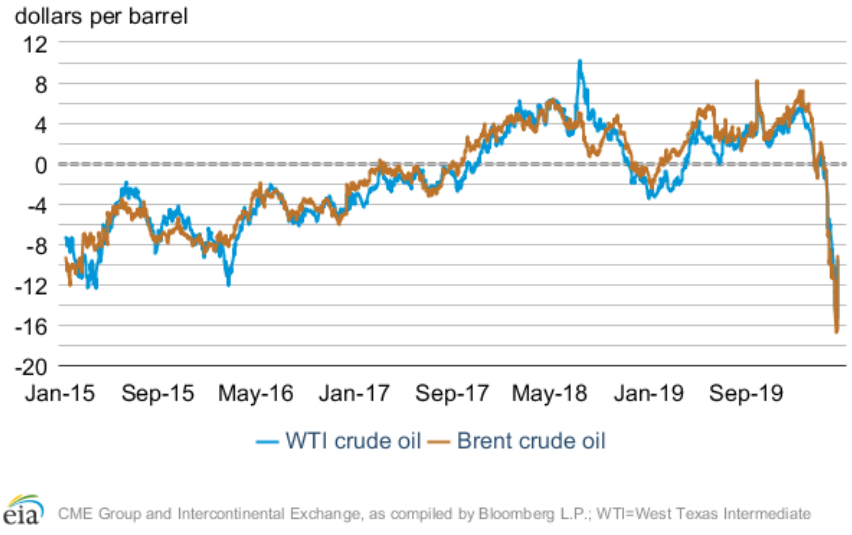
Figure 1. Crude oil front-month futures prices

eia CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.; WTI=West Texas Intermediate

Oil and other financial markets reached all-time high levels of volatility in March. Several economic indicators suggest the global economy entered a recession, primarily as a result of containment efforts related to the 2019 novel coronavirus disease (COVID-19).

Although real-time data remain limited, EIA estimates global liquid fuels consumption declined by 11.4 million barrels per day (b/d) in March from the 2019 annual average and forecasts demand to decline by 17.1 million b/d in April from the 2019 average. For 2020, EIA estimates that global liquid fuels consumption will average 95.5 million b/d, down 5.2 million b/d (5.2%)

from 2019. If realized, 2020 would see the largest year-over-year percentage decline in global oil consumption since at least 1990, the year EIA began tracking global consumption levels. In the United States, EIA forecasts that total oil consumption will decline 6.5% in 2020 to average 19.1 million b/d, which would be the largest percentage decline in consumption since 1980 and the second-largest decline since 1949, the earliest EIA data available.



Aside from these significant changes to oil demand, EIA expects global oil supply to remain near first-quarter 2020 levels in the coming months. Upstream supply projects from countries outside the Organization of the Petroleum Exporting Countries (OPEC) require years of development and, once brought online, continue producing in low oil price environments as operating costs per barrel are generally low. However, EIA forecasts that low oil prices will immediately reduce U.S. Lower 48 crude oil production in the second quarter of 2020 as drilling activity slows significantly. In addition, as a result of OPEC and partner countries no longer restraining production, several OPEC members have begun increasing crude oil production by bringing previously idle spare production capacity online and selling additional crude oil from storage.

These supply and demand developments are contributing to significant increases in liquid fuels inventories. EIA estimates that second-quarter 2020 global petroleum inventories will increase at an average rate of 11.4 million b/d, which would be the largest rate of inventory increases since EIA record keeping began. Within the Organization for Economic Cooperation and Development (OECD), the highest stock levels recorded dating back to 2003 was in July 2016, when total commercial petroleum inventories ended the month at slightly more than 3.1 billion barrels. EIA forecasts inventories will surpass this level, but it remains uncertain how much commercially available storage capacity exists globally, particularly in non-OECD countries. Trade press is reporting an increase in unconventional forms of storage, such as floating storage, as becoming used increasingly as on-land storage quickly fills.

EIA expects these large stock builds to keep downward price pressure on crude oil prices for several months. As a result, EIA forecasts Brent crude oil to average $23/b in the second quarter of 2020. As non-OPEC crude oil production begins declining in the fourth quarter of 2020, and global liquid fuels demand increases, prices will increase gradually. EIA forecasts Brent crude oil will increase from the lows of the second quarter of 2020 to average $46/b in 2021.

Crude oil price spreads: In addition to the decline in front-month crude oil futures prices, the market structure for crude oil along the futures curve developed significant levels of contango (when near-term crude oil prices are lower than longer-dated ones). Both the Brent and WTI 1st–13th spreads declined to the lowest levels since the global financial crisis of 2008–09, settling at -$9.20/b and -$9.59/b, respectively, on April 2 **(Figure 2)**. The immediate and large loss of demand means that oil must be put in storage, as options for reducing crude oil production are limited in the short-term. Various trade press reports indicate that market participants are leasing tankers for floating storage, which is significantly more expensive than on-land storage.

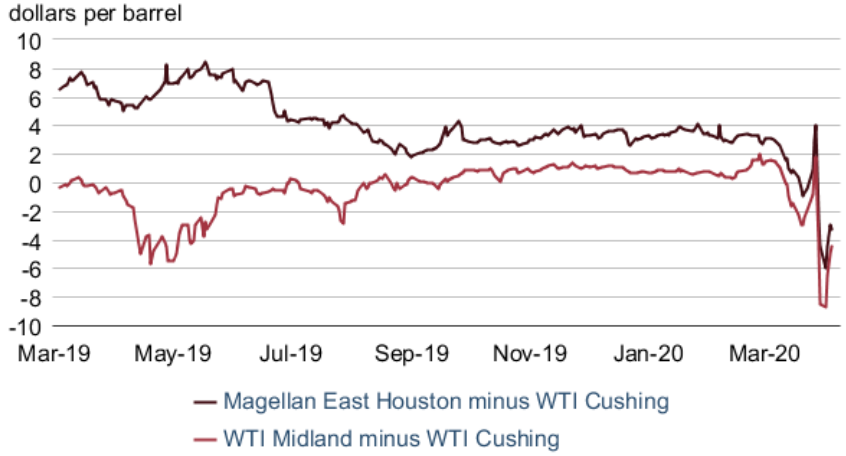


Figure 2. Crude oil front-month to 13th month futures price spread

eia CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.; WTI=West Texas Intermediate

Not only do crude oil inventory builds reflect price contango, but changes in price spreads between WTI for delivery in Cushing, Oklahoma—the delivery point for the WTI futures contract—and other light sweet crude oils in the United States suggest on-land storage in Cushing could begin filling rapidly. WTI Midland reflects crude oil prices at the point of production in the Permian region of Texas and New Mexico, and Magellan East Houston (MEH) crude oil reflects the price of light sweet crude oil on the U.S. Gulf Coast. Both WTI Midland and MEH developed discounts to WTI Cushing in March, when they had been averaging premiums of 88 cents/b and $3.24/b, respectively, since the fourth quarter of 2019 through February 2020 **(Figure 3)**.

Figure 3. U.S. crude oil price spreads

eia Bloomberg L.P., WTI=West Texas Intermediate

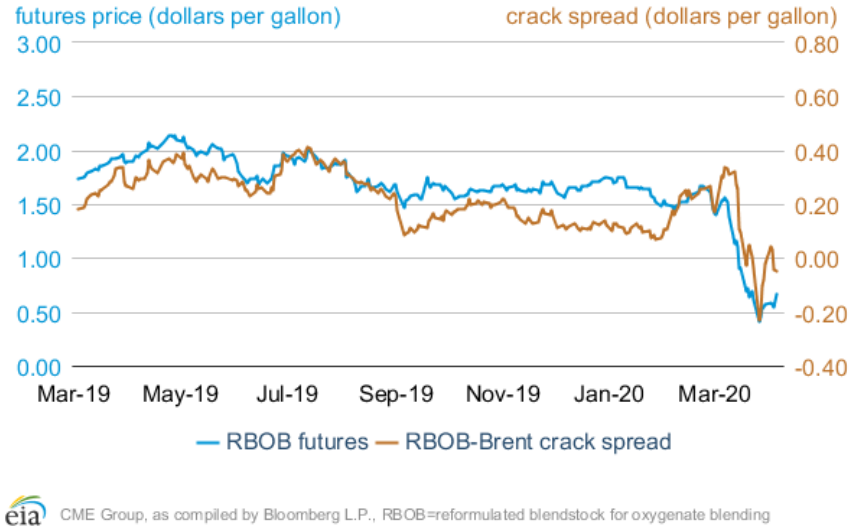
The WTI Midland discount to WTI Cushing was large when there was a lack of available pipeline capacity from the Permian production region to transport crude oil to Cushing. However, after several pipeline projects came online in the second half of 2019, there was more capacity than

current production, contributing to a slight premium in WTI Midland prices. Houston, on the other hand, is a destination point for crude oil from Cushing because local refineries can use it or it can be exported. The typical premium of MEH crude oil to Cushing generally reflects the cost of shipping crude oil by pipeline to the U.S. Gulf Coast. The rare discount that developed in late March provides a strong indication that barrels are being bought for storage in Cushing amid a significant decline in purchases from both U.S. and international refineries. Crude oil inventories in Cushing increased 3.5 million barrels for the week ending March 27, the largest week on week build in two years.

Oil company bond yields: Higher bond yields reflect increased risk aversion among bond investors and indicates tightening credit availability among companies. Bond yields for crude oil exploration and production companies increased in March, particularly for companies with a credit rating below Investment Grade, also called high yield bonds. The Bloomberg Barclays Energy High Yield Corporate Bond Index's yield-to-worst (YTW), which represents the minimum achievable yield on the bonds after accounting for early prepayment, increased to 23.9% on March 20, the highest since at least 2010 **(Figure 4).**

Figure 4. Energy company bond yields

eia Bloomberg L.P., Barclays



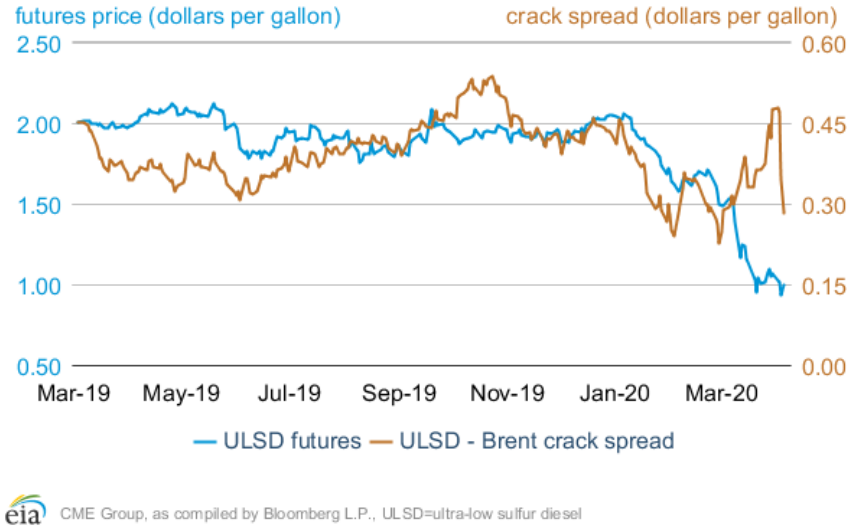
According to the latest Dallas Fed Energy Survey, nearly 40% of survey respondents from exploration and production companies would be able remain solvent for two years or less if WTI crude oil prices stayed at $40/b. As discussed in the crude oil price spreads section, many U.S. producers are receiving prices at large discounts to WTI Cushing crude oil prices, and some trades are as low as $10/b or lower. These prices could lead to asset impairments and bankruptcies among U.S. oil companies, and perhaps some producers will shut in wells if conditions persist.

Petroleum products

Gasoline prices*:* The front-month futures price of reformulated blendstock for oxygenate blending (RBOB, the petroleum component of gasoline used in many parts of the country)

settled at $0.66 per gallon (gal) on April 2, down 88 cents/gal since March 2, 2020 **(Figure 5)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) decreased by 35 cents/gal to settle at 5 cents/gal during the same period.

Figure 5. Historical RBOB front-month futures prices and crack spread



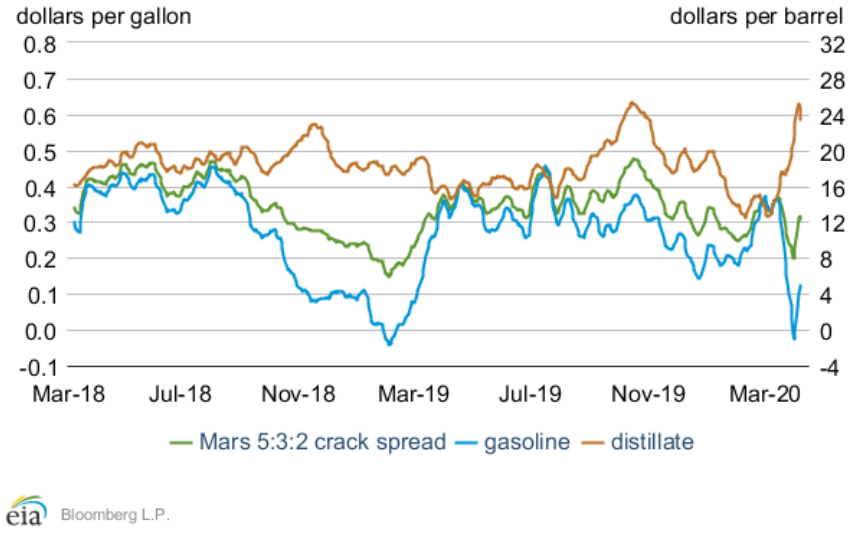
eia CME Group, as compiled by Bloomberg L.P., RBOB=reformulated blendstock for oxygenate blending

RBOB prices declined substantially throughout much of March and experienced week-on-week declines for four consecutive weeks. U.S. average retail gasoline prices also declined from $2.42/gal on March 2, 2020, to $2.01 per gallon on March 30, 2020. Average gasoline retail prices in the East Coast (Petroleum Administration for Defense District, or PADD 1), the Midwest (PADD 2), and the Gulf Coast (PADD 3) all fell below $2.00 /gal in March 2020, the first time since March 2016, November 2016, and February 2019, respectively. The lower prices for retail gasoline and RBOB futures prices likely reflect the interaction of two forces: the fall in the price of crude oil, the primary input cost for producing gasoline, and the fall in gasoline demand as a result of the decline in automotive travel caused by efforts to contain the outbreak of COVID-19 in North America. For example, U.S. vehicle miles traveled (VMT) fell to 8.3 billion miles in March 2020, 5% below March 2019, and EIA anticipates further declines throughout 2020 when VMT is expected to average 8.2 billion miles—the lowest level since 2012.

Ultra-low sulfur diesel prices: The ultra-low sulfur diesel (ULSD) front-month futures price for delivery in New York Harbor settled at $1.00/gal on April 2, 2020 **(Figure 6)**, down 53 cents/gal from March 2, 2020. The ULSD–Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) decreased by 1 cent/gal to settle at 28 cents/gal during the same period.

Figure 6. Historical ULSD front-month futures price and crack spread

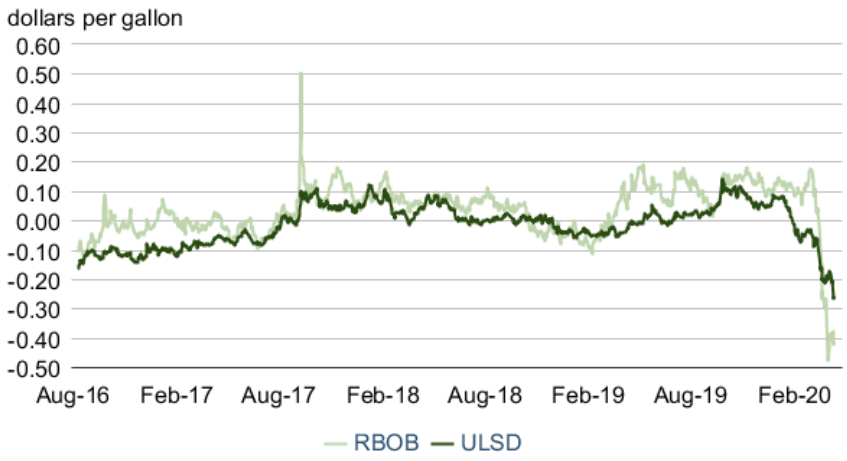
eia CME Group, as compiled by Bloomberg L.P., ULSD=ultra-low sulfur diesel



Through March, the ULSD–Brent crack spread has remained well above the five-year (2015–19) average, even as ULSD and other petroleum prices fell. EIA expects the economic slowdown as a result of COVID-19 will have a much greater effect on gasoline and jet fuel than distillate fuel. EIA forecasts a 25% decline in gasoline consumption and a 34% decrease in jet fuel consumption in the second quarter 2020 compared with a 6% decline in distillate consumption. EIA's March 2020 estimate of distillate consumption was 1% lower than the bottom of the previous five-year range, but distillate exports remained very strong. Distillate exports for the four weeks ending March 27 averaged 1.4 million barrels per day, which if confirmed by the monthly data, would be the most ever recorded for March.

More exports helped to reduce March distillate inventories below the five-year range and contributed to higher crack spreads. The ULSD–Brent crack spread fell sharply on April 1-2 as the ULSD price responded more slowly to the increase in Brent crude oil prices, but the crack spread remained near the five-year average.

Refining margins: The availability of cheaper crude oil inputs have somewhat blunted the impact of declining petroleum demand on U.S. refinery margins. EIA approximates these margins using the 5:3:2 crack spread, calculated as the combined revenue earned from selling 3 barrels of gasoline and 2 barrels of distillate less the cost of 5 barrels of crude oil inputs (using Mars, the U.S. Gulf Coast sour crude oil benchmark). Mars crude oil declined by 57% from $48.00/b on March 2, 2020, to $20.79/b on April 2, 2020. And although prices for distillate increased during the same period, the higher distillate price was more than offset by declines in the price for gasoline, which reduced the overall 5:3:2 crack spread by 6% to $12.32/gal during the same period **(Figure 7)**. While crack spreads for some products such as low sulfur fuel oil remain healthy, the decline in the 5:3:2 spread is likely fairly reflective of the margins realized by many U.S. Gulf Coast refiners. Because of this decrease in estimated margins, EIA expects refinery runs to decline over the next several months, with second quarter 2020 refinery distillation inputs falling by 14% relative to the preceding quarter to 14.2 million barrels per day,

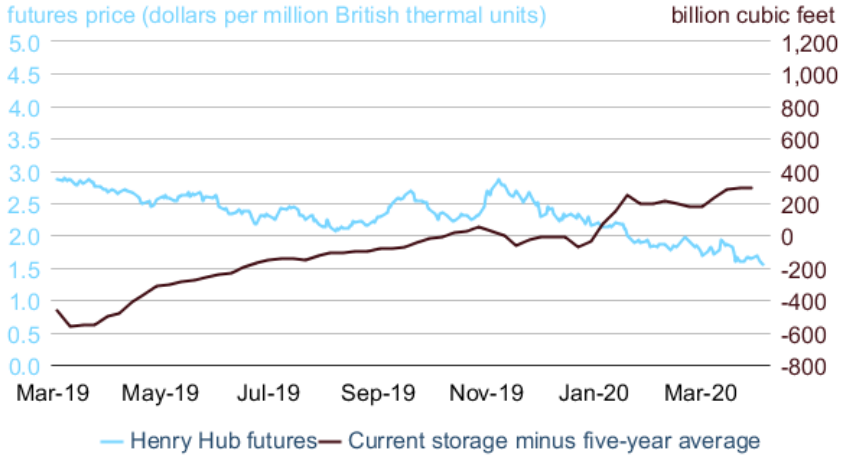


and 2020 refinery runs averaging 15.8 million barrels per day over the year, 7% less than 2019. Consequently, EIA estimates that the average U.S. refinery distillation utilization factor will fall from 87% in the first quarter 2020 to a 34 year low of 75% in the second quarter of 2020, and will average 83% throughout 2020 compared to 90% in 2019.

Figure 7. U.S. Gulf Coast refinery margins, five-day moving average

Futures price spreads: The shape of the futures curves for both RBOB and ULSD shifted in early 2020 from backwardation—when near-term futures prices are higher than longer-dated ones—to contango—when near-term futures prices are lower than longer-dated ones. The 1st-13th spread (the difference between the price for a product settled in the nearest month and the price for 13 months in the future) for RBOB declined from $0.03 per gallon on March 2, 2020, to the lowest since RBOB began trading in 2005 to -$0.38/gal per gallon on April 2, 2020, while the 1st-13th spread for ULSD declined from -$0.06 per gallon to -$0.26 per gallon over the same period **(Figure 8)**. The increased degree of contango likely reflects concerns of a significant decline in petroleum product demand, resulting in increases in inventory. As of March 27, U.S. commercial inventories of RBOB stood at 55.4 million barrels, 6.1 million more than their March 6 level, and 12% above the five-year average. The 1st-13th spread in ULSD declined by a smaller amount, reflecting a somewhat tighter distillate market. Expected decreases in consumption in the next few months will likely result in more product than normal moving into storage.

Figure 8. 1st-13th month futures spread

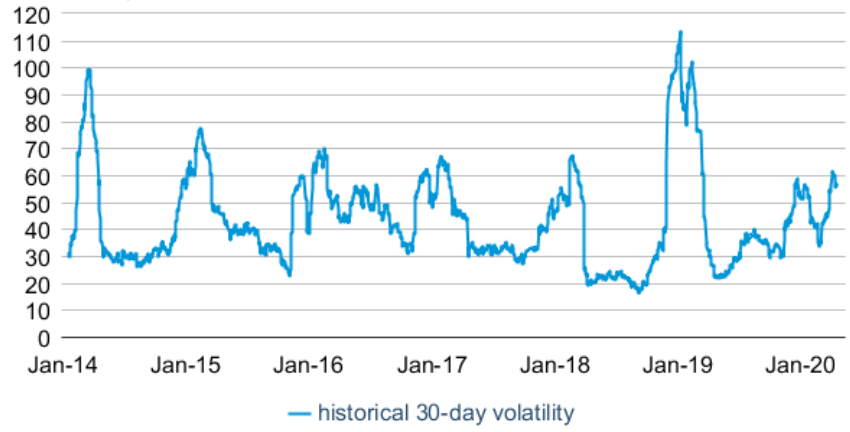


U.S. EIA, Bloomberg LP

Natural Gas

Prices: The front-month natural gas futures contract for May delivery at the Henry Hub settled at $1.55 per million British thermal units (MMBtu) on April 2, down 20 cents/MMBtu from March 2 **(Figure 9)**. Production gains combined with a mild winter have led to markedly higher year-over-year inventory levels compared with March 2019. Typically, March inventories are some of the lowest of the year immediately following the winter heating months.

Figure 9. U.S. natural gas front-month futures prices and storage



U.S. Energy Information Administration, CME Group, as compiled by Bloomberg L.P.

Historical Volatility: During the past month, oil prices and equities have seen significant movements that have drastically increased measures of their volatility. Natural gas volatility also increased in March but by a much smaller amount than in other markets. Historical 30-day volatility is defined as a rolling measure of the magnitude of price movements during the past 30 days **(Figure 10).** Many factors, including record production levels in 2019 and an atypically

warm winter, have led to historically low natural gas prices even before current economic conditions. This winter saw a much lower-than-usual increase in demand and prices during the winter months of late 2019 and early 2020. As a result, historical 30-day volatility peaked at significantly lower levels than several of the past winters.

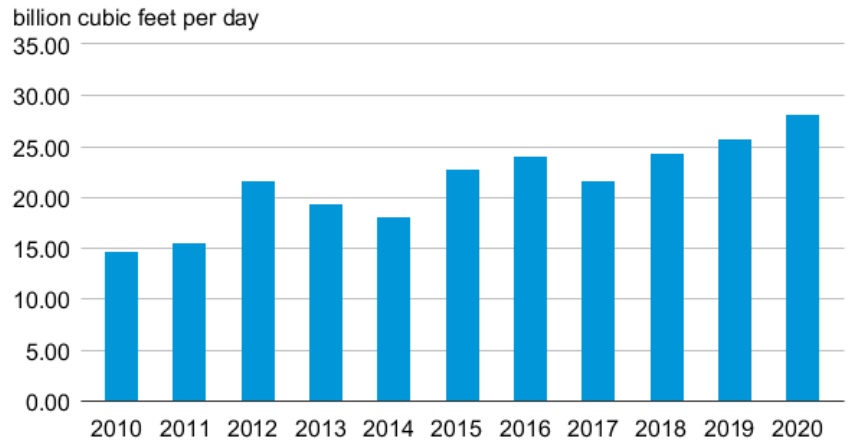


Figure 10. Natural gas historical volatility

eia Bloomberg L.P.

Natural gas in power generation: Power generation has been the largest source of natural gas demand for the past year. In addition, lower prices have contributed to increased competitiveness between natural gas and coal as a source of power generation. **Figure 11** displays the March natural gas consumption for power generation from 2010 to the 2020 estimate. EIA forecasts annual average natural gas consumption for electric power to increase to 31.3 billion cubic feet (Bcf) per day in 2020 compared with 31.0 Bcf/day in 2019. Although natural gas consumption for electric power is forecast to increase, total U.S. electricity consumption is expected to decline in 2020.

Figure 11. March consumption of natural gas for power generation, 2010-present

- = no data available

Prices are not adjusted for inflation.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.

EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).

Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

Weather projections from National Oceanic and Atmospheric Administration.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

(a) Weighted geometric mean of real indices for various countries with weights equal to each country's share of world oil consumption in the base period. Exchange rate is measured in foreign currency per U.S. dollar. GDP and exchange rate data are from Oxford Economics, and oil consumption data are from EIA.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" inludes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

LNG: liquefied natural gas.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

Prices are not adjusted for inflation.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report*, DOE/EIA-0121; and *Electric Power Monthly*, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Table 7c. U.S. Regional Retail Electricity Prices (Cents per Kilowatthour)

- = no data available

Prices are not adjusted for inflation.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distributed solar photovoltaic systems.

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly,* DOE/EIA-0226 and *Renewable Energy Annual,* DOE/EIA-0603; *Petroleum Supply Monthly,* DOE/EIA-0109.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

-- = no data available

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to one megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than one megawatt).

(d) Solar photovoltaic systems smaller than one megawatt, as measured in alternating current.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA-860M database, EIA-826 Solar PV database, and EIA Regional Short-Term Energy Model.

- = no data available

SAAR = Seasonally-adjusted annual rate

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Aviation Administration. Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

- = no data available

Notes: Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National Oceanic and Atmospheric Administration (NOAA).

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Projections: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Appendix to the April 2020 *Short-Term Energy Outlook*

This appendix is prepared in fulfillment of section 1245(d)(4)(A) of the National Defense Authorization Act (NDAA) for Fiscal Year 2012, as amended. The law requires the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy, to submit to Congress a report on the availability and price of petroleum and petroleum products produced in countries other than Iran in the two-month period preceding the submission of the report. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The data in this appendix, therefore, should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

EIA consulted with the U.S. Department of the Treasury, the U.S. Department of State, and the intelligence community in the process of developing the NDAA report, which was previously published as a stand-alone report. Detailed background and contextual information not repeated here can be found in early editions of the NDAA report.

This appendix is published in the *Short-Term Energy Outlook* in even numbered months.

Table a1. Summary of Estimated Petroleum and Other Liquids Quantities

	February 2020	March 2020	February – March 2020 Average	February – March 2019 Average	2017–2019 Average
Global Petroleum and Other Liquids (million barrels per day)					
Global Petroleum and Other Liquids Production (a)	100.1	99.0	99.5	100.2	99.8
Global Petroleum and Other Liquids Consumption (b)	95.7	89.4	92.4	100.3	99.8
Biofuels Production (c)	2.0	2.1	2.1	2.0	2.5
Biofuels Consumption (c)	2.3	2.3	2.3	2.3	2.3
Iran Liquid Fuels Production	2.6	2.5	2.5	3.6	4.1
Iran Liquid Fuels Consumption	2.1	1.8	2.0	1.9	1.8
Petroleum and Petroleum Products Produced and Consumed in Countries Other Than Iran (million barrels per day)					
Production (d)	95.5	94.5	95.0	94.6	93.2
Consumption (d)	91.3	85.3	88.2	96.1	95.6
Production minus Consumption	4.2	9.2	6.8	-1.5	-2.4
World Inventory Net Withdrawals Including Iran	-4.4	-9.6	-7.1	0.1	0.0
Estimated OECD Inventory Level (e) (million barrels)	2,950	3,059	3,005	2,860	2,911
Surplus Production Capacity (million barrels per day)					
OPEC Surplus Crude Oil Production Capacity (f)	3.0	3.0	3.0	2.5	2.0

Note: The term “petroleum and other liquids” encompasses crude oil, lease condensate, natural gas liquids, biofuels, coal-to-liquids, gas-to-liquids, and refinery processing gains, which are important to consider in concert due to the inter-related supply, demand, and price dynamics of petroleum, petroleum products, and related fuels.
(a) Production includes crude oil (including lease condensates), natural gas liquids, other liquids, and refinery processing gains.
(b) Consumption of petroleum by the OECD countries is synonymous with “products supplied," defined in the glossary of the EIA Petroleum Supply Monthly, DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel, and loss, and bunkering.
(c) Biofuels production and consumption are based on EIA estimates as published in the International Energy Statistics. Biofuels production in the third quarter tends to be at its highest level in the year as ethanol production in Brazil reaches its seasonal peak and is typically lowest in the first quarter as seasonal production falls in the South/South-Central region of Brazil.
(d) Global production of petroleum and petroleum products outside of Iran is derived by subtracting biofuels production and Iran liquid fuels production from global liquid fuels production. The same method is used to calculate global consumption outside of Iran.
(e) Estimated inventory level is for OECD countries only.
(f) EIA defines surplus oil production capacity as potential oil production that could be brought online within 30 days and sustained for at least 90 days, consistent with sound business practices. This does not include oil production increases that could not be sustained without degrading the future production capacity of a field.
Source: U.S. Energy Information Administration.

Table a2. Crude Oil and Petroleum Product Price Data

Item	February 2020	March 2020	February – March 2020 Average	February – March 2019 Average	2017–2019 Average
Brent Front Month Futures Price ($ per barrel)	55.48	33.73	44.09	65.80	57.19
WTI Front Month Futures Price ($ per barrel)	50.54	30.45	39.76	56.65	53.07
Dubai Front Month Futures Price ($ per barrel)	54.42	34.22	43.84	65.84	55.04

May 2020

Short-Term Energy Outlook (STEO)

Forecast highlights

Global liquid fuels

- Although all market outlooks are subject to many risks, the May edition of EIA's *Short-Term Energy Outlook* remains subject to heightened levels of uncertainty because the effects on energy markets of mitigation efforts related to the 2019 novel coronavirus disease (COVID-19) are still evolving. Reduced economic activity related to the COVID-19 pandemic has caused significant changes in energy supply and demand patterns. Crude oil prices, in particular, have fallen significantly since the beginning of 2020, largely driven by reduced oil demand because of COVID-19 mitigation efforts. Despite the April agreement between the Organization of the Petroleum Exporting Countries (OPEC) and partner countries (OPEC+) to reduce production levels beyond the end of the STEO forecast period, crude oil prices have remained at some of their lowest levels in more than 20 years. Uncertainties persist across EIA's outlook for other energy sources, including natural gas, electricity, coal, and renewables.

- Brent crude oil prices averaged $18 per barrel (b) in April, a decrease of $13/b from the average in March. EIA forecasts Brent crude oil prices will average $34/b in 2020, down from an average of $64/b in 2019. EIA expects prices will average $23/b during the second quarter of 2020 before increasing to $32/b during the second half of the year. EIA forecasts that Brent prices will rise to an average of $48/b in 2021, $2/b higher than forecast last month, as EIA expects that declining global oil inventories next year will put upward pressure on oil prices.

- EIA estimates global petroleum and liquid fuels consumption averaged 94.1 million barrels per day (b/d) in the first quarter of 2020, a decline of 5.8 million b/d from the same period in 2019. EIA expects global petroleum and liquid fuels demand will average 92.6 million b/d in 2020, a decrease of 8.1 million b/d from last year, before increasing by 7.0 million b/d in 2021. Lower global oil demand growth for 2020 in the May STEO reflects growing evidence of disruptions to global economic activity along with reduced expected travel globally as a result of restrictions related to COVID-19.

- EIA expects that global liquid fuels inventories will grow by an average of 2.6 million b/d in 2020 after falling by 0.2 million b/d in 2019. EIA expects inventory builds will

be largest in the first half of 2020, rising at a rate of 6.6 million b/d in the first quarter and increasing to builds of 11.5 million b/d in the second quarter as a result of widespread travel limitations and sharp reductions in economic activity. Firmer demand growth as the global economy begins to recover and slower supply growth will contribute to global oil inventory draws beginning in the third quarter of 2020. EIA expects global liquid fuels inventories will fall by 1.9 million b/d in 2021.

- EIA forecasts significant decreases in U.S. liquid fuels demand during the first half of 2020 as a result of COVID-19 travel restrictions and disruptions to business and economic activity. EIA expects the largest impacts will occur in the second quarter of 2020 before gradually dissipating over the next 18 months. EIA expects U.S. motor gasoline consumption to fall from 8.6 million b/d in the first quarter of 2020 to an average of 7.0 million b/d in the second quarter before gradually increasing to 8.7 million b/d in the second half of the year. U.S. jet fuel consumption will fall from 1.6 million b/d in the first quarter of 2020 to an average of 0.8 million b/d in the second quarter. U.S. distillate fuel oil consumption is forecast to decline by 0.6 million b/d to average 3.3 million b/d during the same period. For all of 2020, EIA forecasts that U.S. motor gasoline consumption will average 8.3 million b/d, a decrease of 11% compared with 2019, while jet fuel and distillate fuel oil consumption will fall by 25% and 10%, respectively, during the same period.

- EIA has revised its current forecast of domestic crude oil production down from the April STEO as a result of lower crude oil prices. EIA forecasts U.S. crude oil production will average 11.7 million b/d in 2020, down 0.5 million b/d from 2019. In 2021, EIA expects U.S. crude oil production to decline further by 0.8 million b/d. If realized, the 2020 production decline would mark the first annual decline since 2016. U.S. crude oil production has not declined for two years in a row since the 17-year period of declines beginning in 1992 and running through 2008. Typically, price changes affect production after about a six-month lag. However, current market conditions will likely reduce this lag as many producers have already announced plans to reduce capital spending and drilling levels.

Natural Gas

- In April, the Henry Hub natural gas spot price averaged $1.73 per million British thermal units (MMBtu). EIA forecasts that natural gas prices will generally rise through the rest of 2020 as U.S. production declines. EIA forecasts that Henry Hub natural gas spot prices will average $2.14/MMBtu in 2020 and then increase in 2021, reaching an annual average of $2.89/MMBtu. EIA expects prices to rise largely because of lower natural gas production compared with 2020.

- EIA expects total consumption of natural gas to average 81.7 billion cubic feet per day (Bcf/d) in 2020, down 3.9% from the 2019 average primarily because of lower industrial sector consumption of natural gas. EIA forecasts industrial natural gas consumption to average 21.3 Bcf/d in 2020, down 7.1% from 2019 as a result of lower expected manufacturing activity. This expected decline is lower than the 0.3% decline forecast in the April STEO because of large downward revisions to the macroeconomic forecast in the May STEO.

- U.S. dry natural gas production set a record in 2019, averaging 92.2 Bcf/d. EIA forecasts dry natural gas production will average 89.8 Bcf/d in 2020, with monthly production falling from an estimated 93.1 Bcf/d in April to 85.4 Bcf/d in December. Natural gas production declines the most in the Appalachian region and Permian region. In the Appalachian region, low natural gas prices are discouraging producers from engaging in natural gas-directed drilling, and in the Permian region, low oil prices reduce associated gas output from oil-directed wells. In 2021, forecast dry natural gas production averages 84.9 Bcf/d, rising in the second half of 2021 in response to higher prices.

- EIA estimates that total U.S. working natural gas in storage ended April at 2.3 trillion cubic feet (Tcf), 20% more than the five-year (2015–19) average. In the forecast, inventories rise by 2.1 Tcf during the April through October injection season to reach almost 4.2 Tcf on October 31, which would be a record level.

- EIA forecasts that U.S. liquefied natural gas exports will average 5.8 Bcf/d in the second quarter of 2020 and 4.8 Bcf/d in the third quarter of 2020. U.S. liquefied natural gas exports are expected to decline through the end of the summer as a result of lower expected global demand for natural gas.

Electricity, coal, renewables, and emissions

- Although some stay-at-home orders are beginning to be relaxed, the effects of social distancing guidelines are likely to continue affecting U.S. electricity consumption during the next few months. EIA expects retail sales of electricity in the commercial sector will fall by 6.5% in 2020 because many businesses have closed and many people are working from home. Similarly, EIA expects industrial retail sales of electricity will fall by 6.5% in 2020 as many factories cut back production. Forecast U.S. sales of electricity to the residential sector fall by 1.3% in 2020 because of lower electricity demand as a result of milder winter and summer weather, which is offset slightly by increased household electricity consumption as much of the population spends relatively more time at home.

- EIA forecasts that total U.S. electric power sector generation will decline by 5% in 2020. Most of the expected decline in electricity supply is reflected in lower fossil fuel generation, especially at coal-fired power plants. EIA expects that coal generation will fall by 25% in 2020. Forecast natural gas generation is relatively flat

this year, reflecting favorable fuel costs and the addition of new generating capacity. Renewable energy sources account for the largest portion of new generating capacity in 2020, driving EIA's forecast of 11% growth in renewable generation by the electric power sector. Renewable energy is typically dispatched whenever it is available because of its low operating cost.

- Although EIA expects renewable energy to be the fastest-growing source of electricity generation in 2020, the effects the economic slowdown related to COVID-19 are likely to affect new generating capacity builds during the next few months. EIA expects the electric power sector will add 20.4 gigawatts of new wind capacity and 12.7 gigawatts of utility-scale solar capacity in 2020. However, these forecasts are subject to a high degree of uncertainty, and EIA will continue to monitor reported planned capacity builds.

- EIA forecasts U.S. average coal consumption will decrease by 23% to 453 MMst in 2020. The decrease is primarily driven by a 24% decline in electric power sector consumption and persistently low natural gas prices. In 2021, consumption is expected to increase by 10% to 498 MMst because of stronger natural gas prices and an overall economic recovery that results in rising electricity generation.

- After decreasing by 2.8% in 2019, EIA forecasts that U.S. energy-related carbon dioxide (CO2) emissions will decrease by 11% (572 million metric tons) in 2020. This record decline is the result of restrictions on business and travel activity and slowing economic growth related to COVID-19. CO2 emissions decline from all fossil fuels, particularly coal (23%) and petroleum (11%). In 2021, EIA forecasts that energy-related CO2 emissions will increase by 5% as the economy recovers and stay-at-home orders are lifted. Energy-related CO2 emissions are sensitive to changes in weather, economic growth, energy prices, and fuel mix.

