Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distributed solar photovoltaic systems.

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly,* DOE/EIA-0226 and *Renewable Energy Annual,* DOE/EIA-0603; *Petroleum Supply Monthly,* DOE/EIA-0109.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

-- = no data available

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to one megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than one megawatt).

(d) Solar photovoltaic systems smaller than one megawatt, as measured in alternating current.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA-860M database, EIA-826 Solar PV database, and EIA Regional Short-Term Energy Model.

- = no data available

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Projections: Macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

- = no data available

Notes: Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National Oceanic and Atmospheric Administration (NOAA).

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Projections: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Appendix to the October 2020 *Short-Term Energy Outlook*

This appendix is prepared in fulfillment of section 1245(d)(4)(A) of the National Defense Authorization Act (NDAA) for Fiscal Year 2012, as amended. The law requires the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy, to submit to Congress a report on the availability and price of petroleum and petroleum products produced in countries other than Iran in the two-month period preceding the submission of the report. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The data in this appendix, therefore, should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

EIA consulted with the U.S. Department of the Treasury, the U.S. Department of State, and the intelligence community in the process of developing the NDAA report, which was previously published as a stand-alone report. Detailed background and contextual information not repeated here can be found in early editions of the NDAA report.

This appendix is published in the *Short-Term Energy Outlook* in even numbered months.

Table a1. Summary of Estimated Petroleum and Other Liquids Quantities

	Aug 2020	Sep 2020	Aug- Sep 2020 Average	Aug - Sep 2019 Average	2017 - 2019 Average
Global Petroleum and Other Liquids (million barrels per day)					
Global Petroleum and Other Liquids Production (a)	91.5	91.7	91.6	100.2	99.9
Global Petroleum and Other Liquids Consumption (b)	93.9	95.3	94.6	102.1	100.3
Biofuels Production (c)	2.9	2.9	2.9	3.0	2.5
Biofuels Consumption (c)	2.2	2.3	2.3	2.3	2.3
Iran Liquid Fuels Production	2.7	2.7	2.7	3.0	4.1
Iran Liquid Fuels Consumption	1.7	1.8	1.7	1.9	1.8
Petroleum and Petroleum Products Produced and Consumed in Countries Other Than Iran (million barrels per day)					
Production (d)	85.9	86.1	86.0	94.3	93.3
Consumption (d)	90.0	91.2	90.6	97.9	96.1
Production minus Consumption	-4.1	-5.1	-4.6	-3.7	-2.9
World Inventory Net Withdrawals Including Iran	2.5	3.6	3.0	1.9	0.4
Estimated OECD Inventory Level (e) (million barrels)	3,124	3,090	3,107	2,949	2,910
Surplus Production Capacity (million barrels per day)					
OPEC Surplus Crude Oil Production Capacity (f)	7.6	7.6	7.6	2.4	2.0

Note: The term “petroleum and other liquids” encompasses crude oil, lease condensate, natural gas liquids, biofuels, coal-to-liquids, gas-to-liquids, and refinery processing gains, which are important to consider in concert due to the inter-related supply, demand, and price dynamics of petroleum, petroleum products, and related fuels.
(a) Production includes crude oil (including lease condensates), natural gas liquids, other liquids, and refinery processing gains.
(b) Consumption of petroleum by the OECD countries is synonymous with “products supplied," defined in the glossary of the EIA Petroleum Supply Monthly, DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel, and loss, and bunkering.
(c) Biofuels production and consumption are based on EIA estimates as published in the International Energy Statistics. Biofuels production in the third quarter tends to be at its highest level in the year as ethanol production in Brazil reaches its seasonal peak and is typically lowest in the first quarter as seasonal production falls in the South/South-Central region of Brazil.
(d) Global production of petroleum and petroleum products outside of Iran is derived by subtracting biofuels production and Iran liquid fuels production from global liquid fuels production. The same method is used to calculate global consumption outside of Iran.
(e) Estimated inventory level is for OECD countries only.
(f) EIA defines surplus oil production capacity as potential oil production that could be brought online within 30 days and sustained for at least 90 days, consistent with sound business practices. This does not include oil production increases that could not be sustained without degrading the future production capacity of a field.

Independent Statistics & Analysis
U.S. Energy Information Administration

November 2020

Short-Term Energy Outlook

Forecast highlights

Global liquid fuels

- The November *Short-Term Energy Outlook* (STEO) remains subject to heightened levels of uncertainty because responses to COVID-19 continue to evolve. Reduced economic activity related to the COVID-19 pandemic has caused changes in energy demand and supply patterns in 2020 and will continue to affect these patterns in the future. U.S. gross domestic product (GDP) declined by 4.4% in the first half of 2020 compared with the same period a year ago. GDP began rising in the third quarter of 2020, and this STEO assumes it will grow by 3.7% from 2020 to 2021. The U.S. macroeconomic assumptions in this outlook are based on forecasts by IHS Markit.

- Brent crude oil spot prices averaged $40 per barrel (b) in October, down $1/b from the average in September. Brent prices fell in October as previously disrupted crude oil production in Libya came back online and as COVID-19 cases began increasing in many countries, which could reduce oil demand in the coming months. Despite these developments, the U.S. Energy Information Administration (EIA) expects global oil inventories to continue falling in the coming months. However, EIA expects high global oil inventory levels and surplus crude oil production capacity will limit upward pressure on oil prices and that Brent prices will remain near $40/b through the end of 2020. EIA expects that as global oil demand rises, forecast inventory draws in 2021 will cause some upward oil price pressures. EIA forecasts Brent crude oil prices will average $47/b in 2021.

- EIA estimates that an average of 95.3 million barrels per day (b/d) of petroleum and liquid fuels was consumed globally in October. Liquid fuels consumption was down 5.9 million b/d from October 2019, but it was up from both the third-quarter 2020 average of 94.1 million b/d and the second-quarter 2020 average of 85.3 million b/d. EIA forecasts that global consumption of petroleum and liquid fuels will average 92.9 million b/d for all of 2020, down by 8.6 million b/d from 2019, before increasing by 5.9 million b/d in 2021.

- EIA reported that 10.6 million b/d of crude oil was produced in the United States in August (the most recent month for which historical data are available), down 0.4 million b/d from July. Production fell in August mainly because hurricanes disrupted production from the U.S. Gulf of Mexico. EIA reported that U.S. crude oil production in the Gulf of

Mexico averaged 1.2 million b/d in August, down 0.5 million b/d from July. Since reaching a two-and-a-half year low of 10.0 million b/d in May, when producers curtailed wells, U.S. crude oil production has increased mainly because tight oil operators have brought wells back online in response to rising prices. EIA estimates that production will rise to 11.2 million b/d in November. However, EIA expects U.S. crude oil production to generally decline to an average of 11.0 million b/d in the second quarter of 2021 because new drilling activity will not generate enough production to offset declines from existing wells. EIA expects drilling activity to rise later in 2021, contributing to U.S. crude oil production reaching 11.3 million b/d in the fourth quarter of 2021. On an annual average basis, EIA expects U.S. crude oil production to fall from 12.2 million b/d in 2019 to 11.4 million b/d in 2020 and 11.1 million b/d in 2021.

Natural Gas

- In October, the Henry Hub natural gas spot price averaged $2.39 per million British thermal units (MMBtu), up from an average of $1.92/MMBtu in September. Higher natural gas spot prices reflected stronger demand for liquefied natural gas (LNG) exports as LNG terminals increased liquefaction following hurricane-related disruptions in August and September. EIA expects Henry Hub spot prices to rise to a monthly average of $3.42/MMBtu in January 2021 because of rising domestic demand for natural gas for space heating, rising U.S. LNG exports, and reduced production. EIA expects that monthly average spot prices will remain higher than $3.00/MMBtu throughout 2021, averaging $3.14/MMBtu for the year, up from a forecast average of $2.14/MMBtu in 2020.

- EIA estimates that total U.S. working natural gas in storage ended October at almost 4.0 trillion cubic feet (Tcf), 5% more than the five-year (2015–19) average and the second-highest end-of-October level on record. However, because EIA forecasts less U.S. natural gas production this winter than last winter, EIA forecasts that inventory draws will outpace the five-year average during the heating season (October–March) and end March 2021 at 1.5 Tcf, which would be 16% lower than the 2016–20 average.

- EIA expects that total U.S. consumption of natural gas will average 83.7 billion cubic feet per day (Bcf/d) in 2020, down 1.7% from 2019. The decline in total U.S. consumption reflects less heating demand in early 2020, contributing to residential demand in 2020 averaging 13.2 Bcf/d (down 0.6 Bcf/d from 2019) and commercial demand in 2020 averaging 8.8 Bcf/d (down 0.9 Bcf/d from 2019). EIA forecasts industrial consumption will average 22.5 Bcf/d in 2020, down 0.6 Bcf/d from 2019 as a result of reduced manufacturing activity. EIA expects total U.S. natural gas consumption will average 79.4 Bcf/d in 2021, a 5.2% decline from 2020. The expected decline in 2021 is the result of rising natural gas prices that will reduce demand for natural gas in the electric power sector.

- EIA forecasts U.S. dry natural gas production will average 91.0 Bcf/d in 2020, down from an average of 93.1 Bcf/d in 2019. In the forecast, monthly average production falls from a record 97.0 Bcf/d in December 2019 to 87.0 Bcf/d in April 2021 before increasing slightly. EIA forecasts dry natural gas production in the United States to average 87.9 Bcf/d in 2021. EIA expects production to begin rising in the second quarter of 2021 in response to higher natural gas and crude oil prices. The increase in crude oil prices is expected to raise associated gas production from oil-directed wells in late-2021, especially in the Permian region.

- EIA estimates that the United States exported 7.2 Bcf/d of LNG in October, an increase of 2.3 Bcf/d from September—the largest month-on-month increase since U.S. LNG exports began in 2016. Cameron LNG resumed LNG exports in October after being shut down following Hurricane Laura and Hurricane Delta. Cove Point LNG completed its scheduled three-week annual maintenance and resumed LNG exports in mid-October. Higher global forward prices for LNG indicate improving netbacks for buyers of U.S. LNG in European and Asian markets for the upcoming winter season. The increased prices come amid expectations of natural gas demand recovery in those markets and potential LNG supply reductions because of outages at several LNG export facilities in the Pacific Basin and Atlantic Basin. EIA forecasts that U.S. LNG exports will be above pre-COVID levels in November 2020, averaging 8.5 Bcf/d, and will average 8.4 Bcf/d in 2021, a 31% increase from 2020.

Electricity, coal, renewables, and emissions

- EIA forecasts that the consumption of electricity in the United States will decrease by 3.6% in 2020. EIA expects retail sales of electricity to fall by 6.4% this year in the commercial sector and by 8.8% in the industrial sector. EIA forecasts residential sector retail sales will increase by 2.5% in 2020. Milder winter temperatures earlier this year led to less residential consumption for space heating, offset by increased summer cooling demand and increased electricity use by more people working and attending classes from home. In 2021, EIA forecasts total U.S. electricity consumption will increase by 0.9%. Higher forecast electricity consumption in the first half of 2021 because of increased demand for space heating will be offset slightly by less forecast electricity consumption in the third quarter of 2021 because of less cooling demand based on the NOAA forecast of fewer cooling degree days.

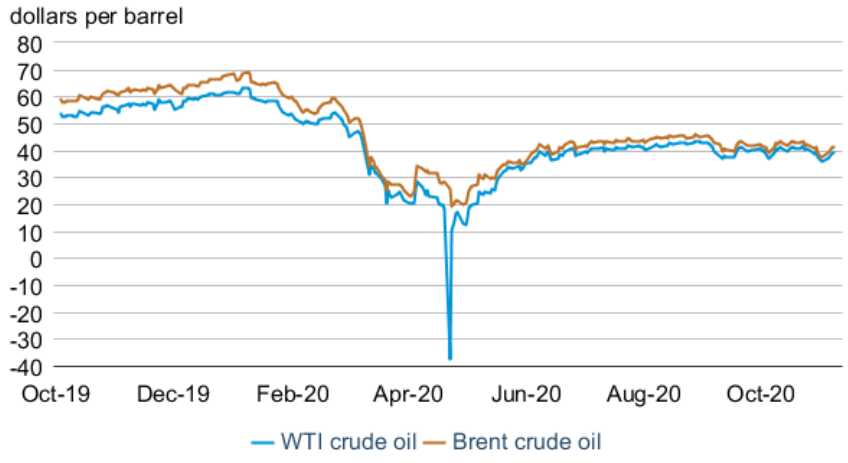
- EIA expects the share of U.S. electric power sector generation from natural gas-fired power plants will increase from 37% in 2019 to 39% this year. In 2021, the forecast natural gas share declines to 33% in response to higher natural gas prices. Coal's forecast share of electricity generation falls from 24% in 2019 to 20% in 2020 and then increases to 25% in 2021. Electricity generation from renewable energy sources rises from 18% in 2019 to 20% in 2020 and to 22% in 2021. The increase in renewables' share is the result of planned additions to wind and solar generating capacity. EIA expects nuclear generation to decline by about 2% in both 2020 and 2021, reflecting recent and

planned retirements of nuclear generating capacity. The nuclear share of U.S. generation remains close to 20% in these years.

- In 2020, EIA expects U.S. residential electricity prices to average 13.1 cents per kilowatthour, which is 0.7% higher than the average electricity price was in 2019. Annual changes in regional residential electricity prices this year range from 0.8% lower in the South Atlantic region to 4.0% higher in the Pacific region.

- EIA forecasts that renewable energy will be the fastest-growing source of electricity generation in 2020. EIA expects the U.S. electric power sector will add 23.2 gigawatts (GW) of new wind capacity in 2020 and 7.9 GW of new capacity in 2021. Expected utility-scale solar capacity rises by 12.8 GW in 2020 and by 13.0 GW in 2021.

- EIA expects U.S. coal production to be 521 million short tons (MMst) in 2020, a decline of 26% compared with 2019 levels. EIA forecasts production to rise to 627 MMst in 2021, an increase of 20%. EIA expects coal production to increase in 2021 in response to increased natural gas prices and increased demand in electric power consumption because of lower-than-average winter temperatures, especially in the Upper Midwest and Northwest regions of the United States. EIA expects that an 18% decline in U.S. coal consumption from the electric power sector in 2020 will be followed by a 23% increase in 2021.



- EIA forecasts that U.S. energy-related carbon dioxide (CO2) emissions, after decreasing by 2.6% in 2019 from the previous year's level, will decrease by 10% in 2020 as a result of reduced consumption of all fossil fuels. EIA expects emissions from coal will be down 18% from 2019 and emissions from petroleum will be down 13% from 2019. This decline in emissions is the result of less energy consumption related to slowing economic growth in response to the COVID-19 pandemic. In 2021, EIA forecasts that energy-related CO2 emissions will increase by 6% from the 2020 level as the economy recovers and energy use increases.

Petroleum and natural gas markets review

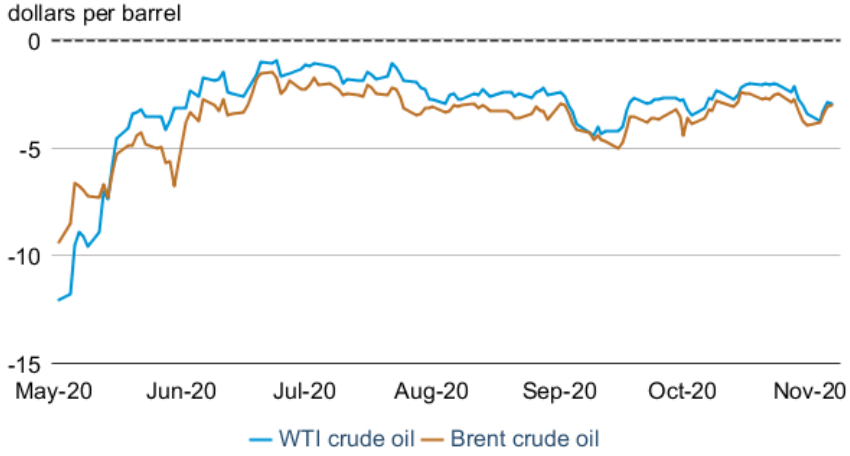
Crude oil

Prices: The front-month futures price for Brent crude oil settled at $40.93 per barrel (b) on November 5, 2020, unchanged from October 1, 2020. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, increased by 7 cents/b during the same period, settling at $38.79/b on November 5 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices

Source: CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate.

Crude oil price pressures were mostly downward in October, pushing Brent to less than $38/b late in the month. However, prices increased during the first week of November to about $40/b. The general downward price pressures came amid renewed crude oil price volatility that was primarily the result of a supply increase from Libya that came sooner than many market participants expected as well as responses to increasing COVID-19 cases.



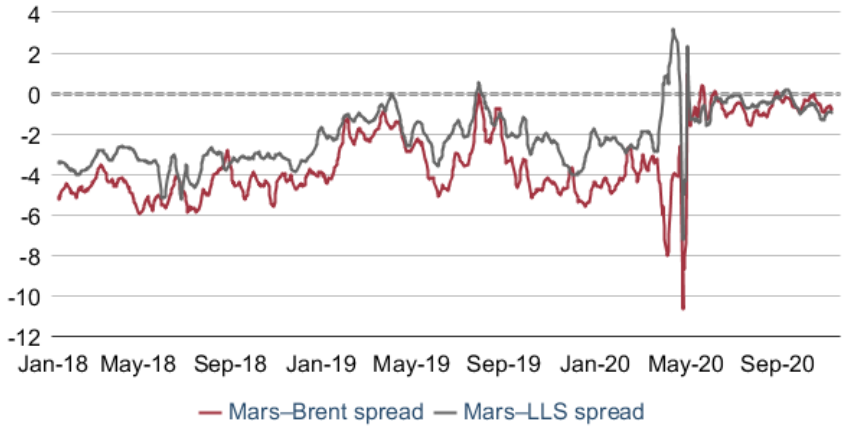
Rapid increases in crude oil production in Libya likely magnified the downside price effects of reduced demand. EIA estimates that Libya's crude oil production increased to 0.4 million barrels per day (b/d) in October 2020 from 0.1 million b/d in September. In addition, trade press reports indicate that production had increased to more than 0.5 million b/d by the end of October, a level EIA had previously forecast would not be reached until the middle of 2021. The increase in crude oil production adds supply to the current market where petroleum inventories remain high, crude oil refinery runs are subdued, and the rate of increase in global oil demand growth is slowing.

Globally, daily cases of COVID-19 increased to a record high in late October, leading to renewed economic pressure. Uncertainty about responses to increasing COVID-19 cases presents downside risk to EIA's global oil demand forecast for the fourth quarter of 2020 and first half of 2021. EIA now expects global oil consumption will average 97.3 million b/d from the fourth quarter of 2020 through the first half of 2021, which is 0.4 million b/d lower than forecast in the

October *Short-Term Energy Outlook* (STEO). The pace of oil demand recovery will affect not only expectations of petroleum inventory withdrawals but also could affect planned oil supply increases from members of the Organization of the Petroleum Exporting Countries (OPEC) and partner countries (OPEC+), who are scheduled to meet on November 30. OPEC+ members currently plan to increase crude oil production by nearly 2.0 million b/d in January 2021. EIA forecasts that OPEC+ production will generally be tailored to match the pace of global oil demand recovery. As a result of EIA's reduced demand growth expectations, EIA forecasts closer adherence to announced production targets from OPEC. For OPEC, EIA forecasts first-half 2021 crude oil production will be 27.9 million b/d, 0.5 million b/d lower than the October STEO. The lower forecast comes despite EIA's assumption of higher production in Libya during early-2021.

These supply and demand developments have primarily affected the front-month contracts for both Brent and WTI, initially contributing to a wider contango (when near-month prices are lower than longer-dated ones) in mid-October before narrowing slightly on the month. The 1st–13th spread for Brent narrowed to -$3.04/b on November 5 from -$3.64/b on October 1, and the WTI 1st–13th spread narrowed to -$2.95/b from -$3.27/b on October 1 **(Figure 2)**. Although increases in Libya's crude oil production may be adding supply to a market with relatively high inventory levels, increased tropical storm and hurricane activity in the U.S. Gulf Coast contributed to significant inventory withdrawals in the United States and is contributing to a narrower contango. In October, rising U.S. petroleum consumption, shutdowns on offshore crude oil production platforms, and lower refinery output in the U.S. Gulf Coast contributed to total U.S. commercial crude oil and petroleum products inventories drawing at a rate of more than 1.3 million b/d, the largest withdrawal rate for any month since February 2007.

Figure 2. Crude oil front-month to 13th month futures price spread

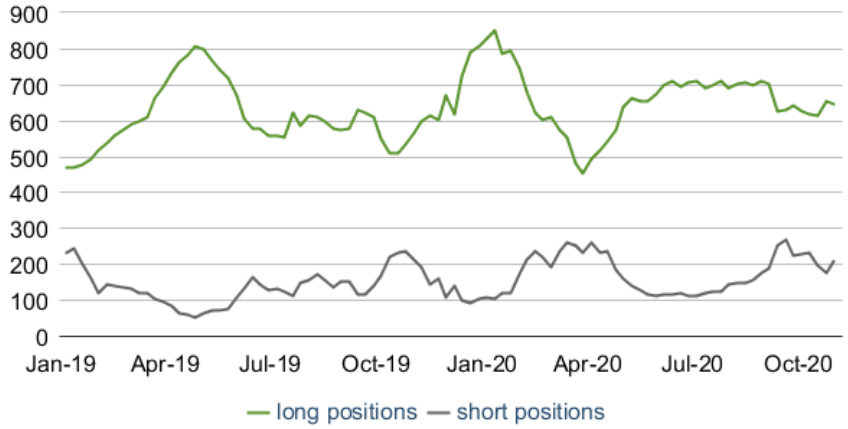


Source: CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate.

Crude oil price spreads: A combination of crude oil supply disruptions in the U.S. Gulf Coast and voluntary production reductions from OPEC+ producers of primarily medium-sour crude oils have contributed to higher price spreads for Mars (a medium-sour U.S. Gulf Coast crude oil) compared with light-sweet crude oils in recent months. Mars and other medium-sour crude oils

are popular with complex refiners along the U.S. Gulf Coast, and its price spread with light-sweet crude oils (such as Light Louisiana Sweet (LLS) and Brent) can affect crack spreads and refinery purchasing decisions. The five-day moving average of the Mars-LLS price spread has traded at a premium several times in 2020 and settled at -95 cents/b on November 5, and the Mars-Brent spread settled at -80 cents/b **(Figure 3)**.