Forecast Assumptions

Because of the heightened uncertainty surrounding this month's STEO, we have included some of the driving assumptions that affected our forecast this month.

Global Liquid Fuels

Global Petroleum and Other Liquid Fuels Consumption

In the May STEO, EIA revised its 2020 global oil consumption forecast to reflect the most up-to-date information available.

Similar to the March and April STEOs, EIA analyzed reductions in oil demand by evaluating three main drivers: lower economic growth, less air travel, and other declines in demand not captured by these two categories, largely related to reductions in travel because of stay-at-home orders. Based on incoming data and updated assessments of lockdowns and stay-at-home orders across dozens of countries globally, EIA has lowered its forecasts for global oil demand in 2020. The precise effect of lockdowns on petroleum consumption remains highly uncertain because the severity and enforcement of the shutdowns vary by country. EIA currently assumes all stay-at-home orders will be eased by the fourth quarter of 2020. EIA is not assuming resurgent outbreaks of COVID-19 that result in the announcement of further lockdowns.

The May STEO's forecast for non-U.S. economic growth is based on forecasts from Oxford Economics, which have been revised down since the April STEO. In 2020, EIA forecasts global oil consumption-weighted gross domestic product (GDP) to decline by 4.1%, compared with a decline of 0.1% in the April STEO. The sharpest declines occur in the second quarter of 2020 when Oxford Economics forecasts that global GDP will decrease 7.1% compared with 2019.

EIA forecasts global liquid fuels consumption will average 92.6 million barrels per day (b/d) in 2020, down 8.1 million b/d from 2019. Following the pattern of the GDP forecast, the sharpest consumption declines are in the second quarter, when EIA forecasts a year-over-year decline in liquid fuels consumption of 18.8 million b/d. EIA forecasts both economic growth and global liquid fuels consumption to increase in 2021. However, any lasting changes to transportation and other oil consumption patterns once COVID-19 mitigation efforts end present considerable uncertainty to the increase in liquid fuels consumption, even if GDP growth increases significantly.

Non-OPEC Petroleum and Other Liquid Fuels Supply

EIA forecasts that the supply of non-OPEC petroleum and other liquid fuels will decline by 2.4 million b/d in 2020, compared with a decline of 0.2 million b/d in the April STEO. The steeper decline largely reflects the newly implemented production cuts from non-OPEC participants in the OPEC+ agreement. EIA expects the largest non-OPEC production declines in 2020 to occur in Russia, the United States, and Canada.

EIA expects production of non-OPEC petroleum and other liquid fuels to increase in 2021. Production in countries that have implemented voluntary production cuts will generally rise in 2021 as global oil demand recovers. However, EIA forecasts production to continue to decline in the United States, where production is driven by price-sensitive shale operators.

EIA expects Russia to experience the largest liquid fuels production declines in 2020 among OPEC+ producers, with forecast declines of more than 0.8 million b/d compared with 2019. EIA expects Russia's liquid fuels production to rise in 2021.

EIA expects total production of liquid fuels in the United States to fall by 0.8 million b/d in 2020, largely as a result of reductions in drilling in price-sensitive tight oil regions. EIA expects U.S. supply to fall by another 0.6 million b/d in 2021.

EIA expects Canada's total liquid fuels production to fall by 0.4 million b/d in 2020. This decrease is a result of 2019 government-ordered production cuts in Alberta and economic shut-ins because of the effect of low oil prices and falling demand for oil exports. In 2021, EIA expects Canada's production to increase and return to near 2019 levels. EIA does not expect any additional production from new upstream projects to come online during the forecast period, only expansions of existing projects.

EIA expects Brazil's production of petroleum and other liquid fuels to grow more slowly than previously forecast. On April 1, Brazil's national oil company, Petroleo Brasileiro, S.A. (Petrobras), deepened its production cuts to 200,000 b/d. EIA expects this level of cuts to continue for the remainder of 2020. Petrobras will idle some shallow-water platforms with higher production costs in the Sergipe, Rio Grande do Norte, and Ceará states to achieve these cuts. In addition, production volumes from the P-70 floating, production, storage, and offloading vessel (FPSO) will be delayed until 2021. The P-70 was originally scheduled to begin producing in the first half of 2020, before it was damaged in a storm in February 2020. Growth in 2021 will be restrained as previously scheduled FPSOs (Carioca, Sepia, Guanabara) are now delayed because of the economic slowdown related to COVID-19 restrictions that are affecting production schedules. In 2020, EIA also expects biofuels to be affected by reduced ethanol demand, and it expects sugar cane millers to switch to sugar production as a result of pricing conditions.

Mexico agreed to 100,000 b/d of cuts under the OPEC+ agreement. EIA had previously forecast crude oil production to decline in Mexico in 2020 and 2021 because of natural declines in mature fields. EIA now expects additional declines as result of Mexico shutting in new priority wells to fulfill the OPEC+ obligation. Overall EIA expects Mexico's annual average liquid fuels production to fall by almost 0.1 million b/d in both 2020 and 2021.

Norway's Ministry of Petroleum and Energy announced unilateral production cuts on the Norwegian continental shelf to help stabilize world oil markets. Norway will limit production of crude oil to no more than 1.609 million b/d in June and no more than 1.725 million b/d for the remainder of 2020. EIA assumes Norway's crude oil production will adhere to these levels.

In Asia, EIA expects India to shut in about 120,000 b/d of production during the next few months as a result of the immediate economic impacts related to COVID-19 on labor mobility and other logistics. In addition, the significantly lower oil price environment will reduce capital expenditure by upstream investors in both China and India and shutter production at higher production cost fields, such as China's tight oil plays in the north central and northwest of the country and the mature fields that require enhanced oil recovery. EIA expects declines to deepen in 2020 and 2021. India plans to begin oil production from the deepwater KG-DWN-98/2 oil and natural gas project in early 2021, which will offset some production declines from mature basins in 2021.

EIA assumes that Malaysia will fully comply with the April 2020 OPEC+ agreement for the months of May and June 2020. Malaysia reports that the production cuts will come from the deepwater Kimanis crude oil grade.

In the non-OPEC Middle East, EIA expects Oman's production to decline in 2020, in contrast to last month's STEO, which forecasted growth. EIA assumes Oman will fully comply with the OPEC+ agreement for May and June 2020. Condensate production will grow slightly through the forecast period from new projects, but crude oil production will remain constrained by lower oil prices and falling investment.

OPEC Petroleum and Other Liquid Fuels Supply

OPEC and partner countries (OPEC+) agreed to new production cuts in early April that will remain in place throughout the STEO forecast period. EIA assumes OPEC countries will mostly adhere to announced cuts during the first two months of the agreement (May and June). This forecast assumes OPEC's production compliance relaxes later in the forecast period, as stated production cuts are reduced and global oil demand begins growing again.

EIA forecasts OPEC crude oil production will fall below 24.1 million b/d in June, a 6.3 million b/d decline from April when OPEC production increased following an inconclusive meeting in March. The forecast for June OPEC production does not account for additional voluntary cuts announced by the Saudi Energy Ministry on May 11. If OPEC production declines to less than 24.1 million b/d, it would be the group's lowest level of production since March 1995.

EIA expects OPEC production will begin increasing in July 2020 in response to rising global oil demand and prices. From that point EIA expects a gradual increase in OPEC crude oil production through the remainder of the forecast, with production rising to an average of 28.5 million b/d during the second half of 2021.

Part of this increase is the result of oil production resuming in Libya. After reaching production levels of 1.2 million b/d in late 2019, Libya's crude oil output averaged 80,000 b/d in April 2020. Most of the country's export ports closed and several oil fields were shut-in, including El Sharara and El Feel, in January 2020. With the ongoing civil war in Libya, EIA does not expect production to increase until late 2020. Once currently shuttered export terminals and oil fields reopen, EIA expects that Libya will boost production to near-capacity despite low oil prices in a relatively short time.

EIA expects that OPEC surplus crude oil production capacity, which averaged 2.5 million b/d in 2019, will average 5.8 million b/d during the third quarter of 2020. EIA expects it to decline to an average of 3.7 million b/d in 2021 with increased production as the targeted cuts are relaxed. These capacity increases include the Neutral Zone production ramp up that started in March 2020 that will add 0.6 million b/d of additional surplus capacity when completed in a year.

OECD Petroleum Inventories

An unprecedented drop in global oil demand in 2020 leads EIA to forecast that global oil inventories will build at an average rate of 2.6 million b/d for the year, the largest annual inventory build during the 40 years that EIA has tracked international data.

Unlike previous periods of significant global oil inventory builds, where oversupplied market conditions persisted for several quarters (for example, 1997–98 and 2014–16), EIA expects that inventory builds in 2020 will be of an unprecedented magnitude but will only occur for two quarters. Forecast builds average 9.1 million b/d during the first half of 2020, peaking at a build of 22.8 million b/d during April. EIA estimates that builds during the first half of 2020 could add 1.6 billion barrels to global inventories, likely leaving global storage near full capacity. EIA expects global liquid fuels inventories to draw at an average rate between 2.5 million b/d and 3.0 million b/d from the third quarter of 2020 through the end of 2021, given the implementation of OPEC+ production cuts beginning in May, economically driven reductions in U.S. oil production, and a return of global oil demand. Draws of this magnitude would largely work off the inventory builds accrued during the first half of 2020.

Crude Oil Prices

Brent crude oil spot prices averaged $18 per barrel (b) in April, down $13/b from March as global oil demand continued to fall and global oil inventories rose strongly. In particular, crude oil prices fell as concerns regarding the capacity of global oil storage to handle expected inventory builds increased. EIA expects that the rate of inventory builds peaked in April, and as oil demand begins to return and oil supply decreases, upward price pressures will begin to emerge. With global oil demand expected to exceed supply beginning in the second half of 2020 and continuing through the forecast period, prices could rise steadily beginning in the second half of this year. Although EIA forecasts significant inventory draws beginning in July, high existing inventory levels, high OPEC spare production capacity, and uncertainty about the trajectory of oil demand will likely limit, but not completely contain, upward crude oil price movements.

EIA expects Brent crude oil prices will rise to an average of $32/b during the second half of 2020 and $48/b on average in 2021, reaching $54/b by the end of the year. However, this price path reflects an expected of global oil consumption to 97.4 million b/d during the second half of 2020, along with relatively high compliance to announced OPEC+ production cuts, both of which are uncertain. Also, the degree to which the U.S. shale industry responds to the current low prices will affect the oil price path in the coming quarters.

U.S. Liquid Fuels

Consumption

EIA assumes significantly lower levels of U.S. liquid fuels consumption during much of 2020 as a result of the disruptions to economic and business activity because of the strict containment measures related to COVID-19 that have dramatically reduced all forms of travel. These impacts are expected to be most pronounced during the second quarter of 2020, when most containment measures and wide-scale reductions in business activity are assumed to be in place. EIA expects these impacts to persist through most of 2020, but in the second half of 2020, EIA expects liquid fuels consumption will gradually increase from second-quarter levels as some business activity resumes and stay-at-home orders gradually ease. EIA expects U.S. total liquid fuels consumption will rise from an average of 15.9 million b/d in the second quarter of 2020 to 18.7 million b/d in the third quarter of 2020 and then to average 19.8 million b/d in 2021, up 8% from 2020, but lower than 2019 levels. EIA forecasts travel disruptions will affect jet fuel consumption the most in percentage terms, with consumption expected to decline by 25% year-over-year for all of 2020 and by more than 50% year-over-year in the second quarter. EIA expects gasoline and distillate fuel consumption will both see consumption fall about 10% compared with 2019 levels.

EIA's current forecast for U.S. annual average hydrocarbon gas liquids (HGL) consumption reflects a steeper decline in 2020 followed by a slower recovery in 2021 compared with the previous forecast. The May STEO expects HGL consumption will decline by 7.4% in 2020 and increase by 5.3% in 2021. The current forecast expects a deeper slowdown in manufacturing that keeps petrochemical feedstock and gasoline blending demand for HGLs lower than 2019 levels in both 2020 and 2021. Ethane consumption begins to rise in the first quarter of 2021 as manufacturing begins to recover and as ethane-fed petrochemical plants increase utilization.

Crude Oil Supply

EIA's model for crude oil production in the Lower 48 states' includes structural parameters that reduce the forecast for rigs and wells when the West Texas Intermediate crude oil price falls below $45/b or the Henry Hub natural gas price falls below $2 per million British thermal units, based on historical trends in each region. In addition to this model-based drop, EIA assumes a further 30% reduction in drilling activity on average in the second quarter of 2020 and a 6% reduction in the third quarter of 2020 as a result of low oil prices related to the unprecedented effects of restrictions as a result of COVID-19; many producers have already announced plans to reduce capital spending and drilling levels.

EIA expects that steepest declines in U.S. crude oil production will be in the second quarter of 2020, with forecast month-over-month declines averaging 0.5 million b/d during those three months. EIA expects production to continue declining, albeit at a slower rate, through March 2021, when production bottoms out at 10.7 million b/d, which would be a 2.1 million b/d decline from the record monthly production reached in November 2019. EIA expects production to rise modestly through the end 2021 in response to rising crude oil prices. EIA forecasts annual

average crude oil production to be 11.7 million b/d in 2020 and 10.9 million b/d in 2021, both of which are about 0.1 million b/d lower than forecast in the April STEO.

The decline in U.S. crude oil production in 2020 and 2021, combined with rising U.S. liquid fuels consumption, results in the United States returning to being a net importer of crude oil and petroleum products in the third quarter of 2020 and remaining a net importer in most months through the end of the forecast period.

Product Prices

EIA expects that restrictions related to COVID-19 will drive sharp reductions in crude oil prices and U.S. liquid fuels demand during the second quarter of 2020, which will significantly reduce prices for gasoline and diesel fuel during the same period. EIA forecasts that U.S. average retail prices for regular-grade gasoline will average $1.91 per gallon (gal) and diesel retail prices will average $2.22/gal in the second quarter of 2020.

The gasoline and diesel price declines largely reflect a drop in crude oil prices. Refinery margins, after falling significantly as gasoline and diesel demand fell quickly in March and April, have increased recently as refiners have reduced runs. EIA expects petroleum product prices will rise as crude oil prices rise in the coming quarters. However, EIA generally expects U.S. average gasoline prices to remain lower than $2/gal until March 2021.

Natural Gas

Natural Gas Consumption

EIA expects the most significant effects of COVID-19 related restrictions on natural gas demand to occur in the industrial sector. EIA forecasts that industrial demand for natural gas will decrease by 7% in 2020 compared with 2019. The decline reflects a reduction in economic activity, leading to a declining forecast natural gas-weighted manufacturing index through October 2020. The industrial demand for natural gas forecast is particularly sensitive to macroeconomic conditions, and the size and pace of the forecast economic contraction and the subsequent expected economic recovery significantly affect industrial demand for natural gas.

The May STEO assumes minor shifts in space heating demand in April as more people stayed at home rather than go to work or shop at retail establishments as a result of restrictions related to the COVID-19 pandemic. This shift increases residential natural gas demand for a given temperature level while decreasing commercial natural gas demand. Commercial natural gas demand will decrease further in the near term under the assumption that restaurants and other food establishments, which use more natural gas for cooking food and for hot water heating compared with other segments of the commercial sector, will see a particularly high number of closings.

The May STEO forecast assumes that a combination of lower global natural gas demand as a result of restriction related to the COVID-19 pandemic and an unfavorable liquefied natural gas (LNG) pricing environment will lower U.S. LNG exports, primarily in the third quarter of 2020.

Natural Gas Supply

EIA's model for natural gas production in the Lower 48 states includes structural parameters that reduce the forecast for rigs and wells when the West Texas Intermediate crude oil price falls lower than $45/b or the Henry Hub natural gas price falls lower than $2 per million British thermal units (MMBtu), based on historical trends. In addition to this model-based drop, EIA assumes a further 30% reduction in activity on average in the second quarter of 2020 and a 6% reduction in the third quarter of 2020 to account for the unprecedented effects of travel restrictions related to COVID-19 on the level of drilling activity; many producers have already announced plans to reduce capital spending and drilling levels.

Natural Gas Inventories

EIA's natural gas storage forecast assumes an injection season (March through October) storage build that is slightly higher than average because natural gas consumption is forecast to decline relatively quickly in the second quarter of 2020, while production also declines but at a slower rate. In addition, reductions in economic activity reduce natural-gas fired electricity generation. EIA assumes that end-of-October storage levels in 2020 will be almost 4.2 trillion cubic feet, which would be the largest U.S. natural gas storage inventory on record.

Natural Gas Prices

The May STEO assumes that the Henry Hub spot price will remain low compared with historical levels in the near term as reduced business activity and higher-than-average storage levels entering the summer injection season contribute to keeping prices low. In the third quarter of 2020, slowing natural gas production, combined with increasing industrial demand and higher winter demand for space heating, encourage increases in the natural gas price. EIA expects the Henry Hub spot prices will rise from an average of $2.14/MMBtu in 2020 to an average of $2.89/MMBtu in 2021.

Coal

Coal Supply

Coal production has continued to slow, primarily because of low electric power demand. Some large producers have stipulated that their mines will be shut down or idled for periods ranging from 14 to 30 days, while others have not implied a date to resume normal operations. EIA expects that these decreases in overall production will have a noticeable effect on supply, contributing to a steeper decline than would have occurred had these measures not been put into place.

Coal Consumption

EIA expects coal consumption to decline in 2020 as a result of an overall decline in electricity generation. However, EIA forecasts that coal consumption will rise in 2021 because of a general economic recovery that will increase overall electricity generation and an expected increase in

natural gas prices that will cause some coal-fired generation units to become more economic to dispatch. Secondary stocks (at power plants) remain high, and even with decreased production, coal plants do not expect shortfalls in the next few months. EIA projects that industrial consumption will also decline as coal coke demand is slowed by unfavorable market conditions and by significantly decreased raw steel production.

Coal Trade

EIA estimates that U.S. coal exports will decrease through 2020. Atlantic markets, which are the primary outlet for U.S. coal exports, are showing considerably decreased demand because of the global economic slowdown. India, the top destination for U.S. exports, has decreased demand for both steam and coking coals as a result of nationwide lockdowns. Smaller U.S. coal export destinations such as Egypt have cancelled proposed coal projects that would have relied on imported fuel. Japan, a large consumer of U.S. coking coal, idled many blast furnaces in the beginning of the second quarter of 2020. COVID-19 related lockdowns affecting large seaborne market suppliers, including Colombia and Indonesia, have stifled global supply, providing some support to international prices but not enough to overcome the overarching shortfalls in demand.

Coal Prices

EIA estimates the delivered coal price to U.S. electricity generators averaged $2.02 per million British thermal units (MMBtu) in 2019, which was 4 cents/MMBtu lower than in 2018. EIA forecasts that coal prices will decrease in 2020 to $1.99/MMBtu and increase in 2021 to $2.04/MMBtu.

Electricity

The restrictions related to the COVID-19 pandemic and the associated economic effects also create a high level of uncertainty regarding EIA's short-term outlook for U.S. electricity markets. EIA has developed some initial assumptions about potential effects. As EIA receives new survey data during the coming weeks, future STEO forecasts will incorporate this information.

Electricity Consumption

The current STEO forecast incorporates new macroeconomic projections, which lead to a forecast of declines in retail sales of electricity to the commercial and industrial sectors. Social distancing guidelines are likely to especially affect electricity consumption in the commercial sector where many businesses, such as lodging and food service establishments, will experience reduced activity. In addition, increased numbers of people working from home reduces electricity usage in office buildings. EIA assumes these social distancing effects will magnify the economic impact on commercial electricity consumption during the next three to six months, after which time commercial electricity usage is likely to begin to increase.

As people spend more time in their homes, weather-adjusted electricity consumption by the residential sector is likely to increase in the near term, in contrast to the effects on the

commercial and industrial sectors. EIA assumes, in particular, that household usage of electronic equipment such as computers and televisions will increase. Other uses of electricity, such as for cooking and for heating water, may also rise. Household use of air conditioning during the summer months is also likely to be greater than normal as more people stay home during the daytime.

Electricity Generation

Macroeconomic effects on electricity supply are also very uncertain because of rapidly changing economic conditions. The status of component supply chains and the construction workforce are likely to affect the building new generating capacity in the near term in many areas of the country. Most of the generating capacity that had been scheduled to come online in 2020 is fueled by renewable energy sources—including solar and wind—and by natural gas.

To represent these impacts on electricity supply, EIA assumes that some of the generating capacity previously reported to EIA as planned to come online in the next six months will be postponed to sometime beyond the STEO forecast period. Most of these postponements are in solar and wind. As EIA continues to collect updates for project development activities reported on our surveys, we will revise these assumptions in future STEO forecasts.

Electricity Prices

The forecast reduction in overall electricity demand resulting from the economic slowdown, along with lower expected natural gas fuel costs for power generation, drives EIA's expectation that wholesale electricity prices will be lower in 2020 throughout the country. The lower costs of electricity supply will likely not affect retail electricity prices in the near term but may be reflected in lower retail prices in the future as utilities make adjustments to their electric rates during the coming months.

U.S. Economic Assumptions and Energy-Related Carbon Dioxide Emissions

Recent Economic Indicators

The STEO is based on macroeconomic projections by Oxford Economics (for countries other than the United States) and by IHS Markit (for the United States). Given the tremendous uncertainty in both the spread and severity of COVID-19 and in the efforts to stop the spread of the virus, these forecasts are significantly more uncertain than normal.

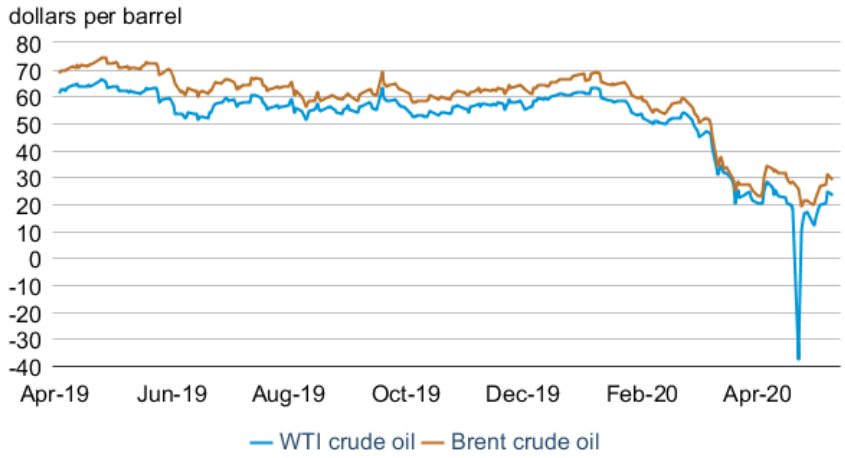
The April version of the Oxford forecast used in this STEO represents a significant downward revision from the previous month, reflecting a greater understanding of the severity of the virus and the effects of the travel restrictions and stay-at-home orders. Using the Oxford data, EIA assumes that global oil-consumption weighted GDP will contract by 2.8% in the first quarter of 2020 and by 4.5% in the second quarter (quarter-over-quarter growth rates). With the assumption that most lockdowns are lifted sometime during the second quarter, growth returns in the second half of 2020, leading to an overall year-over-year growth rate for oil consumption-weighted GDP in 2020 of -4.1%. The recovery continues in 2021, leading to a 6.7% growth rate.

For the United States, EIA used the April 2, 2020 release of the IHS Markit U.S. Short-Term Macroeconomic model with EIA's energy prices. Since the release of the April STEO, the near-term outlook for GDP has significantly declined as policies to slow the spread of COVID-19 remain in place. U.S. real GDP in the May STEO is forecasted to decline by 7.5% in the second quarter of 2020 (quarter-over-quarter) as compared with a 3.5% decline forecast in the April STEO. Year-over-year, the decline in 2020 for the May STEO is 5.4% as compared to the 2.0% decline forecasted in the April STEO. As in the April STEO, the economy is forecasted to return to growth in the fourth quarter of 2020. Employment does not return to pre-pandemic levels by the end of the STEO forecast period.

Energy-Related Carbon Dioxide Emissions.

After decreasing by 2.8% in 2019, EIA forecasts that U.S. energy-related carbon dioxide (CO2) emissions will decrease by 11% (572 million metric tons) in 2020. This record decline is the result of restrictions on business and travel activity and slowing economic growth related to COVID-19. CO2 emissions decline from all fossil fuels, particularly coal (23%) and petroleum (11%). In 2021, EIA forecasts that energy-related CO2 emissions will increase by 5% as the economy recovers and stay-at-home orders are lifted. Energy-related CO2 emissions are sensitive to changes in weather, economic growth, energy prices, and fuel mix.

Notable forecast changes



- Because of the rapidly changing situation in energy markets, EIA's forecast includes a significant number of notable forecast changes. Please see the detailed table of forecast changes for more information.

Petroleum and natural gas markets review

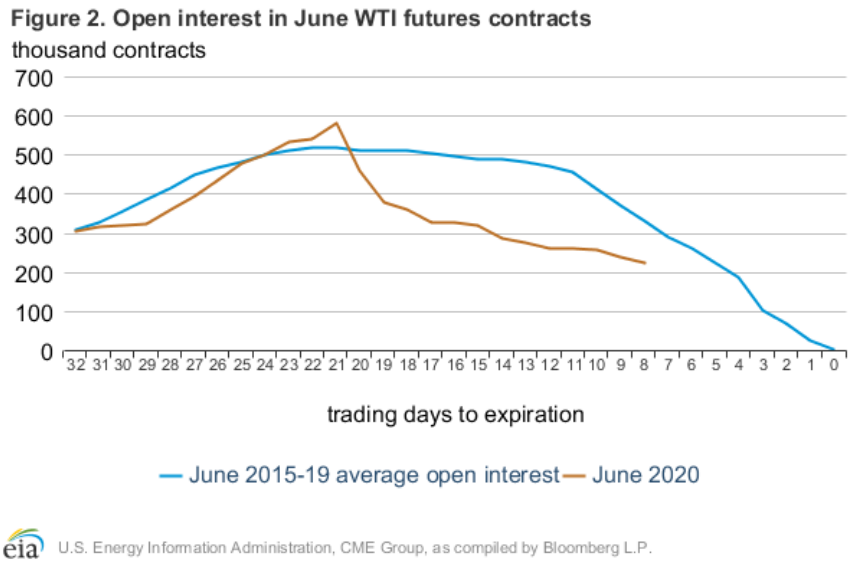
Crude oil

Prices: The front-month futures price for Brent crude oil settled at $29.46 per barrel (b) on May 7, 2020, an increase of $4.72/b from April 1, 2020. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, increased by $3.24/b during the same period, settling at $23.55/b on May 7 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices

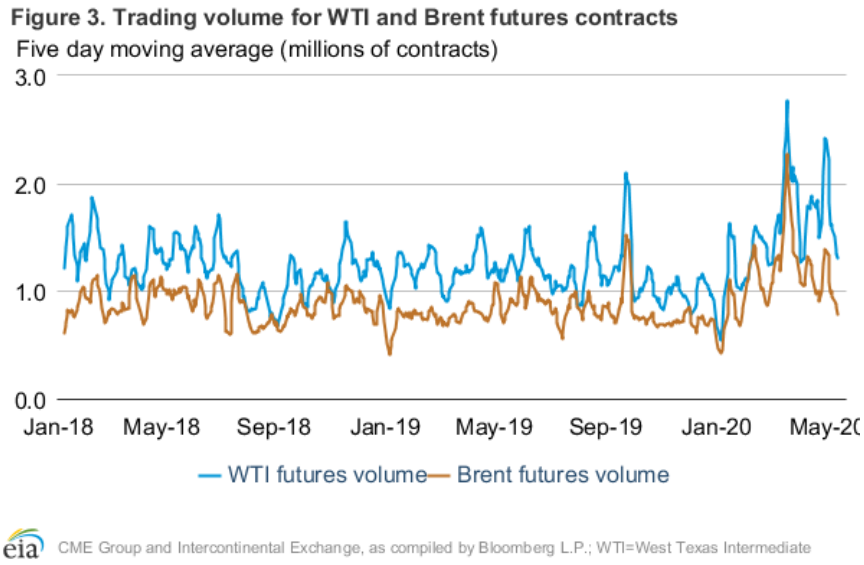
eia CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.; WTI=West Texas Intermediate

The oil futures market continued to exhibit significant volatility in April, marked in particular by the WTI front-month futures price closing at -$37.63/b on April 20, 2020. Although negative pricing has occurred in other commodity markets, it has never occurred in a highly visible and widely traded benchmark crude oil price. For a full explanation of this event, see *This Week in Petroleum*. Since April 21, crude oil prices have steadily increased and could indicate downside price pressure is easing. Many countries have begun to reopen their economies. In addition, the Organization of the Petroleum Exporting Countries (OPEC), along with Russia and a number of other non-OPEC producers (OPEC+), agreed to significant production reductions from May 2020 through April 2022, which should slow the pace of petroleum inventory builds. Although the outlook for global oil markets remains highly uncertain, April 2020 could mark the low-point for oil prices.



Voluntary production reductions from OPEC+ countries will not be sufficient to prevent significant inventory builds in May and June, however, as EIA expects global demand is forecast to remain subdued, albeit increasing from the lows of March and April. In the May STEO, EIA forecasts global liquid fuels inventories will increase at a pace of 10.1 million barrels per day (b/d) in May and build an additional 1.6 million b/d in June. In the United States, total commercial liquid fuels inventories increased by 2.7 million b/d in April 2020, which would be the largest build for any month since 1959 if confirmed in EIA's *Petroleum Supply Monthly*. Although petroleum inventory data outside the United States is unavailable in real-time, EIA

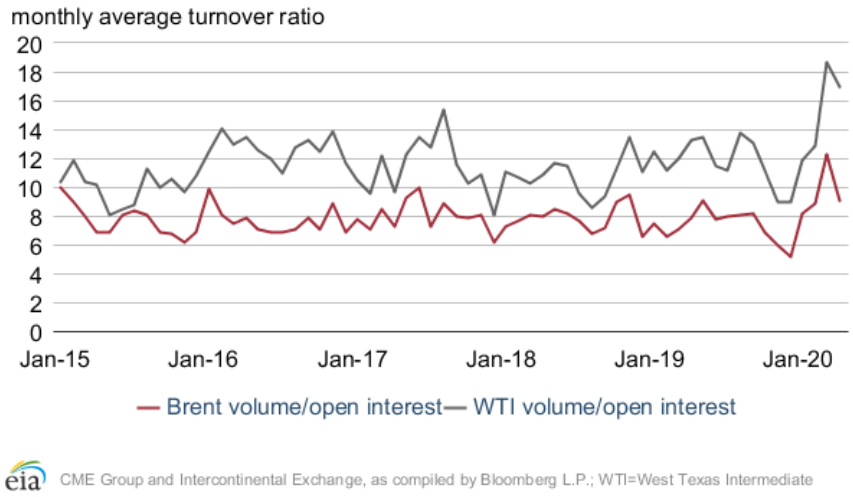
estimates a combination of on-land commercial storage, floating storage, and government strategic stocks will have to be used to accommodate the significant stock builds through June 2020.



EIA forecasts inventories to begin drawing in July 2020, with draws continuing through the end of 2021. A combination of increased demand, declines in production from non-OPEC countries, and continued production restraint from OPEC and partner countries contribute to an average draw of 2.5 million b/d from July 2020 through December 2021. EIA expects continued inventory withdrawals will provide upward price pressure on crude oil prices, although the very high stock level will prevent oil prices from returning to $60/b throughout 2021. In the May STEO, EIA has increased its Brent crude oil price forecast from an average of $46/b in 2021 in last month's STEO to $48/b, largely as a result of the production agreement from OPEC and partner countries and the resulting inventory withdrawals. EIA forecasts Brent crude oil prices to average $34/b in 2020, $1/b higher than the April STEO forecast.

WTI open interest: Price volatility in WTI futures in recent weeks has likely been exacerbated by factors specific to the financial markets. As referenced in EIA's *This Week in Petroleum*, market participants trading the May 2020 WTI contract ahead of expiration paid sellers to avoid taking physical delivery in Cushing, Oklahoma, and settle the contract financially. After the front-month contract rolled to WTI for June 2020 delivery, several market participants that use WTI futures for financial exposure to the crude oil market made public announcements that they would close their positions in the June contract earlier than normal. As a result, open interest (the number of outstanding contracts yet to be settled financially or through physical delivery) in the June WTI futures contract has decreased to levels lower than normal.

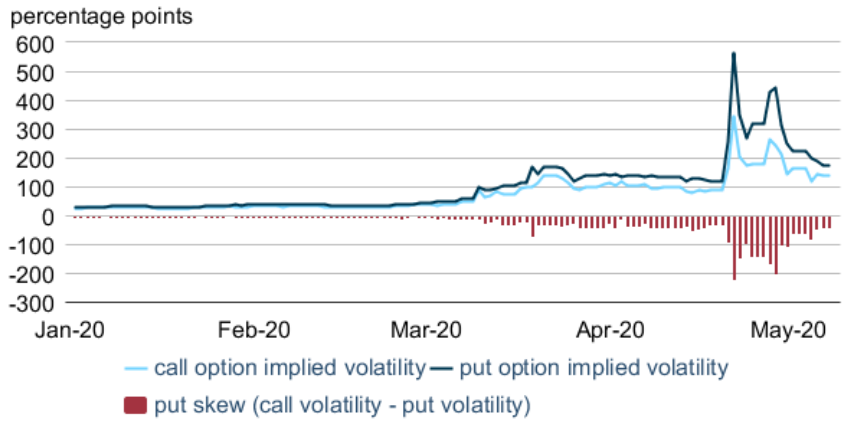
For example, the United States Oil Fund (USOF) is the largest crude oil exchange-traded fund (ETF) by total assets. Although the ETF typically holds about 5%–10% of the front-month WTI futures contract's open interest, its holdings increased to about 20% of the open interest by early April. To avoid similar price volatility ahead of the June contract's expiration on May 19, 2020, both USOF and several other funds that hold WTI front-month futures contracts in financial products announced they would be exiting positions in the June contract and rolling to other delivery months. As a result, open interest in the June 2020 WTI futures contract has declined significantly **(Figure 2)**. The five-year (2015–19) pattern for the June WTI contract tends to see open interest remain at about 500,000 contracts until about 12–14 trading days left to expiration, when market participants begin closing positions to avoid settlement for physical delivery. In contrast, the June 2020 contract declined to 221,819 contracts as of May 7, 2020, eight trading days before expiration.



Crude oil trading volume and open interest: Trading volume for both Brent and WTI crude oil futures reached all-time high levels in March and have remained at elevated levels through the first week of May. The five-day moving average trading volume for all Brent and WTI futures contracts was 0.8 million and 1.3 million contracts, respectively, as of May 7, 2020 **(Figure 3)**.

One way to identify trading activity and liquidity is the turnover ratio, which measures the average number of times a futures contract trades each day. This value is calculated by dividing a given future contract's total monthly trading volume by its average daily open interest. In March and April, the turnover ratio for all WTI futures contracts increased to record high levels of 19 and 17 per day, respectively. The turnover ratio for Brent futures was lower than that for WTI and did not reach an all-time high, but it increased to the highest level since 2011 in March 2020, averaging 12 per day **(Figure 4)**. Trading activity typically increases when price volatility increases.

Figure 4. Crude oil futures total monthly volume divided by average monthly open interest

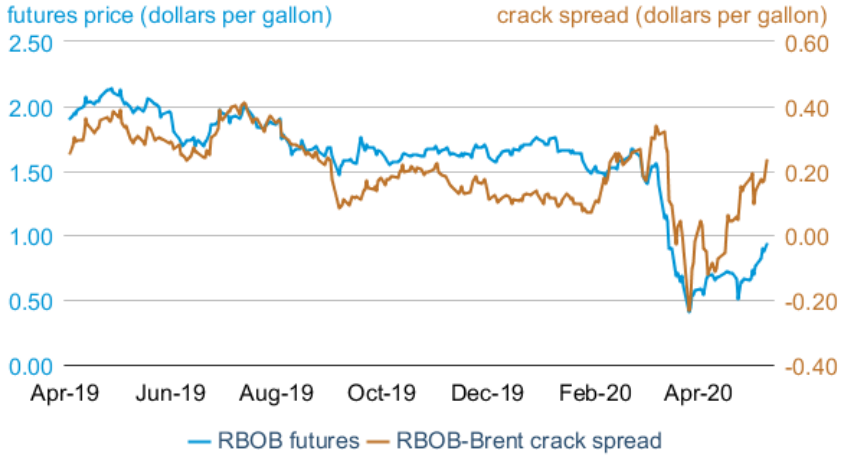


eia CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.; WTI=West Texas Intermediate

***Financial option volatility**:* The prices of financial options on WTI futures contracts deviated significantly from their usual patterns throughout much of March and April. The value of NYMEX WTI call options and put options (which give the option holder the right to buy or sell, respectively, a WTI futures contract at a given price within a set timeframe) increases when oil price volatility rises and decreases when price volatility falls. Although, theoretically, with the same strike price and expiration date, the implied volatility of WTI call options should be equal to the implied volatility of WTI put options, the latter almost always exceeds the former. The difference between call and put option volatility (known as the put skew) of front-month WTI futures averaged -2.3 percentage points between 2004 and 2019—a persistence generally attributed to the tendency of market participants to be loss-adverse or to relatively prefer preventing losses over making larger gains.

The skew has grown significantly wider during the past several months **(Figure 5)**. Although the implied volatility of WTI as derived from both call options and put options increased during March and April, call option volatility grew less than put option volatility, leading the put skew for the June 2020 WTI contract to fall to less than -220 percentage points on April 21. This level was the lowest put skew for the front-month WTI futures since at least 2004, the earliest year for which data are available. Much of the overall increase in volatility can be attributed to the particular circumstances surrounding the May 2020 WTI futures contract, and the reaction of market participants to negative crude oil prices—which many had believed were incapable of falling below zero. The disproportionate increase in the level of volatility implied by put options, however, suggests very high demand for protection against further downside price movements, but it also reflects the high premiums that sellers of put options require to take on this risk.

Figure 5. Volatility of financial options for the June 2020 NYMEX WTI contract



Note: Implied volatilities calculated using standard Black-Scholes assumptions (DFLT) on 25 delta calls and 25 delta puts as listed on Bloomberg.