Figure 3. Mars crude oil price spreads
dollars per barrel, five-day moving average



Source: Bloomberg L.P.
Note: LLS=Light Louisiana Sweet.

An active tropical storm and hurricane season in the U.S. Gulf Coast has contributed to several personnel evacuations and well shut-ins on offshore platforms, which continued into October following Hurricanes Delta and Zeta. Aside from these supply disruptions, Mars and other medium-sour crude oil prices have increased relative to light-sweet crude oils more broadly since 2018. The largest voluntary production reductions from OPEC+ members have been from countries that produce mainly medium-sour crude oil, including Saudi Arabia and Russia. In addition, lower production from Iran and Venezuela since 2019 have contributed to the loss of medium and heavy crude oil production in those countries, adding further upward price premiums on available medium-sour crude oils like Mars. Year-to-date through November 5, 2020, the Mars-LLS spread averaged -98 cents/b, up from -$3.35/b in 2018 and from -$1.89/b in 2019, and the Mars-Brent spread has averaged -$2.04/b year-to-date, up from -$4.64/b in 2018 and from -$3.24/b in 2019. Aside from the various supply-side factors contributing to higher medium-sour crude oil price spreads, increased refining capacity in Asia in recent years has also contributed to higher medium-sour crude oil prices because the capacity has broadly been designed to process medium-sour crude oil.

Money manager positions: Money managers that hold long positions in Brent and WTI futures contracts can often be an important source of liquidity in the futures market and can often trade indirectly with producers that short crude oil futures. As of October 2020, total open interest in Brent and WTI futures contracts has declined since each of their respective 2020 highs in April, and it is at about the same level as in October 2019. Among the various trader classifications the Commodity Futures Trading Commission (CFTC) determines, WTI long positions held by money

managers increased by more than any other trader's position from the last week in October 2019 through October 27, 2020, increasing by more than 169,000 contracts **(Figure 4)**. Brent money manager long positions, on the other hand, decreased by 86,000 contracts during the same period. The combined contracts' money manager short positions nearly offset each other. WTI short positions decreased by 20,000 contracts, and Brent short positions increased by 19,000 contracts during the year. Money flowing into exchange-traded funds that hold WTI futures contracts reached record highs in the first quarter of 2020, and total assets under management remained at elevated levels, which partially explains the large increase in money manager WTI long positions.

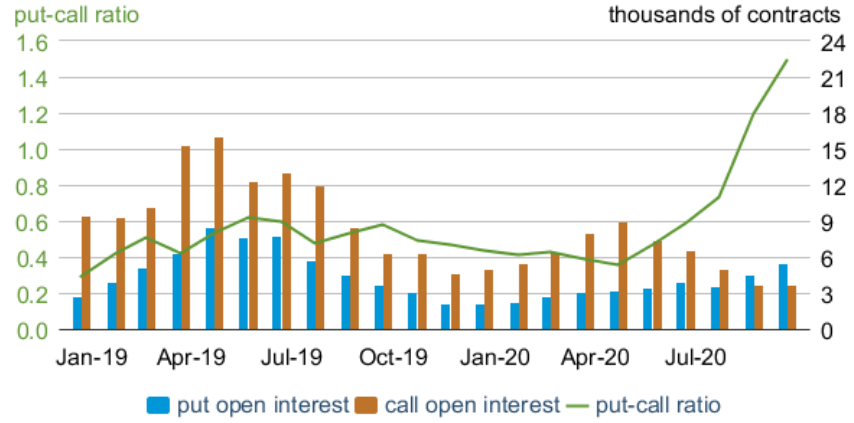
Petroleum products

Gasoline prices: The front-month futures price of reformulated blendstock for oxygenate blending (RBOB, the petroleum component of gasoline used in many parts of the country) settled at $1.12 per gallon (gal) on November 5, down 4 cents/gal from October 1, 2020 **(Figure 5)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) decreased by 4 cents/gal to settle at 14 cents/gal during the same period. The crack spread peaked on October 6 at 22 cents/gal and fell to 12 cents/gal on November 2.

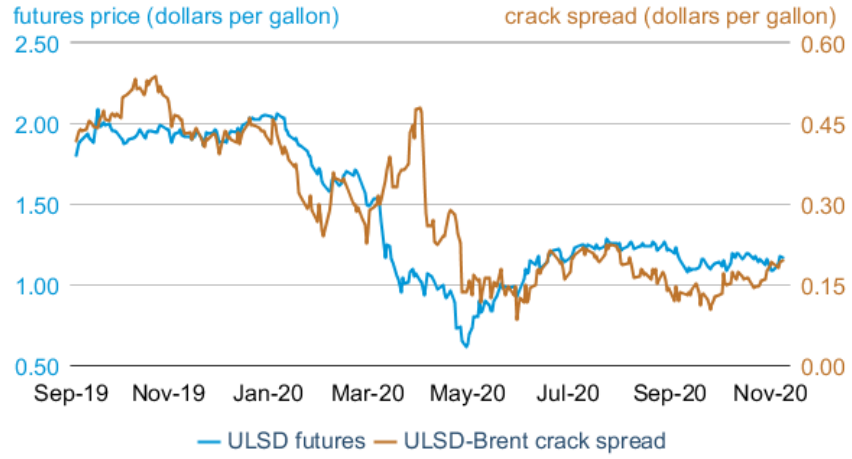


Despite the futures price falling as low as $1.05/gal on October 30, the lowest since May 29, and the crack spread decreasing throughout the month, the average crack spread in October remained within the five-year (2015–19) monthly range for the second consecutive month. One factor that likely supported gasoline crack spreads was reduced production due to temporary disruptions to refineries from Hurricanes Delta, which shut in 62% of gasoline production at U.S. Gulf Coast refiners at its peak on October 9, and Zeta, which shut in 58% of gasoline production at U.S. Gulf Coast refiners at its peak on October 28.

RBOB put-call ratio: The put-call ratio can provide insight into the expectations of market participants. Changes in the relationships between put and call options for RBOB contracts may indicate that market participants are concerned about the continuing economic effects of COVID-19. A put option increases in value when the underlying commodity price declines, and a call option increases in value when the underlying commodity price increases. The put-call ratio is calculated by dividing the open interest (number of contracts outstanding) of put options by the open interest of call options. Put and call options can be used for hedging or mitigating price risk among refiners or other traders.

The average monthly put-call ratio for all RBOB contracts from 2015 to 2019 was 0.53, meaning market participants held almost twice as many calls as puts. After eight consecutive months of ratios that were lower than the average, the ratio increased to higher than the average in July 2020 and has increased since. In September 2020, the ratio increased to 1.20, the first time since January 2018 that the ratio was higher than 1.0 and the highest ratio since April 2012. In October, the ratio increased further to a 10-year record of 1.49. Although overall open interest for both put options and call options are down in 2020, put option open interest has generally increased since May 2020, whereas call options have generally decreased during the same period **(Figure 6)**.

Figure 6. Put-call ratio on open interest for all RBOB contracts, monthly average

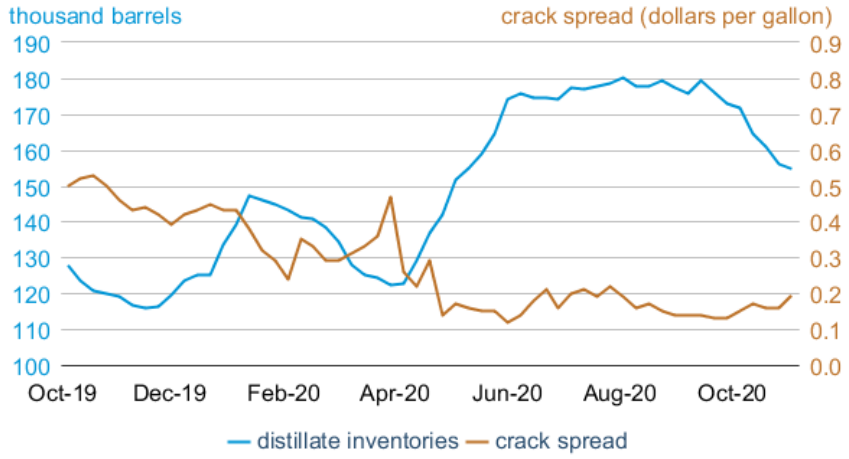


Source: CME Group, Bloomberg L.P.
Note: RBOB=reformulated blendstock for oxygenate blending

For RBOB options as of October 2020, 61% of the put options and 78% of the call options were for the November and December 2020 contracts. The put-call ratio in October for November contracts was 0.90, and the ratio for December contracts was 1.32. In addition, 33% of the open interest on put options was for April contracts, the first contract for delivery of summer-grade gasoline. The put-call ratio of 21.46 for April RBOB contracts drove October's put-call ratio to 1.49. A possible explanation for this phenomenon is that market participants are hedging against a potential continuation of economic effects of COVID-19 into the 2021 summer driving season. This trend of buying or holding April puts in October is not customary. In the previous three years, the open interest for April puts in October was 0.

Ultra-low sulfur diesel prices: The ultra-low sulfur diesel (ULSD) front-month futures price for delivery in New York Harbor settled at $1.17/gal on November 5, 2020, up 4 cents/gal from October 1, 2020 **(Figure 7)**. The ULSD–Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) increased by 4 cents/gal to settle at 20 cents/gal during the same period.

Figure 7. Historical ULSD front-month futures price and crack spread



Source: CME Group, as compiled by Bloomberg L.P.
Note: ULSD=ultra-low sulfur diesel

Inventories of distillate fuel typically decline in the United States during October because U.S. distillate demand typically increases during the fall when diesel-powered agricultural equipment is used to harvest crops, the winter heating season begins, and many refineries reduce crude oil runs to perform maintenance. This year, U.S. distillate consumption increased by 0.4 million barrels per day (b/d) from September to 3.9 million b/d in October, which is more than the five-year (2015–19) average increase of 0.1 million b/d. Whereas in the past five years, the increase in consumption and decrease in inventories led to an average September to October increase of 1 cent/gal on the ULSD–Brent crack spread, this year the average crack spread increased by 3 cents/gal.

From the week ending October 4, 2019, to the week ending October 2, 2020, distillate inventories increased 44 million barrels (35%), contributing to a decrease in the monthly average crack spread from 51 cents/gal in October 2019 to 13 cents/gal in September 2020, a decrease of 38 cents/gal **(Figure 8)**. Although the month-over-month withdrawal from September to October is typically high, averaging 8.7 million barrels the past five years, this October saw a monthly draw of 17.6 million barrels, which was the largest draw of any month since January 2003. These inventory draws can partially be explained by the decrease in distillate production because of refinery closures in response to Hurricanes Delta and Zeta. If confirmed by monthly data, October's distillate production of 4.1 million b/d would be the lowest since February 2011. October's decrease in distillate inventory was met with an increase in the ULSD–Brent crack spread from 15 cents/gal on October 1 to 19 cents/gal on October 30. EIA expects further inventory decreases in the winter and spring because of lower-than-average refinery distillate production and the U.S. Department of Agriculture's forecast of a larger-than-usual harvest season this year for corn and soybeans.

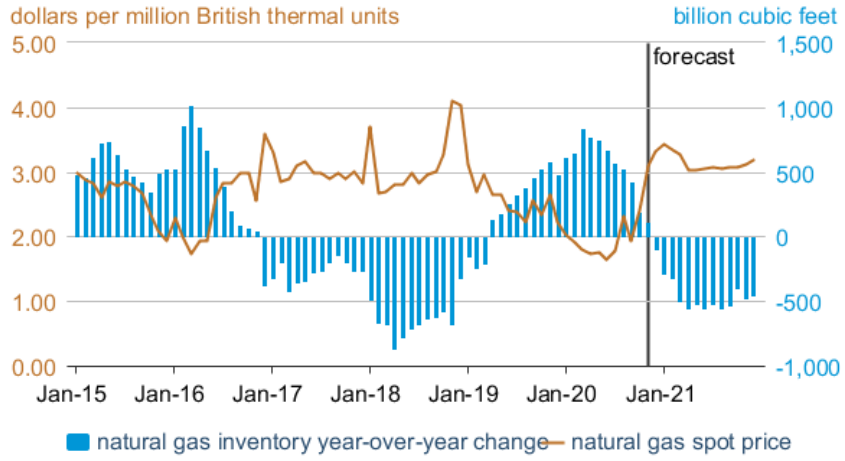
Natural Gas

Prices: The front-month natural gas futures contract for delivery at the Henry Hub settled at $2.94 per million British thermal units (MMBtu) on November 5, up 42 cents/MMBtu from October 1 **(Figure 9)**. The front-month contract changed from November to December delivery on October 29, 2020, and that change contributed 30 cents/MMBtu to the front-month price increase. When the front-month futures price settled at $3.02/MMBtu on October 21, 2020, it was the first time that the front-month price had risen higher than $3.00/MMBtu since January 25, 2019.

Figure 9. U.S. natural gas front-month futures prices and storage



Source: U.S. Energy Information Administration, CME Group, as compiled by Bloomberg L.P.

Natural gas prices received support from higher U.S. LNG exports and lower natural gas production. EIA estimates that LNG exports rose to 7.2 billion cubic feet per day (Bcf/d) in October, an increase of 2.3 Bcf/d from the previous month and 1.5 Bcf/d from October 2019.

U.S. natural gas production decreased 0.7 Bcf/d in October from September, and it was 6.6 Bcf/d lower than October 2019 production. The reduction in year-on-year production in October 2020 contributed to the smallest increase in U.S. natural gas inventories in the month of October since 2002. Despite the decreased additions to storage, EIA estimates the level of natural gas inventories increased to the second-highest level on record at the end of October. Although high inventories tend to push prices lower, market participants appear to be focusing on expected changes in market balances over the next several months.

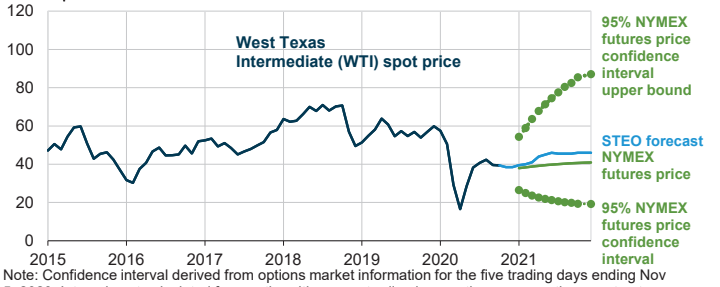
Natural gas prices and changes in inventory: EIA forecasts that natural gas inventories will decline by 2,419 Bcf from the end of October 2020 to the end of March 2021, which would be the third-largest decrease recorded during those months, and that monthly inventories will fall below the previous year's levels by December 2020 **(Figure 10)**. Decreasing natural gas production, which EIA forecasts will fall from November 2020 until May 2021, is one key factor affecting the decline in inventories, but EIA also forecasts that LNG exports will increase, rising to a record high in November 2020. Higher prices for natural gas and LNG in Europe and Asia are helping to boost U.S. LNG exports. Lower production and higher exports, combined with the usual seasonal increase in natural gas consumption, will contribute to the rapid decline in inventories during the winter. This expected change in market fundamentals contributed to the large increase in natural gas prices in October and contributed to EIA's forecast of higher natural gas prices in 2021 compared with 2020.

Figure 10. Natural gas prices and year-over-year change in inventory

eia Source: U.S. Energy Information Administration and Refinitiv

Notable forecast changes

- EIA forecasts U.S. gasoline consumption will average 8.4 million barrels per day (b/d) in the fourth quarter of 2020 and 8.7 million b/d in the first half of 2021. Those forecasts are 0.3 and 0.2 million b/d less, respectively, than forecast in the October STEO.
- EIA forecasts OPEC crude oil production will average 25.4 million b/d in the fourth quarter of 2020 and 27.9 million b/d in the first half of 2021, which are 0.3 million b/d and 0.5 million b/d lower than previously forecast. The reduced forecast reflects less production in response to lower forecast global oil consumption, as EIA forecasts closer adherence to announced production targets from OPEC.
- This edition of the STEO incorporates revised historical data for electricity consumption and supply in 2019 and in 2020. Most of these data are relatively similar to the data published in the October STEO. However, retail sales of electricity to the industrial sector for 2019 are about 5% higher than previously estimated, and 2020 retail sales are about 2% higher. As a result, the current STEO forecasts industrial electricity use will fall by 9% between 2019 and 2020 compared with a forecast decline of 6% in the previous STEO.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the United States Government. (a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.

EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).

Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

Weather projections from National Oceanic and Atmospheric Administration.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

(a) Weighted geometric mean of real indices for various countries with weights equal to each country's share of world oil consumption in the base period. Exchange rate is measured in foreign currency per U.S. dollar. GDP and exchange rate data are from Oxford Economics, and oil consumption data are from EIA.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" inludes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

LNG: liquefied natural gas.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report*, DOE/EIA-0121; and *Electric Power Monthly*, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

Prices are not adjusted for inflation.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distributed solar photovoltaic systems.

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly,* DOE/EIA-0226 and *Renewable Energy Annual,* DOE/EIA-0603; *Petroleum Supply Monthly,* DOE/EIA-0109.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

-- = no data available

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to one megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than one megawatt).

(d) Solar photovoltaic systems smaller than one megawatt, as measured in alternating current.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA-860M database, EIA-826 Solar PV database, and EIA Regional Short-Term Energy Model.

- = no data available

SAAR = Seasonally-adjusted annual rate

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Aviation Administration. Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

Notes: Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National Oceanic and Atmospheric Administration (NOAA).

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Projections: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Independent Statistics & Analysis
U.S. Energy Information Administration

December 2020

Short-Term Energy Outlook

Forecast highlights

Global liquid fuels

- The December *Short-Term Energy Outlook* (STEO) remains subject to heightened levels of uncertainty because responses to COVID-19 continue to evolve. Reduced economic activity related to the COVID-19 pandemic has caused changes in energy demand and supply patterns in 2020 and will continue to affect these patterns in the future. U.S. gross domestic product (GDP) declined by 4.4% in the first half of 2020 from the same period a year ago. GDP began rising in the third quarter of 2020, and this STEO assumes it will grow by 3.1% annually in 2021 from 2020. The U.S. macroeconomic assumptions in this outlook are based on forecasts by IHS Markit completed in early November.

- Brent crude oil spot prices averaged $43 per barrel (b) in November, up $3/b from the average in October. Brent prices increased in November in part because of news about the viability of multiple COVID-19 vaccines, along with market expectations that the Organization of the Petroleum Exporting Countries (OPEC) and partner countries (OPEC+) would delay or limit production increases planned for January 2021.

- The U.S. Energy Information Administration (EIA) expects that Brent prices will average $49/b in 2021, up from an expected average of $43/b in the fourth quarter of 2020. The forecast for higher crude oil prices next year reflects EIA's expectation that while inventories will remain high, they will decline with rising global oil demand and restrained OPEC+ oil production. EIA forecasts Brent prices will average $47/b in the first quarter of 2021 and rise to an average of $50/b by the fourth quarter. The first quarter 2021 average is $5/b more than forecast in last month's STEO, and the fourth quarter average is $1/b more. The higher expected first quarter prices reflect steeper expected global oil inventory draws as a result of the December 3 OPEC+ decision to limit its previously planned production increases in January 2021. EIA expects high global oil inventory levels and surplus crude oil production capacity will limit upward pressure on oil prices through much of 2021.

- EIA forecasts OPEC crude oil production will average 27.5 million barrels per day (b/d) in 2021, up from an estimated 25.6 million b/d in 2020. The increase reflects OPEC's announced potential increases to production targets and production increases in Libya. At the December 3 meeting, OPEC and OPEC+ participants decided to limit oil production increases planned for January 2021. OPEC+ announced it will increase its

production target by 0.5 million b/d in January 2021. The group had initially planned to increase its target by 2.0 million b/d. The group will also assess the state of global oil markets and petroleum demand monthly, adjusting targets based on market conditions. EIA now forecasts OPEC crude oil production will average 25.7 million b/d in the first quarter of 2021, which is 1.7 million b/d lower than forecast in the November STEO and reflects the announced changes to OPEC+ targets and more effective assumed compliance with targets.

- EIA estimates that the world consumed 95.6 million b/d of petroleum and liquid fuels in November, which is down 6.3 million b/d from November 2019 but up from the third-quarter 2020 average of 93.5 million b/d. EIA forecasts that global consumption of petroleum and liquid fuels will average 92.4 million b/d for all of 2020, which is down by 8.8 million b/d from 2019, before increasing by 5.8 million b/d in 2021.

- EIA estimates that U.S. crude oil production was 11.2 million b/d in November, which is up from 10.9 million b/d in September (the most recent month for which historical data are available). The increase mostly reflects greater production in the U.S. Federal Gulf of Mexico after hurricane-related disruptions. EIA expects that U.S. crude oil production will decline to less than 11.0 million b/d in March 2021 mostly because of falling production in the Lower 48 states, where EIA expects declining production rates at existing wells will outpace production from newly drilled wells in the coming months. EIA expects crude oil production in the Lower 48 states will increase from 8.7 million b/d in February 2021 to 9.1 million b/d in December 2021, as drilling increases in response to rising oil prices. This increase contributes to total U.S. crude oil production reaching 11.4 million b/d in December 2021. On an annual average basis, EIA expects U.S. crude oil production to fall from 12.2 million b/d in 2019 to 11.3 million b/d in 2020 and 11.1 million b/d in 2021.

Natural Gas

- In November, the Henry Hub natural gas spot price averaged $2.61 per million British thermal units (MMBtu), up from the October average of $2.39/MMBtu. Price increases last month were moderated by significantly warmer-than-normal temperatures, which reduced residential space heating demand for natural gas despite many remaining at home in response to the pandemic. EIA expects Henry Hub spot prices to reach a monthly average of $3.10/MMBtu in January 2021, which is down from the forecast January average price of $3.42/MMBtu in last month's STEO. Although EIA still expects prices to increase in the coming months because of rising space heating demand and rising U.S. liquefied natural gas (LNG) exports amid declining U.S. natural gas production, the lower January price forecast reflects higher forecast storage levels this winter compared with last month's forecast. EIA expects that monthly average spot prices will average $3.01/MMBtu in 2021, which is up from the forecast average of $2.07/MMBtu for 2020.

- U.S. working natural gas in storage ended October at almost 4.0 trillion cubic feet (Tcf), 5% more than the five-year (2015–19) average and the second-highest end-of-October level on record. EIA estimates that inventories fell by 20 billion cubic feet (Bcf) in November, compared with a five-year average November withdrawal of 103 Bcf and a forecast withdrawal of 222 Bcf in last month's STEO. The lower-than-expected withdrawal is the result of warmer-than-normal November temperatures that reduced natural gas use for space heating. However, EIA forecasts that declines in U.S. natural gas production this winter compared with last winter will more than offset the declines in natural gas consumption, which will contribute to inventory withdrawals outpacing the five-year average during the remainder of the winter season that ends in March. Forecast natural gas inventories end March 2021 at 1.6 Tcf, 15% lower than the 2016–20 average.