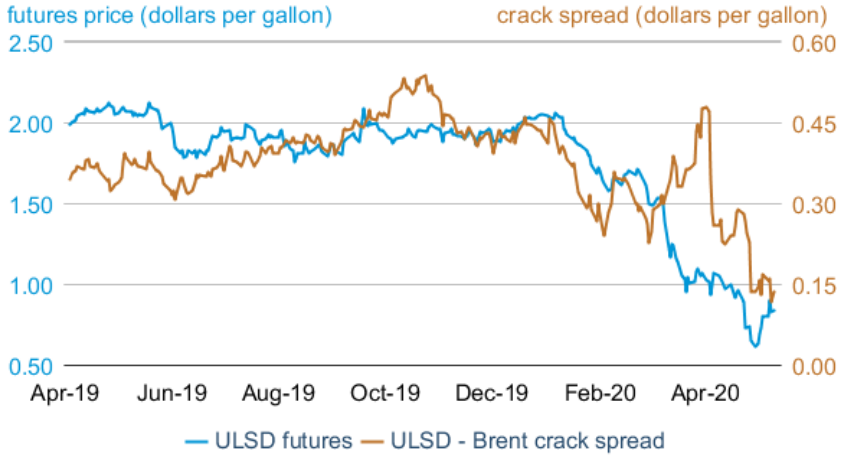
Petroleum products

Gasoline prices: The front-month futures price of reformulated blendstock for oxygenate blending (RBOB, the petroleum component of gasoline used in many parts of the country) settled at 93 cents per gallon (gal) on May 7, up 38 cents/gal from April 1, 2020 **(Figure 6)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) increased by 27 cents/gal to settle at 23 cents/gal during the same period. After briefly declining to negative values in late March and again in early April, the RBOB-Brent crack spread increased in the middle of April and continued to rise for the rest of the month.

Figure 6. Historical RBOB front-month futures prices and crack spread



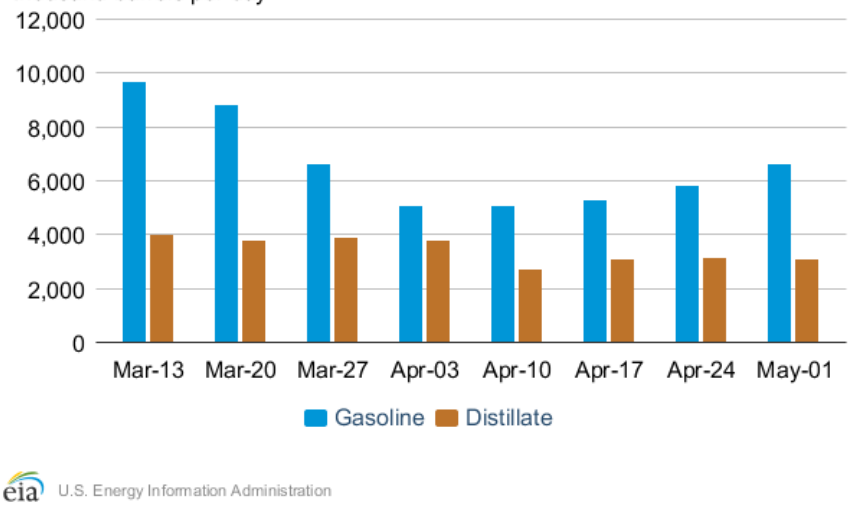
eia Source: CME Group, as compiled by Bloomberg L.P. Note: RBOB=reformulated blendstock for oxygenate blending

Finished motor gasoline consumption (measured by product supplied) grew to 6.7 million b/d for the week ending May 1, up from 5.1 million b/d on April 3, which contributed to the increases in RBOB front-month futures prices and the RBOB-Brent crack spread. Even with this

trend, April's finished motor gasoline consumption of 5.6 million b/d remains 40% below the 9.4 million b/d in April 2019. Personal travel numbers matched the trend of motor gasoline consumption. According to INRIX, compared with the week ending February 29, weekly personal travel was down 47% on April 3 and was down by 36% as of May 1. This lower overall consumption led to gasoline inventories reaching record levels, peaking at 263 million barrels for the week ending April 17.

Ultra-low sulfur diesel prices: The front-month futures price for ultra-low sulfur diesel (ULSD) delivered in New York Harbor settled at 84 cents/gal on May 7, 2020, down 10 cents/gal from April 1, 2020 **(Figure 7)**. The ULSD–Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) decreased by 21 cents/gal to settle at 14 cents/gal during the same period. The ULSD-Brent crack spread ended March at the highest level for that month in five years, but it declined significantly the first week of April through the end of the month.

Figure 7. Historical ULSD front-month futures price and crack spread



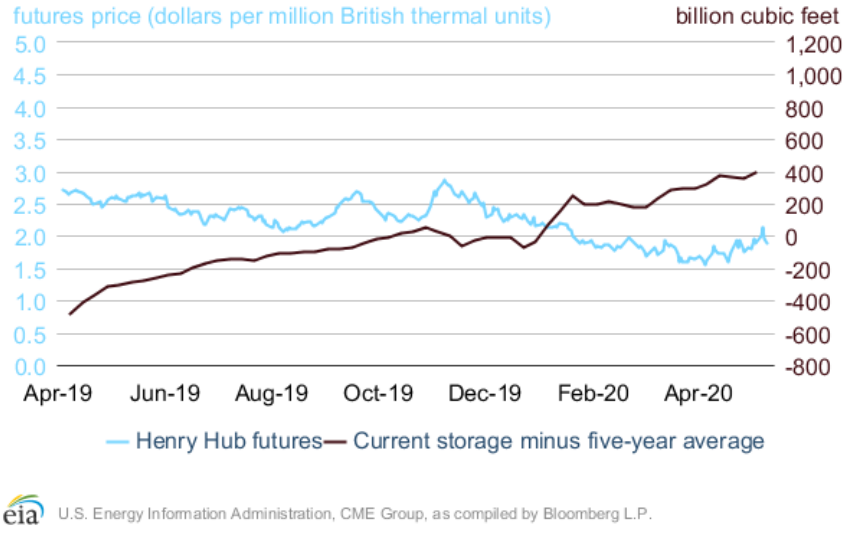
eia Source: CME Group, as compiled by Bloomberg L.P. Note: ULSD=ultra-low sulfur diesel

The ULSD-Brent crack spread declined as distillate consumption decreased. Although real-time data remain limited, EIA estimates that April 2020 distillate consumption was 3.0 million b/d, a decrease of 0.9 million b/d (23%) from April 2019. If confirmed in EIA's *Petroleum Supply Monthly*, this level will be the lowest monthly consumption level for the month of April since 1993. A possible explanation for the drop in consumption is less long-haul truck travel. For example, according to INRIX's data, for the week ending February 29 trucking was down 9% the week ending April 24. Even though distillate consumption has recently decreased, refiners have shifted more of their efforts toward refining distillate, likely because diesel demand initially decreased less than that for other fuels such as gasoline and jet fuel. The more delayed drop in distillate consumption initially supported distillate refining margins and encouraged refineries to increase distillate production. EIA estimates the refinery distillate yield increased to 39%, compared with 30% in April 2019, and refinery gasoline yield decreased to 40%, compared with 45% a year ago. As a result of the downward shift in demand and increased distillate yield,

ending stocks of distillate increased throughout the month, ending the month with 23 million more barrels (18%) than at the same time last year.

Gasoline and distillate consumption: When the United States proclaimed a national state of emergency on March 13, gasoline and distillate demand responded differently. From March 13 to April 3, gasoline consumption dropped 48%, from 9.7 million b/d to 5.1 million b/d **(Figure 8)**. In that same time frame, distillate consumption dropped 5%, from 4.0 million b/d to 3.8 million b/d. The next week, from April 3 to April 10, distillate declined 1.1 million b/d (28%), while gasoline increased slightly. From April 10 to May 1, distillate consumption increased by 0.4 million b/d (13%) and gasoline consumption increased by 1.6 million b/d (31%).

Figure 8. U.S. gasoline and distillate product supplied



eia U.S. Energy Information Administration

The lag between the decreases in demand can likely be attributed to the difference in how restrictions to limit the spread of COVID-19 affect the uses of the two fuels. Gasoline consumption depends heavily on personal travel such as commuting to work or to social gatherings that were generally suspended by restrictions. As a result, gasoline consumption decreased immediately. Distillate consumption depends more on freight movements and likely was more affected by slowing economic growth than the restrictions themselves. Distillate is also used in activities that are less directly affected by restrictions, such as the diesel engines of heavy construction equipment and as heating oil both for heating buildings and for industrial heating. The restrictions may have indirectly affected these uses over time by means of reduced economic activity that eventually led to a decrease in consumer spending for all goods. Diesel fuel is also used in oil and natural gas drilling operations, which have decreased significantly.

Natural Gas

Prices: The front-month natural gas futures contract for June delivery at the Henry Hub settled at $1.89 per million British thermal units (MMBtu) on May 7, up 31 cents/MMBtu from April 1, 2020 **(Figure 9)**.

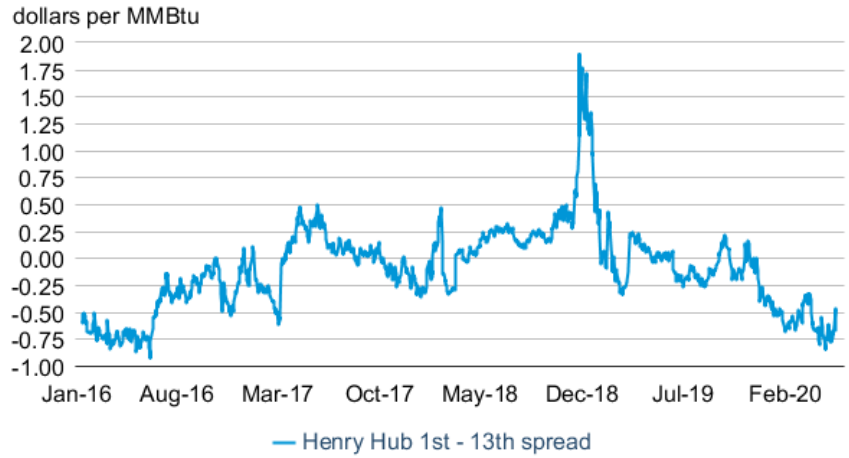


Figure 9. U.S. natural gas front-month futures prices and storage

U.S. Energy Information Administration, CME Group, as compiled by Bloomberg L.P.

Futures price spreads: The natural gas 1st-13th price spread settled at -$0.67/MMBtu on May 7, continuing a period of contango (when near-term prices are lower than longer dated ones) which began in November 2019 **(Figure 10)**. In periods of contango, there is an incentive for market participants to store natural gas and sell it later at the higher priced future month contract. The 1st-13th spread has been in contango since late 2019 because of three major factors. First, mild winter weather contributed to higher inventories relative to the five-year average. Second, reduced demand for natural gas in the power and industrial sectors related to mitigation efforts related to COVID-19 has contributed to lower front-month prices relative to 13th-month prices. Finally, EIA expects U.S. production of dry natural gas to fall by more than consumption over the next year, placing upward pressure on future prices. EIA forecasts a decline of 0.2 Bcf/d and 4.9 Bcf/d in consumption and dry gas production, respectively, between June 2020 (the current front-month futures price) and June 2021 (the current 13th-month). Inventories are forecast to decline by 331 billion cubic feet (Bcf) between the same two months.

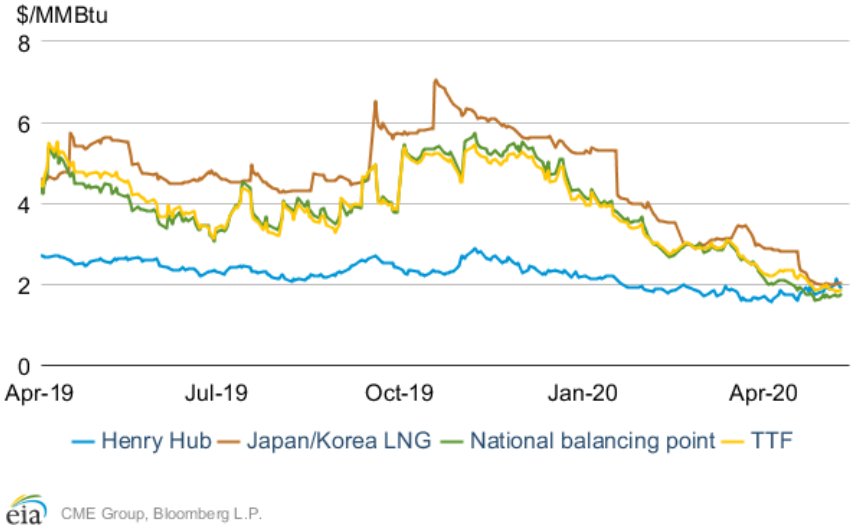

Figure 10. Natural gas 1st-13th futures price spread

CME Group

International natural gas prices: Similar to Henry Hub, major international front-month futures benchmarks in Europe (UK National Balancing Point, or NBP; Dutch Title Transfer Facility, or TTF) and Asia (Japan-Korea LNG, or JKM) experienced a significant decline in prices, with spreads between benchmarks also narrowing considerably because of a mild winter as well as the widespread international policy response related to COVID-19 **(Figure 11)**. Notably, TTF and NBP prices traded lower than the corresponding Henry Hub contract. The lack of opportunities for arbitrage stemming from lower spreads between international prices has important implications for the international trade of natural gas and liquefied natural gas (LNG). EIA forecasts in the May STEO that U.S. LNG exports will average 6.0 Bcf/d in 2020 and 7.3 Bcf/d in 2021. Although these levels still represent year-over-year increases, the rate of growth in exports is expected to decline from 67.9% year-over-year in 2019 to 21.1% in 2020 and 21.2% in 2021.

Figure 11. International natural gas prices

- = no data available

Prices are not adjusted for inflation.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.

EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).

Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

Weather projections from National Oceanic and Atmospheric Administration.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Iran, Iraq, Kuwait, Saudi Arabia, and the United Arab Emirates (Middle East); Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Libya, Nigeria, and Venezuela (Other).

(a) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

(a) Weighted geometric mean of real indices for various countries with weights equal to each country's share of world oil consumption in the base period. Exchange rate is measured in foreign currency per U.S. dollar. GDP and exchange rate data are from Oxford Economics, and oil consumption data are from EIA.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" inludes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Table 4b. U.S. Hydrocarbon Gas Liquids (HGL) and Petroleum Refinery Balances (million barrels per day, except inventories and utilization factor)

- = no data available

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

LNG: liquefied natural gas.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

Prices are not adjusted for inflation.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report*, DOE/EIA-0121; and *Electric Power Monthly*, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

Prices are not adjusted for inflation.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Table 7d part 1. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continues on Table 7d part 2*

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distributed solar photovoltaic systems.

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly,* DOE/EIA-0226 and *Renewable Energy Annual,* DOE/EIA-0603; *Petroleum Supply Monthly,* DOE/EIA-0109.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

-- = no data available

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to one megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than one megawatt).

(d) Solar photovoltaic systems smaller than one megawatt, as measured in alternating current.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA-860M database, EIA-826 Solar PV database, and EIA Regional Short-Term Energy Model.

- = no data available

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Projections: Macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

Notes: Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National Oceanic and Atmospheric Administration (NOAA).

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Projections: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Independent Statistics & Analysis
U.S. Energy Information Administration

June 2020

Short-Term Energy Outlook (STEO)

Forecast highlights

Global liquid fuels

- Although revisions to EIA's forecasts in the June STEO are generally smaller than they have been in recent months, this forecast remains subject to heightened levels of uncertainty because mitigation and reopening efforts related to the 2019 novel coronavirus disease (COVID-19) continue to evolve. Reduced economic activity related to the COVID-19 pandemic has caused changes in energy supply and demand patterns in 2020, particularly for petroleum and other liquid fuels. Uncertainties persist across EIA's outlook for other energy sources, including natural gas, electricity, coal, and renewables.

- Daily Brent crude oil spot prices averaged $29 per barrel (b) in May, up $11/b from the average in April. Oil prices rose in May as initial data show global oil demand was higher than EIA had forecast and as adherence to announced production cuts by Organization of the Petroleum Exporting Countries (OPEC) and partner countries (OPEC+) was high. EIA expects monthly Brent prices will average $37/b during the second half of 2020 and rise to an average of $48/b in 2021. The forecast of rising crude oil prices reflects expected declines in global oil inventories during the second half of 2020 and through 2021. EIA expects high inventory levels and spare crude oil production capacity will limit upward price pressures in the coming months, but as inventories decline into 2021, those upward price pressures will increase.

- EIA forecasts that demand for global petroleum and liquid fuels will average 83.8 million barrels per day (b/d) in the second quarter of 2020, 16.6 million b/d lower than at the same time last year. Lower demand is the result of COVID-19-related shutdowns throughout much of the world. As stay-at-home orders are eased, EIA expects liquid fuels consumption will rise to an average of 94.9 million b/d in the third quarter (down 6.7 million b/d year over year). EIA forecasts that consumption of petroleum and liquid fuels globally will average 92.5 million b/d for all of 2020, down 8.3 million b/d from 2019, before increasing by 7.2 million b/d in 2021.

- EIA expects the supply of liquid fuels globally will average 92.6 million b/d in the second quarter of 2020, down 7.9 million b/d year over year. The declines reflect voluntary supply cuts by OPEC+ and reductions in drilling activity in the United States because of low oil prices. Supply of oil fell by less than demand in the second

quarter, and EIA expects supply to be slower to increase. In the forecast, the global supply of oil declines to 92.0 million b/d in the third quarter before rising to an annual average of 97.4 million b/d in 2021. EIA expects OPEC to drive supply growth in 2021.

- EIA expects that global liquid fuels inventories will grow by an average of 2.2 million b/d in 2020. EIA estimates inventories rose from January through May at an average rate of 9.4 million b/d. The builds, which peaked during April, were the result of a sharp decline in global oil demand because of widespread travel limitations and reduced economic activity. EIA estimates that global oil inventories at the end of May stood 1.4 billion barrels higher than they were at the end of 2019. However, EIA now expects global oil inventories will begin declining in June, a month earlier than previously forecast, with draws continuing through the end of 2021. The sooner-than-expected draws are the result of sharper declines in global oil production during June and higher global oil demand than previously expected. EIA expects global liquid fuels inventories will fall at an average rate of 2.5 million b/d from June 2020 through the end of 2021.

- EIA forecasts U.S. liquid fuels consumption will average 15.7 million b/d in the second quarter of 2020, down 4.6 million b/d (23%) from the same period in 2019. The decline reflects travel restrictions and reduced economic activity related to COVID-19 mitigation efforts. EIA expects the largest declines in U.S. oil consumption have already occurred and demand will generally rise during the next 18 months. EIA forecasts U.S. liquid fuels consumption will average 18.4 million b/d in the third quarter of 2020 (down 2.3 million b/d year-over-year) before rising to an average of 19.5 million b/d in 2021. Although that level would be 1.4 million b/d more than EIA's forecast 2020 consumption, it would be 1.0 million b/d less than the 2019 average.

- Declines in U.S. liquid fuels consumption vary across products. EIA expects jet fuel consumption to fall by 64% year-over-year in the second quarter of 2020, while gasoline consumption falls by 26% and distillate consumption falls by 17%. EIA forecasts the consumption of all three fuels to rise in the third quarter and into 2021 but to remain lower than 2019 levels.

- EIA estimates U.S. crude oil production fell from a record 12.9 million b/d in November 2019 to 11.4 million b/d in May 2020 as Baker Hughes reported the fewest active drilling wells in the United States in their records which go back to 1987. EIA expects U.S. crude oil production will continue to decline, to 10.6 million b/d in March 2021, then increase slightly through the end of 2021. EIA forecasts that U.S. crude oil production will average 11.6 million b/d in 2020, down 0.7 million b/d from 2019. In 2021, EIA expects U.S. crude oil production will average 10.8 million b/d. This 2020 production decline would mark the first annual decline since 2016. Typically, price changes affect production after about a six-month lag.

However, current market conditions have shortened this lag as many producers have already curtailed production and reduced capital spending and drilling in response to lower prices.

Natural Gas

- In May, the Henry Hub natural gas spot price averaged $1.75 per million British thermal units (MMBtu). EIA forecasts that relatively low natural gas demand will keep spot prices lower than $2/MMBtu through August. However, EIA expects prices will generally rise through the end of 2021. EIA expects that natural gas price increases will be sharpest this fall and winter when they rise from an average of $2.06/MMBtu in September to $3.08/MMBtu in January. Despite EIA's forecast of record end-of-October storage levels, EIA expects that rising demand heading into winter, combined with reduced production, will cause upward price pressures. EIA forecasts that Henry Hub natural gas spot prices will average $2.04/MMBtu in 2020 and $3.08/MMBtu in 2021.

- EIA expects that total U.S. consumption of natural gas will average 81.9 billion cubic feet per day (Bcf/d) in 2020, down 3.6% from 2019. The decline primarily reflects less consumption in the industrial-sector, which EIA forecasts will average 21.0 Bcf/d in 2020, down 8.7% from 2019 as a result of reduced manufacturing activity.

- U.S. dry natural gas production set an annual record in 2019, averaging 92.2 Bcf/d. EIA forecasts dry natural gas production will average 89.7 Bcf/d in 2020, with monthly production falling from 96.2 Bcf/d in November 2019 to 83.6 Bcf/d in March 2021, before increasing slightly. Natural gas production declines the most in the Appalachian and Permian regions. In the Appalachian region, low natural gas prices are discouraging producers from engaging in natural gas-directed drilling, and in the Permian region, low crude oil prices reduce associated natural gas output from oil-directed wells. In 2021, EIA's forecast production of dry natural gas in the United States averages 85.4 Bcf/d. EIA expects production to begin rising in the second quarter of 2021 in response to higher prices.

- EIA estimates that total U.S. working natural gas in storage ended May at almost 2.8 trillion cubic feet (Tcf), 18% more than the five-year (2015–19) average. In the forecast, inventories rise by 2.1 Tcf during the April-through-October injection season to reach more than 4.1 Tcf on October 31, which would be a record.

- EIA forecasts that U.S. liquefied natural gas exports will average 5.6 Bcf/d in the second quarter of 2020 and 3.7 Bcf/d in the third quarter of 2020. EIA expects that U.S. liquefied natural gas exports will decline through the end of the summer as a result of reduced global demand for natural gas.

Electricity, coal, renewables, and emissions

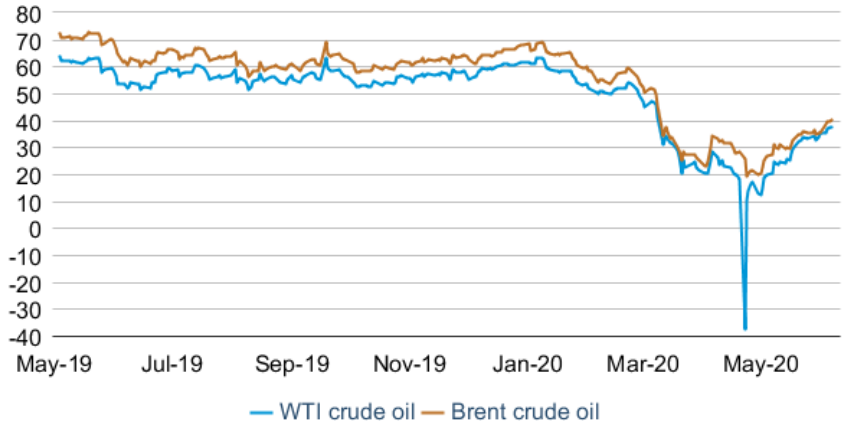
- EIA forecasts 5.7% less electricity consumption in the United States in 2020, compared with 2019. The largest decline by consumption sector on a percentage basis occurs in the commercial sector, where EIA expects retail sales of electricity to fall by 9.1% this year. Forecast industrial retail electricity sales fall by 6.7%. EIA forecasts residential sector retail sales will decrease by 1.5% in 2020. Milder expected temperatures compared with 2019 reduce EIA's forecast of electricity consumption for space heating and cooling, but that effect is partly offset by an assumed increase in electricity use by more people who are working from home. In 2021, EIA forecasts total U.S. electricity consumption will rise by 1.0%.

- EIA expects the share of U.S. utility-scale electricity generation from natural gas-fired power plants will increase from 37% in 2019 to 41% this year. In 2021, the forecast natural gas share declines to 36% in response to higher natural gas prices. Coal's forecast share of electricity generation falls from 24% in 2019 to 17% in 2020 and then increases to 20% in 2021. Electricity generation from renewable energy sources rise from 17% in 2019 to 21% in 2020 and to 23% in 2021. The increase in the share from renewables is the result of expected additions to wind and solar generating capacity. Expected nuclear generation declines slightly in both 2020 and 2021, but its generation share rises from 20% in 2019 to an average of 22% in 2020 and 21% in 2021 because total U.S. generation falls by more than nuclear generation.

- EIA forecasts that renewable energy will be the fastest-growing source of electricity generation in 2020. EIA expects the electric power sector will add 23.2 gigawatts of new wind capacity and 12.6 gigawatts of utility-scale solar capacity in 2020. However, these future capacity additions are subject to a high degree of uncertainty, and EIA continues to monitor reported planned capacity builds.

- EIA expects coal production will decrease by 25% to 530 million short tons (MMst) in 2020. Metallurgical coal mines in Appalachia have slowed production based on reduced demand from global steel production and coking coal, and EIA forecasts production in that region will decline by 35% this year. EIA forecasts Western region production to decline by 25%, partly because of slowing demand for steam coal from key importers such as India and a decline in U.S. coal-fired generation in 2020. In 2021, EIA forecasts coal production will rise to 549 MMst because of forecast rising natural gas prices and rising demand for U.S. exports.

- After decreasing by 2.8% in 2019, EIA forecasts that U.S. energy-related carbon dioxide (CO2) emissions will decrease by 14% (714 million metric tons) in 2020. This record decline is the result of less energy consumption related to restrictions on business and travel activity and slowing economic growth related to COVID-19 mitigation efforts. CO2 emissions decline with reduced consumption of all fossil



fuels, particularly coal (33%) and petroleum (13%). In 2021, EIA forecasts that energy-related CO2 emissions will increase by 5%, as the economy recovers and stay-at-home orders are lifted, for a net decrease in energy-related CO2 emissions of 9% for 2020 and 2021 combined. Energy-related CO2 emissions are sensitive to changes in weather, economic growth, energy prices, and fuel mix.

Petroleum and natural gas markets review

Crude oil

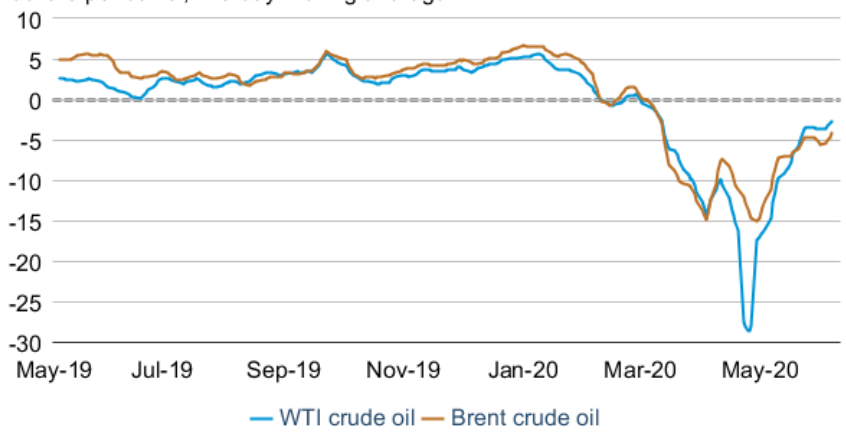
Prices: The front-month futures price for Brent crude oil settled at $39.99 per barrel (b) on June 4, 2020, an increase of $13.55/b from May 1, 2020. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, increased by $17.63/b during the same period, settling at $37.41/b on June 4 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices

Source: CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate

The average daily settlement price for Brent front-month futures contracts increased by 22% from April to May, the largest percentage increase for any month since March 1999. However, even with this increase, prices remain significantly lower than the first-quarter 2020 average. Several factors likely provided support to crude oil prices. Initial oil consumption data and additional efforts by major oil producers indicate that the oversupply in global oil markets has not been as severe as EIA had forecast in the May STEO. As U.S. states and countries in the Organization of Economic Cooperation and Development (OECD) began to reopen from lockdown, early indicators of petroleum consumption have shown increases from the low April levels. EIA estimates that the global consumption of petroleum and other liquid fuels averaged 82.9 million barrels per day (b/d) in May, up 3.7 million b/d from April consumption and 2.9 million b/d more than forecast in the May STEO.

In addition, global oil production has been declining as a result of voluntary production cuts from members of the Organization of the Petroleum Exporting Countries and partner countries



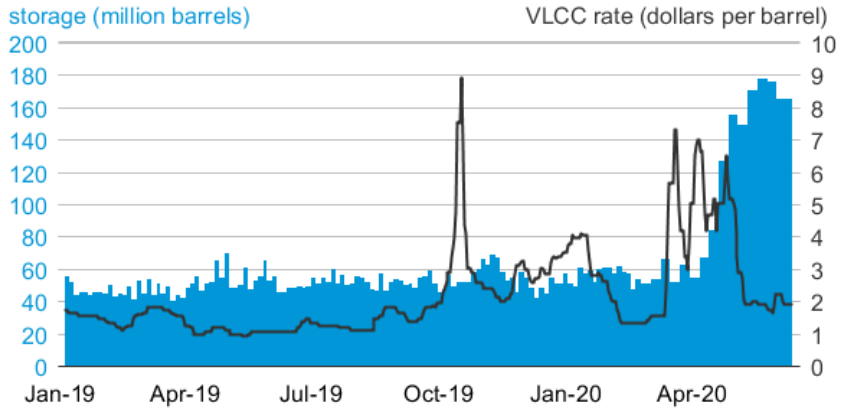
(OPEC+), as well as from rapid declines in tight oil production in the United States. EIA's estimate of global liquid fuels supply in May is 0.5 million b/d lower than forecast in last month's STEO. In addition to OPEC+'s initial production cuts—totaling 9.7 million b/d—Saudi Arabia, Kuwait, and the United Arab Emirates announced additional reductions of approximately 1.2 million b/d for June 2020 beyond their initial commitments. Partly based on these cuts, EIA has revised down the forecast for supply of petroleum liquids globally during June by 2.2 million b/d compared with last month's forecast.

EIA completed this forecast before OPEC+ announced on June 6 that it would extend production cuts from May and June through July. Leading up to this decision, talks of extended production management contributed to higher crude oil prices. This STEO does not reflect an extension of the May and June cuts.

Taken together, the faster recovery of global oil demand and steeper declines in global oil production are bringing markets closer to balance sooner than EIA forecast in the May STEO. EIA forecasts global petroleum inventory withdrawals in June 2020, averaging 1.9 million b/d, compared with a 1.6 million b/d inventory build EIA had forecast in the May STEO. EIA forecasts global inventory withdrawals will average 3.0 million b/d for the second half of 2020.

The Brent and WTI futures curves have returned to shapes similar to those observed in early March, before many countries entered lockdown and before the OPEC+ production agreement. From May 1 to June 4, the five-day moving average of the Brent 1st–13th spreads increased by $8.19/b to settle at -$4.27/b and WTI 1st–13th spreads increased by $13.17/b to settle at -$2.79/b, respectively **(Figure 2)**. The structure of the futures curve remains in contango (when near-term prices are lower than longer-dated ones), reflecting high levels of oil inventories but also suggesting that storing oil on vessels may no longer be necessary to balance the markets.

Figure 2. Crude oil front-month to 13th month futures price spread



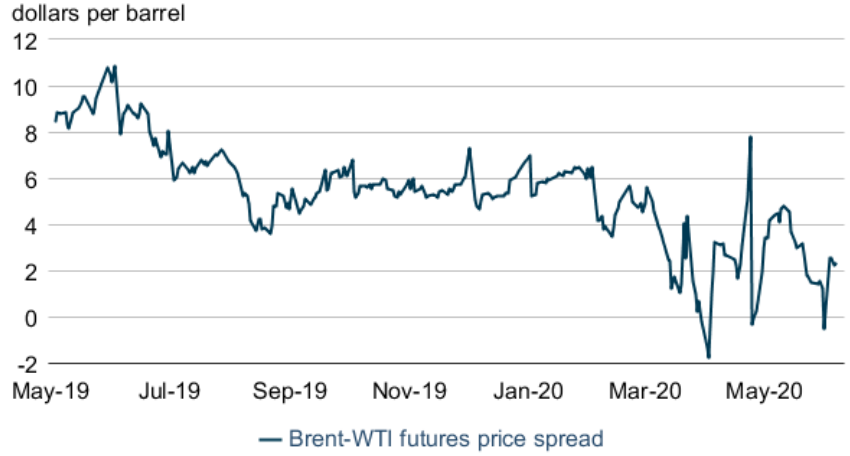
Source: CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate

***Floating crude oil stocks*:** According to energy analytics company Vortexa, global stocks of crude oil stored in waterborne tankers reached 181 million barrels in May 2020, the most since

data collection began in January 2016 **(Figure 3)**. Storing crude oil in tankers is more expensive than storing it onshore, and floating storage is typically only used as a last resort because tanker owners must be compensated for both the operational costs of their vessels and the revenues they would have otherwise collected from delivering crude oil. The rapid increase of relatively expensive floating storage volumes is further evidence of the magnitude and speed of the global liquid fuels stock builds in the first half of 2020, which EIA estimates peaked in April at 21.5 million b/d.

Floating storage volumes have already begun declining as global supply and demand balances return to equilibrium. After reaching 181 million barrels in the week of May 15, floating volumes fell to 178 million barrels on May 22 and 164 million barrels on May 29. Tanker rates have also declined, which is often a leading indicator of floating storage volumes because charter rates are set in advance of physical loading. Although tanker rates rose in March and remained elevated throughout most of April, rates declined sharply in late April. The benchmark rate to ship crude oil on the Arabian Gulf to Japan route aboard a Very Large Crude Carrier (VLCC) declined from $6.48/b on April 22 to $1.97/b on June 4.

Figure 3. Floating crude oil storage

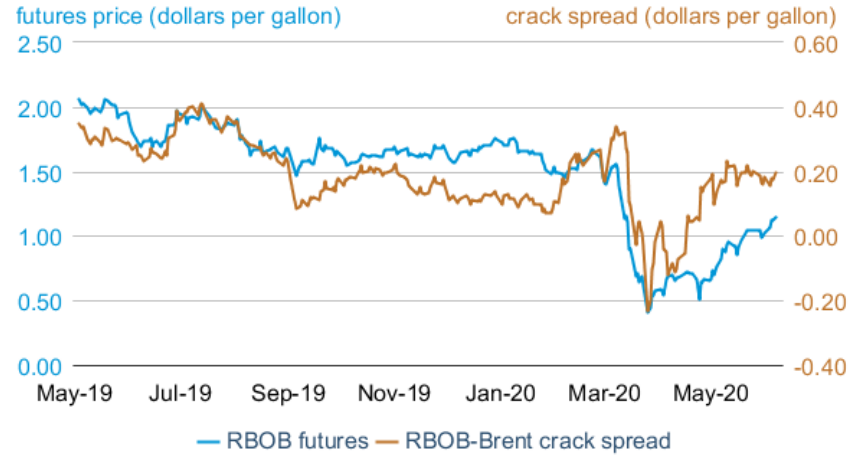


eia Source: Vortexa, as compiled by Bloomberg, L.P.
Note: VLCC=very large crude carrier

Brent–WTI spread: Rapid declines in U.S. crude oil production could be contributing to a narrowing of the Brent–WTI futures price spread. The Brent–WTI spread decreased by $1.88/b since May 1, 2020, settling at $2.27/b on June 4 **(Figure 4)**. The Brent–WTI spread (calculated as front-month Brent crude oil futures prices minus second-month WTI prices, which compares crude oils by aligned delivery date) generally reflects the cost of exporting U.S. crude oil to Asia relative to the cost of exporting North Sea crude oil to Asia. This spread regularly traded lower than $2/b in 2016, another year in which U.S. crude oil production declined. This year, the rapid decline in U.S. crude oil production is reducing the supply of exportable crude oil and could be increasing the relative value of U.S. crude oil compared with other waterborne crude oils such as Brent, particularly now that European and Asian refiners have begun increasing crude oil runs. In addition, crude oil production from the North Sea is generally less price responsive than onshore

U.S. crude oil production, keeping Brent-linked crude oil production comparatively elevated. EIA estimates that, of the 4.5 million b/d decline in total non-OPEC liquids production from April to May, 1.0 million b/d of the decline was from United States crude oil production. EIA forecasts further declines in U.S. crude oil production through March 2021, when it will average 10.6 million b/d, a decline of 2.2 million b/d from its November 2019 peak.

Figure 4. Brent-WTI futures price spread

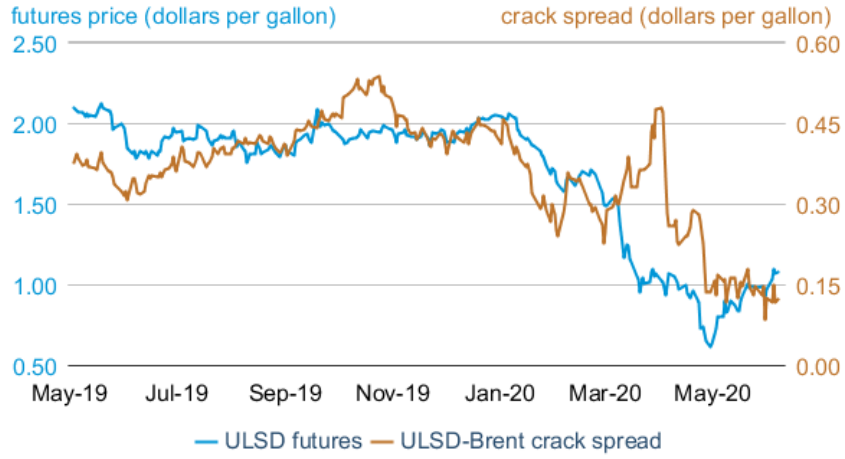


Source: CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate

Petroleum products

Gasoline prices: The front-month futures price of reformulated blendstock for oxygenate blending (RBOB, the petroleum component of gasoline used in many parts of the country) settled at $1.15 per gallon (gal) on June 4, up 38 cents/gal from May 1, 2020 **(Figure 5)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) increased by 6 cents/gal to settle at 20 cents/gal during the same period. In May, crack spreads ranged from a minimum of 14 cents/gal, a record-low crack spread for that month since 2006 (when RBOB contracts began selling), to a maximum of 23 cents/gal.