- EIA expects that total U.S. consumption of natural gas will average 83.4 billion cubic feet per day (Bcf/d) in 2020, down 2.0% from 2019. The decline in total U.S. consumption reflects warmer temperatures in 2020 compared with 2019 that lowered residential space heating demand for natural gas despite many staying home in response to the pandemic. EIA expects residential demand in 2020 to average 12.9 Bcf/d (down 0.8 Bcf/d from 2019) and commercial demand in 2020 to average 8.6 Bcf/d (down 1.0 Bcf/d from 2019). EIA forecasts industrial consumption will average 22.5 Bcf/d in 2020 (down 0.5 Bcf/d from 2019) as a result of reduced manufacturing activity. EIA expects total U.S. natural gas consumption will average 79.4 Bcf/d in 2021, a 4.8% decline from 2020. The forecast decline in 2021 results from rising natural gas prices that lower forecast natural gas demand in the electric power sector.

- EIA forecasts U.S. dry natural gas production will average 90.9 Bcf/d in 2020, which is down from an average of 93.1 Bcf/d in 2019. In the forecast, monthly average production falls from a record 97.0 Bcf/d in December 2019 to 87.1 Bcf/d in April 2021 before increasing slightly. EIA forecasts dry natural gas production in the United States to average 87.9 Bcf/d in 2021. EIA expects production to begin rising in the second quarter of 2021 in response to higher natural gas and crude oil prices. The increase in crude oil prices is expected to raise associated gas production from oil-directed wells in late-2021, especially in the Permian region.

- EIA estimates that the United States exported 9.4 Bcf/d of LNG in November—the most for any month on record. International spot and forward LNG prices continued to increase in late November, supported by reduced global LNG supply because of outages at LNG export plants in several countries and reported congestion at the Panama Canal, which affected westbound U.S. LNG exports to Asia. EIA expects LNG demand to continue increasing. The primary drivers of this increase are forecasts of colder-than-normal winter weather in Northern Asia and Europe and coal plant closures in South Korea that could increase demand for natural gas for power generation. EIA forecasts that U.S. LNG exports will exceed 9.5 Bcf/d from December through February and will average 8.5 Bcf/d in 2021, a 30% increase from 2020.

Electricity, coal, renewables, and emissions

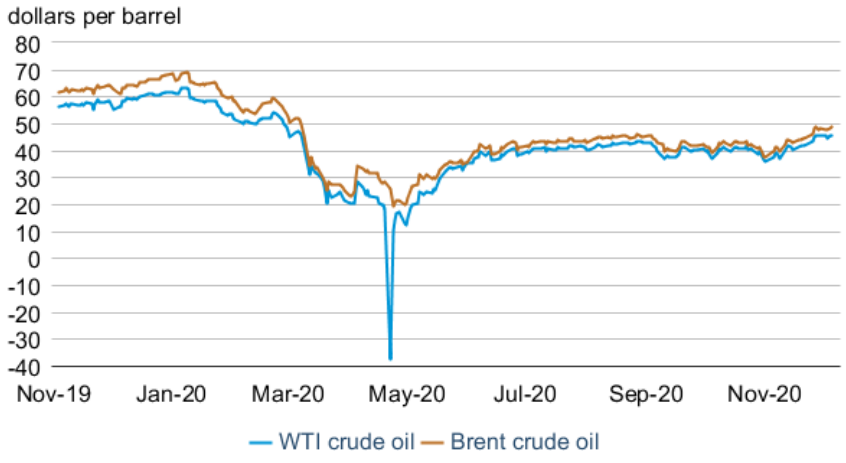
- EIA forecasts that consumption of electricity in the United States will decrease by 3.9% in 2020. EIA expects retail sales of electricity in the commercial sector to fall this year by 5.9% and by 8.8% in the industrial sector. EIA forecasts residential sector retail sales will rise by 1.5% in 2020. Milder winter temperatures in early 2020 led to less residential consumption for space heating, but this effect was offset by increased summer cooling demand and increased electricity use by more people staying home in response to the pandemic. EIA forecasts total U.S. electricity consumption will rise by 1.3% in 2021. The increase in electricity consumption next year is a result of forecast colder temperatures in the first quarter compared with the same period last year, in addition to continued higher consumption as many people will still be at home more because of the pandemic.

- EIA expects the share of U.S. electric power sector generation from natural gas will increase from 37% in 2019 to 39% this year. In 2021, the forecast natural gas share declines to 34% in response to a forecast increase in the price of natural gas delivered to electricity generators from an average of $2.44/MMBtu in 2020 to $3.38/MMBtu in 2021 (an increase of 39%). Coal's forecast share of electricity generation falls from 24% in 2019 to 20% in 2020 and then returns to 24% in 2021. Electricity generation from renewable energy sources rises from 18% in 2019 to 20% in 2020 and to 21% in 2021. The nuclear share of U.S. generation remains close to 20% through the forecast period.

- In 2020, EIA expects U.S. residential electricity prices to average 13.1 cents per kilowatthour, which is 0.8% higher than the average electricity price in 2019. Annual changes in regional residential electricity prices this year range from 0.4% lower in the South Atlantic region to 3.7% higher in the Pacific region.

- EIA forecasts that planned additions to wind and solar generating capacity in 2020 and 2021 will contribute to increasing electricity generation from those sources. EIA expects the U.S. electric power sector will add 23.0 gigawatts (GW) of new wind capacity in 2020 and 9.5 GW of new capacity in 2021. Expected utility-scale solar capacity rises by 12.8 GW in 2020 and by 14.0 GW in 2021.

- EIA forecasts U.S. coal production to total 521 million short tons (MMst) in 2020, a 26% decline from 2019. Forecast coal production rises to 624 MMst in 2021, a 20% increase from 2020 levels. EIA expects coal production to grow because of increased coal demand from the electric power sector amid higher natural gas prices in 2021.



- EIA expects that U.S. energy-related carbon dioxide (CO2) emissions, after decreasing by almost 3% in 2019 from the previous year's level, will decrease by 11% in 2020. This decline in emissions is the result of less energy consumption related to slowing economic growth in response to the COVID-19 pandemic. EIA expects emissions from coal will be down 19% from 2019 and emissions from petroleum will be down 13% from 2019. In 2021, EIA forecasts that energy-related CO2 emissions will increase by 6% from the 2020 level as the economy recovers and energy use increases.

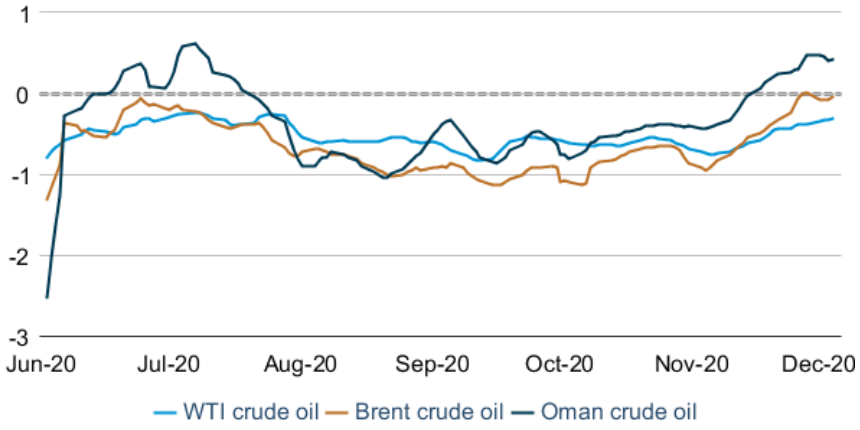
Petroleum and natural gas markets review

Crude oil

Prices: The front-month futures price for Brent crude oil settled at $48.71 per barrel (b) on December 3, 2020, an increase of $9.74/b from November 2, 2020. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, increased by $8.83/b during the same period, settling at $45.64/b on December 3 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices

Sources: CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate.



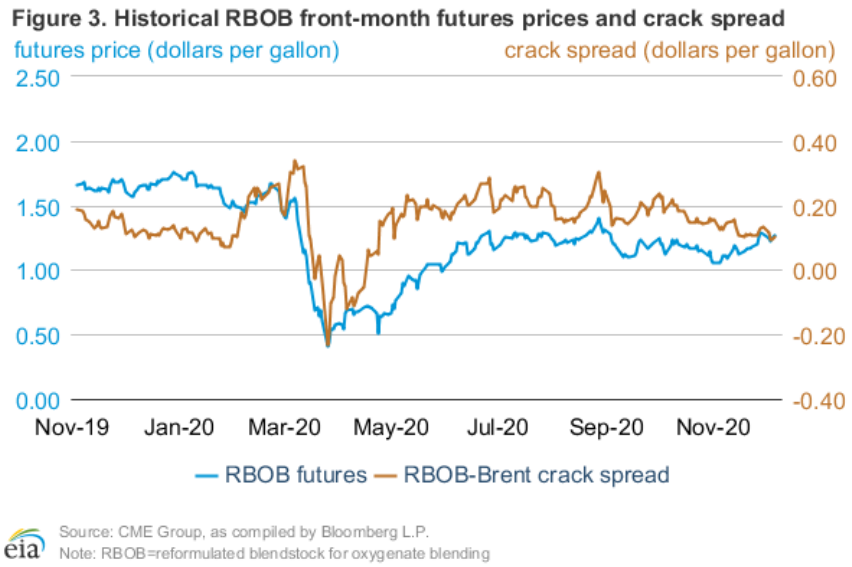
In late November, crude oil prices reached their highest levels since early March, before responses to COVID-19 affected worldwide economies. Prices for crude oil as well as other risk assets such as equities and industrial metals all increased in response to optimism following the announcement of the efficacy of several COVID-19 vaccine candidates, and the price increase likely reflects solidified market expectations for economic recovery during 2021. This optimism came despite record highs in daily cases of COVID-19 during November, which is slowing the recovery in transportation demand in the near term, particularly in Europe and regions of the United States.

The meeting on December 3 between members of the Organization of the Petroleum Exporting Countries (OPEC) and partner countries (OPEC+) resulted in a change to their production cuts beginning in January 2021. The group had initially planned to raise production by 2.0 million barrels per day (b/d) in January 2021 but will instead raise production by 0.5 million b/d. In addition, the group will assess the state of global oil markets and petroleum demand monthly, adjusting production targets based on prevailing oil market conditions. The U.S. Energy Information Administration (EIA) assumes the OPEC+ group will be highly compliant with this agreement in early 2021. EIA forecasts crude oil production from OPEC to average 25.7 million b/d in the first quarter of 2021, a 1.7 million b/d reduction from the November STEO. Partly because of EIA's forecast of more restrained OPEC+ production in 2021, EIA forecasts tighter oil markets next year, particularly in the first quarter. EIA now forecasts first-quarter 2021 global oil

inventory draws to average 1.8 million b/d, which is 1.0 million b/d more than previously forecast.

The combined effect of lower supply expectations from OPEC+ countries as well as firmer market expectations for a recovery in global oil demand is contributing to higher prices for near-term oil deliveries relative to prices for delivery further in the future. The five-day moving averages for the Oman crude oil 1st–3rd spread approached 50 cents/b in late November, and Brent's spread settled at -4 cents/b on December 3. The WTI spread also increased, but by less than the other crude oils **(Figure 2)**.