Figure 5. Historical RBOB front-month futures prices and crack spread



Source: CME Group, as compiled by Bloomberg L.P.
Note: RBOB=reformulated blendstock for oxygenate blending

May marked the first time the crack spread was positive for each trading day of a month since February, the last complete month before the March 13 proclamation of a national state of emergency in the United States. Increasing gasoline demand and relaxed lockdowns related to COVID-19 mitigation efforts provided some strength to the crack spread. EIA estimates that the consumption of finished motor gasoline increased to 7.3 million b/d in May from 5.7 million b/d in April. Personal travel numbers matched the trend of motor gasoline consumption. According to INRIX, compared with the last pre-lockdown week ending February 29, weekly personal travel was down 16% on May 29—compared with 47% on April 3. This increase in consumption, along with reduced refinery runs, contributed to gasoline inventories decreasing from record high levels in mid-April to an estimated 256 million barrels at the end of May. Increased net imports of gasoline partly offset the effect of rising consumption on gasoline inventories. EIA estimates a 0.7 million b/d increase in month-over-month net imports to 0.3 million b/d.

Ultra-low sulfur diesel prices: The ultra-low sulfur diesel (ULSD) front-month futures price for delivery in New York Harbor settled at $1.07/gal on June 4, 2020, up 28 cents/gal from May 1, 2020 **(Figure 6)**. The ULSD–Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) decreased by 4 cents/gal to settle at 12 cents/gal during the same period. The average ULSD–Brent crack spread for May at 14 cents/gal was less than the five-year (2015–19) average of 34 cents/gal.

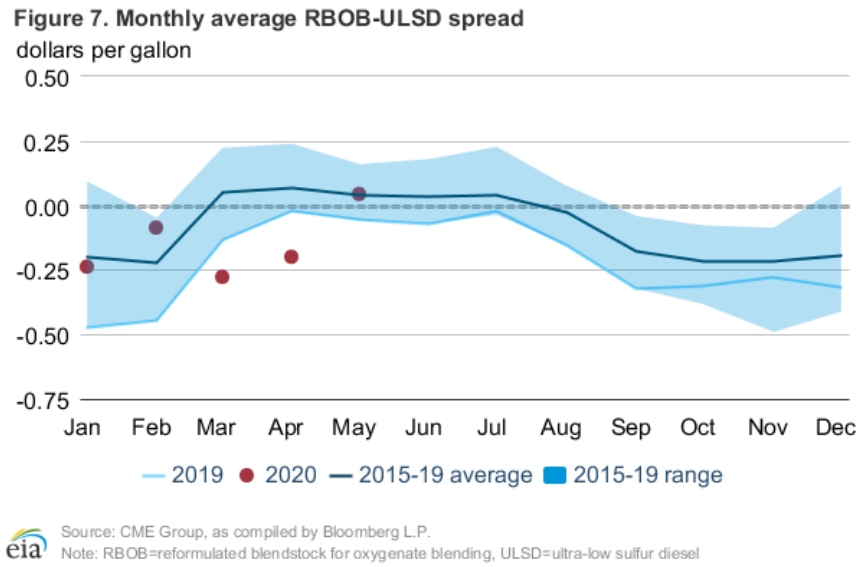


Figure 6. Historical ULSD front-month futures price and crack spread

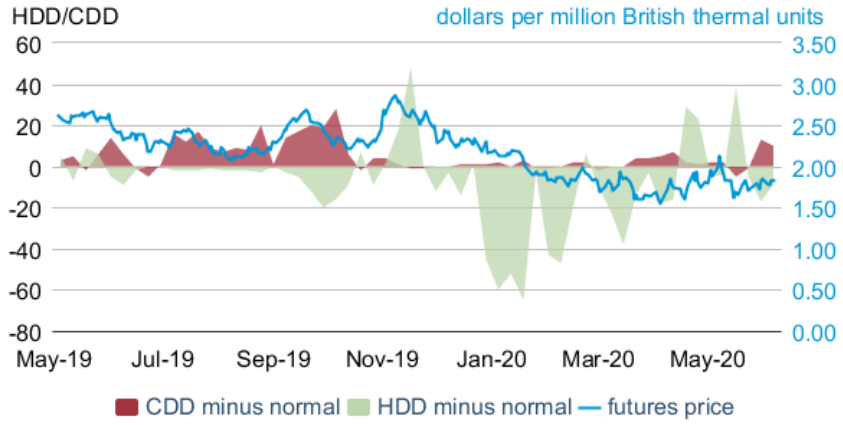
Source: CME Group, as compiled by Bloomberg L.P.
Note: ULSD=ultra-low sulfur diesel

EIA estimates May 2020 distillate consumption was 3.4 million b/d, down 0.7 million b/d (17%) from May 2019, but up 0.3 million b/d (11%) from April 2020. This increase can partially be explained by the increase in long-haul trucking as economic activity begins to recover. According to INRIX, which compared traffic data for the week ending May 22 with that of the week ending February 29, trucking was down 5% from pre-lockdown levels. Meanwhile, if confirmed by EIA's *Petroleum Supply Monthly*, distillate imports for the four weeks ending May 29 increased to their highest May levels since 2007, and exports decreased to their lowest May levels since 2011. Overall, net exports of distillate in May were 0.8 million b/d, down 0.6 million b/d from April. This decrease likely contributed to the increase in inventories, with distillate inventories rising to 174 million barrels at the end of May, 44 million barrels more than in May 2019 and the highest May-ending level since 1980.

RBOB–ULSD product spread: RBOB front-month futures averaged 4 cents/gal more than ULSD front-month futures in May 2020 after averaging 20 cents/gal less in April **(Figure 7)**. Although a positive spread has historically occurred during the summer months, the monthly average RBOB–ULSD front-month futures spread has not been positive since March 2018.



The reversion to the five-year average, after two consecutive months of being lower than it had been in the past five years, indicates a shift in the relative strength of gasoline markets compared with diesel markets. Although diesel demand decreased less than gasoline demand during the initial stages of COVID-19-related restrictions, gasoline demand has recently begun to increase more than diesel. This shift back toward gasoline demand is also reflected by refinery yields.

April refinery yields were unusual because the initial drop in distillate consumption relative to gasoline consumption was small, which supported distillate refining margins that encouraged refineries to increase distillate production. May refinery gasoline yields reverted back to levels similar to historical yields as the recent shift toward gasoline demand has supported increased gasoline production. EIA estimates that the May refinery gasoline yield increased to 46% compared with 40% in April, while the refinery distillate yield decreased to 36%, compared with 39% a month ago. Retail prices have reflected the same trend as front-month futures prices. Regular gasoline retail prices have increased every week in May, but regular diesel retail prices decreased every week until May 25.

Natural Gas

Prices: The front-month natural gas futures contract at the Henry Hub settled at $1.82 per million British thermal units (MMBtu) on June 4, down 7 cents/MMBtu compared with May 1 **(Figure 8)**.

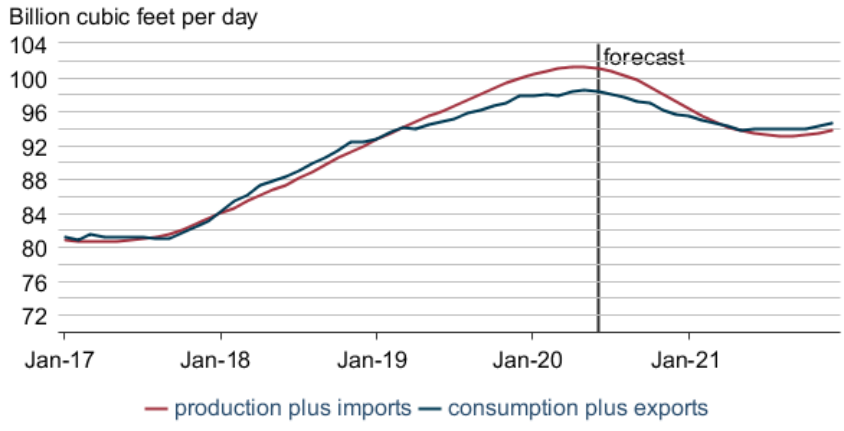


Figure 8. Natural gas front-month futures prices and actual minus historical average HDD and CDD

Source: CME Group and National Oceanic and Atmospheric Administration, as compiled by Bloomberg L.P.
Note: HDD stands for heating degree days, CDD stands for cooling degree days

EIA estimates that total U.S. natural gas consumption in May 2020 was slightly higher than in May 2019 because of more residential and electric power sector natural gas consumption relative to the same time in 2019. These increases were partly offset by year-over-year decreases in industrial natural gas consumption, which likely occurred because of a slowdown in economic activity related to COVID-19 mitigation efforts. EIA forecasts that both production (including imports) and consumption (including exports) will begin to decline from the middle of 2020 to the end of 2021 and that this version of consumption will exceed production by the end of 2021 **(seen as a 12-month moving average in Figure 9)**. The more rapid decline in production plus imports is expected to provide support for natural gas prices. EIA forecasts that Henry Hub natural gas spot prices will increase for the rest of 2020 and will average $3.08 /MMBtu in 2021, which is higher than the $2.04/MMBtu average for 2020.

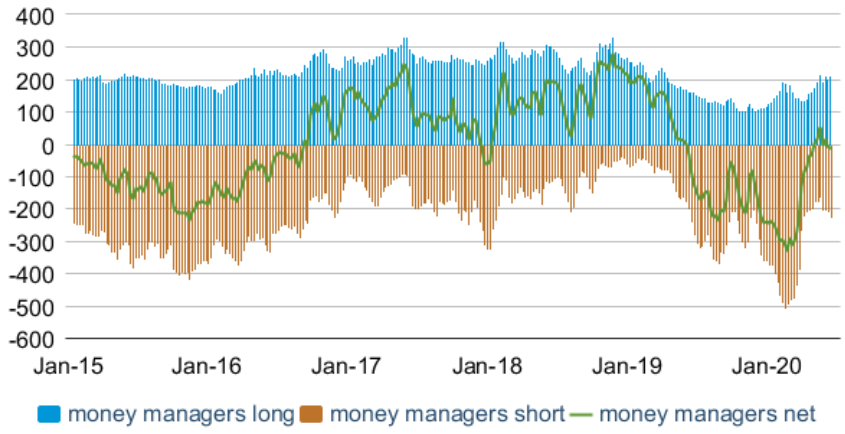

Figure 9. Natural gas production plus imports and consumption plus exports, 12-month moving average

Source: U.S. Energy Information Administration

Money managers open interest: The net positions taken by money managers in natural gas futures markets reveal these traders' expectations regarding future movements in contract prices for this market participant category. A short position—selling a futures contract—typically indicates expected price declines because the trader would profit from a decline in prices. Meanwhile, a long position—buying a futures contract—typically indicates expected price increases because a trader would profit from the higher price in the future. On February 4, 2020, following a very mild winter, money managers had accumulated the largest net short position in the history of the Commodity Futures Trading Commission's (CFTC) weekly report on the commitments of traders. Over the course of April and May 2020, net positions reversed from net short to a marginal net long **(Figure 10)**. The movement was fueled primarily by reduced gross short positions, and the relatively even split between gross short and gross long positions indicates the likely heightened uncertainty in futures markets at the present time.

Notable forecast changes

- Because of the rapidly changing situation in energy markets, EIA's current forecast includes a significant number of notable forecast changes. You can find more information in the detailed table of forecast changes.

- EIA used the May 2020 IHS Markit macroeconomic forecast in this STEO. Using this forecast, EIA assumes U.S. gross domestic product (GDP) will decline by 7.4% in 2020, compared with a decline of 5.4% in the May STEO. In addition, the IHS forecast used in the June STEO includes average non-farm employment of 130.6 million for 2020 and 136.0 for 2021, down by 13.0 million jobs and 6.3 million jobs, respectively, from the May STEO.

- The Brent crude oil spot price forecast for 2020 in this month's STEO is $38 per barrel (b), up from a forecast of $34/b last month. The higher Brent crude oil price forecast reflects

increases in crude oil prices during May from their multiyear low levels in April. The higher prices were driven by a combination of announced OPEC+ cuts to oil production, declining U.S. crude oil production, and rising oil demand related to relaxed COVID-19 stay-at-home orders.

- In the June STEO, EIA forecasts U.S. crude oil production to average 11.6 million b/d in 2020 and 10.8 million b/d in 2021. Both forecasts are about 0.1 million b/d lower than in the May STEO. Lower drilling activity offsets the effect of higher forecast crude oil prices, resulting in the lower forecast production. Drilling activity during May fell by more than EIA expected, lowering the starting point for active drilling rigs in the forecast.

- EIA expects U.S. gasoline consumption to average 8.1 million b/d in 2020 and 8.7 million b/d in 2021. These forecasts are 0.2 million b/d and 0.1 million b/d lower, respectively, than forecast in the May STEO and reflect lower assumed employment levels compared with last month.

- Overall U.S. petroleum and other liquids consumption in this forecast averages 18.1 million b/d in 2020 (0.2 million b/d lower than in the May STEO) and 19.5 million b/d in 2021 (0.3 million b/d lower than in the May STEO). The lower forecast is the result of both less gasoline consumption and less distillate and jet fuel consumption, which results from a lower assumed GDP.

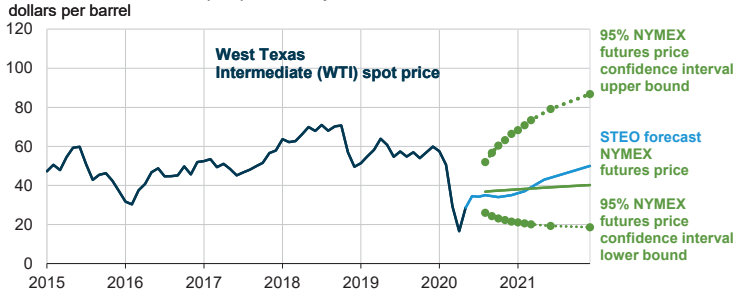
- EIA forecasts industrial natural gas consumption to decline 8.7% in 2020 in the June STEO. This change compares with a forecast 7.1% decline in the May STEO. The downward revision in industrial natural gas consumption is primarily driven by lower levels of assumed economic activity in this forecast, with the natural gas-weighted manufacturing index declining by 11% in 2020 in the June STEO compared with a 9% decline in the May STEO.

- EIA forecasts that U.S. liquefied natural gas exports will average 3.7 Bcf/d in the third quarter of 2020, down by 1.2 Bcf/d from the May STEO, based on lower global demand for natural gas.

- EIA lowered its forecast for Henry Hub natural gas spot prices for the rest of 2020, while raising the price forecast for 2021. EIA forecast prices to average $2.26/MMBtu for the second half of 2020, down 15 cents/MMBtu from the May STEO. The lower forecast is the result of lower-than-expected natural gas consumption (including exports) during this period. For 2021, EIA expects Henry Hub prices to average $3.08/MMBtu, up 19 cents/MMBtu from the May STEO. With lower production in 2020 because of lower prices, EIA expects prices will move higher to encourage more production to balance the market in 2021.

- EIA forecasts that total U.S. retail sales electricity in 2020 will decline by 5.5% relative to 2019 in the current STEO, compared with a forecast decline of 4.5% in the previous STEO. Most of the decline is attributable to the updated macroeconomic projections, which assume a larger decline in the GDP than previously expected. EIA continues to assume that

social distancing guidelines will magnify the economic-related decline in retail sales of electricity to the commercial sector. EIA believes that the forecast decline in industrial electricity sales this year is fully captured by the assumed decline in overall manufacturing activity. An assumption about increased use by households of electricity for electronics, appliances, and other devices is reflected in EIA's forecast for residential retail electricity sales, as in the previous STEO.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the United States Government. The views in this report therefore should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

- = no data available

Prices are not adjusted for inflation.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.

EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).

Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

Weather projections from National Oceanic and Atmospheric Administration.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

(a) Weighted geometric mean of real indices for various countries with weights equal to each country's share of world oil consumption in the base period. Exchange rate is measured in foreign currency per U.S. dollar. GDP and exchange rate data are from Oxford Economics, and oil consumption data are from EIA.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" inludes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

LNG: liquefied natural gas.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report*, DOE/EIA-0121; and *Electric Power Monthly*, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Table 7c. U.S. Regional Retail Electricity Prices (Cents per Kilowatthour)

- = no data available

Prices are not adjusted for inflation.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distributed solar photovoltaic systems.

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly,* DOE/EIA-0226 and *Renewable Energy Annual,* DOE/EIA-0603; *Petroleum Supply Monthly,* DOE/EIA-0109.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

-- = no data available

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to one megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than one megawatt).

(d) Solar photovoltaic systems smaller than one megawatt, as measured in alternating current.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA-860M database, EIA-826 Solar PV database, and EIA Regional Short-Term Energy Model.

- = no data available

SAAR = Seasonally-adjusted annual rate

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Aviation Administration. Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

Notes: Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National Oceanic and Atmospheric Administration (NOAA).

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Projections: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Appendix to the June 2020 *Short-Term Energy Outlook*

This appendix is prepared in fulfillment of section 1245(d)(4)(A) of the National Defense Authorization Act (NDAA) for Fiscal Year 2012, as amended. The law requires the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy, to submit to Congress a report on the availability and price of petroleum and petroleum products produced in countries other than Iran in the two-month period preceding the submission of the report. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The data in this appendix, therefore, should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

EIA consulted with the U.S. Department of the Treasury, the U.S. Department of State, and the intelligence community in the process of developing the NDAA report, which was previously published as a stand-alone report. Detailed background and contextual information not repeated here can be found in early editions of the NDAA report.

This appendix is published in the *Short-Term Energy Outlook* in even numbered months.

Table a1. Summary of Estimated Petroleum and Other Liquids Quantities

	Apr-2020	May-2020	April - May 2020 Average	April - May 2019 Average	2017- 2019 Average
Global Petroleum and Other Liquids (million barrels per day)					
Global Petroleum and Other Liquids Production (a)	100.6	89.6	95.0	100.4	99.9
Global Petroleum and Other Liquids Consumption (b)	79.2	82.9	81.0	100.2	99.9
Biofuels Production (c)	2.3	2.4	2.4	2.6	2.5
Biofuels Consumption (c)	2.0	2.1	2.0	2.4	2.3
Iran Liquid Fuels Production	2.8	2.8	2.8	3.4	4.1
Iran Liquid Fuels Consumption	1.4	1.5	1.4	1.9	1.8
Petroleum and Petroleum Products Produced and Consumed in Countries Other Than Iran (million barrels per day)					
Production (d)	95.5	84.3	89.9	94.4	93.2
Consumption (d)	75.8	79.3	77.6	95.9	95.7
Production minus Consumption	19.7	5.0	12.3	-1.6	-2.5
World Inventory Net Withdrawals Including Iran	-21.5	-6.7	-14.0	-0.2	0.0
Estimated OECD Inventory Level (e) (million barrels)	3,264	3,358	3,311	2,891	2,912
Surplus Production Capacity (million barrels per day)					
OPEC Surplus Crude Oil Production Capacity (f)	1.0	6.6	3.8	2.8	2.0

Note: The term “petroleum and other liquids” encompasses crude oil, lease condensate, natural gas liquids, biofuels, coal-to-liquids, gas-to-liquids, and refinery processing gains, which are important to consider in concert due to the inter-related supply, demand, and price dynamics of petroleum, petroleum products, and related fuels.
(a) Production includes crude oil (including lease condensates), natural gas liquids, other liquids, and refinery processing gains.
(b) Consumption of petroleum by the OECD countries is synonymous with “products supplied," defined in the glossary of the EIA Petroleum Supply Monthly, DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel, and loss, and bunkering.
(c) Biofuels production and consumption are based on EIA estimates as published in the International Energy Statistics. Biofuels production in the third quarter tends to be at its highest level in the year as ethanol production in Brazil reaches its seasonal peak and is typically lowest in the first quarter as seasonal production falls in the South/South-Central region of Brazil.
(d) Global production of petroleum and petroleum products outside of Iran is derived by subtracting biofuels production and Iran liquid fuels production from global liquid fuels production. The same method is used to calculate global consumption outside of Iran.
(e) Estimated inventory level is for OECD countries only.
(f) EIA defines surplus oil production capacity as potential oil production that could be brought online within 30 days and sustained for at least 90 days, consistent with sound business practices. This does not include oil production increases that could not be sustained without degrading the future production capacity of a field.

Independent Statistics & Analysis
U.S. Energy Information Administration

July 2020

Short-Term Energy Outlook (STEO)

Forecast highlights

- The July *Short-Term Energy Outlook* (STEO) remains subject to heightened levels of uncertainty because mitigation and reopening efforts related to the 2019 novel coronavirus disease (COVID-19) continue to evolve. Reduced economic activity related to the COVID-19 pandemic has caused changes in energy supply and demand patterns in 2020. Uncertainties persist across the U.S. Energy Information Administration's (EIA) outlook for all energy sources, including liquid fuels, natural gas, electricity, coal, and renewables. The STEO is based on U.S. macroeconomic forecasts by IHS Markit, which assumes U.S. gross domestic product declined by 6.4% in the first half of 2020 from the same period a year ago before rising from the third quarter of 2020 through 2021.

- Daily Brent crude oil spot prices averaged $40 per barrel (b) in June, up $11/b from the average in May and up $22/b from the multiyear low monthly average price in April. Oil prices rose in June as numerous regions worldwide began to lift stay-at-home orders and as global oil supply fell as a result of production cuts by the Organization of the Petroleum Exporting Countries (OPEC) and partner countries (OPEC+). In June, OPEC+ announced that they extended through July their period of deepest cuts that had been set to relax on July 1. EIA expects monthly Brent spot prices will average $41/b during the second half of 2020 and rise to an average of $50/b in 2021, $4/b and $2/b higher than forecast in last month's STEO, respectively.

- The forecast of rising crude oil prices reflects EIA's expectation of declines in global oil inventories during the second half of 2020 and through 2021. EIA expects high inventory levels and surplus crude oil production capacity will limit upward price pressures in the coming months, but as inventories decline into 2021, those upward price pressures will increase. EIA estimates global liquid fuels inventories rose at a rate of 6.7 million barrels per day (b/d) in the first half of 2020 and expects they will decline at a rate of 3.3 million b/d in the second half of 2020 and then decline by a further 1.1 million b/d in 2021.

- EIA expects annual average U.S. crude oil production to fall in 2020 and 2021 as forecast West Texas Intermediate (WTI) spot prices remain less than $50/b through 2021. EIA forecasts that U.S. crude oil production will average 11.6 million b/d in 2020 and 11.0 million b/d in 2021. These levels are 0.6 million b/d and 1.2 million b/d, respectively, lower than the 2019 average of 12.2 million b/d. EIA finalized this month's forecast before a U.S. District Court ordered on July 6 the temporary closure of the Dakota

Access Pipeline. The operators of the pipeline have announced they will file a motion to stay the decision.

- EIA forecasts U.S. liquid fuels consumption will average 18.3 million b/d in 2020, down 2.1 million b/d from 2019. Declines in U.S. liquid fuels consumption vary across products. From 2019 to 2020, EIA expects jet fuel consumption to fall by 31% and gasoline and distillate fuel consumption to both fall by 10%. The declines reflect travel restrictions and reduced economic activity related to COVID-19 mitigation efforts. EIA expects the largest declines in U.S. liquid fuels consumption have already occurred and consumption will generally rise through the second half of 2020 and in 2021. EIA forecasts U.S. liquid fuels consumption will average 19.9 million b/d in 2021.

- EIA expects U.S. dry natural gas production to average 89.2 billion cubic feet per day (Bcf/d) in 2020, down from 92.2 Bcf/d in 2019. This 3% decrease is the result of falling natural gas prices that caused a decline in drilling activity and production curtailments. EIA expects annual average dry natural gas production in the United States will decline by 6% in 2021 to 84.2 Bcf/d. However, EIA expects production to increase during the second half of 2021 as natural gas prices in the forecast rise.

- EIA expects U.S. natural gas consumption will decline by 3% in 2020. The main driver of the decline is lower consumption in the industrial sector because of COVID-19 mitigation efforts and related reductions in economic activity. Forecast U.S. natural gas consumption declines by 5% in 2021 as a result of expected rising natural gas prices. The rising prices will reduce the use of natural gas in the electric power sector, which will more than offset increases in natural gas consumption in the industrial, commercial, and residential sectors.

- The Henry Hub natural gas spot price averaged $1.63 per million British thermal units (MMBtu) in June, the lowest inflation-adjusted price going back to at least 1989, as a result of low demand. EIA expects falling production will put upward pressure on natural gas prices through the end of 2021. EIA forecasts that Henry Hub spot prices will average $1.93/MMBtu in 2020 and $3.10/MMBtu in 2021.

- EIA forecasts working natural gas in storage will reach 4,039 billion cubic feet (Bcf) at the end of October, which would be the most U.S. natural gas in storage as of the end-of-October on record. This forecast level surpasses the previous end-of-October record of 4,013 Bcf reached in October 2016.

- EIA forecasts total U.S. coal production will decrease by 29% to 501 million short tons (MMst) in 2020. This decline largely reflects less demand for coal from the electric power sector and the coal export market. In 2021, EIA expects coal production to increase by 7% to 536 MMst because of forecast rising natural gas prices that make coal more competitive in the electric power sector.

- EIA forecasts 4.2% less electricity consumption in the United States in 2020 compared with 2019. The largest forecast decline occurs in the commercial sector, where EIA expects retail sales of electricity to fall by 7.0% this year because of COVID-19 mitigation efforts. Forecast electricity sales to the industrial sector fall by 5.6%. EIA forecasts that residential sector retail electricity sales in 2020 will be similar to 2019 as less electricity use for heating in the first quarter is offset by more consumption during the rest of the year as a result of people spending more time at home. EIA forecasts total U.S. electricity consumption will rise by 1.5% in 2021.

- EIA expects the share of U.S. electric power sector generation from natural gas-fired power plants will increase from 37% in 2019 to 41% this year. In 2021, the forecast natural gas share will decline to 36% in response to higher natural gas prices. Coal's forecast share of electricity generation falls from 24% in 2019 to 18% in 2020 and then increases to 21% in 2021. Electricity generation from renewable energy sources rises from 17% in 2019 to 20% in 2020 and to 22% in 2021. The increase in the share from renewables is the result of expected additions to wind and solar generating capacity. The forecast nuclear share of generation averages about 21% in 2020 and will be slightly less than 21% by 2021, which is consistent with upcoming reactor retirements.

- EIA forecasts that energy-related carbon dioxide (CO2) emissions, after decreasing by 2.8% in 2019, will decrease by 12.2% in 2020 and increase by 6.0% in 2021. This forecast is highly dependent on assumptions regarding the economic impact and subsequent recovery from COVID-19 mitigation efforts. In addition to economic growth, energy-related CO2 emissions are sensitive to changes in weather, energy prices, and fuel mix.

Global Liquid Fuels

The disruptions to global petroleum supply and consumption as a result of COVID-19 and associated mitigation efforts have been significant. As road and air travel fell sharply when economies around the world went into lockdown in the first quarter and early second quarter of this year, global liquid fuels consumption fell more quickly than production. Based on the mismatch between production and consumption of liquid fuels, EIA estimates that global oil inventories increased by almost 1.3 billion barrels from the start of 2020 through the end of May. Inventory accumulation caused Brent crude oil spot prices to fall from a monthly average of $64 per barrel (b) in January to $18/b in April. In late April, when price declines were the steepest, market participants had concerns about the ability of global storage capacity to hold the quickly rising inventory.

The situation in oil markets has now shifted. EIA estimates that, in June, global consumption of petroleum and other liquid fuels was up 10 million barrels per day (b/d) from April levels as economies worldwide have begun emerging from lockdown. EIA estimates global supply has fallen by 12 million b/d during the same period as a result of reduced production from OPEC+ and price-driven declines and curtailments in the United States and Canada. These changes in

EIA's supply and demand estimates have shifted global oil markets from 21 million b/d of oversupply in April to inventory draws in June.

EIA expects global oil inventories to generally draw through the end of 2021 as EIA forecasts global oil demand will continue to recover. Although EIA's forecast consumption of global liquid fuels of 101.1 million b/d in the fourth quarter of 2021 would still be less than during the same period of 2019, it would be 16.7 million b/d more than in the second quarter of 2020. EIA also expects global oil supply to rise in the coming quarters. However, voluntary production restraint from OPEC+ producers, along with the lingering effects of low oil prices on U.S. tight oil production, will limit increases. As a result, EIA expects global oil inventories to decline at a rate of 1.8 million b/d through the end of 2021, eliminating most of the surplus that accumulated in early 2020. These inventory draws will likely put upward pressure on oil prices, but that pressure will be partly offset by high existing oil inventories, particularly in the second half of 2020, and a large amount of spare crude oil production capacity. The trajectory of both supply and demand are highly uncertain, however, and EIA will continue to closely track incoming data and oil market drivers in the coming months and adjust our forecasts accordingly.

Global Petroleum and Other Liquid Fuels Consumption. In the July STEO, EIA revised its 2020 global oil consumption forecast to reflect the most up-to-date information available on the impacts of COVID-19 and associated mitigation efforts on global oil consumption.

Initial data indicate the extent of demand declines for global liquid fuels were not as significant as EIA had previously estimated. EIA estimates that consumption of global liquid fuels averaged 84.4 million b/d in the second quarter of 2020, down by 16.3 million b/d from the same period in 2019. Although these declines are the largest for any quarter on record, EIA had estimated a drop of 16.6 million b/d in the June STEO, and EIA had estimated a drop of 18.8 million b/d in the May STEO. Initial second-quarter consumption data for the United States was 0.4 million b/d more than estimated in the June STEO and consumption in Canada and Brazil were each about 0.3 million b/d higher. Those increases were partly offset by lower-than-expected liquid fuels consumption in India and China.

EIA's most recent estimates of global oil consumption in the second quarter came in higher than in the previous forecast despite a lower assumed level of economic activity compared with previous forecasts. The July STEO's forecast for global economic growth is based on forecasts from Oxford Economics. In the July STEO, EIA assumes global oil consumption-weighted gross domestic product (GDP) in 2020 will decline by 5.7% from 2019, compared with an assumed decline of 5.0% in the June STEO. The sharpest declines occur in the second quarter of 2020, when oil consumption-weighted GDP is estimated to have declined by 10.3% compared with the second quarter of 2019. In the June STEO, the assumed decline in second-quarter 2020 GDP was 8.6%. In 2021, EIA assumes global GDP weighted by oil consumption will grow by 6.3%.

For the full year of 2020, EIA forecasts that consumption of global liquid fuels will average 92.9 million b/d, down 8.1 million b/d from 2019. EIA forecasts that both oil-consumption weighted GDP and global liquid fuels consumption will begin increasing in the third quarter of 2020 and

will continue increasing through 2021. However, EIA expects global liquids consumption in the second half of 2020 to remain lower, by 5.8 million b/d, than the same period in 2019, which would still be an increase of 6.2 million b/d from the first half of the year. The increase in oil consumption results from a normalization of economic activity following COVID-19-related disruptions. Although EIA expects steady increases in consumption of gasoline and diesel in the second half of 2020, forecast jet fuel consumption remains weak as EIA expects the recovery in air travel to lag behind the recovery in road travel in most countries.

Annual average global consumption of liquid fuels rises in 2021 by 7.0 million b/d from 2020 levels. This increase reflects forecast GDP growth and increases in travel. However, any lasting changes to transportation and other oil consumption patterns once the effects of COVID-19 and associated mitigation efforts end present considerable uncertainty to the increase in liquid fuels consumption for 2021.

Non-OPEC Production of Petroleum and Other Liquid Fuels. EIA estimates that non-OPEC production of petroleum and other liquid fuels fell by 5.4 million b/d in the second quarter of 2020 from the first quarter of the year. Almost 85% of these declines came from the three largest non-OPEC producers: the United States, Russia, and Canada. U.S. declines resulted from a drop in active drilling rigs in response to low oil prices. Declines in Russia were the result of voluntary reductions resulting from the April OPEC+ agreement. In Canada, declines largely reflected a drop in activity at oil sands operations in Alberta because of low oil prices.

EIA forecasts that for 2020 as a whole, non-OPEC production will decline by 2.2 million b/d from 2019 levels. EIA expects that the second quarter marked a low point for non-OPEC production, and it will begin rising in the third quarter as oil demand increases. EIA expects production of non-OPEC petroleum and other liquid fuels to increase by 1.1 million b/d in 2021. Production in countries that have implemented voluntary cuts will generally rise in 2021 as global oil demand recovers. However, EIA forecasts production to continue to decline in the United States, where production is driven by price-sensitive shale operators.

In Russia, EIA forecasts production to decline sharply in 2020 and grow in 2021 as OPEC+ cuts limit production in 2020 and moderate in 2021. EIA expects Russia to experience the largest liquid fuels production declines in 2020 among OPEC+ producers, with forecast declines of 1.0 million b/d compared with 2019. EIA expects Russia’s liquid fuels production to rise by 0.6 million b/d in 2021.

EIA expects total production of liquid fuels in the United States to fall by 0.7 million b/d in 2020, largely as a result of reduced drilling in price-sensitive tight oil regions. EIA expects U.S. production to fall by 0.3 million b/d in 2021.

EIA expects Canada’s total liquid fuels production to fall by 0.4 million b/d in 2020. This decrease is a result of both 2019 government-ordered production cuts in Alberta that continue into 2020 and economic shut-ins because of the effect of low oil prices and falling demand for oil exports. In 2021, EIA expects Canada’s production to increase by almost 0.5 million b/d and surpass 2019 levels in the second half of the year as demand rebounds and deferred or shut-in projects come

online. EIA expects no additional Canadian production from new upstream projects to come online during the forecast period, only expansions or debottlenecking of existing projects. EIA does not expect any new Canadian pipeline capacity until the second half of 2021.

Mexico agreed to 100,000 b/d of oil production cuts under the April OPEC+ agreement. However, Mexico declined to extend cuts past June, breaking from other OPEC+ producers. Independent of the OPEC+ agreement, EIA forecasts crude oil production to decline in Mexico in 2020 and 2021 because of natural declines in mature fields. Overall, EIA expects Mexico's annual average liquid fuels production to fall by almost 100,000 b/d in 2020 and by a similar amount in 2021.

EIA expects a number of other non-OPEC producers will experience notable production declines in 2020, including India, Azerbaijan, Kazakhstan, Colombia, Malaysia, and Egypt. Forecast annual average declines in each of these countries range between 50,000 b/d and 100,000 b/d.

The only non-OPEC countries where EIA expects production will grow significantly in 2020 are Brazil and Norway. EIA expects Brazil's production of petroleum and other liquid fuels to grow by 0.2 million in 2020 b/d and by 0.3 million b/d 2021. On April 1, Brazil's national oil company, Petroleo Brasileiro, S.A. (Petrobras), deepened its production cuts to 0.2 million b/d for 2020. Weeks after this announcement, Petrobras reversed these cuts as demand for crude oil exports remained strong. In addition, EIA now expects the P-70 floating, production, storage, and offloading vessel (FPSO) in Brazil to start production in the second half of 2020, bringing on additional volumes. The P-70 was originally scheduled to begin producing in the first half of 2020, before it was damaged in a storm in February 2020. This expected new supply growth offsets planned heavy maintenance for the second half of 2020. EIA also estimates Brazil's biofuels production was lower in the first half of 2020 than previously estimated because of reduced ethanol demand related to COVID-19 mitigation efforts combined with weak ethanol prices relative to sugar prices that caused sugar cane millers to shift toward more sugar production.

Despite voluntary production cuts announced in April 2020, EIA expects production growth in Norway during 2020 and 2021. Norway's Ministry of Petroleum and Energy enacted unilateral production cuts on the Norwegian continental shelf, which will limit production of crude oil from June to December 2020. These cuts limit growth in total liquids production in 2020 to less than 0.3 million b/d. After the expiration of production limits, EIA forecasts production growth of 0.1 million b/d in 2021. Phase 1 of the Johan Sverdrup field came online in October 2019 and reached production of more than 0.4 million b/d in early 2020 before the government production cuts took effect. The Johan Sverdrup field will drive most of the production growth in Norway in 2020 and 2021.

OPEC Production of Petroleum and Other Liquid Fuels. On June 6, 2020, OPEC+ announced that they were extending through July the large production cuts for May and June originally announced in April 2020. In addition, OPEC+ producers reconfirmed the remaining cuts under

the April agreement that extend into 2022. EIA assumes that participating OPEC+ countries are broadly complying with the May–July cuts.

EIA forecasts OPEC crude oil production will fall below 22.5 million b/d in July, a 7.9 million b/d decline from April. If OPEC production declines to forecast levels in July, it would be the group's lowest level of crude oil production since November 1991. After July, EIA expects OPEC will continue to limit production, but to a lesser degree as cuts are relaxed, global oil demand rises, and compliance lessens. With increases in forecast global oil demand growth in 2021, EIA assumes that OPEC members will further increase production in the face of large oil supply/demand imbalances that lead to large stock drawdowns and rising oil prices. EIA forecasts that OPEC crude oil production will average 29.2 million b/d in 2021, up 3.2 million b/d from 2020 but about the same as 2019 levels.

Venezuela, Libya, and Iran are not subject to the OPEC+ agreement. EIA expects Venezuela's production to continue falling throughout the forecast period. Production declines accelerated following the imposition of new sanctions by the United States government on Rosneft Trading in mid-February. In addition, the decline in global oil demand following the onset of the COVID-19 pandemic further reduced the demand for Venezuela's oil. Much of Venezuela's exports had been used for in-kind loan payments to China; however, the decline in oil demand from China in 2020 as a result of COVID-19 mitigation efforts further reduced outlets for Venezuela's oil production.

Libya's crude oil production fell in the first half of 2020 after the January closure of five export terminals in eastern Libya and the pipelines connecting the El Sharara and El Feel oilfields to those terminals. By May 2020, Libya's crude oil production averaged 80,000 b/d, down from 1.2 million b/d at the end of 2019. With the ongoing civil war in Libya, EIA does not expect production to increase until late 2020. However, that forecast is very uncertain as the timing of any settlement or resolution in Libya's civil war is not possible to forecast. Once currently shuttered export terminals and oil fields reopen, EIA expects that Libya will boost production to near-capacity in a relatively short time despite low oil prices.

EIA expects that crude oil production in the Neutral Zone shared between Saudi Arabia and Kuwait, which resumed in March 2020, will increase to full production levels in 2021, following a one-month hiatus in June 2020. However, EIA assumes that increases in Neutral Zone production will be offset elsewhere, as Kuwait and Saudi Arabia reduce production at other fields in response to the OPEC+ cuts.

EIA estimates that OPEC production of other liquids will decline to 4.8 million b/d on average in 2020, down from 5.4 million b/d in 2019. The 2020 decrease in production of other liquids is the result of less associated liquids production stemming from a reduction in crude oil production because of the OPEC+ cuts. The decrease in production of other liquids in 2021 is the result of less expected condensate output in Iran.