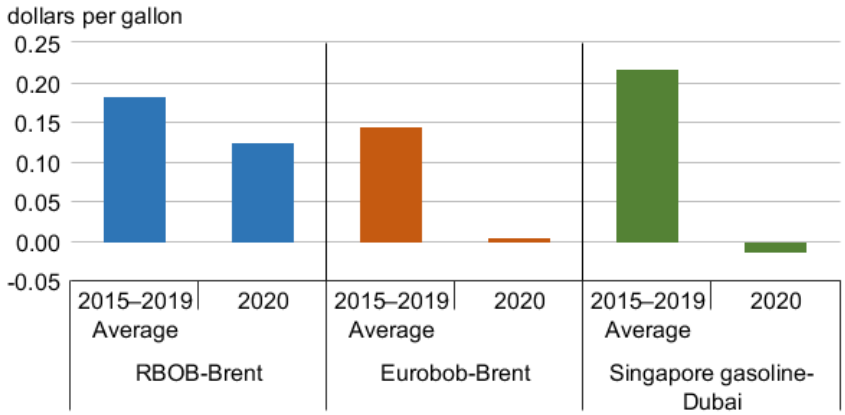
Figure 2. Crude oil front-month to 3rd month futures price spread
dollars per barrel, five-day moving average



Sources: CME Group, Dubai Mercantile Exchange, and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate.

The increasing crude oil price spreads reflect both the global oil inventory drawdown since June 2020 as well as expectations for increasing demand and continued stock draws in the coming months. Higher Oman crude oil price spreads, which generally reflect Middle Eastern crude oil exported to Asia, could reflect increasing demand and refinery runs from China, India, or other Asian countries. China's National Bureau of Statistics reported that crude oil refinery runs in China reached an all-time high of 14.1 million b/d in October. Based on data from India's Ministry of Petroleum & Natural Gas, EIA estimates that India's total petroleum consumption was 4.6 million b/d in October 2020, the most of any month since February.

Petroleum products

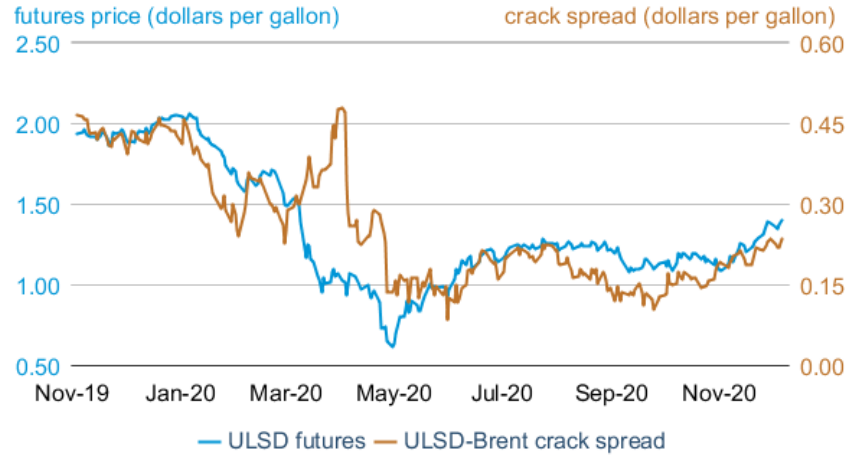


Gasoline prices: The front-month futures price of reformulated blendstock for oxygenate blending (RBOB, the petroleum component of gasoline used in many parts of the country) settled at $1.26 per gallon (gal) on December 3, up 21 cents/gal from November 2, 2020 **(Figure 3)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) decreased by 2 cents/gal to settle at 10 cents/gal during the same period.

The gasoline crack spread started November at a six-month low of 12 cents/gal and traded within a 5-cent range during the month, the narrowest range for any month in 2020. The month's average crack spread of 12 cents/gal was within the five-year (2015–2019) range and was down 5 cents/gal from October 2020. The crack spread decrease likely reflects higher inventories and lower consumption than in October. In this STEO, the U.S. Energy Information Administration (EIA) estimates gasoline inventories increased by 7.4 million barrels (3.3%) from October, which is slightly higher than the average five-year increase of 2.7% from October to November. EIA estimates November gasoline consumption averaged 8.2 million barrels per day (b/d), a decrease of 3.2% from October.

International gasoline crack spreads: Gasoline crack spreads in both Europe and Asia declined to historically low levels, based on the Eurobob–Brent crack spread for Europe and the Singapore gasoline–Dubai crack spread for Singapore. The European monthly average gasoline crack spread was less than 1 cent/gal, and Singapore's was -1 cent/gal in November. Meanwhile, the RBOB–Brent crack spread averaged 12 cents/gal for the month. Although the RBOB–Brent crack spread was 6 cents/gal less than the five-year average, it remained high relative to the crack spreads for Europe and Singapore, which were 14 cents/gal and 22 cents/gal less than their five-year averages, respectively **(Figure 4)**.

Figure 4. November gasoline crack spreads

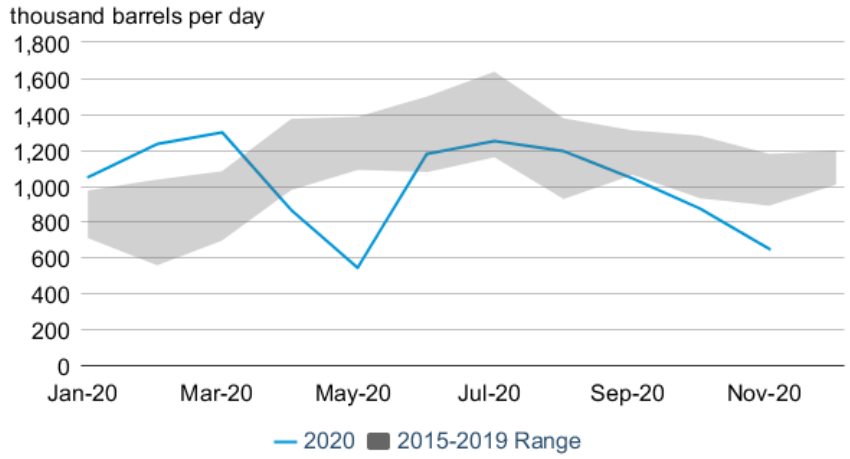


Source: CME Group, as compiled by Bloomberg L.P.
Note: RBOB=reformulated blendstock for oxygenate blending

Although U.S. gasoline crack spreads are less than their five-year average, gasoline crack spreads in Europe and Singapore have decreased more relative to their five-year averages. In Europe, especially high gasoline inventories likely explain the greater decrease. Gasoline inventories at the Amsterdam-Rotterdam-Antwerp hub for the week ending November 19 were at their highest November level in more than 10 years and were 68% higher than the same week a year ago. In Asia, crack spreads have decreased more than U.S. crack spreads because China increased refinery runs to 14.1 million b/d in October, up 5% from a year ago. In contrast to China, U.S. refiners have maintained low refinery runs and gasoline production levels. Furthermore, according to trade press, China exported record levels of gasoline in October, increasing product supplies throughout Asian markets.

Ultra-low sulfur diesel prices: The ultra-low sulfur diesel (ULSD) front-month futures price for delivery in New York Harbor settled at $1.39/gal on December 3, 2020, up 28 cents/gal from November 2, 2020 **(Figure 5)**. The ULSD–Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) increased by 5 cents/gal to settle at 23 cents/gal during the same period.

Figure 5. Historical ULSD front-month futures price and crack spread

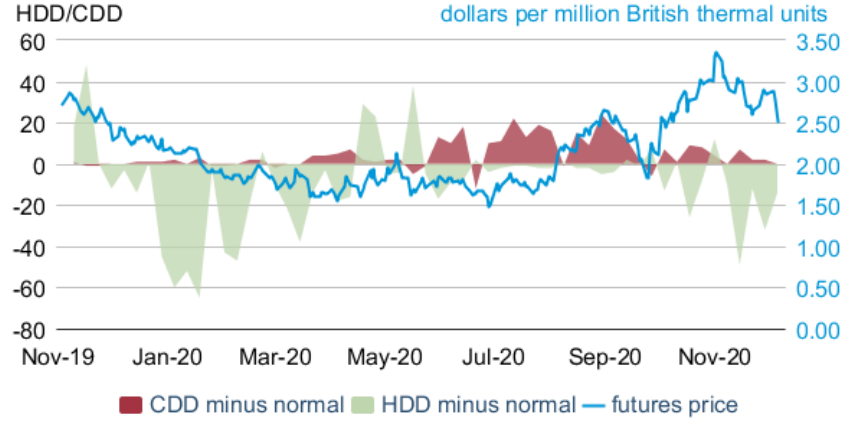


Source: CME Group, as compiled by Bloomberg L.P.
Note: ULSD=ultra-low sulfur diesel

The average ULSD–Brent crack spread in November increased to 21 cents/gal, up 4 cents/gal from October 2020 but down 23 cents/gal from last November. EIA estimates that distillate consumption increased from October to November by 0.1 million b/d (2.6%) to 4.0 million b/d. If confirmed by monthly data, it will mark the fifth consecutive month of distillate consumption increases. In addition, since August, distillate consumption has increased by 0.4 million b/d. As distillate production has decreased to their lowest levels since 2009 in October and November, according to EIA estimates, demand has been increasingly met by distillate inventories, which have fallen by 32.8 million barrels since August 2020, the largest three-month decrease since March 2003.

Reduced net exports of distillate have provided an additional supply source. EIA estimates net exports of distillate fuel were 0.6 million b/d in November, the lowest level for November since 2010 **(Figure 6)**. EIA data for the week ending November 27 show that four-week average distillate imports were 60% higher than the five-year average and four-week average exports were 20% lower than the five-year average. In addition to increased distillate consumption, the widening spread between the ULSD front-month futures price and European distillate spot price is likely contributing to the increase in net imports. The spread in November averaged 13 cents/gal, the highest monthly average since December 2017. The high spread has facilitated imports of distillate on the East Coast (Petroleum Administration for Defense District–PADD–1). Weekly EIA estimates the week ending November 27 showed East Coast distillate imports of 575,000 b/d, the highest for any week since the week ending February 5, 2010.

Figure 6. Monthly distillate net exports

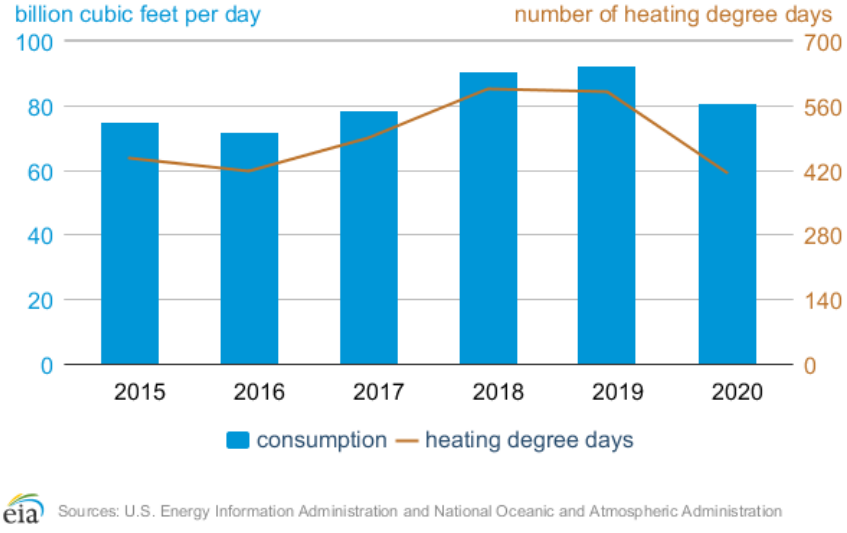


Source: U.S. Energy Information Administration

Natural Gas

Prices: The front-month natural gas futures contract for delivery at the Henry Hub settled at $2.51 per million British thermal units (MMBtu) on December 3, which is down 74 cents/MMBtu from November 2 **(Figure 7)**. The warmest November since 2001 lessened concerns of a tight natural gas market this winter and helped lower prices.