EIA expects that OPEC surplus crude oil production capacity, which averaged 2.5 million b/d in 2019, will average 5.7 million b/d in 2020, peaking during the third quarter of 2020 at 7.9 million

b/d before declining to 3.1 million b/d on average in 2021. The forecast 2020 annual level would mark the first time since 2002 that surplus capacity averaged at least 5 million b/d and would be the highest level since the mid-1980s. The fluctuations in surplus capacity are a direct result of crude oil production changes in response to the OPEC+ agreement. These estimates do not include additional capacity that may be available in Iran but is offline because of U.S. sanctions on Iran's oil sales.

Global Petroleum Inventories. A faster recovery of global oil demand and steeper declines in global oil production than EIA had forecast in previous outlooks mean inventory builds during the first five months of 2020 were not as large as previously expected. EIA now estimates that implied global oil inventory growth (measured as the difference between estimated global liquid fuels demand and production) averaged 8.4 million b/d from January through May. This level of growth implies oil inventories stood almost 1.3 billion barrels higher at the end of May than they did at the start of the year. In the June STEO, EIA had estimated builds of more than 1.4 billion barrels during this period.

EIA now forecasts that global petroleum inventory builds will average 1.7 million b/d in 2020, compared with the 2.2 million b/d inventory build EIA had forecast in the June STEO. EIA estimates that global inventories began declining in June. Forecast petroleum inventory draws average 3.3 million b/d for the second half of 2020 and 1.1 million b/d in 2021. As a result, EIA expects that commercial crude oil and other liquid fuels inventories held within the Organization of Economic Cooperation and Development (OECD), which peaked at an estimated 3.3 billion barrels in May, will decline to 3.0 billion barrels by the end of 2020. By the end of 2021, the inventory builds that occurred in 2020 will have disappeared, and OECD commercial inventories will fall below 2.9 billion barrels, a level last seen at the end of February 2020.

Crude Oil Prices. Brent crude oil spot prices averaged $40/b in June, up $11/b from May and up $22/b from the multiyear lows from April. Prices rose as OPEC+ producers agreed to extend the deepest production cuts through July and as indications that many locations previously under lockdown orders were increasing liquid fuels demand. Given supply reductions and rising demand, EIA estimates that global oil inventories declined in June for the first time since December 2019. This decline followed five months in which global oil inventory builds averaged 8.4 million b/d, which caused crude oil prices to drop sharply. Because EIA expects global oil demand to exceed supply in the second half of 2020, and continue to exceed through the forecast period, EIA expects crude oil prices to rise through the end of the forecast. However, existing inventory levels, significant OPEC surplus production capacity, and uncertainty about the trajectory of oil demand will likely limit upward crude oil price movements, particularly in the third quarter of 2020.

EIA expects Brent crude oil prices to average $41/b during the second half of 2020 and $50/b during 2021, reaching $53/b by the end of 2021. However, this price path reflects global oil consumption of 96.0 million b/d during the second half of 2020 along with relatively strict compliance to announced OPEC+ production cuts, both of which are uncertain. Also, the degree

to which the U.S. shale industry responds to the recent relative strength in oil prices compared with their recent lows in April will affect the oil price path in the coming quarters.

Global economic developments and numerous uncertainties surrounding the ongoing COVID-19 pandemic in the coming months could push oil prices higher or lower than the current STEO price forecast. Uncertainty also remains regarding the duration of, and adherence to, the current OPEC+ production cuts. Lastly, the U.S. tight oil sector continues to be dynamic, and the ability of producers to adjust to an especially volatile pricing environment in the face of significant reductions in drilling activity in recent months could affect both current crude oil prices and expectations for future prices.

EIA forecasts West Texas Intermediate (WTI) crude oil prices will average about $3/b less than Brent prices in 2020 and $4/b in 2021. This price discount is based on EIA's assumption that the current reduced discount of WTI to Brent of $2/b on average in June reflects significant declines in U.S. crude oil production and reduced available volumes of U.S. crude oil for export to distant markets relative to other global benchmarks. As the global market adjusts to reduced demand and production levels, EIA expects the spread to return to $4/b by the end of 2020 based on the relative cost of exporting U.S. crude oil from the Cushing distribution hub to Asia, compared with Brent crude oil from the North Sea.

U.S. Liquid Fuels

Consumption. Consumption of U.S. liquid fuels fell in early 2020 as a result of reduced travel because of COVID-19 and associated mitigation measures. Consumption of liquid fuels in the United States reached its low point in April at an average of 14.7 million barrels per day (b/d), down 5.4 million b/d from April 2019. Initial data show consumption increased to 16.1 million b/d in May and to 17.5 million b/d in June as states relaxed restrictions. EIA expects consumption will continue increasing in the second half of the year as economic activity increases.

EIA forecasts that U.S. consumption of petroleum and other liquid fuels will average 18.9 million b/d in the second half of 2020, up from an average of 17.7 million b/d in the first half of the year. EIA forecasts that annual consumption in 2020 will average 18.3 million b/d, down 2.1 million b/d from 2019. On a volumetric basis, almost half of the decrease in 2020 of U.S. consumption of liquid fuels is reduced gasoline use. On a percentage basis, however, jet fuel consumption declines the most (-31%) in 2020 from 2019, followed by residual fuel oil (-20%), gasoline (-10%), and distillate (-10%). EIA forecasts U.S. consumption of liquid fuels will recover to 19.9 million b/d in 2021.

EIA forecasts that U.S. jet fuel consumption will decline by 540,000 b/d from 2019 to average 1.2 million b/d in 2020. Estimated consumption fell to 660,000 b/d in the second quarter of 2020, and EIA expects it to rise to 1.4 million b/d in the fourth quarter. EIA's forecast consumption continues rising in 2021, and averages 1.5 million b/d for the year, remaining less than the 2019 consumption level of 1.7 million b/d.

U.S. motor gasoline consumption in the forecast averages 8.3 million b/d in 2020, down 1.0 million b/d (10.3%) from 2019 consumption levels. The annual declines are largely the result of travel disruptions and COVID-19 mitigation efforts that occurred predominantly in the first half of 2020. In the second half of 2020, gasoline consumption is supported by a forecast increase in employment and is expected to rise from an average of 7.8 million b/d in the first half of 2020 to 8.8 million b/d in the second half of the year. EIA assumes employment levels continue to grow in 2021, driving gasoline consumption up 0.8 million b/d from 2020 levels to average 9.1 million b/d in 2021.

U.S. consumption of distillate fuel in the forecast averages 3.7 million b/d in 2020 and 3.8 million b/d in 2021, down from 4.1 million b/d in 2019. Distillate consumption in the forecast is less affected on a percentage basis by COVID-19 mitigation efforts than jet fuel consumption, decreasing a forecast 10.1% in 2020 compared with 2019. Distillate consumption is driven by economic activity and by freight movements and is more likely affected by slowing economic growth than by travel restrictions themselves. Distillate fuel is also used in activities that are less directly affected by restrictions, such as for diesel engines of heavy construction equipment and as heating oil both for space heating in buildings and industrial heating. The restrictions may have indirectly affected these uses over time as a result of reduced economic activity that eventually led to a decrease in consumer spending for all goods. Diesel fuel is also used in oil and natural gas drilling operations, which have decreased significantly. U.S. gross domestic product reached an estimated low in the second quarter of 2020, and EIA assumes it will increase throughout the forecast, driving the recovery in distillate consumption.

EIA forecasts that U.S. consumption of hydrocarbon gas liquids (HGL) will decline by 110,000 b/d in 2020 to an average 3.0 million b/d in 2020 and increase to 3.3 million b/d in 2021. The decline in HGL consumption in 2020 is driven by an exceptionally warm first quarter that depressed propane consumption for space heating, followed by COVID-19 related mitigation measures, which depressed demand for HGLs as a petrochemical feedstock and for other end uses. The forecast decline in propane, butanes, and natural gasoline consumption is partially offset by an increase in the use of ethane as a feedstock for additional petrochemical capacity expected to come online in 2020 and 2021. EIA forecasts ethane consumption will increase by 110,000 b/d in 2020 and by a further 160,000 b/d in 2021.

Crude Oil Supply. EIA estimates that annual U.S. crude oil production will average 11.6 million b/d in 2020, down 0.6 million b/d from 2019 as result of a drop in drilling activity and production curtailments related to low oil prices. This 2020 production decline would mark the first annual decline since 2016. EIA expects production to decline slightly through the first half of 2021 and then to generally increase for the rest of 2021 as prices and economic conditions become more favorable for oil drilling.

EIA estimates that U.S. crude oil production in June averaged 11.0 million b/d, down 1.9 million b/d from the record level reached in November 2019. The declines occurred because producers quickly curtailed production and reduced drilling activity in response to falling prices. As of July 2, Baker Hughes reported the fewest active drilling rigs in the United States in their records,

which date back to 1987. Adding to the June drop in U.S. crude oil production were declines in the Federal Gulf of Mexico (GOM) stemming from shut-in production in response to Tropical Storm Cristobal.

In July, EIA expects U.S. oil production to increase to 11.4 million b/d as production returns in the GOM. EIA also expects small increases in crude oil production in the Lower 48 states and Alaska in July as operators respond to recent oil price increases.

EIA's forecast of a small increase in tight oil production in July is a result of expectations that some producers will reduce curtailments as oil prices have increased. EIA forecasts that the effect of reduced curtailments will be relatively short lived, and then the effects of less drilling take back over and cause production to fall. As a result, EIA expects that production declines in the tight oil basins of the Lower 48 states will resume after July. Although crude oil prices have increased, they are not high enough to encourage a significant recovery in drilling. Typically, crude oil price changes lead to changes in crude oil production in tight oil basins after about six months. However, current market conditions forced U.S. producers to curtail production more quickly as the WTI spot price dropped to less than $20 per barrel (b) in April and remained less than $40/b during most days in June. With EIA's West Texas Intermediate (WTI) crude oil price forecast averaging $39/b during the second half of 2020, EIA expects onshore production in the Lower 48 states decline from 9.0 million b/d in July 2020 to 8.5 million b/d in April 2021. EIA finalized this month's forecast before a U.S. District Court ordered on July 6 the temporary closure of the Dakota Access Pipeline beginning in early August. Energy Transfer, the operators of the pipeline, have announced they will "file a motion to stay this decision and if not granted, to pursue a stay and expedited appeal with the Court of Appeals." Depending on the outcome, a closure could affect oil prices and wellhead economics during the forecast period, particularly in Bakken region of North Dakota. EIA will incorporate any relevant information related to the pipeline's status in its August STEO.

EIA expects some growth in U.S. crude oil production to resume in mid-2021 as oil prices increase. However, EIA's forecast WTI prices remain lower than $50/b through 2021, and with an uncertain capital environment growth could be limited. EIA expects crude oil production in the Lower 48 states to increase to 8.7 million b/d in the fourth quarter of 2021 and total U.S. crude oil production to increase to 11.1 million b/d; both would be lower than June 2020 levels. Forecast annual average U.S. crude oil production in 2021 is 11.0 million b/d.

Hydrocarbon Gas Liquids Supply. EIA forecasts natural gas plant production of HGLs to increase by 70,000 b/d in 2020 and by 110,000 b/d in 2021, despite the forecast decline in natural gas production. Declines in the production of propane and butanes at natural gas processing plants in 2021, resulting from less natural gas production, will be more than offset by increased ethane production. EIA forecasts higher rates of ethane recovery at natural gas processing plants to increase to meet growing demand for ethane as a petrochemical feedstock in the United States and abroad between 2020 and 2021.

Liquid Biofuels. COVID-19 related reductions in economic activity in general and demand for liquid fuels in particular have had significant effects on U.S. biofuels markets that are expected to persist throughout the STEO forecast period. EIA still expects that current targets in the Renewable Fuel Standard (RFS) program will primarily impact biomass-based diesel production and net imports, which help to meet multiple RFS targets for biomass-based diesel, advanced biofuel, and total renewable fuel, but those impacts will be outweighed by COVID-19 disruptions during 2020.

U.S. biodiesel production fell by 7% from 2018 to 2019, averaging an estimated 112,000 b/d last year. EIA expects biodiesel production will again decrease by nearly 2% to average 110,000 b/d in 2020 before increasing by 21% to average 133,000 b/d in 2021, driven largely by increasing RFS targets and the renewal of the biodiesel production tax credit through 2022.

U.S. net imports of biomass-based diesel increased by 32% to an average 20,000 b/d in 2019, driven primarily by growth in renewable diesel imports, and EIA expects them to increase further to an average of 24,000 b/d in 2020 and 39,000 b/d in 2021. Increased net imports of biomass-based diesel are driven primarily by increased volumes of renewable diesel imported to meet both California Low Carbon Fuel Standard requirements and the rising RFS targets.

As a result of limited demand growth and oversupply, U.S. ethanol producers experienced weakening operating margins, and ethanol production fell for the first time in seven years in 2019, down 2.0% from 2018 to an average of 1.03 million b/d. In 2020, ethanol producers have seen even weaker margins and have significantly curtailed production in response to dramatic decreases to domestic motor gasoline demand. As a result, EIA forecasts that persistent reductions in domestic gasoline demand and limited higher-blend ethanol growth potential will result in ethanol production remaining lower than 2019 levels throughout the STEO forecast. EIA expects ethanol production to average 0.90 million b/d in 2020, 12% less than in 2019, and to average 1.00 million b/d in 2021, which would still be 2% lower than the 2019 level.

U.S. ethanol consumption averaged 948,000 b/d in 2019, and EIA forecasts significant decreases to average 836,000 b/d in 2020 and 919,000 b/d in 2021, driven by persistent COVID-19 related demand impacts. This level of consumption results in the ethanol share of total gasoline, which was an estimated 10.1% in 2018 and 10.2% in 2019, to be 10.1% on average during 2020 and 2021. This stable ethanol share assumes that growth in higher-level ethanol blends is limited by a combination of lower gasoline prices reducing incentives for increased ethanol blending and limited consumer demand for higher levels of ethanol blending beyond 10% of gasoline (E10).

Product Prices. Travel reductions related to COVID-19 mitigation efforts have resulted in sharp reductions in crude oil prices and demand for liquid fuels in the United States during the second quarter of 2020, which have significantly reduced prices for gasoline and diesel fuel during the same period. U.S. retail prices for regular-grade gasoline averaged $1.94 per gallon (gal) during the second quarter of 2020 and diesel retail prices averaged $2.43/gal, down about 47 cents/gal from the first quarter of 2020 for both fuels.

The U.S. gasoline and diesel price declines largely reflect a drop in crude oil prices. Refinery margins, after falling significantly as gasoline and diesel demand fell quickly in March and April, have increased recently as refiners have reduced runs. EIA expects petroleum product prices will rise as crude oil prices rise in the coming quarters. However, EIA generally expects U.S. average gasoline prices to remain near $2/gal until March 2021.

Refinery wholesale gasoline margins in the United States (the difference between the wholesale price of gasoline and the price of Brent crude oil) averaged 21 cents/gal in April 2020 before increasing to 30 cents/gal in June. This level in June was 8 cents/gal less than the average for the same time last year and 18 cents/gal less than the five-year (2015–19) average for June. EIA expects the U.S. refinery wholesale gasoline margin will average 31 cents/gal in 2020 and 30 cents/gal in 2021.

EIA expects the retail price of regular gasoline in the United States will average $2.06/gal during the third quarter of 2020, 59 cents/gal lower than at the same time last year. EIA expects the U.S. monthly regular retail gasoline price will increase from an average of $2.08/gal in June to $2.10/gal in July before falling to $2.00/gal in September 2020. The U.S. regular gasoline retail price, which averaged $2.60/gal in 2019, is forecast to average $2.11/gal in 2020 and $2.23/gal in 2021.

Regional annual average forecast prices for 2020 range from a low of $1.83/gal in the Gulf Coast region—Petroleum Administration for Defense District (PADD) 3—to a high of $2.77/gal in the West Coast region (PADD 5).

The retail price of diesel fuel in the United States averaged $3.06/gal in 2019, which was 13 cents/gal lower than in 2018. EIA forecasts that the diesel price will average $2.52/gal in 2020 and $2.59/gal in 2021. EIA expects that sharp reductions in forecast global economic activity and high levels of diesel inventories will keep diesel refinery margins lower during the forecast period. Diesel refinery margins based on Brent crude oil averaged 20 cents/gal in June 2020, which was 18 cents/gal lower than the five-year average for June and the lowest monthly average since June 2009. They averaged 43 cents/gal in 2019. EIA expects diesel refinery margins will average 33 cents/gal in 2020 and 38 cents/gal in 2021.

Natural Gas

Natural Gas Consumption. Consumption of natural gas in the United States averaged an estimated 85.0 billion cubic feet per day (Bcf/d) in 2019, and EIA expects U.S. consumption will decrease by 2.6 Bcf/d (3.1%) in 2020 before decreasing by an additional 3.7 Bcf/d (4.5%) in 2021.

The largest natural gas consuming sector in the United States is the electric power sector. EIA estimates that electric generation will consume an average 31.9 Bcf/d in 2020, which is 2.9% more than in 2019 because of new natural gas-fired electric generation capacity and competitive natural gas prices. EIA forecasts power sector consumption of natural gas to decline by 14.3% in 2021, which reflects increased competition from renewable sources and from coal.

Growth in renewable sources of electricity generation is a result of continuing renewables capacity additions. EIA's forecast of higher natural gas spot prices in 2021 compared with 2020, makes natural gas less competitive compared with coal for use in power generation.

EIA expects combined U.S. residential and commercial natural gas consumption will average 21.8 Bcf/d in 2020, down 6.8% from 2019, primarily because of warmer-than-average temperatures in the first quarter of 2020 that reduced demand for space heating. Based on forecasts by the National Oceanic and Atmospheric Administration (NOAA), EIA assumes a cooler summer with 7.2% fewer heating degree days (HDD) across the United States in 2020 compared with 2019. EIA expects natural gas consumption in the residential and commercial sectors to increase by 1.6% in 2021, based on a forecast increase in U.S. HDD of 4.0% in 2021.

EIA forecasts U.S. consumption of natural gas by the industrial sector will decline by 6.2% in 2020. Most of this 2020 decrease is the result of less manufacturing activity following COVID-19 mitigation efforts. EIA forecasts industrial sector natural gas consumption to rise by 2.6% as economic growth supports renewed manufacturing activity.

Natural Gas Production and Trade. EIA estimates that U.S. production of dry natural gas averaged 89.9 Bcf/d in the second quarter of 2020, down 6.1 Bcf/d (6.3%) from the fourth quarter of 2019. The declines are the result of a sharp drop in drilling activity because of low natural gas and crude oil prices and because of production curtailments. EIA expects dry natural gas production to continue to decline through the end of 2020. Forecast dry natural gas production in the United States averages 89.2 Bcf/d in 2020, down 3.0 Bcf/d (3.2%) from 2019. Natural gas production declines the most in the Permian region because of a drop in drilling activity and low crude oil prices reduce associated natural gas output from oil-directed wells.

In 2021, EIA expects dry natural gas production to decline by 5.0 Bcf/d (5.6%) from 2020. EIA forecasts the low point in natural gas production to occur in the second quarter of 2021 at an average of 83.3 Bcf/d, which would be down 12.7 Bcf/d (13.2%) from the fourth-quarter 2019 peak. However, toward the second half of 2021, as Henry Hub prices rise and economic conditions become more favorable, EIA expects dry natural gas production to increase, reaching 85.6 Bcf/d in the fourth quarter of 2021.

EIA forecasts net natural gas exports will rise to average 6.1 Bcf/d in 2020 and 7.5 Bcf/d in 2021. Because of rising liquefied natural gas (LNG) and pipeline exports, the United States has been a net exporter of natural gas since the second quarter of 2017. EIA estimates that gross exports of U.S. LNG averaged 5.0 Bcf/d in 2019. EIA expects LNG exports will increase to 5.4 Bcf/d in 2020 and 7.3 Bcf/d in 2021.

In 2020, U.S. LNG liquefaction capacity continues to expand. In May 2020, the third train at Freeport LNG in Texas began commercial operations. Later this summer, the third train at the Cameron LNG export facility in Louisiana and three of Elba Island's small-scale moveable modular liquefaction system units are expected to come online in Georgia, bringing U.S. total liquefaction export capacity to 8.9 Bcf/d of baseload (10.1 Bcf/d peak).

U.S. LNG exports averaged 7.7 Bcf/d through the first four months of 2020, but declined by 17% between April and May. A mild winter and COVID-19 mitigation efforts have led to declining global natural gas demand and high natural gas inventories in Europe and Asia, reducing the need for LNG imports. Historically low natural gas and LNG spot prices in Europe and Asia have reduced the economic viability of U.S. LNG exports, which are highly price sensitive. In the summer 2020, more than 70 LNG export cargoes from the United States were canceled for June and July deliveries, and more than 40 cargoes were canceled for August deliveries. In comparison, 74 cargoes were exported from the United States in January 2020.

EIA estimates that as a result of these cancellations, U.S. LNG exports averaged 3.6 Bcf/d in June and forecasts that they will average 2.2 Bcf/d in July and August 2020, implying a 25% utilization of LNG export capacity. EIA expects U.S. LNG exports to increase beginning in September and average 7.1 Bcf/d from December 2020–February 2021 as global natural gas demand gradually recovers.

U.S. natural gas exports to Mexico by pipeline have also increased as more infrastructure has been built to transport natural gas both to and within Mexico. U.S. pipeline exports to Mexico averaged 5.3 Bcf/d in the first quarter of 2020, an increase of 9% compared with the same period in 2019. Exports to Mexico should continue to increase as more natural gas-fired power plants come online in Mexico and more pipeline infrastructure within Mexico is built. EIA expects gross U.S. pipeline exports to Mexico and Canada to average 7.9 Bcf/d and 8.3 Bcf/d in 2020 and 2021, respectively.

U.S. net natural gas pipeline imports from Canada decreased from 2019 to 2020, continuing a trend that began in 2008. This decrease in net imports is expected to continue as Appalachian production growth displaces some imports of Canadian natural gas to U.S. Midwest markets.

Natural Gas Inventories. As of June 26, 2020, U.S. working gas inventories were 3,077 Bcf, 30% more than the year-ago level and 18% more than the five-year (2015–19) average level. A warmer-than-normal winter led to the smallest total storage withdrawal since the 2015–16 winter, and inventories at the end of the winter heating season on March 31 were 18% more than the five-year average. Weekly storage injections so far during the April–October injection season have been close to the five-year average rate as falling production has been offset by falling demand from the industrial sector and LNG exports. EIA expects declining natural gas production will cause injections to fall short of the five-year average later in the summer. However, because of the high starting point for inventories during this injection season, EIA forecasts inventories will reach a record 4,039 Bcf by the end of October, which would be 8% more than the five-year average for that time period.

Natural Gas Prices. Henry Hub spot prices averaged $1.63 per million British thermal units (MMBtu) in June, down 12 cents/MMBtu from May and the lowest inflation adjusted monthly average price since at least 1989. Currently, the effects of reduced natural gas demand are outweighing the effects of falling U.S. natural gas production and are contributing to low natural gas prices. EIA expects that these conditions will largely persist in the coming months, keeping

the third quarter average price at $1.65/MMBtu. However, EIA expects general upward price pressures to emerge later in 2020 as demand for natural gas increases and production continues to decline, particularly in the fourth quarter when space heating demand rises. EIA forecasts that the Henry Hub spot price will average $2.46/MMBtu in the fourth quarter of 2020, bringing the 2020 annual average to $1.93/MMBtu. EIA expects the Henry Hub price will average $3.10/MMBtu in 2021 as falling natural gas production levels continue to exert upward price pressures.

Coal

Coal Supply. Initial data show U.S. coal production was 113 million short tons (MMst) in the second quarter of 2020, down 37% from the same period a year ago. Coal production has declined primarily because of falling electric power sector demand for coal amid low natural gas prices. As a result of COVID-19 mitigation efforts, some coal mines have either been idled or shut down. Steam coal production has been more affected by lower demand from the domestic electric power sector, but metallurgical coal production has been more affected by falling demand for U.S. exports. EIA expects that U.S. coal production will be 501 MMst in 2020, down 29% from 2019. EIA's forecast coal production rises 7% in 2021 to 536 MMst, driven primarily by a recovery in Western region production.

Coal Consumption. EIA expects U.S. coal consumption to decline by 28% in 2020 as a result of a decline in coal use for electricity generation, which is the effect of both lower overall electricity generation and low natural gas prices that make coal less competitive as a generation fuel. The largest drops in coal use for power generation occur in the Midwest, Southeast, and mid-Atlantic. However, EIA forecasts that U.S. coal consumption will rise by 21% in 2021 largely because of an expected increase in natural gas prices that will cause some coal-fired generation units to become more economic to dispatch.

Coal Trade. EIA forecasts that U.S. coal exports will decrease in 2020 by 32% to 63 MMst. U.S. Atlantic ports, which are the primary outlet for U.S. coal exports, are seeing decreased demand because of the global economic slowdown. Based on an assumed increase in global coal demand in 2021, EIA expects U.S. coal exports to increase by 7% next year. EIA expects increases in 2021 to be limited because of less demand for U.S. coal in India. India, the top destination for U.S. exports, has decreased consumption of both steam and coking coals by nearly 50% this year. India has also opened up domestic mining options to private companies.

Coal Prices. EIA estimates the delivered coal price to U.S. electricity generators averaged $2.02 per million British thermal units (MMBtu) in 2019, which was 4 cents/MMBtu lower than in 2018. EIA forecasts that coal prices will decrease in 2020 to $1.98/MMBtu and increase in 2021 to $2.04/MMBtu.

Electricity

Electricity Consumption. EIA forecasts that consumption of electricity in the United States, including direct use of electricity by combined-heat-and-power plants, will decline by 4% in 2020

and then grow by 1% in 2021. This decline in expected consumption reflects significant changes in electricity consumption patterns resulting from efforts to mitigate COVID-19. These mitigation and reopening efforts are currently evolving, which introduces heightened uncertainty into the STEO's electricity forecasts.

Most of EIA's expected decline during 2020 occurs in the commercial and industrial sectors. EIA forecasts that retail sales of electricity to the U.S. commercial sector will be 7% lower than in 2019. Commercial electricity demand was slightly lower in the first quarter of 2020 compared with 2019 as a result of mild winter temperatures. The stay-at-home orders in the late spring months especially affected commercial businesses such as restaurants, hotels, and similar establishments because they were required to cease operations. In addition, many office employees worked from home instead of their normal workplaces. EIA's most recent survey data indicate that commercial retail electricity sales in April 2020 were 11% lower than in April 2019. EIA estimates similar year-over-year declines have occurred in May and June. The relaxing of stay-at-home orders will likely result in slowed growth in electricity consumption in the commercial sector, but social distancing guidelines that remain in place will likely keep consumption less than 2019 levels.

Retail sales of electricity to the industrial sector have generally been declining over the past 10 years. However, the economic slowdown resulting from COVID-19 mitigation efforts has intensified declines in electricity sales in recent months. Although retail sales of electricity to the U.S. industrial sector during the first quarter of 2020 were slightly higher than the same period in 2019, EIA estimates industrial electricity consumption during the second quarter of 2020 was 8% lower than for the same period last year. EIA expects similar year-over-year declines through the end of the year, leading to a forecast annual decline of 6% in U.S. retail industrial electricity sales during 2020.

Residential electricity consumption during the first quarter of 2020 was 6% lower than for the same period last year as a result of milder winter temperatures. Since late March, the residential sector has generally been consuming more electricity as a result of stay-at-home orders and social distancing guidelines related to COVID-19. U.S. retail sales of electricity to the residential sector in April 2020, when most states had implemented stay-at-home guidance, was 8% higher than in April 2019. Some of this year-over-year increase was likely a result of increased electricity use for heating because the April temperatures were generally colder than in April 2019, but it is likely the increase in consumption was also a result of people spending more time in their homes. EIA assumes this extra use of electricity related to COVID-19 mitigation efforts will decrease gradually through the third quarter of 2020. EIA forecasts 2020 annual residential electricity sales will be essentially the same amount as in 2019.

In 2021, assumed increases in economic activity drive EIA's forecast that residential electricity sales will grow by 1% and commercial electricity sales will grow by 3%. EIA expects industrial electricity consumption in 2021 to remain essentially flat as some manufacturers boost production while others increase the efficiency of their electricity usage.

Electricity Generation. EIA's expectation for less electricity demand overall drives the forecast of a 5% decrease in U.S. electric power sector generation during 2020 compared with 2019. Electric power sector generation in the forecast increases by 1% in 2021.

Coal-fired electricity generation has been the energy source most affected by the reduction in electricity demand resulting from COVID-19 mitigation measures. EIA estimates that U.S. electric power sector coal generation was 314 billion kilowatthours (kWh) during the first half of 2020 compared with 467 billion kWh during the first half of 2019. Coal-fired generation has been falling faster than the overall level of electricity demand as a result of competition from other energy sources. In particular, the cost of natural gas has fallen to its lowest levels in 25 years. In addition, significant levels of new generating capacity using renewable energy sources have been added. EIA expects the share of total U.S. generation from coal-fired power plants will average 18% in 2020 compared with 24% in 2019.

Although the cost of natural gas for power generation has been relatively low for the past few years, recent prices have fallen even farther. EIA expects the cost of natural gas delivered to electric generators in 2020 will average $2.05 per million British thermal units, which would be 29% below the 2019 average and the lowest annual price since 1995. These sustained low prices drive EIA's forecast that natural gas-fired power generators will supply 41% of total U.S. electricity generation in 2020, up from 37% in 2019. Most of the projected increase in natural gas-fired generation occurs in the midwestern and eastern regions of the United States.

EIA also expects generation from renewable energy sources will increase in 2020. Slightly higher precipitation levels in the Pacific Northwest drive EIA's forecast that conventional hydroelectric generation will provide 8% of total U.S. generation in 2020, compared with 7% last year. Most of the expected increase in generation from renewables is a result of new solar and wind generation capacity additions. EIA expects the generation share from renewable energy sources other than hydropower will increase to 13% in 2020 compared with 11% in 2019.

Five nuclear reactors retired in 2019 or are scheduled to retire before the end of 2021. EIA expects the electric power sector will generate 794 billion kWh in 2020, down from 809 billion kWh last year. The forecast level of U.S. nuclear generation corresponds with a generation share of 21%.

In 2021, rising natural gas prices and continued additions of renewable generating capacity drive EIA's forecast for the U.S. electricity generation fuel mix. EIA forecasts the U.S. average delivered cost of natural gas in 2021 will rise to $3.43 per million Btu. These higher natural gas prices cause the forecast share of generation from natural gas-fired power plants to decline to 36% in 2021 from 41% in 2020. Conversely, coal-fired power plants become more economically competitive, and EIA forecasts the U.S. coal generation share in 2021 will average 21% compared with 18% in 2020. Nonhydro renewables provide a forecast share of 15% in 2021, up from an expected share of 13% this year.

Renewables Capacity. After adding 5 gigawatts (GW) of capacity in 2019, EIA forecasts 13 GW of utility-scale solar photovoltaic (PV) capacity will be added in 2020 and 11 GW more will be

added in 2021. Fewer capacity additions in 2021 takes into consideration some effects of the Investment Tax Credit (ITC) phase-down. Based on the latest available data that EIA has received, the impact of COVID-19 on PV capacity in development is limited; therefore, the forecast for utility-scale PV capacity additions in 2020 and 2021 is only slightly lower than the forecast in the January STEO.

EIA also expects a total of 9 GW of small-scale solar PV capacity will be installed during 2020 and 2021, mostly in the residential sector. EIA expects small-scale solar to continue to grow, although at a slower pace than the level forecasted in the January STEO. Various state and federal policies support EIA's forecast solar capacity growth, including California's requirement that all new home construction has rooftop solar panels beginning this year. The National Renewable Energy Laboratory (NREL) estimates that 15% of detached single-family homes in California currently have solar PV systems.

Electricity Prices. EIA expects wholesale electricity prices throughout the United States will be lower in 2020 than they were in 2019, reflecting the lower cost for natural gas as a fuel for power generation and less overall electricity demand. The expected declines in wholesale electricity prices range from 11% lower at the Midcontinent Illinois hub to an expected decline of 53% at the ERCOT North hub in Texas, where prices spiked during some hours in 2019.

EIA forecasts the U.S. retail electricity price for the residential sector will average 13.1 cents per kWh in 2020, which is 1.2% higher than the average retail price in 2019. These higher retail prices reflect the power industry's increased expenditures for generation and transmission infrastructure during the past few years. Forecast residential prices rise by an additional 1.2% in 2021.

U.S. Economic Assumptions and Energy-Related Carbon Dioxide Emissions

The STEO is based on macroeconomic forecasts by IHS Markit (for the United States). EIA used the June 2020 version of the IHS Markit macroeconomic model with EIA's energy price forecasts as model inputs to develop the economic forecasts in STEO.

Using the IHS Markit model, EIA assumes U.S. real gross domestic product (GDP) will decline by 8.2% in 2020 and grow by 5.1% in 2021, compared with 2.3% growth in 2019. EIA assumes that total industrial production will decrease 14.9% in 2020 and increase 1.4% in 2021, compared with 0.9% growth in 2019. In the forecast, nonfarm employment, which grew by 1.4% in 2019, decreases by 7.0% in 2020 and will increase by 4.9% in 2021.

Energy-Related Carbon Dioxide Emissions. After decreasing by 2.8%—150 million metric tons (MMmt)—in 2019 EIA forecasts that energy-related carbon dioxide (CO2) emissions will decrease by 12.2% (624 MMmt) in 2020 and increase by 6.0% (268 MMmt) in 2021. This forecast is highly dependent on assumptions regarding the economic impact and subsequent recovery from COVID-19. In addition to economic growth, energy-related CO2 emissions are sensitive to changes in weather, energy prices, and fuel mix.

The relative prices of coal and natural gas are especially important in determining the fuel mix for electricity generation because these substitutes for one another in the generation dispatch order. Because natural gas typically has a 30% advantage in terms of generation efficiency, even when coal prices are slightly lower on a dollars-per-MMBtu basis, natural gas generation will be dispatched first since it would have a lower dollars-per-MWh cost.

In 2020, EIA forecasts natural gas prices for electric generators to decline by 29% to $2.05/MMBtu, while forecast coal prices decline by 2% to $1.98/MMBtu. This price pattern shifts more electricity generation toward natural gas. However, in 2021 EIA expects natural gas prices for the power sector to increase by 67% to $3.43/MMBtu and coal prices to increase by 3% to $2.04/MMBtu, leading to an 11% decline in natural gas generation and a 22% increase in coal generation. This fuel shift contributes to a 164 MMmt increase in coal emissions in 2021, which more than offsets the 78 MMmt decline in natural gas CO2 emissions. Petroleum-related CO2 emissions are forecast to decline by 12% (279 MMmt) in 2020 as vehicle miles traveled (VMT) decline by 11% because of restricted travel and work-from-home orders.

Notable forecast changes

- EIA forecasts Brent crude oil spot prices will average $41 per barrel (b) in 2020 and $50/b in 2021 and West Texas Intermediate spot prices will average $38/b in 2020 and $46/b in 2021. All of these prices are $2/b higher than forecast in the June STEO. The higher price forecast largely reflects lower expected global oil inventory builds during the first half of 2020.

- This STEO incorporates the extension of May and June supply reductions from OPEC+ through July. Largely as a result of this extension, EIA expects global production of crude oil and other liquid fuels to average 90.8 million barrels per day (b/d) in the third quarter of 2020, 1.1 million b/d lower than forecast last month.

- Based on a forecast of higher crude oil prices, EIA expects U.S. production of crude oil to average 11.0 million b/d in 2021, up 0.2 million b/d from last month's forecast. The U.S. crude oil production forecast for 2020 is mostly unchanged.

- EIA expects U.S. consumption of petroleum and other liquid fuels will average 18.3 million b/d in 2020 and 19.9 million b/d in 2021. Those forecasts are almost 0.3 million b/d and 0.5 million b/d more, respectively, than in the June STEO. The main driver of the higher forecast in both years is more expected gasoline consumption. EIA raised its forecast for U.S. gasoline consumption after incorporating the IHS Markit macroeconomic forecast that shows higher expected employment levels over the next 18 months. EIA also raised its forecast for hydrocarbon gas liquids (HGL) consumption based on incoming data. April HGL consumption in the *Petroleum Supply Monthly* was more than EIA's estimate from the June STEO, which indicates higher utilization rates at ethane-fed petrochemical plants than previously expected.

- EIA's forecast Henry Hub natural gas spot price averages $2.05 per million British thermal units (MMBtu) in the second half of 2020, down from a forecast of $2.26/MMBtu last month. The lower price forecast in this STEO reflects EIA's reduction in forecast U.S. liquefied natural gas (LNG) exports during the third quarter of 2020.
- EIA expects U.S. LNG exports will average 2.6 billion cubic feet per day (Bcf/d) in the third quarter of 2020, down 1.0 Bcf/d from the last forecast as a result of low global demand for natural gas.
- For more information, see the detailed table of forecast changes

- = no data available

Prices are not adjusted for inflation.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109;
Petroleum Supply Annual , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130;
Electric Power Monthly , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.
Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.
Weather projections from National Oceanic and Atmospheric Administration.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

(a) Weighted geometric mean of real indices for various countries with weights equal to each country's share of world oil consumption in the base period. Exchange rate is measured in foreign currency per U.S. dollar. GDP and exchange rate data are from Oxford Economics, and oil consumption data are from EIA.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" inludes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Table 4b. U.S. Hydrocarbon Gas Liquids (HGL) and Petroleum Refinery Balances (million barrels per day, except inventories and utilization factor)

- = no data available

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

LNG: liquefied natural gas.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report*, DOE/EIA-0121; and *Electric Power Monthly*, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distributed solar photovoltaic systems.

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly,* DOE/EIA-0226 and *Renewable Energy Annual,* DOE/EIA-0603; *Petroleum Supply Monthly,* DOE/EIA-0109.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

-- = no data available

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to one megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than one megawatt).

(d) Solar photovoltaic systems smaller than one megawatt, as measured in alternating current.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA-860M database, EIA-826 Solar PV database, and EIA Regional Short-Term Energy Model.

- = no data available

SAAR = Seasonally-adjusted annual rate

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Aviation Administration. Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

- = no data available

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Projections: Macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

Notes: Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National Oceanic and Atmospheric Administration (NOAA).

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Projections: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Independent Statistics & Analysis
U.S. Energy Information Administration

August 2020

Short-Term Energy Outlook (STEO)

Forecast highlights

Global liquid fuels

- The August *Short-Term Energy Outlook* (STEO) remains subject to heightened levels of uncertainty because mitigation and reopening efforts related to the 2019 novel coronavirus disease (COVID-19) continue to evolve. Reduced economic activity related to the COVID-19 pandemic has caused changes in energy demand and supply patterns in 2020. Uncertainties persist across the U.S. Energy Information Administration's (EIA) outlook for all energy sources, including liquid fuels, natural gas, electricity, coal, and renewables. The STEO is based on U.S. macroeconomic forecasts by IHS Markit, which assume U.S. gross domestic product declined by 5.2% in the first half of 2020 from the same period a year ago and will rise from the third quarter of 2020 through 2021.

- Daily Brent crude oil spot prices averaged $43 per barrel (b) in July, up $3/b from the average in June and up $25/b from the multiyear low monthly average price in April. EIA expects monthly Brent spot prices will average $43/b during the second half of 2020 and rise to an average of $50/b in 2021.

- U.S. regular gasoline retail prices averaged $2.18 per gallon (gal) in July, an increase of 10 cents/gal from the average in June but 56 cents/gal lower than at the same time last year. EIA expects that gasoline prices will gradually decrease through the rest of the summer to reach an average of $2.04/gal in September before falling to an average of $1.99/gal in the fourth quarter. Forecast U.S. regular gasoline retail prices will average $2.23/gal in 2021, compared with an average of $2.12/gal in 2020.

- EIA expects high inventory levels and surplus crude oil production capacity will limit upward price pressures in the coming months, but as inventories decline into 2021, those upward price pressures will increase. EIA estimates global liquid fuels inventories rose at a rate of 6.4 million barrels per day (b/d) in the first half of 2020 and expects they will decline at a rate of 4.2 million b/d in the second half of 2020 and then decline by 0.8 million b/d in 2021.

- EIA estimates that demand for global petroleum and liquid fuels averaged 93.4 million b/d in July. Demand was down 9.1 million b/d from July 2019, but it was up

from an average of 85.0 million b/d during the second quarter of 2020, which was down 15.8 million b/d from year-ago levels. EIA forecasts that consumption of petroleum and liquid fuels globally will average 93.1 million b/d for all of 2020, down 8.1 million b/d from 2019, before increasing by 7.0 million b/d in 2021. Reduced economic activity related to the COVID-19 pandemic has caused changes in energy supply and demand patterns in 2020.

- EIA estimates that global liquid fuels production averaged 91.8 million b/d in the second quarter of 2020, down 8.6 million b/d year over year. The decline reflects voluntary production cuts by the Organization of the Petroleum Exporting Countries (OPEC) and partner countries (OPEC+), and reductions in drilling activity and production curtailments in the United States because of low oil prices. In the forecast, the global supply of oil continues to decline to 90.4 million b/d in the third quarter of 2020 before rising to an annual average of 99.4 million b/d in 2021.

- EIA estimates that U.S. liquid fuels consumption averaged 16.2 million b/d in the second quarter of 2020, down 4.1 million b/d (20%) from the same period in 2019. The decline reflects travel restrictions and reduced economic activity related to COVID-19 mitigation efforts. EIA expects U.S. oil consumption will generally rise through the end of 2021. EIA forecasts U.S. liquid fuels consumption will average 18.9 million b/d in the third quarter of 2020 (down 1.8 million b/d year over year) before rising to an average of 20.0 million b/d in 2021. Although the 2021 forecast level is 1.6 million b/d more than EIA's forecast 2020 consumption, it is 0.4 million b/d less than the 2019 average.

- EIA has lowered U.S. crude oil production estimates for 2020 by 370,000 b/d from the previous STEO. EIA expects crude production to average 11.3 million b/d in 2020 and 11.1 million b/d in 2021, down from 12.2 million b/d in 2019. Recently released EIA data show that average monthly U.S. oil production for May was 1.2 million b/d lower than the July STEO forecast, indicating more extensive production curtailments than previously estimated. Also, EIA's August STEO assumes that the Dakota Access Pipeline will remain operational. A U.S. District Court ordered on July 6 the temporary closure of the Dakota Access Pipeline beginning in early August. A U.S. appeals court has overturned the lower court decision, allowing the pipeline to remain running while further litigation proceedings continue.

Natural Gas

- In July, the Henry Hub natural gas spot price averaged $1.77 per million British thermal units (MMBtu). EIA expects natural gas prices will generally rise through the end of 2021 but the sharpest increases will be during this fall and winter when they rise from an average of $2.11/MMBtu in September to $3.14/MMBtu in February. EIA expects that rising demand heading into winter, combined with reduced

production, will cause upward price pressures. EIA forecasts that Henry Hub natural gas spot prices will average $2.03/MMBtu in 2020 and $3.14/MMBtu in 2021.

- EIA estimates that total U.S. working natural gas in storage ended July at about 3.3 trillion cubic feet (Tcf), 15% more than the five-year (2015–19) average. In the forecast, inventories rise by 2.0 Tcf during the April-through-October injection season to reach nearly 4.0 Tcf on October 31.

- EIA expects that total U.S. consumption of natural gas will average 82.4 billion cubic feet per day (Bcf/d) in 2020, down 3.0% from 2019. The largest decline in consumption occurs in the industrial sector, which EIA forecasts will average 22.0 Bcf/d in 2020, down 1.0 Bcf/d from 2019, as a result of reduced manufacturing activity. The decline in total U.S. consumption also reflects lower heating demand in early 2020, contributing to residential and commercial demand in 2020 averaging 12.8 Bcf/d (down 0.9 Bcf/d from 2019) and 8.8 Bcf/d (down 0.8 Bcf/d from 2019), respectively.

- U.S. dry natural gas production set an annual record in 2019, averaging 92.2 Bcf/d. EIA forecasts dry natural gas production will average 88.7 Bcf/d in 2020, with monthly production falling from its monthly average peak of 96.2 Bcf/d in November 2019 to 82.7 Bcf/d by April 2021, before increasing slightly. Natural gas production declines the most in the Permian region, where EIA expects low crude oil prices will reduce associated natural gas output from oil-directed rigs. EIA's forecast of dry natural gas production in the United States averages 84.0 Bcf/d in 2021. EIA expects production to begin rising in the second quarter of 2021 in response to higher natural gas and crude oil prices.

- EIA estimates that U.S. liquefied natural gas (LNG) exports will average 5.5 Bcf/d in 2020 and will average 7.3 Bcf/d in 2021. EIA expects that U.S. LNG exports will decline through the end of the summer as a result of reduced global demand for natural gas. U.S. exports of LNG in July 2020 averaged 3.1 Bcf/d, which is about the same as in May 2018, when the available liquefaction capacity was about one-third of the current capacity. Declines in global natural gas demand associated with COVID-19 mitigation efforts, high natural gas storage inventories in Europe and Asia, and an on-going expansion in LNG liquefaction capacity have contributed to natural gas and LNG prices reaching all-time historical lows. Low international prices have affected the economic competitiveness of U.S. LNG exports and have led to numerous cargo cancellations, particularly at the Sabine Pass, Corpus Christi, and Freeport LNG export terminals. EIA expects LNG exports from the United States to remain low in the next few months. Based on numerous trade press reports, EIA estimates about 45 cargoes have been canceled for upcoming August shipments and about 30 cargoes have been canceled for September shipments.

Electricity, coal, renewables, and emissions

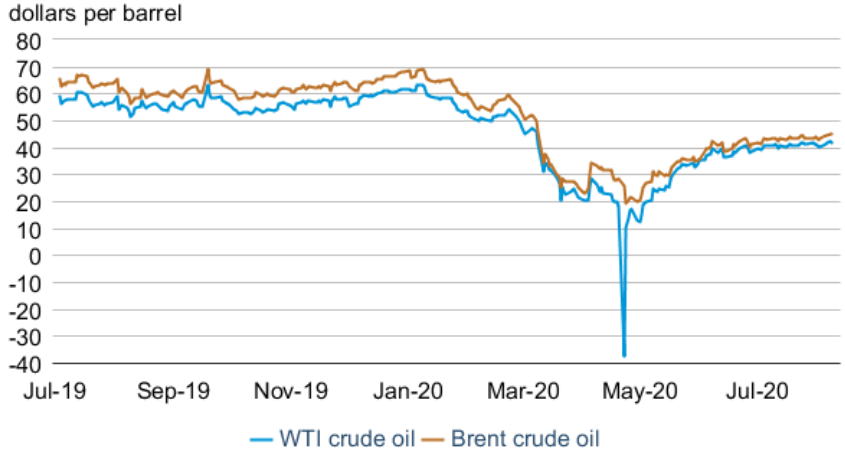
- EIA forecasts 3.6% less electricity consumption in the United States in 2020 compared with 2019. The largest decline on a percentage basis is in the commercial sector, where EIA expects retail sales of electricity to fall by 7.4% this year. Forecast industrial retail electricity sales fall by 5.8%. EIA forecasts residential sector retail sales will increase by 2.0% in 2020. Milder winter temperatures earlier in the year led to lower consumption for space heating, but that factor is offset by increased summer cooling demand and an assumed increase in electricity use by more people working from home. In 2021, EIA forecasts total U.S. electricity consumption will rise by 0.8%.

- EIA expects the share of U.S. electric power sector generation from natural gas-fired power plants will increase from 37% in 2019 to 40% this year. In 2021, the forecast natural gas share declines to 35% in response to higher natural gas prices. Coal's forecast share of electricity generation falls from 24% in 2019 to 18% in 2020 and then increases to 22% in 2021. Electricity generation from renewable energy sources rises from 17% in 2019 to 20% in 2020 and to 22% in 2021. The increase in the share from renewables is the result of expected additions to wind and solar generating capacity. EIA expects a decline in nuclear generation in both 2020 and 2021, reflecting recent and upcoming retirements of nuclear generating capacity.

- EIA forecasts that renewable energy will be the fastest-growing source of electricity generation in 2020. EIA expects the electric power sector will add 23.2 gigawatts (GW) of new wind capacity and 12.9 GW of utility-scale solar capacity in 2020. However, these future capacity additions are subject to a high degree of uncertainty, and EIA continues to monitor reported planned capacity builds.

- U.S. coal consumption, which dropped to its lowest point since April, totaled 95 MMst in the second quarter of 2020. EIA expects coal consumption to rise to a seasonal peak of 127 MMst in the third quarter but remain lower than 2019 levels through the end of 2020. EIA estimates that U.S. coal consumption will decrease by 26% in 2020 and increase by 20% in 2021. EIA estimates that total U.S. coal production in 2020 will decrease by 29% from 2019 levels to 502 MMst. In 2021, EIA expects higher demand and rising natural gas prices to a lead to a recovery in coal production of 12%, with a total annual production level of 564 MMst.

- EIA forecasts that U.S. energy-related carbon dioxide (CO2) emissions, after decreasing by 2.8% in 2019, will decrease by 11.5% (588 million metric tons) in 2020. This record decline is the result of less energy consumption related to restrictions on business and travel activity and slowing economic growth related to COVID-19 mitigation efforts. CO2 emissions decline with reduced consumption of all fossil fuels, particularly coal (24.9%) and petroleum (11.6%). In 2021, EIA forecasts that energy-related CO2 emissions will increase by 5.6%, as the economy recovers



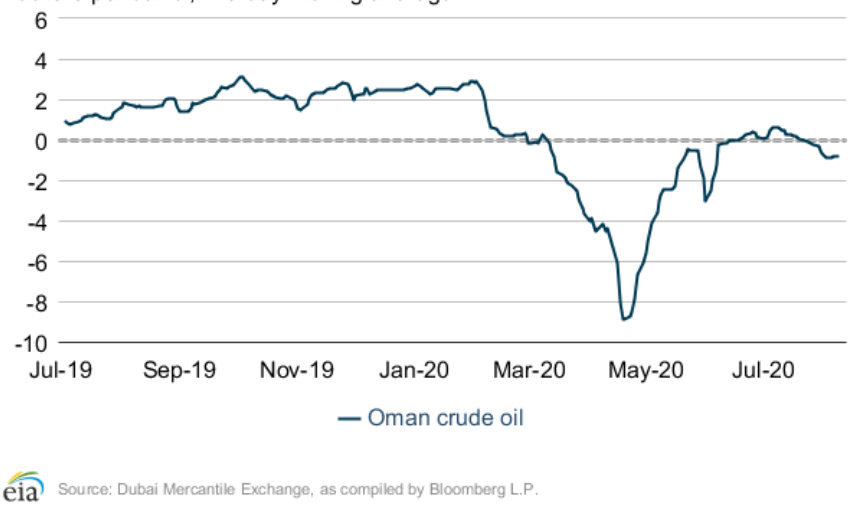
and stay-at-home orders are lifted. Energy-related CO2 emissions are sensitive to changes in weather, economic growth, energy prices, and fuel mix.

Petroleum and natural gas markets review

Crude oil

Prices: The front-month futures price for Brent crude oil settled at $45.09 per barrel (b) on August 6, 2020, an increase of $3.06/b from July 1, 2020. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, increased by $2.13/b during the same period, settling at $41.95/b on August 6 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices



Source: CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate

Crude oil prices developed a narrow trading range in July as price volatility declined to the lowest levels since January 2020. Global petroleum demand continued to recover in July, but continued growth in global coronavirus cases could bring renewed lockdown measures and presents considerable uncertainty to global oil demand for the remainder of the year. World oil-weighted real gross domestic product (GDP) declined 9.3% in the second quarter of 2020—one of the largest declines for any quarter on record—however, a number of leading indicators suggest increases in economic activity since then in some sectors, such as manufacturing. Despite the continued demand-side uncertainty, global petroleum production remains subdued from rapid declines in U.S. crude oil production as well as oil supply management from members of the Organization of the Petroleum Exporting Countries (OPEC) and partner countries (OPEC+). The group plans to ease production cuts by nearly 2 million barrels per day (b/d) in August, but it is committed to monitoring global inventory levels and could adjust production levels lower if global demand growth slows.

The U.S. Energy Information Administration (EIA) forecasts high petroleum stock withdrawal rates will put modest upward price pressure from current prices through the end of 2020. However, the currently high inventory levels (as a result of the large stock builds from January through May 2020) are forecast to mitigate any significant increase in prices. EIA forecasts Brent crude oil prices will increase to $44/b by the end of the year, slightly higher than the July 2020 average price. Global inventory withdrawals through the end of 2021 will put upward pressure on crude oil prices, which EIA forecasts will average $50/b in 2021.

Oman crude oil price spreads: Recent movements in crude oil price spreads could indicate a slowdown in refinery purchases and demand in Asia. The Dubai Mercantile Exchange's Oman crude oil futures contract is a benchmark crude oil contract that reflects oil produced in the Middle East and exported to Asia. The five-day moving average of Oman crude oil's 1st–3rd futures contract price spread developed slight backwardation (when near-term prices are higher than longer-dated ones) from mid-June through mid-July, but it declined to -79 cents/b as of August 6 **(Figure 2)**. The contract may have developed backwardation as a result of increased crude oil purchases and refinery runs among Chinese refiners, who increased refinery runs to more than 14 million b/d in June, an all-time high for any month. Since mid-July, however, extreme flooding in the Yangtze region is contributing to declines in Chinese economic activity and refinery utilization, which is likely contributing to declines in the Oman 1st–3rd spread. In addition, the planned increase in several Middle Eastern OPEC members' crude oil production in August is also likely contributing to reduced Oman crude oil futures price spreads.

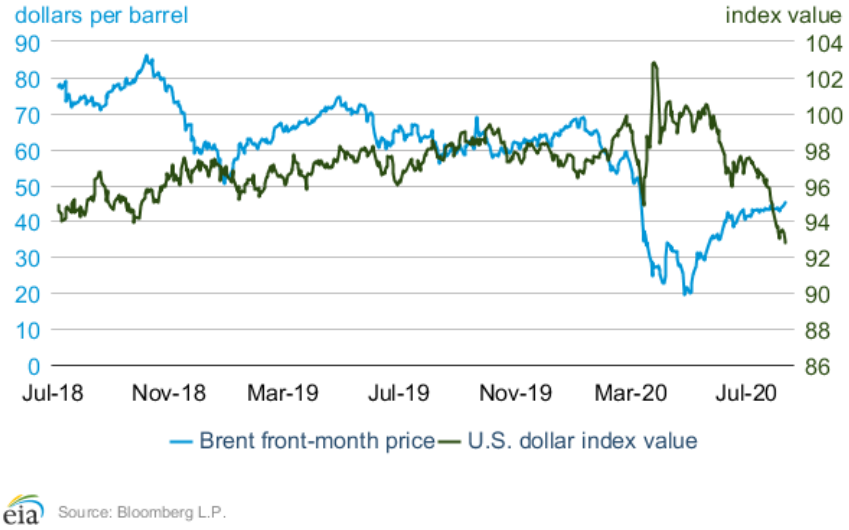


Figure 2. Oman crude oil front-month to 3rd month futures price spread

Crude oil prices and the U.S. dollar index: Brent crude oil prices have exhibited high negative correlation with the U.S. dollar index since the end of June. The U.S. dollar index measures the value of the U.S. dollar against six currencies' exchange rates: the euro, Japanese yen, British pound, Canadian dollar, Swiss franc, and Swedish krona. A decrease in the index means the dollar is depreciating against this group of currencies. The U.S. dollar index declined to 92.8 as of August 6, the lowest level in more than two years **(Figure 3)**. In general, a depreciation of the

U.S. dollar index with other currencies reflects differences in market participants' expectations of economic growth in the United States compared with other countries. The euro represents 58% of the currency weighting in the U.S. dollar index, and suggests economic growth expectations are increasing in Eurozone countries, supported by a combination of the €750 billion fiscal stimulus package, European Central Bank monetary policy support, and slowing growth in COVID-19 cases. Because Brent crude oil is priced in U.S. dollars, a depreciation in the U.S. dollar also makes crude oil imports relatively less expensive for countries that use the euro, which tend to be net crude oil importers. From June 1 to August 6, for example, Brent crude oil prices increased 18% in U.S. dollars but only 10% in euros as a result of the euro's appreciation against the U.S. dollar.

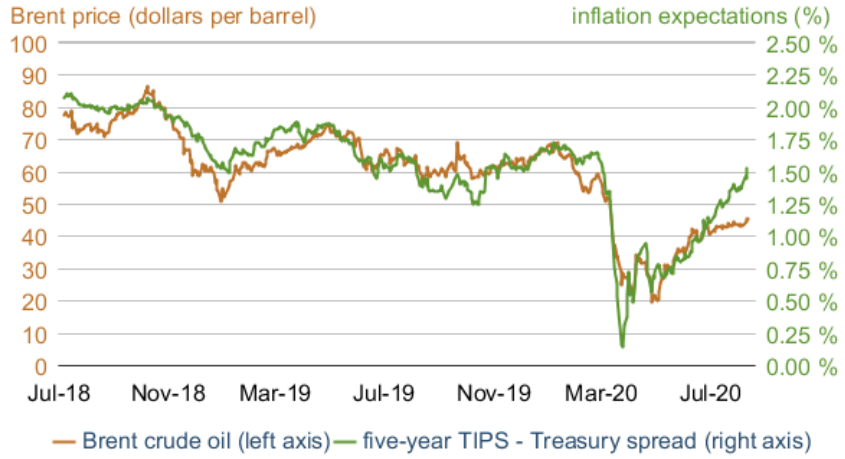

Figure 3. Brent crude oil price vs. the value of the U.S. dollar

eia Source: Bloomberg L.P.

Inflation expectations: Because energy is a significant input into other areas of the economy and is an important variable cost for businesses and consumers, changes in crude oil prices affect market participants' expectations of future rates of inflation. The difference in yield between the five-year Treasury rate and five-year Treasury Inflation Protected Securities (TIPS) is an indicator of market participants' inflation expectations during the next five years, and the difference increased from 1.17% on July 1 to 1.52% on August 5 **(Figure 4)**. According to the latest Federal Open Market Committee meeting, the U.S. Federal Reserve plans to target interest rates near 0% until its targets of full employment and inflation of 2% are met. Partially as a result of accommodative monetary policy, market expectations for inflation during the next five years have increased from March's low of near 0%. However, inflation expectations remain less than the Federal Reserve's 2% target and are still at some of the lowest levels in the past five years.

Figure 4. Crude oil and inflation expectations

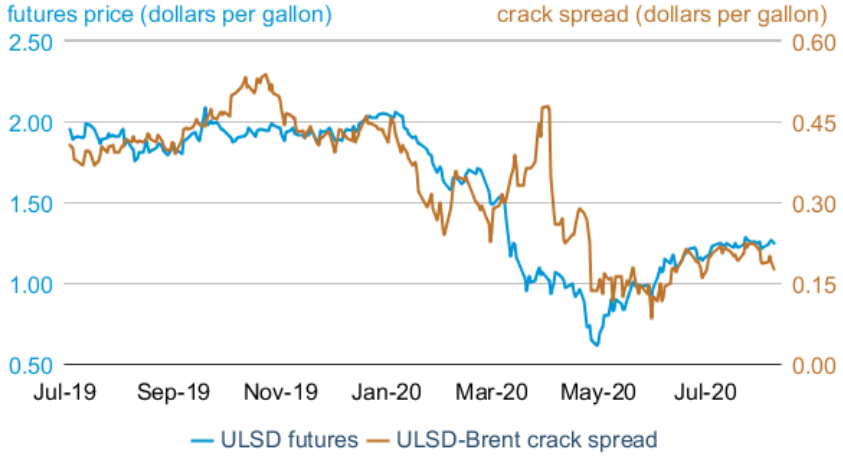
Note: TIPS=Treasury Inflation Protected Securities

Petroleum products

Gasoline prices: The front-month futures price of reformulated blendstock for oxygenate blending (RBOB, the petroleum component of gasoline used in many parts of the country) settled at $1.23 per gallon (gal) on August 6, up 1 cent/gal from July 1, 2020 **(Figure 5)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) decreased by 6 cents/gal to settle at 15 cents/gal during the same period. The crack spread averaged lower than the five-year (2015–19) minimum for the fifth consecutive month in July.

Figure 5. Historical RBOB front-month futures prices and crack spread



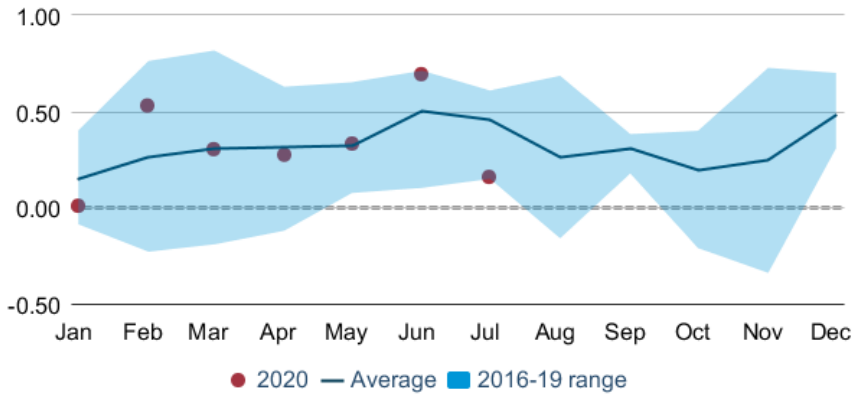
Source: CME Group, as compiled by Bloomberg L.P.
Note: RBOB=reformulated blendstock for oxygenate blending

Gasoline consumption, production, and inventory levels moved toward pre-COVID-19 levels in July. Meanwhile, the crack spread traded in a narrow 6 cent/gal range from July 1 to July 30 before declining 4 cents/gal on July 31. EIA estimates that July 2020 gasoline consumption was

8.7 million barrels per day (b/d), an increase of 0.2 million b/d (2%) from June 2020 and a decrease of 0.8 million b/d (9%) from July 2019. July 2020 gasoline consumption was 9% lower than the month's five-year (2015–19) average but marked a modest return toward normal levels when compared with June 2020, which was 12% lower than its five-year average, and April 2020, which bottomed out at 37% lower than its five-year average. Similarly, EIA estimates July production closer to its five-year average. July 2020 gasoline production was 12% lower than the month's five-year average, but June was 15% lower than its five-year average and April troughed at 36% lower than its five-year average. Inventories of total gasoline in July decreased 3.9 million barrels (2%) from June to 248 million barrels. As consumption, production, and inventories have moved closer to their five-year averages, U.S. average retail gasoline prices have stabilized. Four of the five weeks from June 29 to August 3 had less than 1 cent/gal week-to-week changes. Before the week starting June 29, there were only two such weeks in 2020.

Ultra-low sulfur diesel prices: The ultra-low sulfur diesel (ULSD) front-month futures price for delivery in New York Harbor settled at $1.25/gal on August 6, 2020, up 5 cents/gal from July 1, 2020 **(Figure 6)**. The ULSD–Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) decreased by 2 cents/gal to settle at 18 cents/gal during the same period.

Figure 6. Historical ULSD front-month futures price and crack spread

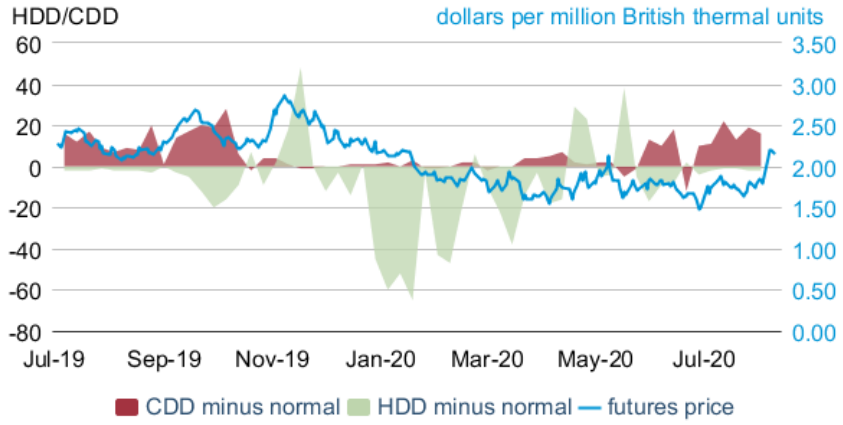


Source: CME Group, as compiled by Bloomberg L.P.
Note: ULSD=ultra-low sulfur diesel

The July ULSD–Brent crack spread traded in its narrowest range in 2020 so far, ranging from $0.19 to $0.22. Part of this stability in the crack spread can likely be attributed to the fact that distillate consumption changed very little from June to July. However, July 2020 consumption was 0.4 million b/d lower (10%) than the year ago levels, and it was also the month's lowest consumption level since 2009. Meanwhile, net exports of distillate increased from June by 5% to an estimated 1.2 million b/d. Inventory levels increased by 2.7 million barrels from June to 180.0 million barrels in July, the highest for any month since 1982. Compared with July 2019, inventory levels are up 31%.

***Crack spread correlations*:** Historically, a day-to-day change in the RBOB–Brent crack spread tends to correlate positively with the day-to-day change in the ULSD–Brent crack spread. That is, both RBOB and ULSD crack spreads tend to increase or decrease on a daily basis and it is less likely for one to increase and the other to decrease on a given day. As a result of several factors—including economic trends, refining yields, and seasonality—one month may have a stronger correlation than others. Based on the average from 2016 (the first year of the current Brent futures expiration calendar) to 2019, June and July correlations are typically some of the highest for the year **(Figure 7)**. In 2020, June and July had correlation coefficients of 0.69 and 0.16, respectively.

Figure 7. Monthly correlation of daily changes in RBOB crack spread to daily changes in ULSD crack spread



Note: RBOB=reformulated blendstock for oxygenate blending, ULSD=ultra-low sulfur diesel
Note: The correlations use crack spreads between 2nd month product contracts and 1st month Brent contracts.

In June 2020, the strength of the relationship between the day-to-day changes of the two crack spreads was stronger than usual. June's correlation coefficient of 0.69 was higher than that for 43 of the 48 months (90%) from 2016 to 2019. Meanwhile, July 2020 showed a weaker-than-usual correlation coefficient of 0.16, which was greater than only 13 of the 48 months (27%). The high correlation in June can likely be attributed in part to the fact that as more of the economy opened up, expectations for economic activity likely drove both crack spreads upward. As economic optimism subsided in July with increasing COVID-19 cases, the prospect of further economic lockdowns may be having a greater effect on RBOB crack spreads.

Natural Gas

Prices: The front-month natural gas futures contract for delivery at the Henry Hub settled at $2.17 per million British thermal units (MMBtu) on August 6, up 49 cents/MMBtu from July 1 **(Figure 8)**. Futures prices increased substantially at the beginning of August. Before August 3, the front-month futures price had settled higher than $2/MMBtu only once since January 17, 2020.

Figure 8. Natural gas front-month futures prices and actual minus historical average HDD and CDD

Source: CME Group and National Oceanic and Atmospheric Administration, as compiled by Bloomberg L.P.
Note: HDD stands for heating degree days, CDD stands for cooling degree days.

Natural gas prices received support from strong demand from natural gas-fired power generation. EIA estimates that natural gas consumption for power generation rose to 43.6 billion cubic feet per day (Bcf/d) in July 2020, higher than any month on record. Consumption from the electric power sector was partially offset by a decrease in industrial natural gas consumption, which declined 1.4 Bcf/d in July compared with the previous year, likely because of slower economic activity. Liquefied natural gas (LNG) exports also fell substantially as international natural gas demand growth slowed. EIA estimates that in July U.S. LNG exports decreased 5.0 Bcf/d (62%) from their peak in January 2020.

Natural gas production has also fallen as producers have cut back on drilling and completion activities as a result of lower oil and natural gas prices. EIA estimates that U.S. natural gas production declined to 86.8 Bcf/d in July, down 9.5 Bcf/d from the peak in November 2019. The decrease in natural gas production and the increase in consumption for power generation contributed to lower-than-average natural gas injections into inventory in July. However, much more natural gas is currently in storage than average. For the week ending July 31, natural gas inventories were 3,274 billion cubic feet (Bcf), 429 Bcf (15%) higher than the five-year (2015–19) average.

Natural gas futures contract price spreads: The natural gas 1st–13th futures contract price spread fell to -$1.02/MMBtu on June 25, 2020 **(Figure 9)**, the lowest level since June 13, 2012. A negative 1st–13th futures price spread typically indicates that current inventories and supplies are ample to meet expected demand. This price spread declined in January and February 2020 after mild winter weather reduced natural gas demand, and it fell further in the spring after responses to the coronavirus pandemic lowered expectations for natural gas consumption and LNG exports. However, the 1st–13th futures price spread reversed course and increased sharply in the first week of August, settling -$0.52/MMBtu on August 6, 2020. Declining natural gas production and robust demand for natural gas for power generation contributed to higher near-term prices.

Notable forecast changes

- Because of the rapidly changing situation in energy markets, the U.S. Energy Information Administration's (EIA) current forecast includes a significant number of notable forecast changes. You can find more information in the detailed table of forecast changes.

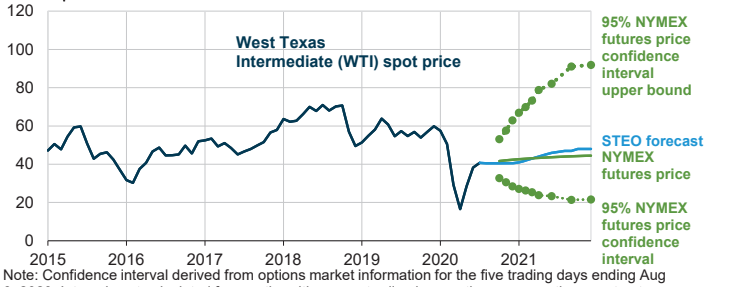
- EIA used the July 2020 IHS Markit macroeconomic forecast in this *Short-Term Energy Outlook* (STEO). The macroeconomic forecast assumes a smaller decline in U.S. gross domestic product (GDP) in 2020 of 6.1% compared with an assumed decline of 8.2% in the July STEO. EIA also assumes smaller increase in GDP in 2021 of 3.7% compared with 5.1% growth assumed in the previous forecast. In addition, the IHS forecast used in the August STEO includes average non-farm employment of 143.0 million for 2020 and 149.4 for 2021, up by 2.6 million jobs and 2.0 million jobs, respectively, from the previous forecast.

- EIA forecasts Brent crude oil spot prices will average $41 per barrel (b) in 2020 and $50/b in 2021 and West Texas Intermediate spot prices will average $39/b in 2020 and $46/b in 2021. The slight increase in 2020 prices reflect larger forecast stock draws in the second half of 2020.

- EIA expects U.S. consumption of petroleum and other liquid fuels will average 18.5 million barrels per day (b/d) in 2020 and 20.0 million b/d in 2021. The August STEO forecast is 120,000 b/d more in 2020 and 90,000 more in 2021 than the July STEO forecast. This August STEO reflects higher forecast consumption of gasoline, hydrocarbon gas liquids, and distillate. Higher assumed 2020 and 2021 employment levels in the August STEO, contribute to higher forecast gasoline consumption. Stronger assumed petrochemical industry growth and higher-than-anticipated ethane consumption data for May from EIA's *Petroleum Supply Monthly* contribute to higher forecast hydrocarbon gas liquids consumption in 2020 and

2021 in this STEO. Also, stronger assumed U.S. GDP growth for 2020 contributes to the higher distillate consumption forecast in the August STEO. Reduced economic activity related to the COVID-19 pandemic has caused changes in energy supply and demand patterns in 2020.

- EIA estimates that liquefied natural gas (LNG) exports were 3.6 billion cubic feet per day (Bcf/d) in June (32 loaded cargoes) and 3.1 Bcf/d in July (28 loaded cargoes). Based on the available liquefaction capacity in operation, EIA estimates that about 46 cargoes were canceled in June and about 50 cargoes were canceled in July 2020, exceeding the reported number of canceled cargoes from earlier this summer for both months.
- EIA has extended its assumptions for the effect of increased working from home on retail sales of electricity to the commercial sector and the residential sector through the end of 2020. In previous STEO forecasts, this assumption only applied through the end of the third quarter of this year.
- EIA has increased the amount of electric power sector solar photovoltaic generating capacity expected to come online in 2021 to 12.2 gigawatts compared with expected additions of 11.4 gigawatts in the previous STEO. This change reflects new information received on the Form EIA-860 survey.
- EIA expects global consumption of petroleum and other liquid fuels will average 93.1 million b/d in 2020 and 100.2 million b/d in 2021. Those forecasts are 240,000 b/d and 290,000 b/d more, respectively, than in the July STEO. Factors driving the change in the forecast are adjustments to assumptions about lockdown restrictions in a number of countries and the construction of a number of new petrochemical crackers in China during the second half of 2020.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the United States Government. The views in this report therefore should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

- = no data available

Prices are not adjusted for inflation.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109;
Petroleum Supply Annual , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130;
Electric Power Monthly , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.
Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.
Weather projections from National Oceanic and Atmospheric Administration.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

(a) Weighted geometric mean of real indices for various countries with weights equal to each country's share of world oil consumption in the base period. Exchange rate is measured in foreign currency per U.S. dollar. GDP and exchange rate data are from Oxford Economics, and oil consumption data are from EIA.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" inludes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Table 4b. U.S. Hydrocarbon Gas Liquids (HGL) and Petroleum Refinery Balances (million barrels per day, except inventories and utilization factor)

- = no data available

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

LNG: liquefied natural gas.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report*, DOE/EIA-0121; and *Electric Power Monthly*, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Table 7c. U.S. Regional Retail Electricity Prices (Cents per Kilowatthour)

- = no data available

Prices are not adjusted for inflation.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distributed solar photovoltaic systems.

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly,* DOE/EIA-0226 and *Renewable Energy Annual,* DOE/EIA-0603; *Petroleum Supply Monthly,* DOE/EIA-0109.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

-- = no data available

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to one megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than one megawatt).

(d) Solar photovoltaic systems smaller than one megawatt, as measured in alternating current.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA-860M database, EIA-826 Solar PV database, and EIA Regional Short-Term Energy Model.

- = no data available

SAAR = Seasonally-adjusted annual rate

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Aviation Administration. Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

- = no data available

Notes: Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National Oceanic and Atmospheric Administration (NOAA).

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Projections: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Appendix to the August 2020 *Short-Term Energy Outlook*

This appendix is prepared in fulfillment of section 1245(d)(4)(A) of the National Defense Authorization Act (NDAA) for Fiscal Year 2012, as amended. The law requires the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy, to submit to Congress a report on the availability and price of petroleum and petroleum products produced in countries other than Iran in the two-month period preceding the submission of the report. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The data in this appendix, therefore, should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

EIA consulted with the U.S. Department of the Treasury, the U.S. Department of State, and the intelligence community in the process of developing the NDAA report, which was previously published as a stand-alone report. Detailed background and contextual information not repeated here can be found in early editions of the NDAA report.

This appendix is published in the *Short-Term Energy Outlook* in even numbered months.

Table a1. Summary of Estimated Petroleum and Other Liquids Quantities

	June 2020	July 2020	June - July 2020 Average	June - July 2019 Average	2017–2019 Average
Global Petroleum and Other Liquids (million barrels per day)					
Global Petroleum and Other Liquids Production (a)	87.1	88.7	87.9	100.3	99.9
Global Petroleum and Other Liquids Consumption (b)	90.4	93.4	91.9	102.0	100.2
Biofuels Production (c)	2.6	2.8	2.7	3.0	2.5
Biofuels Consumption (c)	2.3	2.2	2.2	2.4	2.3
Iran Liquid Fuels Production	2.8	2.7	2.7	3.1	4.1
Iran Liquid Fuels Consumption	1.7	1.7	1.7	1.9	1.8
Petroleum and Petroleum Products Produced and Consumed in Countries Other Than Iran (million barrels per day)					
Production (d)	81.7	83.2	82.5	94.2	93.2
Consumption (d)	86.4	89.5	88.0	97.7	96.0
Production minus Consumption	-4.7	-6.3	-5.5	-3.5	-2.8
World Inventory Net Withdrawals Including Iran	3.3	4.7	4.0	1.6	0.3
Estimated OECD Inventory Level (e) (million barrels)	3,170	3,113	3,142	2,931	2,912
Surplus Production Capacity (million barrels per day)					
OPEC Surplus Crude Oil Production Capacity (f)	9.2	8.5	8.8	2.8	2.0

Note: The term “petroleum and other liquids” encompasses crude oil, lease condensate, natural gas liquids, biofuels, coal-to-liquids, gas-to-liquids, and refinery processing gains, which are important to consider in concert due to the inter-related supply, demand, and price dynamics of petroleum, petroleum products, and related fuels.
(a) Production includes crude oil (including lease condensates), natural gas liquids, other liquids, and refinery processing gains.
(b) Consumption of petroleum by the OECD countries is synonymous with “products supplied," defined in the glossary of the EIA Petroleum Supply Monthly, DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel, and loss, and bunkering.
(c) Biofuels production and consumption are based on EIA estimates as published in the International Energy Statistics. Biofuels production in the third quarter tends to be at its highest level in the year as ethanol production in Brazil reaches its seasonal peak and is typically lowest in the first quarter as seasonal production falls in the South/South-Central region of Brazil.
(d) Global production of petroleum and petroleum products outside of Iran is derived by subtracting biofuels production and Iran liquid fuels production from global liquid fuels production. The same method is used to calculate global consumption outside of Iran.
(e) Estimated inventory level is for OECD countries only.
(f) EIA defines surplus oil production capacity as potential oil production that could be brought online within 30 days and sustained for at least 90 days, consistent with sound business practices. This does not include oil production increases that could not be sustained without degrading the future production capacity of a field.
Source: U.S. Energy Information Administration.