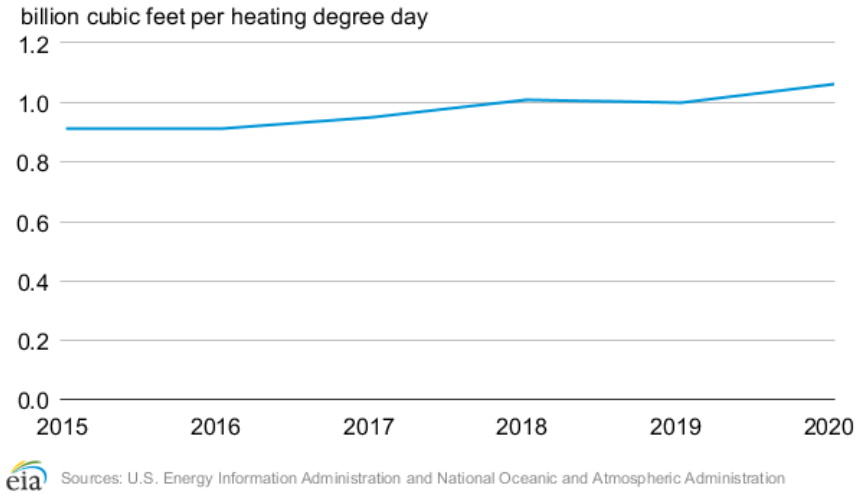
Figure 7. Natural gas front-month futures prices and actual minus historical average HDD and CDD



Sources: CME Group and National Oceanic and Atmospheric Administration, as compiled by Bloomberg L.P.
Note: HDD=heating degree days, CDD=cooling degree days.

The U.S. Energy Information Administration (EIA) estimates that natural gas inventories declined by 20 billion cubic feet (Bcf) in November, the smallest November draw since 2015. Compared with November 2019, lower natural gas consumption because of warmer temperatures helped to moderate the seasonal decline in inventories in November, even with lower natural gas production and higher liquefied natural gas (LNG) exports. Natural gas production decreased 7.1 Bcf per day (Bcf/d) from November 2019, and U.S. LNG exports rose to a record high in

November, up 3.0 Bcf/d from November 2019. Despite lower production and higher LNG exports, natural gas inventories remain 281 Bcf (8%) higher than the five-year (2015–19) average.



Natural gas consumption and heating degree days: U.S. heating degree days (HDD) in November were 21% less than the 2010–19 average (and 30% less than in November 2019), which contributed to an estimate of the lowest natural gas consumption in November since 2017 **(Figure 8)**. EIA forecasts that consumption in the commercial sector fell 29% from November 2019, in the residential sector by 25%, and in the power generation sector by 6%. Even though temperatures in November 2020 were the warmest since 2001, estimated consumption in 2020 still remained higher than in any previous November except 2018 and 2019 because the size of the overall natural gas market in the United States has increased. Much of this growth has been in the industrial and electric power sectors. Considering the longer-term trends, EIA estimates that U.S. natural gas consumption for the full year 2020 increased 56% compared with 2010 in the electric power sector and 21% in the industrial sector. In addition, responses to COVID-19 in 2020 that have resulted in more people working, attending school, and spending more time at home have likely contributed to greater residential consumption relative to the level of HDD. Compared with the five-year average, residential consumption per HDD increased 11% in November 2020 **(Figure 9)**.

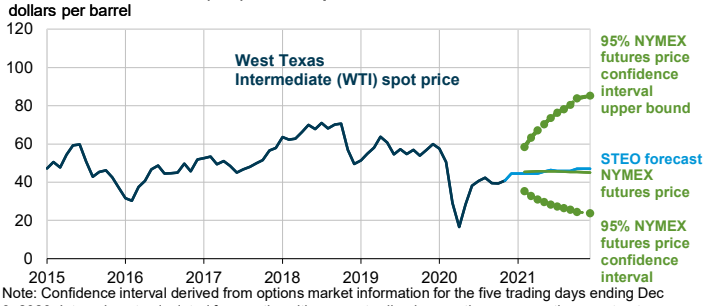
Notable forecast changes

- The U.S. Energy Information Administration (EIA) updated its *International Energy Statistics* (IES) database during November to include 2018 data for petroleum consumption from countries outside of the Organization for Economic Cooperation and Development. The *Short-Term Energy Outlook* (STEO) uses IES for its historical global liquid fuels consumption and production data. Based on this IES update, EIA reports that global liquid fuels consumption averaged 100.4 million barrels per day (b/d) in 2018, 0.2 million b/d lower than estimated in the November STEO. This lower historical baseline for 2018 carries through to estimates and forecasts for 2019 through 2021. EIA now estimates global liquid fuels consumption averaged 101.2 million b/d in 2019, which is 0.3 million b/d less than estimated in the November STEO. EIA forecasts global liquid fuels consumption will average 92.4 million b/d in 2020 and 98.2 million b/d in 2021.

- EIA forecasts OPEC crude oil production will average 27.5 million b/d in 2021, which is 1.0 million b/d lower than previously forecast. The reduction in the forecast reflects EIA's updated assumptions about OPEC production and compliance following the group's December 3 meeting at which OPEC and partner countries announced they were limiting production increases planned for January 2021 to 0.5 million b/d from the previously announced 2.0 million b/d.

- EIA forecasts Henry Hub natural gas spot prices will average $3.01 per million British thermal units (MMBtu) in 2021, which is down from a forecast of $3.14/MMBtu in the November STEO. The lower forecast reflects EIA's expectation of higher inventory levels during 2021 compared with last month's forecast.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the United States Government. The views in this report therefore should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

- = no data available

Prices are not adjusted for inflation.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.

EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).

Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

Weather projections from National Oceanic and Atmospheric Administration.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Iran, Iraq, Kuwait, Saudi Arabia, and the United Arab Emirates (Middle East); Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Libya, Nigeria, and Venezuela (Other).

(a) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

(a) Weighted geometric mean of real indices for various countries with weights equal to each country's share of world oil consumption in the base period. Exchange rate is measured in foreign currency per U.S. dollar. GDP and exchange rate data are from Oxford Economics, and oil consumption data are from EIA.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" inludes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

LNG: liquefied natural gas.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

Prices are not adjusted for inflation.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report*, DOE/EIA-0121; and *Electric Power Monthly*, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

- = no data available

Prices are not adjusted for inflation.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

Table 7d part 1. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continues on Table 7d part 2*

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Projections: EIA Regional Short-Term Energy Model.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

- = no data available

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distributed solar photovoltaic systems.

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly,* DOE/EIA-0226 and *Renewable Energy Annual,* DOE/EIA-0603; *Petroleum Supply Monthly,* DOE/EIA-0109.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model.

-- = no data available

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to one megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than one megawatt).

(d) Solar photovoltaic systems smaller than one megawatt, as measured in alternating current.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA-860M database, EIA-826 Solar PV database, and EIA Regional Short-Term Energy Model.

Total Energy (c)	**1,380**	**1,184**	**1,290**	**1,292**	**1,250**	**973**	**1,179**	*1,195*	*1,263*	*1,134*	*1,228*	*1,256*	**5,146**	*4,597*	*4,881*

- = no data available

SAAR = Seasonally-adjusted annual rate

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Aviation Administration. Minor discrepancies with published historical data are due to independent rounding.

Projections: EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

Notes: The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Projections: Macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

- = no data available

Notes: Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National Oceanic and Atmospheric Administration (NOAA).

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Projections: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Appendix to the December 2020 *Short-Term Energy Outlook*

This appendix is prepared in fulfillment of section 1245(d)(4)(A) of the National Defense Authorization Act (NDAA) for Fiscal Year 2012, as amended. The law requires the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy, to submit to Congress a report on the availability and price of petroleum and petroleum products produced in countries other than Iran in the two-month period preceding the submission of the report. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The data in this appendix, therefore, should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

EIA consulted with the U.S. Department of the Treasury, the U.S. Department of State, and the intelligence community in the process of developing the NDAA report, which was previously published as a stand-alone report. Detailed background and contextual information not repeated here can be found in early editions of the NDAA report.

This appendix is published in the *Short-Term Energy Outlook* in even numbered months.

Table a1. Summary of Estimated Petroleum and Other Liquids Quantities

	October 2020	November 2020	October-November 2020 Average	October-November 2019 Average	2017–2019 Average
Global Petroleum and Other Liquids (million barrels per day)					
Global Petroleum and Other Liquids Production (a)	91.7	93.4	92.5	101.6	99.8
Global Petroleum and Other Liquids Consumption (b)	94.8	95.6	95.2	101.4	100.3
Biofuels Production (c)	2.6	2.4	2.5	2.7	2.5
Biofuels Consumption (c)	2.3	2.3	2.3	2.4	2.3
Iran Liquid Fuels Production	2.6	2.7	2.7	3.0	4.1
Iran Liquid Fuels Consumption	1.7	1.7	1.7	1.8	1.8
Petroleum and Petroleum Products Produced and Consumed in Countries Other Than Iran (million barrels per day)					
Production (d)	86.4	88.4	87.4	96.0	93.2
Consumption (d)	90.8	91.6	91.2	97.2	96.2
Production minus Consumption	-4.5	-3.2	-3.8	-1.2	-2.9
World Inventory Net Withdrawals Including Iran	3.2	2.1	2.7	-0.2	0.5
Estimated OECD Inventory Level (e) (million barrels)	3,091	3,057	3,074	2,885	2,910
Surplus Production Capacity (million barrels per day)					
OPEC Surplus Crude Oil Production Capacity (f)	7.7	7.7	7.7	2.1	2.0

Note: The term “petroleum and other liquids” encompasses crude oil, lease condensate, natural gas liquids, biofuels, coal-to-liquids, gas-to-liquids, and refinery processing gains, which are important to consider in concert due to the inter-related supply, demand, and price dynamics of petroleum, petroleum products, and related fuels.
(a) Production includes crude oil (including lease condensates), natural gas liquids, other liquids, and refinery processing gains.
(b) Consumption of petroleum by the OECD countries is synonymous with “products supplied," defined in the glossary of the EIA Petroleum Supply Monthly, DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel, and loss, and bunkering.
(c) Biofuels production and consumption are based on EIA estimates as published in the International Energy Statistics. Biofuels production in the third quarter tends to be at its highest level in the year as ethanol production in Brazil reaches its seasonal peak and is typically lowest in the first quarter as seasonal production falls in the South/South-Central region of Brazil.
(d) Global production of petroleum and petroleum products outside of Iran is derived by subtracting biofuels production and Iran liquid fuels production from global liquid fuels production. The same method is used to calculate global consumption outside of Iran.
(e) Estimated inventory level is for OECD countries only.
(f) EIA defines surplus oil production capacity as potential oil production that could be brought online within 30 days and sustained for at least 90 days, consistent with sound business practices. This does not include oil production increases that could not be sustained without degrading the future production capacity of a field.