Table a2. Crude Oil and Petroleum Product Price Data

Item	June 2020	July 2020	June - July 2020 Average	June - July 2019 Average	2017–2019 Average
Brent Front Month Futures Price ($ per barrel)	40.77	43.22	42.00	63.65	63.53
WTI Front Month Futures Price ($ per barrel)	38.31	40.77	39.54	56.20	57.60
Dubai Front Month Futures Price ($ per barrel)	41.77	43.72	42.75	62.69	62.36
Brent 1st - 13th Month Futures Spread ($ per barrel)	-2.75	-2.57	-2.66	2.89	2.02
WTI 1st - 13th Month Futures Spread ($ per barrel)	-1.91	-1.75	-1.83	1.65	1.39
RBOB Front Month Futures Price ($ per gallon)	1.19	1.25	1.22	1.84	1.76
Heating Oil Front Month Futures Price ($ per gallon)	1.14	1.24	1.19	1.89	1.90
RBOB - Brent Futures Crack Spread ($ per gallon)	0.22	0.22	0.22	0.33	0.24
Heating Oil - Brent Futures Crack Spread ($ per gallon)	0.17	0.21	0.19	0.37	0.39

(a) Brent refers to Brent crude oil traded on the Intercontinental Exchange (ICE).
(b) WTI refers to West Texas Intermediate crude oil traded on the New York Mercantile Exchange (NYMEX), owned by Chicago Mercantile Exchange (CME) Group.
(c) RBOB refers to r*eformulated blendstock for oxygenate blending traded on the NYMEX.*

(a) Production includes crude oil (including lease condensates), natural gas liquids, other liquids, and refinery processing gains.
(b) Consumption of petroleum by the OECD countries is synonymous with “products supplied," defined in the glossary of the EIA Petroleum Supply Monthly, DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel, and loss, and bunkering.
(c) Biofuels production and consumption are based on EIA estimates as published in the International Energy Statistics. Biofuels production in the third quarter tends to be at its highest level in the year as ethanol production in Brazil reaches its seasonal peak and is typically lowest in the first quarter as seasonal production falls in the South/South-Central region of Brazil.
(d) Global production of petroleum and petroleum products outside of Iran is derived by subtracting biofuels production and Iran liquid fuels production from global liquid fuels production. The same method is used to calculate global consumption outside of Iran.
(e) Estimated inventory level is for OECD countries only.
(f) EIA defines surplus oil production capacity as potential oil production that could be brought online within 30 days and sustained for at least 90 days, consistent with sound business practices. This does not include oil production increases that could not be sustained without degrading the future production capacity of a field.

Independent Statistics & Analysis
U.S. Energy Information Administration

September 2020

Short-Term Energy Outlook (STEO)

Forecast highlights

Global liquid fuels

- The September *Short-Term Energy Outlook* (STEO) remains subject to heightened levels of uncertainty because mitigation and reopening efforts related to the 2019 novel coronavirus disease (COVID-19) continue to evolve. Reduced economic activity related to the COVID-19 pandemic has caused changes in energy demand and supply patterns in 2020. This STEO assumes U.S. gross domestic product declined by 4.6% in the first half of 2020 from the same period a year ago and will rise beginning in the third quarter of 2020, with year-over-year growth of 3.1% in 2021. The U.S. macroeconomic assumptions in this outlook are based on forecasts by IHS Markit.

- Brent crude oil spot prices averaged $45 per barrel (b) in August, up $2/b from the average in July. Brent prices in August were up $26/b from the multiyear low monthly average price in April. The increase in oil prices has occurred as EIA estimates global oil markets have shifted from global liquid fuels inventories building at a rate of 7.2 million barrels per day (b/d) in the second quarter to drawing at a rate of 3.7 million b/d in the third quarter. EIA expects inventory draws in the fourth quarter of 3.1 million b/d before markets become relatively balanced in 2021, with forecast draws of 0.3 million b/d. Despite expected inventory draws in the coming months, EIA expects high inventory levels and surplus crude oil production capacity will limit upward pressure on oil prices. EIA forecasts monthly Brent spot prices will average $44/b during the fourth quarter of 2020 and rise to an average of $49/b in 2021 as oil markets become more balanced.

- EIA estimates that global consumption of petroleum and liquid fuels averaged 94.3 million b/d in August. Liquid fuels consumption was down 8.2 million b/d from August 2019, but it was up from an average of 85.1 million b/d during the second quarter of 2020 and 93.3 million b/d in July. EIA forecasts that consumption of petroleum and liquid fuels globally will average 93.1 million b/d for all of 2020, down 8.3 million b/d from 2019, before increasing by 6.5 million b/d in 2021. EIA's forecast for growth in 2021 is 0.5 million b/d less than in the August STEO. The downward revision is largely a result of lower expected consumption growth in China, which EIA now forecasts to grow by 1.0 million b/d in 2021.

- EIA estimates that global liquid fuels production averaged 91.5 million b/d in August, down 9.7 million b/d year over year. The decline largely reflects voluntary production

cuts by the Organization of the Petroleum Exporting Countries (OPEC) and partner countries (OPEC+), along with reductions in drilling activity and production curtailments in the United States because of low oil prices. EIA expects global liquid fuels production will rise to an annual average of 99.3 million b/d in 2021.

- Crude oil production in the United States has risen in recent months after declining from 12.7 million b/d in the first quarter of 2020 to a recent low of 10.0 million b/d in May. EIA estimates U.S. crude oil production increased to 10.8 million b/d in August. Production has risen as tight oil operators have brought wells back online in response to rising prices after curtailing production amid low oil prices in the second quarter. The increase in total U.S. production occurred despite shut-in production in the Gulf of Mexico as a result of Hurricane Laura. EIA expects production to rise to 11.2 million b/d in September as production in the Gulf of Mexico returns. However, after September, EIA expects U.S. crude oil production to decline slightly, averaging just under 11.0 million b/d during the first half of 2021 because EIA expects that new drilling activity will not generate enough production to offset declines from existing wells. EIA expects drilling activity to rise later in 2021, contributing to U.S. crude oil production reaching an average of 11.3 million b/d in the fourth quarter of 2021. On an annual average basis, EIA expects U.S. crude oil production to fall from an average of 12.2 million b/d in 2019 to 11.4 million b/d in 2020 and 11.1 million b/d in 2021.

- U.S. regular gasoline retail prices averaged $2.18 per gallon (gal) in August, largely unchanged from the average in July but 44 cents/gal lower than at the same time last year. EIA expects that gasoline prices will decrease through the rest of the year, falling to an average of $2.03/gal in December. Forecast U.S. regular gasoline retail prices average $2.16/gal in 2020 and $2.28/gal in 2021.

Natural Gas

- In August, the Henry Hub natural gas spot price averaged $2.30 per million British thermal units (MMBtu), up from an average of $1.77/MMBtu in July. Higher natural gas spot prices reflect rising demand for natural gas from the U.S. electric power sector as a result of warmer-than-normal temperatures during August and rising demand for U.S. liquefied natural gas (LNG) exports amid declining U.S. natural gas production. EIA expects that rising domestic demand and demand for LNG exports heading into winter, combined with reduced production, will cause Henry Hub spot prices to rise to a monthly average of $3.40/MMBtu in January 2021. EIA expects that monthly average spot prices will remain higher than $3.00/MMBtu for all of 2021, averaging $3.19/MMBtu for the year, up from a forecast average of $2.16/MMBtu in 2020.

- EIA estimates that total U.S. working natural gas in storage ended August at 3.5 trillion cubic feet (Tcf), 13% more than the five-year (2015–19) average. In the forecast, EIA expects inventories to reach almost 4.0 Tcf on October 31, which would be 6% more than the five-year average.

- EIA expects that total U.S. consumption of natural gas will average 82.7 billion cubic feet per day (Bcf/d) in 2020, down 2.7% from 2019. The largest decline in consumption occurs in the industrial sector. EIA forecasts industrial consumption will average 21.9 Bcf/d in 2020, down 1.0 Bcf/d from 2019 as a result of reduced manufacturing activity. The decline in total U.S. consumption also reflects lower heating demand in early 2020, contributing to residential and commercial demand in 2020 averaging 12.9 Bcf/d (down 0.8 Bcf/d from 2019) and 8.8 Bcf/d (down 0.8 Bcf/d from 2019), respectively. EIA expects U.S. natural gas consumption will average 79.1 Bcf/d in 2021, a 4.3% decline from 2020. The expected decline is the result of rising natural gas prices that will reduce demand for natural gas in the electric power sector.

- EIA forecasts U.S. dry natural gas production will average 89.9 Bcf/d in 2020 and monthly average production will fall from a record 96.2 Bcf/d in November 2019 to 85.5 Bcf/d in February 2021, before increasing slightly. Natural gas production declines the most in the Permian region, where EIA expects low crude oil prices will reduce associated natural gas output from oil-directed rigs. EIA's forecast of dry natural gas production in the United States averages 86.6 Bcf/d in 2021. EIA expects production to begin rising in the second quarter of 2021 in response to higher natural gas and crude oil prices.

- EIA estimates that U.S. LNG exports averaged 3.7 Bcf/d in August, a 19% increase from July. This increase occurred amid rising spot and forward natural gas prices in Europe and Asia, which had fallen to record lows in late May and June as COVID-19 mitigation efforts reduced global natural gas consumption. Higher global forward prices indicate improving netbacks for buyers of U.S. LNG in European and Asian markets for the upcoming fall and winter seasons amid expectations of natural gas demand recovery and potential LNG supply reduction because of maintenance at the Gorgon LNG plant in Australia. EIA forecasts that U.S. LNG exports will return to pre-COVID levels by November 2020 and will average more than 9 Bcf/d from December 2020 through February 2021.

Electricity, coal, renewables, and emissions

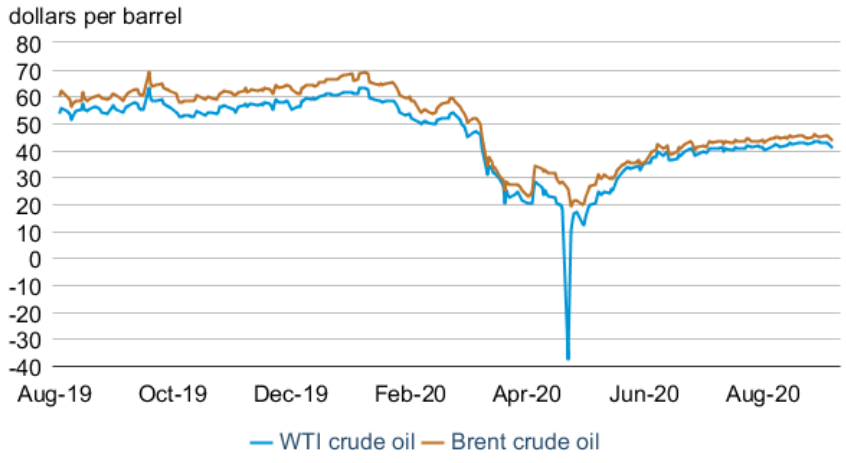
- EIA forecasts 2.4% less electricity consumption in the United States in 2020 compared with 2019. EIA expects retail sales of electricity to fall by 6.4% this year in the commercial sector and by 6.0% in the industrial sector. EIA forecasts residential sector retail sales will increase by 3.5% in 2020. Milder winter temperatures earlier in the year led to lower consumption for space heating, but that factor is offset by increased summer cooling demand and an increase in electricity use by more people working from home. In 2021, EIA forecasts total U.S. electricity consumption will be similar to the 2020 level of consumption.

- EIA expects the share of U.S. electric power sector generation from natural gas-fired power plants will increase from 37% in 2019 to 39% this year. In 2021, the forecast

natural gas share declines to 34% in response to higher natural gas prices. Coal's forecast share of electricity generation falls from 24% in 2019 to 20% in 2020 and then increases to 22% in 2021. Electricity generation from renewable energy sources rises from 17% in 2019 to 20% in 2020 and to 22% in 2021. The increase in the share from renewables is the result of planned additions to wind and solar generating capacity. EIA expects a decline in nuclear generation in both 2020 and 2021, reflecting recent and planned retirements of nuclear generating capacity.

- EIA forecasts that renewable energy will be the fastest-growing source of electricity generation in 2020. EIA expects the electric power sector will add 23.3 gigawatts (GW) of new wind capacity and 13.7 GW of utility-scale solar capacity in 2020.

- EIA expects total U.S. coal production in 2020 to be 511 million short tons (MMst), 194 MMst (28%) lower than in 2019. Mitigation efforts related to COVID-19 and reduced demand from the U.S. electric power sector amid low natural gas prices have both contributed to mine idling and mine closures. EIA expects production to rise to 600 MMst in 2021, up 89 MMst (17%) from 2020. This forecast increase reflects rising demand for coal from U.S. electricity generators because of higher natural gas prices compared with 2020.



- EIA forecasts that U.S. energy-related carbon dioxide (CO2) emissions, after decreasing by 2.8% in 2019, will decrease by 10.0% (512 million metric tons) in 2020 with reduced consumption of all fossil fuels, particularly coal (18.3%) and petroleum (11.7%). This decline in emissions is the result of less energy consumption related to restrictions on business and travel activity and slowing economic growth related to COVID-19 mitigation efforts. In 2021, EIA forecasts that energy-related CO2 emissions will increase by 4.8% as the economy recovers and energy use increases.

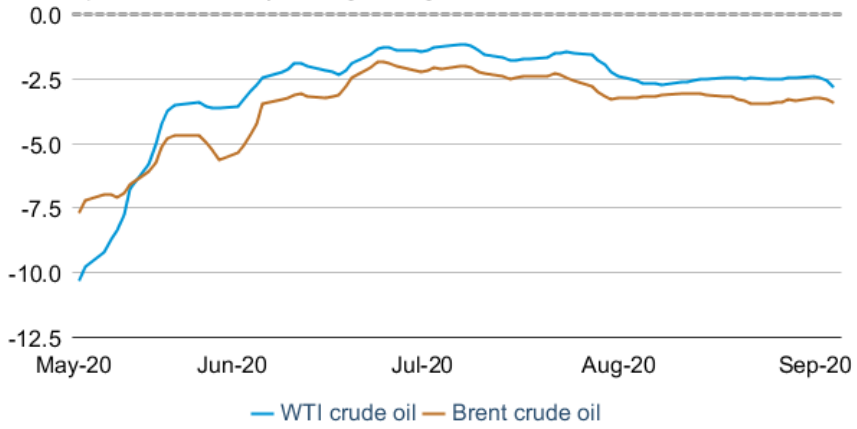
Petroleum and natural gas markets review

Crude oil

Prices: The front-month futures price for Brent crude oil settled at $44.07 per barrel (b) on September 3, 2020, a decrease of 8 cents/b from August 3, 2020. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, increased by 36 cents/b during the same period, settling at $41.37/b on September 3 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices

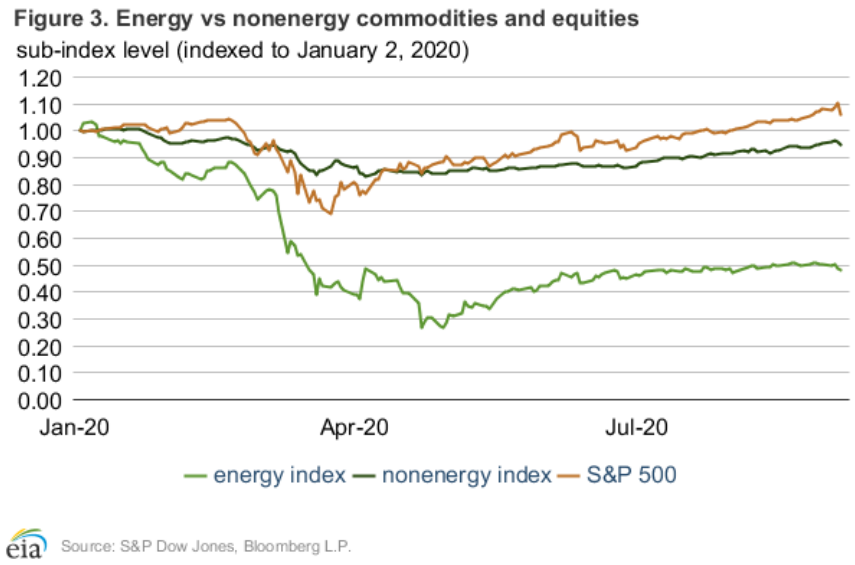
Source: CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate



Brent crude oil prices increased for the fourth-consecutive month, driven by continued increases in global oil consumption amid reduced oil supply. As of the end of August, oil prices had moved into an increasingly narrow trading range with some of the lowest levels of price volatility since 2015. Although considerable uncertainty in the global economy and oil markets remains, price volatility may have declined primarily as a result of the large volume of oil inventories accumulated during the first half of 2020 and a slowing rate of oil consumption growth. EIA estimates that total commercial petroleum inventories in the Organization for Economic Cooperation and Development (OECD) as of the end of August 2020 were sufficient to meet 71 days of current OECD oil demand, compared with 63 days on average for August over the past five years (2015–19). However, crude oil prices fell on September 4 and 8, breaking out of the narrow trading range amid heightened volatility.

Indicators of economic activity have largely been higher than market participants' expectations, particularly in sectors such as housing and in indicators like new durable goods orders. Nonetheless, economic recovery in some sectors that are important for oil consumption, such as personal travel and tourism, has been slower. EIA estimates that global oil consumption in August grew by 1.0 million barrels per day (b/d) from July, the slowest month-over-month increase since consumption began to recover in May and the first time during that period that consumption growth was surpassed by growth in world oil production. Despite the different pace of increase between global oil production and consumption during August, EIA forecasts oil

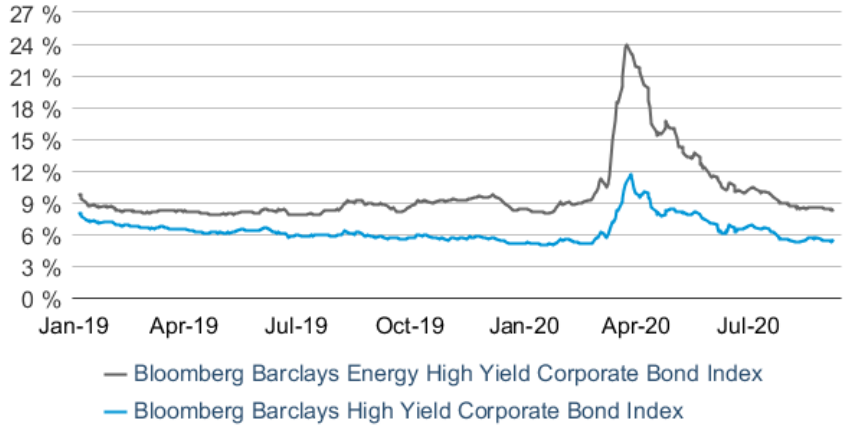
market balances to continue tightening for the remainder of 2020 as a result of continued demand recovery, restrained production from members of the Organization of the Petroleum Exporting Countries and partner countries (OPEC+), and price-related declines in production from the United States.



Although crude oil prices have increased slightly since mid-July, crude oil futures price spreads have developed a wider contango (when near-term prices are lower than longer-dated ones) during the same period. The five-day moving average of the Brent 1st–13th spread widened by 93 cents/b since July 15 to settle at -$3.41/b on September 3, 2020, and that of the WTI 1st–13th spread widened by 99 cents/b during the same period to settle at -$2.83/b **(Figure 2)**. A wider contango can indicate reduced refiner purchases or increased oil supply availability, which could suggest some slower growth in the outlook for global oil consumption and smaller inventory withdrawals. EIA forecasts that the large inventory withdrawals during the second half of 2020, averaging 3.4 million b/d, will subside in 2021 into a more balanced market and that global inventory withdrawals will average 0.3 million b/d for the year.

Figure 2. Crude oil front-month to 13th month futures price spread

Source: CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate

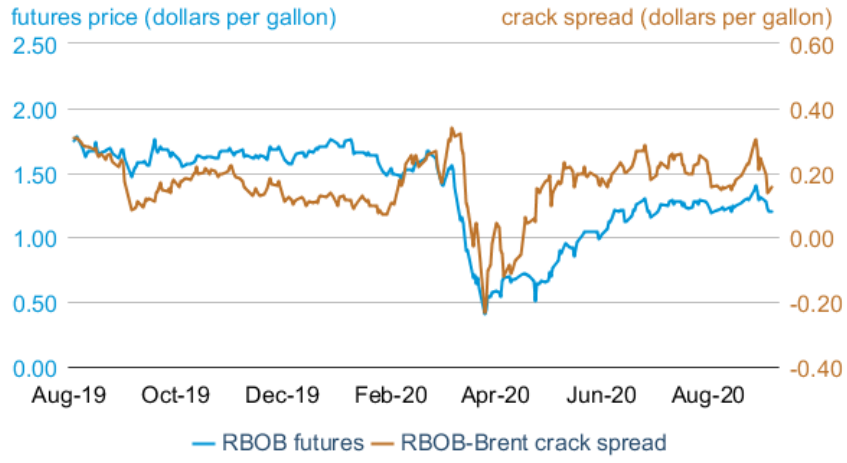


Commodity and equity prices: Certain sectors of the global economy have recovered faster than others, which is reflected in the price trends of different assets. The S&P 500 index, for example, is up 6% year-to-date through September 3 after having declined, at one point, by 31% in March. In addition, the S&P Goldman Sachs (GSCI) nonenergy commodity price index has recovered nearly all losses from the first and second quarters of 2020, down 5% through September 3, whereas the GSCI energy commodity index remains down 52% **(Figure 3)**. These differences in price changes likely reflect the different pace of economic recovery in various sectors. The S&P 500 index of equities is heavily weighted toward information technology and consumer discretionary companies, ones that were likely less affected or even had increases in revenue and activity as a result of the recession, such as internet-based retailers or cloud computing services.

The GSCI nonenergy commodity index has primarily been driven by increases in precious metals prices, which have likely increased as a result of low interest rates and increased inflation expectations. Other nonenergy commodity prices, such as copper and other industrial metals, have also increased as a result of expectations that government stimulus would likely be directed to infrastructure or construction. On the other hand, little recovery and low expectations of increased transportation, travel, and tourism has likely contributed to the subdued growth in the GSCI energy commodities index, which primarily represents crude oil and petroleum products prices.

Oil company bond yields: Bond yields for companies with a credit rating lower than investment grade, called high yield bonds, have declined for both oil exploration and production companies as well as broadly across all sectors. The Bloomberg Barclays Energy High Yield Corporate Bond Index's yield-to-worst (YTW), which represents the minimum achievable yield on the bonds after accounting for early prepayment, decreased to 8.31% as of September 3, 2020, and the broader high yield index declined to 5.35% **(Figure 4)**. The decline in the overall level of interest rates among other corporate bonds and government bonds has contributed to the decline in high yield bonds. More specifically, however, some companies that used to be rated as investment grade may have been reclassified as high yield, and other companies that defaulted on bonds may have been removed from these indexes. Such changes to the holdings of the high yield index would, as a result, remove higher credit risk companies and add lower credit risk companies, which would also contribute to a reduction in the YTW of the index. Nonetheless, the decline in bond yields suggests an improvement in borrowing conditions and lower risk of default for high yield companies. The YTW for high yield energy companies has declined to levels even lower than the end of 2019, when WTI crude oil prices reached $60/b or higher on some days. The lower YTW when WTI prices are near $40/b suggests some of the reduction in capital expenditures or other cost cutting announcements from U.S. oil companies are contributing to improved investor sentiment in the energy sector.

Figure 4. High yield bonds



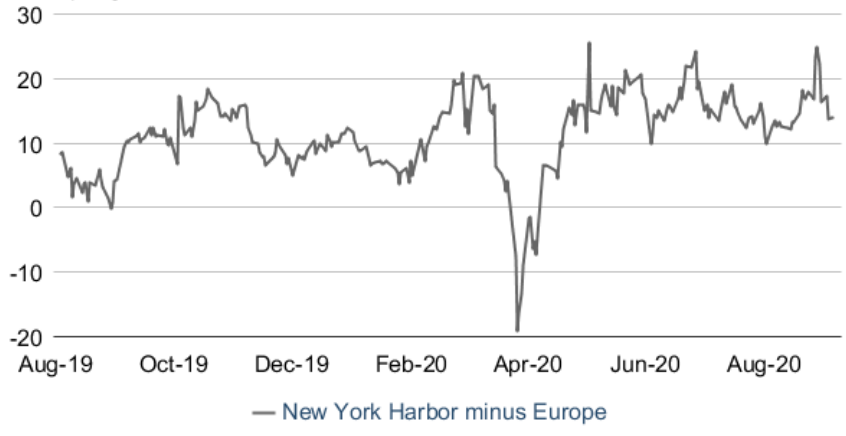
eia Bloomberg L.P., Barclays

Petroleum products

Gasoline prices: The front-month futures price of reformulated blendstock for oxygenate blending (RBOB, the petroleum component of gasoline used in many parts of the country) settled at $1.20 per gallon (gal) on September 3, down 1 cent/gal from August 3, 2020 **(Figure 5)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) decreased by 1 cent/gal to settle at 16 cents/gal during the same period.

Figure 5. Historical RBOB front-month futures prices and crack spread

eia Source: CME Group, as compiled by Bloomberg L.P.
Note: RBOB=reformulated blendstock for oxygenate blending



On August 24, the crack spread increased by more than 6 cents/gal, the largest one-day increase since April 22. The RBOB–Brent crack spread reached 30 cents/gal on August 25, its highest point since before the March 13 proclamation of a national state of emergency and the fifth highest for any day of the past year. The increase in the crack spread reflected expectation of lost gasoline production because of storm-related refinery closures. Hurricane Laura, which

made landfall as a Category 4 hurricane near Lake Charles, Louisiana, on early August 27, caused Gulf Coast refiners to reduce gross inputs by 1.0 million b/d for the week ending August 28 compared with a week earlier. Crack spreads declined to 14 cents/gal on September 1, reflecting both the passage of the hurricane and the front-month RBOB contract rolling to October delivery, which reflects winter grade gasoline that is cheaper for refineries to produce.

U.S. gasoline inventories decreased in August by 15 million barrels (6%) from July as finished motor gasoline consumption and net exports grew. EIA estimates that finished motor gasoline consumption increased to 8.9 million b/d for August, up 2% from 8.7 million b/d in July. Despite the larger-than-average inventory withdrawal, the August monthly average gasoline crack spread remained lower than the month's five-year (2015–2019) minimum for the sixth-consecutive month.

European gasoline: Although Northwest Europe's gasoline spot prices have risen from negative monthly average crack spreads with Brent crude oil in April and May, August's average crack spread was 4 cents/gal, which is 20 cents/gal lower than in August 2019. Furthermore, Europe's daily gasoline crack spreads during the past six months have averaged less than 1 cent/gal. Eurobob gasoline spot prices have been much lower than U.S. gasoline spot prices in New York Harbor. New York Harbor gasoline spot prices traded at a 12 to 25 cent/gal premium to Northwest Europe in August **(Figure 6)**. Since the start of 2018, only two instances of a wider crack spread have occurred. With a high premium for New York Harbor gasoline compared with Eurobob, imports of gasoline into the U.S. East Coast (Petroleum Administration for Defense District—PADD—1) averaged 613,000 b/d for the four weeks ending August 28, which would make it the first month since March in which imports were within the five-year range, if confirmed in EIA's *Petroleum Supply Monthly*. Imports from Europe to the East Coast could increase more in the coming weeks. Gulf Coast (PADD 3) refinery outages in late August and early September could contribute to reductions in supply to the East Coast via the Colonial and Plantation Pipelines, which could further increase demand for gasoline imports from Europe.

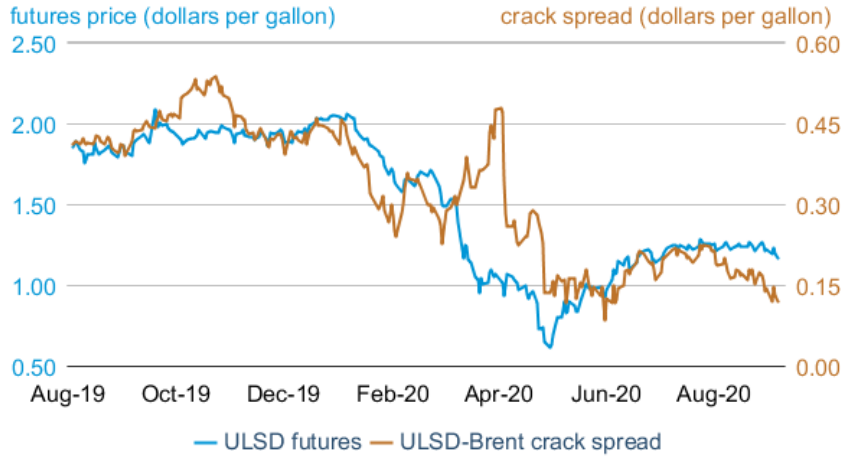


Figure 6. Gasoline spot price differentials

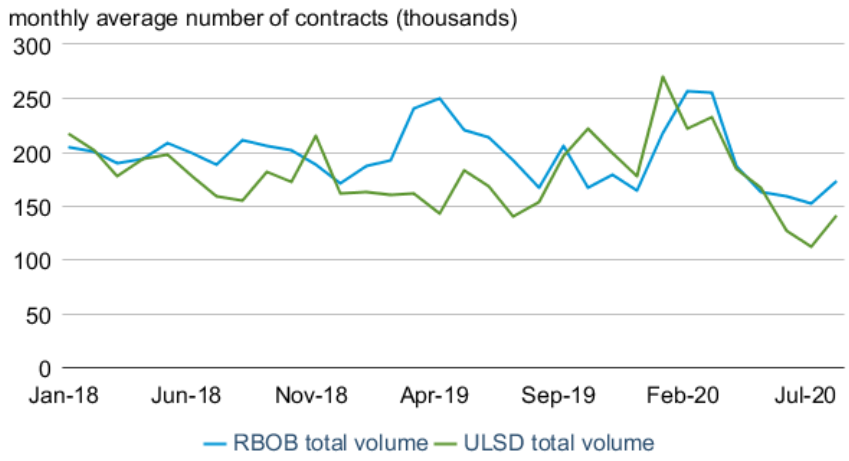
eia Source: Bloomberg L.P.

Ultra-low sulfur diesel prices: The ultra-low sulfur diesel (ULSD) front-month futures price for delivery in New York Harbor settled at $1.17/gal on September 3, 2020, down 7 cents/gal from August 3, 2020 **(Figure 7)**. The ULSD–Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) decreased by 7 cents/gal to settle at 12 cents/gal during the same period. The ULSD–Brent crack spread fell sharply in the last week of August.

Figure 7. Historical ULSD front-month futures price and crack spread



Source: CME Group, as compiled by Bloomberg L.P.
Note: ULSD=ultra-low sulfur diesel

Crack spreads likely fell in August, counter to typical seasonal patterns, as inventories during July and August remained at the highest levels since December 1982. EIA estimates that distillate consumption increased to 3.7 million b/d for August, up 6% from July's estimate of 3.5 million b/d but down 7% from a year ago.

Petroleum product trading volume: Trading volume for all futures contracts of RBOB and ULSD hit more-than-five-year lows in July and remained low in August. The monthly average numbers for all RBOB and ULSD contracts in August were 172,000 and 139,000, respectively **(Figure 8)**. Relative to their August five-year averages, trading volumes for RBOB were down 13%, and trading volumes for ULSD were down 15%. For their respective front-month contracts, volumes for RBOB and ULSD were down 19% and 21%, respectively. The reduction possibly reflects the significant decline in physical petroleum product market activity, including lower refinery runs and end-user hedging. Airlines, for example, regularly use the ULSD futures contract for hedging, and the significant declines in flight activity are likely contributing to a reduction in futures market participation among commercial airlines.

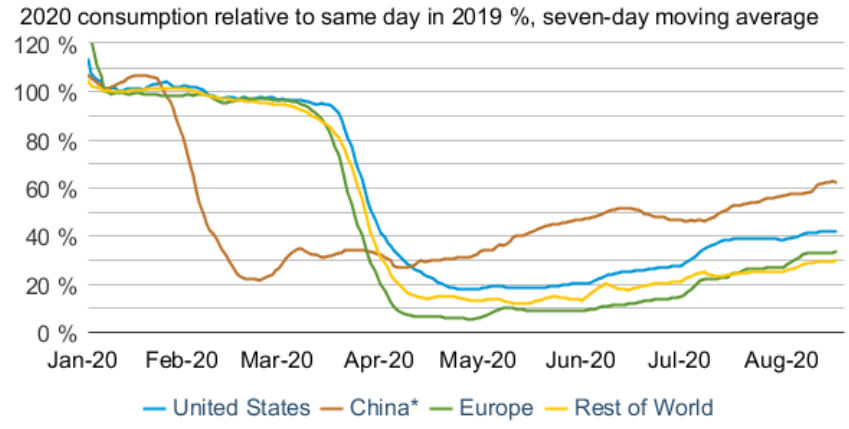


Figure 8. RBOB and ULSD total volume for all contracts

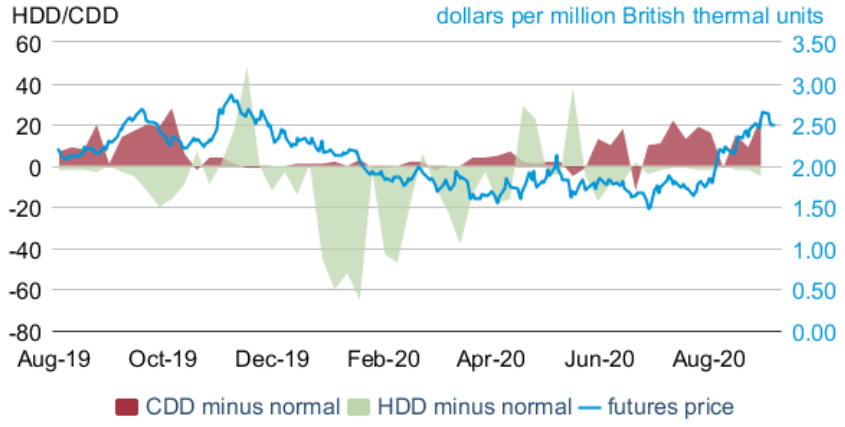
eia Source: CME Group, Bloomberg L.P.

U.S. and international jet fuel: Analysis of flight-level data provided by Cirium on commercial passenger flights suggest that demand for jet fuel in the United States is rising faster than in most other major aviation markets. EIA estimates that as of August 16, 2020, consumption of jet fuel by U.S. commercial passenger flights—a category of aircraft that EIA estimates accounted for 73% of total U.S. jet fuel consumption in January 2020—was about 612,000 b/d. This volume is 43% of the estimated amount consumed on the same date one year earlier **(Figure 9)**. U.S. year-on-year consumption is higher than consumption in Europe (36%), the rest of Africa (31%), the Middle East and North Africa (30%), the rest of Asia (28%), and in the rest of the Americas (24%). Year-on-year consumption in the United States was, however, lower than year-on-year consumption in China (including its Special Administrative Regions Hong Kong and Macau) (60%) and the countries of the Former Soviet Union (63%).

Figure 9. Ratio of year-to-date 2020 jet fuel consumption by commercial passenger jets to 2019 consumption



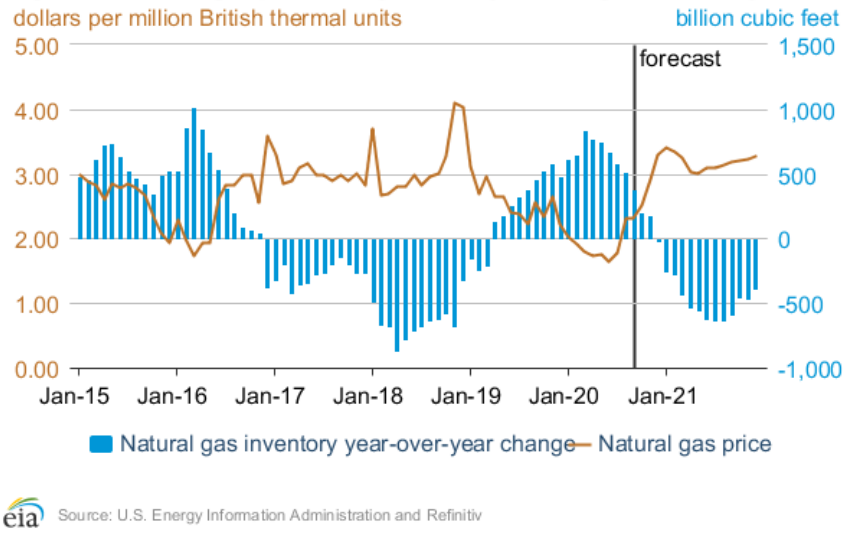
eia U.S. Energy Information Administration, using raw flight data from Cirium
Notes: China* inclusive of Hong Kong and Macau; consumption assigned to region of flight departure.

EIA assumes that the speed of each country's jet fuel demand recovery will depend on several factors, including the timing and intensity of each initial COVID-19 outbreak, the extent of government-required restrictions, and other non-aviation trends, such as gross domestic product growth and changes in energy intensity. Within the United States, EIA currently projects that jet fuel demand will rise from 1.1 million b/d in August 2020 to 1.5 million b/d in December 2020—59% and 85%, respectively, of the amount consumed in August and December 2019.

Natural Gas

Prices: The front-month natural gas futures contract for delivery at the Henry Hub settled at $2.49 per million British thermal units (MMBtu) on September 3, up 39 cents/MMBtu from August 3 **(Figure 10)**. The closing price on August 28 of $2.66/MMBtu was the highest price since November 22, 2019. The front-month futures price traded in a range of 89 cents/MMBtu in August, the widest trading range for August since 2010.

Figure 10. Natural gas front-month futures prices and actual minus historical average HDD and CDD



Source: CME Group and National Oceanic and Atmospheric Administration, as compiled by Bloomberg L.P.
Note: HDD=heating degree days, CDD=cooling degree days.

Higher-than-normal temperatures continued to contribute to increased consumption of natural gas for power generation. EIA estimates that natural gas consumption from the electric power sector totaled 41.0 billion cubic feet per day (Bcf/d) in August 2020, the second-highest on record for the month of August. Low natural gas prices in recent months have contributed to increase consumption for power generation, but they have also contributed to decreasing natural gas production, which declined to 88.4 Bcf/d in August, 4.9 Bcf/d lower than August 2019. EIA forecasts that production will decline by about the same amount in 2021 as consumption declines, but that liquefied natural gas (LNG) exports will increase, which will tend to lower inventories compared with 2020 and provide upward pressure on Henry Hub prices. Rising international natural gas prices are further indications of increasing international demand for natural gas and LNG. The LNG Japan/Korea Marker and Title Transfer Facility price in the Netherlands both increased in August to the highest levels since January 2020.

Natural gas spot prices and inventory changes: The monthly average Henry Hub natural gas spot price rose to $2.30/MMBtu in August 2020, 53 cents/MMBtu higher than July and the first year-on-year increase in the monthly average price since March 2019. Natural gas inventories have shown year-on-year increases since April 2019 **(Figure 11)**. However, EIA forecasts that natural gas production will decline until March 2021, averaging 3.3 Bcf/d lower in 2021 than in 2020, and that natural gas inventories will begin showing year-on-year decreases in December 2020. The decline in inventories is expected to contribute to higher prices. EIA forecasts that Henry Hub spot prices will remain higher than $3.00/MMBtu throughout 2021, averaging $3.19/MMBtu, which would be $1.02/MMBtu higher than in 2020.

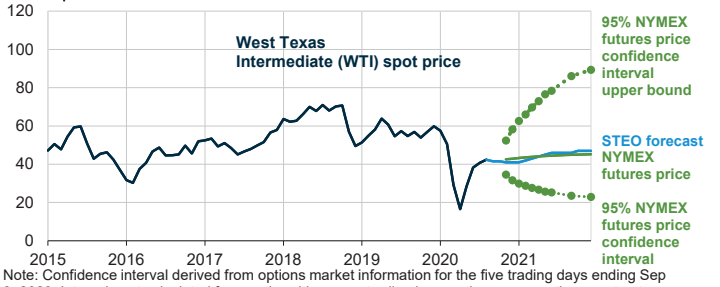
Notable forecast changes

- Because of the rapidly changing situation in energy markets, the U.S. Energy Information Administration's (EIA) current forecast includes a significant number of notable forecast changes. You can find more information in the detailed table of forecast changes.
- The macroeconomic forecast EIA used for this STEO assumes U.S. gross domestic product (GDP) declines by 4.8% in 2020 compared with an assumed decline of 6.1% in the August STEO. EIA also assumes a smaller increase in GDP in 2021 of 3.1%, compared with 3.7% growth assumed in the previous forecast. The U.S. macroeconomic assumptions in this outlook are based on forecasts by IHS Markit.
- EIA expects global consumption of petroleum and other liquid fuels will average 99.6 million barrels per day (b/d) in 2021, a reduction of 0.6 million b/d from the August STEO. The downward revision primarily reflects lower expected growth in China, where EIA forecasts liquid fuels consumption to rise by 1.0 million b/d in 2021 to average 15.0

million b/d. The revised petroleum consumption reflects a more plausible assessment of the country's energy intensity of economic growth.

- Recently released EIA data show that U.S. crude oil production for June was 10.4 million b/d, 0.7 million b/d more than estimated in last month's STEO forecast. The higher-than-expected production indicates a faster return of curtailed production than previously assumed. Despite the higher realized production levels, EIA's forecast for U.S. crude oil production for the fourth quarter of 2020 and 2021 is relatively unchanged.
- EIA forecasts U.S. dry natural gas production will average 86.6 billion cubic feet per day (Bcf/d) in 2021, which is 2.6 Bcf/d (3%) higher than forecast in the August STEO. The higher forecast largely reflects higher expected natural gas prices in the second half of 2020 because prices typically affect production with a lag.
- EIA expects Henry Hub natural gas spot prices to average $2.52 per million British thermal units (MMBtu) in the second half of 2020, compared with $2.26/MMBtu forecast in last month's STEO. The higher prices reflect an increase in demand for natural gas for use in power generation during a relatively hot August and also an increase in demand for U.S. exports of liquefied natural gas.
- EIA forecasts U.S. production of coal will total 600 MMst in 2021, which is 36 MMst (6%) higher than forecast in the August STEO. The higher forecast reflects higher expected natural gas prices in 2021 that will make coal more competitive in the U.S. electric power sector.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the United States Government. The views in this report therefore should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

- = no data available

Prices are not adjusted for inflation.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.

EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).

Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

Weather projections from National Oceanic and Atmospheric Administration.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

(a) Weighted geometric mean of real indices for various countries with weights equal to each country's share of world oil consumption in the base period. Exchange rate is measured in foreign currency per U.S. dollar. GDP and exchange rate data are from Oxford Economics, and oil consumption data are from EIA.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" inludes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

LNG: liquefied natural gas.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report*, DOE/EIA-0121; and *Electric Power Monthly*, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distributed solar photovoltaic systems.

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly,* DOE/EIA-0226 and *Renewable Energy Annual,* DOE/EIA-0603; *Petroleum Supply Monthly,* DOE/EIA-0109.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

-- = no data available

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to one megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than one megawatt).

(d) Solar photovoltaic systems smaller than one megawatt, as measured in alternating current.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA-860M database, EIA-826 Solar PV database, and EIA Regional Short-Term Energy Model.

- = no data available

SAAR = Seasonally-adjusted annual rate

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Aviation Administration. Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

- = no data available

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Projections: Macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

Notes: Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National Oceanic and Atmospheric Administration (NOAA).

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Projections: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Independent Statistics & Analysis
U.S. Energy Information Administration

October 2020

Short-Term Energy Outlook

Forecast highlights

Winter Fuels Outlook

- EIA forecasts that average household expenditures for all major home heating fuels, except heating oil, will increase this winter largely because of higher expected energy consumption. Average increases vary by fuel. Compared with last winter, EIA forecasts natural gas expenditures will increase by 6%, electricity by 7%, and propane by 14%. Home heating oil expenditures in EIA's forecast fall by 10%, driven primarily by a combination of low crude oil prices and high distillate fuel oil supplies heading into the winter. EIA generally expects more space heating demand this winter compared with last winter based on forecasts from the National Oceanic and Atmospheric Administration (NOAA) that indicate colder winter temperatures. U.S. average heating degree days in this forecast are 5% higher than last winter. In addition, EIA expects that ongoing 2019 novel coronavirus disease (COVID-19) mitigation efforts and more people working and attending school at home will contribute to higher levels of home heating use this winter than in previous years (*Winter Fuels Outlook*).

Global liquid fuels

- The October *Short-Term Energy Outlook* (STEO) remains subject to heightened levels of uncertainty because mitigation and reopening efforts related to COVID-19 continue to evolve. Reduced economic activity related to the COVID-19 pandemic has caused changes in energy demand and supply patterns in 2020 and will continue to affect these patterns in the future. This STEO assumes U.S. gross domestic product (GDP) declined by 4.4% in the first half of 2020 from the same period a year ago. It assumes that GDP will rise beginning in the third quarter of 2020, and will grow 3.5% year-over-year in 2021. The U.S. macroeconomic assumptions in this outlook are based on forecasts by IHS Markit.

- Brent crude oil spot prices averaged $41 per barrel (b) in September, down $4/b from the average in August. The decrease in oil prices coincided with slowing increases in global oil demand. Month-over-month consumption rose by 1.0 million b/d on average during August and September compared with an increase of 4.1 million b/d from May through July. EIA estimates that global oil markets have shifted from global liquid fuels inventories building at a rate of 7.3 million barrels per day (b/d) in the second quarter of 2020 to drawing at a rate of 3.1 million b/d in the third quarter. EIA expects inventory

draws in the fourth quarter to be 3.0 million b/d before markets become more balanced, with inventory draws of 0.3 million b/d on average in 2021. Despite expected inventory draws in the coming months, EIA expects high inventory levels and surplus crude oil production capacity will limit upward pressure on oil prices. EIA forecasts monthly Brent spot prices will average $42/b during the fourth quarter of 2020 and will rise to an average of $47/b in 2021.

- EIA estimates that global consumption of petroleum and liquid fuels averaged 95.3 million b/d in September. Liquid fuels consumption was down 6.4 million b/d from September 2019, but it was up from an average of 85.1 million b/d during the second quarter of 2020 and 93.9 million b/d in August. EIA forecasts that global consumption of petroleum and liquid fuels will average 92.8 million b/d for all of 2020, down by 8.6 million b/d from 2019, before increasing by 6.3 million b/d in 2021. EIA's forecast for consumption growth in 2021 is 0.3 million b/d less than in the September STEO.

- EIA reported that U.S. crude oil production averaged 11.0 million b/d in July (the most recent month for which historical data are available), up 0.5 million b/d from June. In May, U.S. crude oil production reached a two-and-a-half-year low of 10.0 million b/d, resulting from curtailed production amid low oil prices. Since then, U.S. production has increased mainly because tight oil operators have brought wells back online in response to rising prices. EIA estimates that production rose to 11.2 million b/d in September. However, EIA expects U.S. crude oil production to generally decline to an average of 11.0 million b/d in the second quarter of 2021 because new drilling activity will not generate enough production to offset declines from existing wells. EIA expects drilling activity to rise later in 2021, contributing to U.S. crude oil production returning to 11.2 million b/d in the fourth quarter of 2021. On an annual average basis, EIA expects U.S. crude oil production to fall from 12.2 million b/d in 2019 to 11.5 million b/d in 2020 and 11.1 million b/d in 2021.

Natural Gas

- In September, the Henry Hub natural gas spot price averaged $1.92 per million British thermal units (MMBtu), down from an average of $2.30/MMBtu in August. Lower natural gas spot prices reflected declining demand for natural gas from the U.S. electric power sector as a result of cooler-than-normal temperatures during the second half of September and relatively low demand for U.S. liquefied natural gas (LNG) exports amid hurricane-related activity in the Gulf of Mexico. EIA expects that rising domestic demand for natural gas and demand for LNG exports heading into winter, combined with reduced production, will cause Henry Hub spot prices to rise to a monthly average of $3.38/MMBtu in January 2021. EIA expects that monthly average spot prices will remain higher than $3.00/MMBtu throughout 2021, averaging $3.13/MMBtu for the year, up from a forecast average of $2.07/MMBtu in 2020.

- EIA estimates that total U.S. working natural gas in storage ended September at more than 3.8 trillion cubic feet (Tcf), 12% more than the five-year (2015–19) average. In the forecast, EIA expects inventories to be more than 4.0 Tcf on October 31, which would be a record high. However, because expected natural gas production will be lower this winter than last winter, EIA forecasts inventory draws will outpace the five-year average during the heating season and end March 2021 at 1.7 Tcf, which would be 6% lower than the 2016–20 average.

- EIA expects that total U.S. consumption of natural gas will average 83.7 billion cubic feet per day (Bcf/d) in 2020, down 1.8% from 2019. The decline in total U.S. consumption reflects less heating demand in early 2020, contributing to residential and commercial demand in 2020 averaging 13.1 Bcf/d (down 0.7 Bcf/d from 2019) and 8.7 Bcf/d (down 0.9 Bcf/d from 2019), respectively. EIA forecasts industrial consumption will average 22.3 Bcf/d in 2020, down 0.8 Bcf/d from 2019 as a result of reduced manufacturing activity. EIA expects total U.S. natural gas consumption will average 78.7 Bcf/d in 2021, a 5.9% decline from 2020. The expected decline in 2021 is the result of rising natural gas prices that will reduce demand for natural gas in the electric power sector.

- EIA forecasts U.S. dry natural gas production will average 90.6 Bcf/d in 2020, down from an average of 93.1 Bcf/d in 2019. In the forecast, monthly average production falls from a record 97.0 Bcf/d in December 2019 to 85.9 Bcf/d in May 2021, before increasing slightly. Natural gas production declines the most in the Permian region, where EIA expects low crude oil prices will reduce associated natural gas output from oil-directed rigs. EIA's forecast of dry natural gas production in the United States averages 86.8 Bcf/d in 2021. EIA expects production to begin rising in the second quarter of 2021 in response to higher natural gas and crude oil prices.

- EIA estimates that U.S. LNG exports averaged 4.9 Bcf/d in September, an increase of 1.2 Bcf/d from August. Higher global forward prices indicate improving netbacks for buyers of U.S. LNG in European and Asian markets for the upcoming fall and winter seasons. The increased prices come amid expectations of natural gas demand recovery and potential LNG supply reductions because of maintenance at the Gorgon LNG plant in Australia. EIA forecasts that U.S. LNG exports will return to pre-COVID levels by November 2020 and will average more than 9.0 Bcf/d from December 2020 through February 2021.

Electricity, coal, renewables, and emissions

- EIA forecasts 2.2% less electricity consumption in the United States in 2020 compared with 2019. EIA expects retail sales of electricity to fall by 6.2% this year in the commercial sector and by 5.6% in the industrial sector. EIA forecasts residential sector retail sales will increase by 3.2% in 2020. Milder winter temperatures earlier in the year led to lower consumption for space heating, offset by increased summer cooling demand and increased electricity use by more people working and attending classes

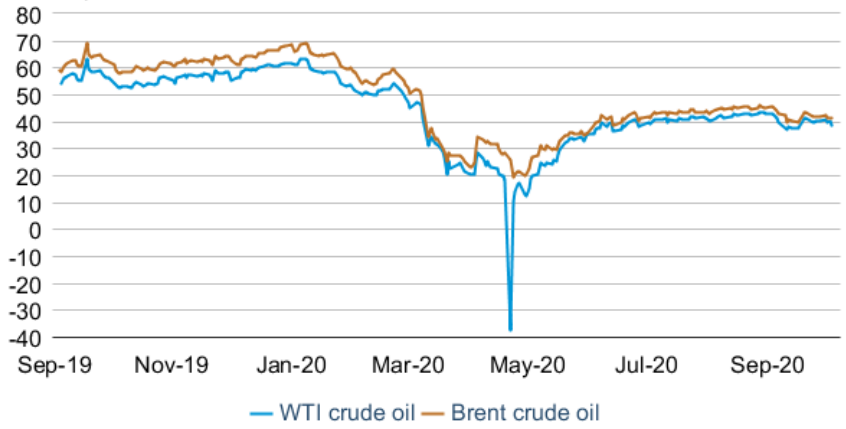
from home. In 2021, EIA forecasts total U.S. electricity consumption will be similar to 2020 consumption. Higher forecast electricity consumption in the first quarter of 2021 because of an increase in demand for space heating is mostly offset by lower forecast electricity consumption in the third quarter of 2021 because of less cooling demand based on NOAA forecast of fewer cooling degree days.

- EIA expects the share of U.S. electric power sector generation from natural gas-fired power plants will increase from 37% in 2019 to 39% this year. In 2021, the forecast natural gas share declines to 34% in response to higher natural gas prices. Coal's forecast share of electricity generation falls from 24% in 2019 to 20% in 2020 and then returns to 24% in 2021. Electricity generation from renewable energy sources rises from 17% in 2019 to 20% in 2020 and to 22% in 2021. The increase in the share from renewables is the result of planned additions to wind and solar generating capacity. EIA expects 3% declines in nuclear generation in both 2020 and 2021, reflecting recent and planned retirements of nuclear generating capacity. The nuclear share of U.S. generation remains close to 20% in all years.

- In 2020, EIA expects U.S. residential electricity prices to average 13.1 cents per kilowatthour, which would be 0.4% higher than the average electricity price in 2019. Annual changes in regional residential electricity prices range from 1.4% lower prices in the South Atlantic region to 4.0% higher prices in the Pacific region.

- EIA forecasts that renewable energy will be the fastest-growing source of electricity generation in 2020. EIA expects the U.S. electric power sector will add 23.3 gigawatts (GW) of new wind capacity in 2020 and 7.3 GW of new capacity in 2021. Expected utility-scale solar capacity rises by 13.7 GW in 2020 and by 11.8 GW in 2021.

- EIA expects total U.S. coal production in 2020 to be 525 million short tons (MMst), compared with 705 MMst in 2019, a 26% decrease. COVID-19 and efforts to mitigate it along with reduced demand from the U.S. electric power sector amid low natural gas prices have contributed to mine idling and mine closures. EIA expects production to rise to 625 MMst in 2021, up 19% from 2020. This forecast increase reflects rising demand for coal from U.S. electricity generators because of higher natural gas prices compared with 2020.



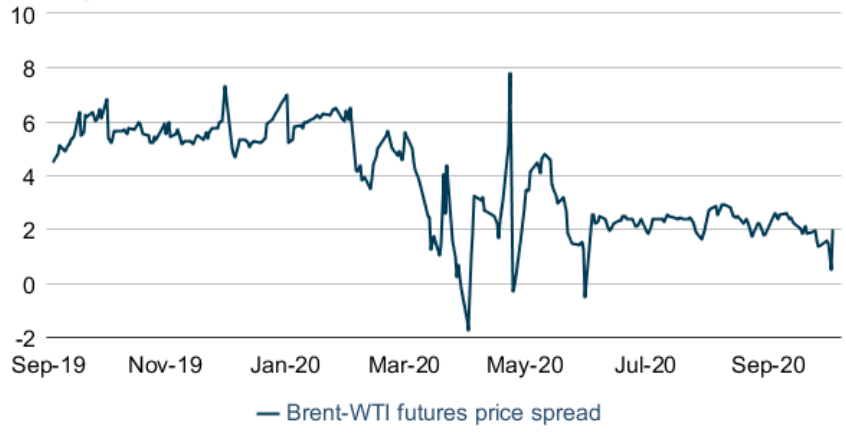
- EIA forecasts that U.S. energy-related carbon dioxide (CO2) emissions, after decreasing by 2.6% in 2019 from the previous year's level, will decrease by 10% (536 million metric tons) in 2020 as a result of reduced consumption of all fossil fuels. EIA expects emissions from coal will be down 19% from 2019 and emissions from petroleum will be down 13% from 2019. This decline in emissions is the result of less energy consumption related to slowing economic growth related to COVID-19 and efforts to mitigate it. In 2021, EIA forecasts that energy-related CO2 emissions will increase by 5.4% from the 2020 level as the economy recovers and energy use increases.

Petroleum and natural gas markets review

Crude oil

Prices: The front-month futures price for Brent crude oil settled at $40.93 per barrel (b) on October 1, 2020, a decrease of $4.65/b from September 1, 2020. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, decreased by $4.04/b during the same period, settling at $38.72/b on October 1 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices



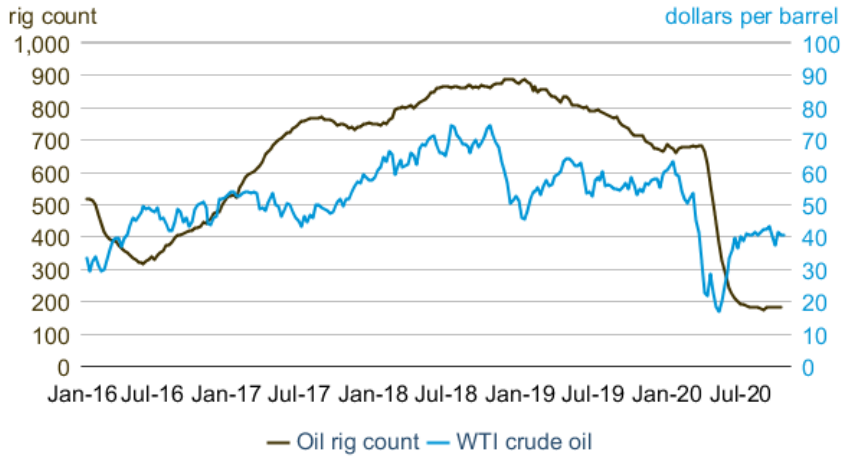
Source: CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate

During early September's heightened volatility, Brent crude oil prices fell to less than $40/b then began to stabilize from mid-September through October 1, trading at an average level of $42/b. Some of the initial decline in prices came as a result of announcements that opposing parties in Libya had agreed to lift the export blockade that had reduced production in the country from 0.8 million b/d in January (the month before the blockade began) to less than 0.1 million b/d in August (the month before the blockade was lifted).

Because Libya is excluded from the current production agreement among members of the Organization of the Petroleum Exporting Countries and partner countries (OPEC+), an increase in crude oil production from the country could significantly affect crude oil supply and inventories in the coming months. In addition, EIA estimates the rate of global oil demand growth slowed in August and September compared with the initial recovery from June and July. June and July's global oil demand increased by 6.0 million barrels per day (b/d) and 3.1 million b/d, respectively, whereas EIA estimates August and September demand increased by 0.6 million b/d and 1.3 million b/d, respectively. Recent increases in cases of COVID-19 in some countries have led to some renewed government imposed restrictions, albeit to a much lesser extent than in March and April 2020, which could also be contributing to some downward pressure on crude oil prices.

Brent–WTI futures price spread: Three developments this year have contributed to a reduction in the Brent–WTI futures price spread, which closed at a four-month low of 48 cents/b on September 30 **(Figure 2)**. First, the pace of crude oil production changes in the United States compared with the North Sea has likely affected the two crude oils' relative prices and contributed to a narrowing of the price spread. The significant crude oil price decline in the second quarter resulted in a faster crude oil production response from U.S. crude oil producers, who curtailed or shut in some wells to avoid financial losses. Although U.S. crude oil production has risen since the second quarter, the estimated September 2020 production level in the United States is 1.0 million b/d lower than the 2019 annual average production level of 12.2 million b/d. In contrast, EIA estimates total production in Norway and the United Kingdom—much of which is delivered or priced against Brent crude oil—was slightly higher than the 2019 annual average in September of 2020. Because North Sea production has not declined while U.S. production has declined, it is likely putting downward price pressure on Brent relative to WTI.

Figure 2. Brent–WTI futures price spread



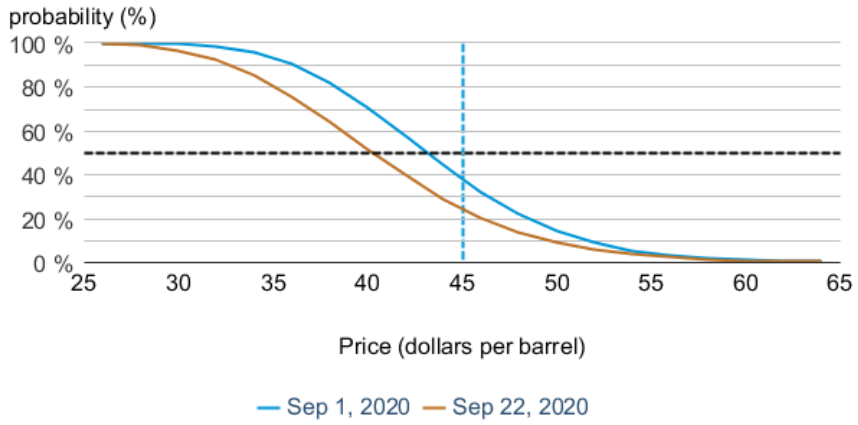
eia Source: CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate

Second, the pace of global oil demand recovery from the second quarter has been slower than EIA estimated in the September STEO. A higher share of crude oil demand from importers in Asia could be met from a combination of inventories as well as rising OPEC+ production. EIA expects this trend will persist as global demand recovers into 2021, which could reduce export demand for U.S. crude oil from the most distant refining markets in Asia.

Third, crude oil export infrastructure has continued to expand along the U.S. Gulf Coast, which has improved efficiency and lowered U.S. crude oil export costs. As a result of all these developments, EIA forecasts the Brent–WTI spread will average $1.50/b in the fourth quarter of 2020 and $2.35/b in 2021, a decrease of $1.50/b and $1.65/b, respectively, from the September STEO.

Oil rigs: Oil-directed rigs in the United States increased in September from 180 rigs as of the last week in August to 183 rigs as of September 25, according to the weekly rig count from Baker Hughes **(Figure 3)**. September marked the first monthly increase in oil-directed rigs since the 2020 high of 683 oil-directed rigs in March.

Figure 3. U.S. oil rigs and WTI prices



eia Baker Hughes and CME Group, as compiled by Bloomberg, L.P.
Note: WTI=West Texas Intermediate

Even as rigs declined during the summer, Lower 48 states' (L48) production rose from 8.0 million b/d in May to an estimated 9.0 million b/d in the third quarter as a result of operators bringing curtailed wells back online. However, EIA forecasts L48 crude oil production will decline to an average of 8.6 million b/d in the first half of 2021. Most curtailed production has already been brought back online, and although EIA expects rig counts to increase in some of the most highly productive areas of the Permian region, the total L48 new drilling activity is not expected to generate enough production to offset declines from existing wells. Because EIA forecasts WTI prices to average at or higher than $45/b from May to December 2021, EIA assumes producers will increase drilling activity in response to the higher oil prices, and forecasts L48 production will return to an average of 8.9 million b/d in the fourth quarter of 2021.

Market-derived probabilities: The December WTI futures contract averaged $40.08/b for the five trading days ending October 1 and has a 20% probability of expiring higher than $45/b **(Figure 4)**. The same contract for the five trading days ending September 1 had a 38% probability of expiring higher than $45/b. The probability is calculated from futures and options prices.

Figure 4. Probability of the December 2020 WTI contract expiring higher than price levels

Note: WTI=West Texas Intermediate

Petroleum products

Gasoline prices: The front-month futures price of reformulated blendstock for oxygenate blending (RBOB, the petroleum component of gasoline used in many parts of the country) settled at $1.15 per gallon (gal) on October 1, down 7 cents/gal from September 1, 2020 **(Figure 5)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) increased by 4 cents/gal to settle at 18 cents/gal during the same period. The average crack spread in September decreased from 20 cents/gal in August to average 18 cents/gal.

Figure 5. Historical RBOB front-month futures prices and crack spread

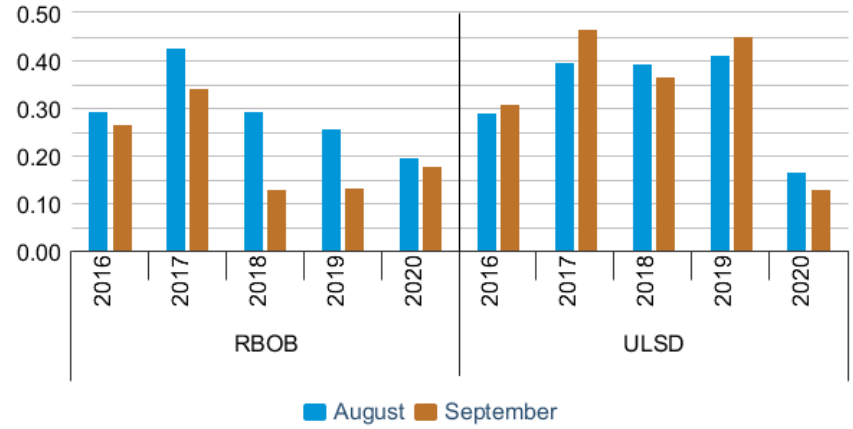
Note: RBOB=reformulated blendstock for oxygenate blending

The transition to winter-grade gasoline and a decrease in gasoline consumption likely contributed to the decrease in the average crack spread from August. EIA estimates U.S. gasoline consumption totaled 8.5 million barrels per day (b/d) in September, down 0.3 million

b/d from August, and if confirmed in monthly data, it would be the lowest level for September since 1999. Nonetheless, the average crack spread came within the month's five-year (2015–19) range for the first time since January 2020 as U.S. total motor gasoline stocks declined by 3.9 million barrels from August, the largest September draw since 2008, when Hurricanes Gustav and Ike made landfall in the Gulf Coast. Lost gasoline production because of storm-related refinery closures contributed to this stock decrease. According to trade press, Citgo's 418,000 b/d Lake Charles refinery and Phillips 66's 260,000 b/d Westlake plant are expected to remain shut through at least mid-October after closing from Hurricane Laura in late-August, and Phillips 66's 255,600 b/d Alliance refinery, which was already scheduled for maintenance in October, has been shut since taking precautions for Hurricane Sally beginning on September 13.

Ultra-low sulfur diesel prices: The ultra-low sulfur diesel (ULSD) front-month futures price for delivery in New York Harbor settled at $1.13/gal on October 1, 2020, down 11 cents/gal from September 1, 2020 **(Figure 6)**. The ULSD–Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) remained mostly unchanged at 15 cents/gal during the same period.

Figure 6. Historical ULSD front-month futures price and crack spread

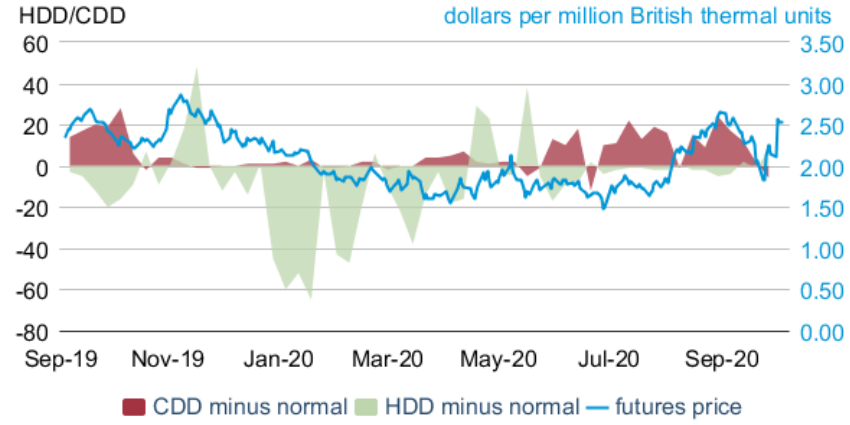


Source: CME Group, as compiled by Bloomberg L.P.
Note: ULSD=ultra-low sulfur diesel

The ULSD–Brent crack spread, which has averaged less than the five-year minimum in each of the past five months, was 27 cents/gal lower than the five-year average for September. Crack spreads decreased as consumption decreased and inventories remained high. EIA estimates that distillate consumption was 3.6 million b/d for September, down 5% from August's estimate of 3.7 million b/d and down 9% from a year ago. EIA also estimates that distillate production decreased in September, falling to 4.4 million b/d, the lowest for any month since March 2013. Despite lower month-over-month production, distillate yields for much of 2020 have remained higher than the 2019 level. Although distillate demand has declined this year, jet fuel demand has declined by more. As a result, refiners have shifted production away from jet fuel and toward distillate, which has contributed to persistently high distillate fuel inventories and low distillate fuel crack spreads.

August and September crack spreads: The RBOB–Brent crack spread typically decreases from August to September because futures contracts switch to the cheaper winter-grade gasoline and consumption decreases as the summer driving months come to an end. This year, the crack spread decreased less than in previous years **(Figure 7)**. Whereas the crack spread decreased in 2018 and 2019 by 17 cents/gal and 13 cents/gal, respectively, the crack spread only decreased by 2 cents/gal this year. The shallower decline this year likely reflects that the crack spread stayed at a lower level this summer because of lower gasoline demand as a result of more people working from home.

Figure 7. August and September average crack spreads



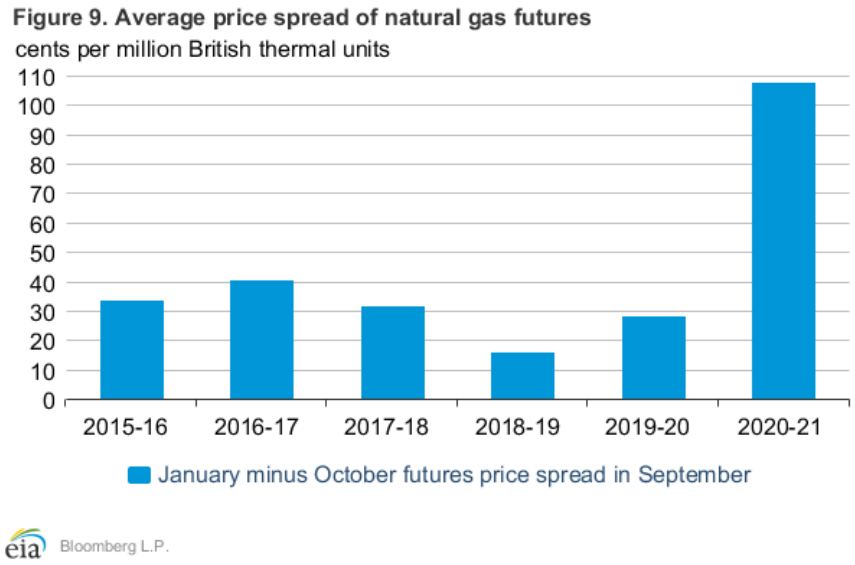
Source: CME Group, as compiled by Bloomberg L.P.
Note: RBOB=reformulated blendstock for oxygenate blending, ULSD=ultra-low sulfur diesel

Unlike the RBOB–Brent crack spread, which typically decreases going into the fall, the ULSD–Brent crack spread typically increases. During the previous four years, the ULSD–Brent crack spread increased by an average of more than 2 cents/gal. In 2020, the crack spread decreased by 4 cents/gal, the largest August-to-September decrease in at least 10 years. The average crack spread for both months were at 10-year lows. As a result of gasoline's relative price premium over distillate, refiners have accordingly been reconfiguring equipment to favor gasoline over middle distillates, according to trade press.

Natural Gas

Prices: The front-month natural gas futures contract for delivery at the Henry Hub settled at $2.53 per million British thermal units (MMBtu) on October 1, unchanged from September 1 **(Figure 8)**. The front-month futures price fell sharply through September 22, when it reached a low of $1.83/MMBtu, before rising at the end of the month. On September 28, the contract for October delivery expired, and the spread between October delivery and November delivery was $0.69/MMBtu. The price spread between the first two natural gas contracts had reached $0.88/MMBtu on September 21, the widest inflation-adjusted spread between the first two natural gas futures contracts since October 2009.

Figure 8. Natural gas front-month futures prices and actual minus historical average HDD and CDD



Source: CME Group and National Oceanic and Atmospheric Administration, as compiled by Bloomberg L.P.
Note: HDD=heating degree days, CDD=cooling degree days.

Front-month natural gas futures prices decreased as a series of hurricanes and tropical storms in the U.S. Gulf Coast limited operations at some liquefied natural gas (LNG) export facilities, which can serve as a major source of natural gas demand. Both Cameron LNG and Sabine Pass LNG facilities reduced operations during the last week in August in advance of Hurricane Laura. Cameron LNG lost power until September 18, and continues to remain offline as a result of surrounding maritime infrastructure issues. EIA estimated that LNG exports in September were 4.9 billion cubic feet per day (Bcf/d), 8% less than the previous year and 39% lower than the amount exported at the peak in January 2020.

EIA also estimates that natural gas production declined to 89.4 Bcf/d in September, 5.3 Bcf/d lower than in September 2019. Despite falling production in 2020, falling LNG exports have contributed to high natural gas inventories. EIA estimates that U.S. natural gas inventories at the end of September reached a record high for the month of September and forecasts that inventory levels at the end of October could be the highest on record for any month.

Natural gas futures price spreads: In addition to the wide price spread between the first and second month natural gas futures contracts, the spread between natural gas prices for October 2020 delivery and January 2021 delivery was more than three times the five-year average in September **(Figure 9)** and the widest since 2009. The front-month futures price volatility was also higher; the contract for October delivery traded within an 88 cents/MMBtu range in September compared with a range of 32 cents/MMBtu for the January contract. The wide spread between these contracts reflects the current high level of inventories, but it also indicates that market participants expect the current oversupply situation to change in the next few months. EIA forecasts that production will continue to fall for the next several months and that LNG exports will grow rapidly and show year-on-year growth by October 2020. Those changes, combined with the usual seasonal increase in natural gas consumption, will begin to draw down inventories and tighten the market. EIA forecasts that natural gas inventories will decline to their monthly five-year average by January 2021.

Notable forecast changes

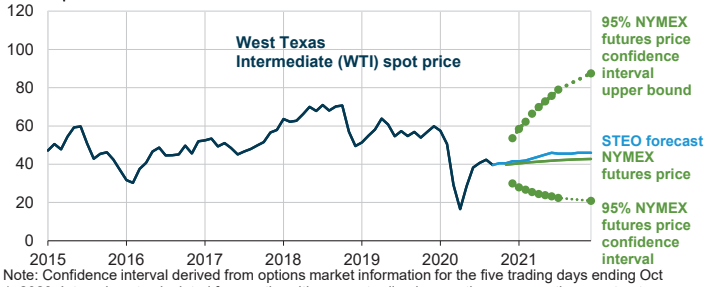
- EIA forecasts global consumption of petroleum and other liquid fuels will average 99.1 million barrels per day (b/d) in 2021, a decrease of 0.5 million b/d from the September STEO. The downward revision is primarily in India, which has realized larger economic declines in 2020 compared with initial estimates, which EIA expects will persist into 2021. In addition, EIA has reduced the 2021 global demand growth forecast as a result of a slower recovery in global jet fuel demand.

- EIA forecasts Brent crude oil prices to trade $2.35 per barrel (b) more than WTI prices in 2021. In the September STEO, EIA had forecast a $4.00/b spread in 2021. The narrower spread reflects EIA's expectation of reduced demand for U.S. crude oil globally because of lower global oil demand amid lower U.S. crude oil production.

- EIA forecasts U.S. jet fuel consumption will average 1.1 million b/d in the fourth quarter of 2020, down from a forecast of 1.5 million b/d in the September STEO. The lower forecast reflects incoming data that show the recovery in jet fuel consumption, particularly by internationally-bound flights, is proceeding more slowly than EIA expected.

- EIA forecasts crude oil inputs at U.S. refineries will average 15.9 million b/d in 2021, which is 0.5 million b/d less than forecast last month. The lower expected refinery inputs reflect updates to EIA's forecasting equation for crude oil refinery runs. The new equation uses U.S. petroleum demand and net petroleum product exports as explanatory variables, compared with refinery product margins and stock levels in the former equation.

- EIA has revised its modeling for retail electricity prices so that forecast retail prices are now a function of regional wholesale electricity prices. Previously, EIA modeled regional retail electricity prices as a function of the average U.S. cost of natural gas and coal delivered to electric generators. Forecast wholesale prices reflect the cost of fossil fuel-fired generators along with the cost of supplying renewable electricity.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the United States Government. Note: Winter covers the period October 1 through March 31. Fuel prices are nominal prices. Fuel consumption per household is based only on households that use that fuel as the primary space-heating fuel. Included in fuel consumption is consumption for water heating, appliances, electronics, and lighting (electricity). Per-household consumption based on EIA's 2015 Residential Energy Consumption Surveys corrected for actual and projected heating degree days. Number of households using heating oil includes kerosene.

- = no data available

Prices are not adjusted for inflation.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.

EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER). Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

Weather projections from National Oceanic and Atmospheric Administration.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

(a) Weighted geometric mean of real indices for various countries with weights equal to each country's share of world oil consumption in the base period. Exchange rate is measured in foreign currency per U.S. dollar. GDP and exchange rate data are from Oxford Economics, and oil consumption data are from EIA.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" inludes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

LNG: liquefied natural gas.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

Prices are not adjusted for inflation.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report*, DOE/EIA-0121; and *Electric Power Monthly*, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.