Independent Statistics & Analysis
U.S. Energy Information Administration

January 2021

Short-Term Energy Outlook

Forecast highlights

- This edition of the *Short-Term Energy Outlook* (STEO) is the first to include forecasts for 2022.
- The January STEO remains subject to heightened levels of uncertainty because responses to COVID-19 continue to evolve. Reduced economic activity and changes to consumer behavior in response to the COVID-19 pandemic caused energy demand and supply to decline in 2020. The ongoing pandemic and the success of vaccination programs will continue to affect energy use in the future.
- Economic assumptions are among the most important drivers of the U.S. Energy Information Administration's (EIA) forecasts. EIA's U.S. macroeconomic assumptions are based on forecasts by IHS Markit and EIA's global economic assumptions are based on forecasts from Oxford Economics. After falling by 3.5% in 2020, IHS Markit forecasts that U.S. real gross domestic product (GDP) will increase by 4.2% in 2021 and 3.8% in 2022. Rising GDP contributes to EIA's forecast of rising total energy use in the United States during 2021 and 2022. After falling by 7.8% in 2020, EIA forecasts that total U.S. energy consumption will rise by 2.6% in 2021 and by 2.5% in 2022, reaching 97.3 quadrillion British thermal units (quads), 3.0 quads less than in 2019.
- EIA forecasts Brent crude oil spot prices to average $53 per barrel (b) in both 2021 and 2022 compared with an average of $42/b in 2020.
- EIA estimates that global consumption of petroleum and liquid fuels averaged 92.2 million barrels per day (b/d) for all of 2020, down by 9.0 million b/d from 2019. EIA expects global liquid fuels consumption will grow by 5.6 million b/d in 2021 and 3.3 million b/d in 2022.
- EIA forecasts crude oil production from the Organization of the Petroleum Exporting Countries (OPEC) will average 27.2 million b/d in 2021, up from an estimated 25.6 million b/d in 2020. Forecast growth in output reflects OPEC's announced increases to production targets and continuing rise in Libya's production. On January 5, 2021, OPEC and partner countries (OPEC+) announced that they will maintain the previously agreed-upon January 2021 production increase of 0.5 million b/d. The latest OPEC+ agreement also calls for production increases from Russia and Kazakhstan in February and March. However, additional voluntary cuts by Saudi Arabia for February and March result in

lower overall OPEC+ production in early 2021. EIA forecasts that OPEC crude oil production will rise by 1.1 million b/d in 2022.

- EIA estimates global liquid fuels inventories rose at a rate of 6.5 million b/d in the first half of 2020 before declining at a rate of 2.4 million b/d in the second half of 2020. EIA forecasts global inventories will continue to fall in the forecast, declining at a rate of 0.6 million b/d in 2021 and 0.5 million b/d in 2022.

- U.S. regular gasoline retail prices averaged $2.18 per gallon (gal) in 2020, compared with an average of $2.60/gal in 2019. EIA forecasts motor gasoline prices to average $2.40/gal in 2021 and $2.42/gal in 2022 U.S. diesel fuel prices averaged $2.55/gal in 2020, compared with $3.06/gal in 2019, and EIA forecasts them to average $2.71/gal in 2021 and $2.74/gal in 2022.

- EIA estimates that U.S. crude oil production fell from the 2019 record level of 12.2 million b/d to 11.3 million b/d in 2020. EIA expects that annual average production will fall to 11.1 million b/d in 2021 before rising to 11.5 million b/d in 2022.

- U.S. liquid fuels consumption in 2020 averaged 18.1 million b/d, down 2.5 million b/d (12%) from 2019 consumption. EIA forecasts U.S. liquid fuels consumption will rise to 19.5 million b/d in 2021 and then to 20.5 million b/d in 2022 (almost equal to the 2019 level).

- Henry Hub natural gas spot prices averaged $2.03 per million British thermal units (MMBtu) in 2020. EIA expects Henry Hub prices will rise to an annual average of $3.01/MMBtu in 2021, limiting natural gas use for power generation amid reduced natural gas production. EIA forecasts Henry Hub prices will rise to an average of $3.27/MMBtu in 2022.

- U.S. working natural gas in storage ended October at more than 3.9 trillion cubic feet (Tcf), 5% more than the five-year (2015–19) average and the fourth-highest end-of-October level on record. EIA forecasts that declines in U.S. natural gas production this winter compared with last winter will more than offset the declines in natural gas consumption, which will contribute to inventory withdrawals outpacing the five-year average during the remainder of the winter, which ends in March. Forecast natural gas inventories end March 2021 at 1.6 Tcf, 12% lower than the 2016–20 average.

- EIA estimates that U.S. natural gas consumption averaged 83.1 billion cubic feet per day (Bcf/d) in 2020, down 2.5% from 2019. EIA expects that natural gas consumption will decline by 2.8% in 2021 and by 2.1% in 2022. Most of the decline in natural gas consumption is the result of less natural gas use in the power sector, which EIA forecasts to decline because of rising natural gas prices. These declines are partly offset by rising natural gas use in other sectors.

- EIA estimates that 2020 dry natural gas production averaged 90.8 Bcf/d, down 2.5% from 2019. EIA expects U.S. dry natural gas production to average 88.2 Bcf/d in 2021, down by 2.8% from 2020, and then rise to 89.7 Bcf/d in 2022.

- EIA forecasts that total consumption of electricity in the United States will increase by 1.5% in 2021 after falling by 4.0% in 2020. The pandemic significantly affected electricity consumption in the commercial and industrial sectors in 2020. EIA estimates retail sales of electricity to the two sectors fell by 6.0% and 7.9%, respectively. EIA expects commercial electricity use in 2021 to rise by 0.9% and industrial electricity use to rise by 1.2%. Social distancing guidelines have caused people to spend more time at home, resulting in increased residential electricity use. In 2020, retail sales of electricity to the residential sector were 1.3% higher despite a mild winter earlier in the year. EIA expects residential electricity use will rise by 2.4% in 2021 as colder winter weather leads to more heating demand. Total forecast electricity consumption in 2022 will rise by 1.7%.

- EIA expects the share of U.S. electric power sector generation from natural gas will decline from 39% in 2020 to 36% in 2021 and 34% in 2022 in response to significantly higher natural gas fuel costs and increased generation from renewable energy sources. Coal's forecast share of electricity generation will rise from 20% in 2020 to 22% in 2021 and 24% in 2022, which is close to its share in 2019. Electricity generation from renewable energy sources will rise from 20% in 2020 to 21% in 2021 and 23% in 2022. The nuclear share of U.S. generation will decline from 21% in 2020 to 20% in 2021 and 19% in 2022.

- During the next two years, EIA expects electricity generation capacity from renewable energy sources to continue growing. Although EIA expects both wind and solar capacity growth, solar capacity grows at a faster rate in the forecast. Based on EIA survey data, large-scale solar capacity growth in gigawatts (GW) will exceed wind growth for the first time in 2021.

- EIA estimates that total U.S. coal production decreased by 24% to 537 million short tons (MMst) in 2020. This decline largely reflected lower demand for coal from the electric power sector and the coal export market. Lower natural gas prices made coal less competitive for power generation. In 2021, EIA expects coal production to increase by 12% to 603 MMst because of a forecast 41% increase in natural gas prices for electricity generators, making coal more competitive in the electric power sector. EIA forecasts coal production will rise to 628 MMst in 2022.

- After declining by 11.1% in 2020, EIA forecasts that total energy-related carbon dioxide (CO_2) emissions will increase by 4.7% in 2021 and by 3.2% in 2022. Even with growth over the next two years, forecast CO_2 emissions in 2022 remain 3.9% lower than 2019 levels. Energy-related CO_2 emissions are sensitive to changes in weather, economic growth, energy prices, and fuel mix.

Global Liquid Fuels

Global liquid fuels supply and consumption patterns experienced two distinct periods in 2020 as a result of the COVID-19 global pandemic and its associated economic effects. From the beginning of 2020 through the end of May, declines in oil consumption outpaced declines in oil production and resulted in global oil inventories rising by 1.2 billion barrels. The sharp rise in inventories contributed to the monthly average Brent crude oil spot price falling to $18 per barrel (b) in April, the lowest price in real terms since February 1999. However, during much of the second half of the year, rising oil consumption, reduced crude oil production from members of the Organization of the Petroleum Exporting Countries (OPEC) and its partners (OPEC+), and lower U.S. crude oil production caused inventories to fall, pushing Brent prices to a monthly average of $50/b in December.

EIA forecasts that global oil consumption and production will rise during 2021 and 2022, and global oil inventories will continue to decline during much of that period. EIA expects that Brent prices will average $53/b over the next two years.

Global Petroleum and Other Liquid Fuels Consumption. Preliminary data and estimates indicate that global liquid fuels consumption declined by 9.0 million barrels per day (b/d) in 2020, the largest annual decline in EIA data going back to 1980. EIA forecasts that consumption will rise by 5.6 million b/d in 2021 and by 3.3 million b/d in 2022. The expected rise in the consumption of liquid fuels results from rising global gross domestic product (GDP) as well as a move toward pre-pandemic patterns of travel, particularly in late 2021 and in 2022. Based on data and forecasts from Oxford Economics, EIA assumes global GDP declined by 3.9% in 2020 and that it will grow by 5.4% in 2021 and by 4.3% in 2022. Despite EIA's forecast of growing consumption in 2021, global consumption of petroleum and other liquid fuels does not return to 2019 levels in the forecast until early 2022.

EIA's forecast assumes that business activity and travel will generally continue to increase throughout the year. EIA estimates that global liquid fuels consumption fell to 80.6 million b/d in April 2020, when responses to the COVID-19 pandemic were most severe across much of the world. EIA estimates that global oil consumption recovered to 95.5 million b/d by December, which was up from April but was still 6.8 million b/d lower than in December 2019. Rising COVID-19 infections during the fourth quarter of 2020 slowed the recovery in oil consumption. EIA estimates that fourth-quarter 2020 global liquid fuels consumption averaged 95.4 million b/d, up only 0.6 million b/d from the September level.

EIA expects the recent rise in COVID-19 infections, the re-imposition of some restrictions, and ongoing changes to consumer behaviors because of the pandemic will continue to affect global oil demand in the first half of 2021. Despite uncertainty, economic activity in the forecast returns to pre-pandemic levels in 2021 partly because of vaccine rollouts. As a result, the pace of oil consumption growth will, to a significant extent, rely on the manufacture and distribution of effective vaccines on a global scale.

The recovery in petroleum demand will also differ by petroleum product. Among petroleum products, jet fuel consumption fell particularly sharply in 2020, and EIA assumes that global jet fuel consumption will remain below its 2019 level through the end of 2022. EIA expects jet fuel consumption to return to pre-pandemic levels more quickly in China and the United States than in most other regions. EIA's forecast assumes consumption of hydrocarbon gas liquids (HGL) will be greater than 2020 levels in 2021 and 2022. EIA expects petrochemical manufacturing activity will contribute to growth in HGL consumption in the forecast. This growth is primarily associated with light-feed petrochemical cracking capacity coming online in China and forecast growth in U.S. HGL consumption.

On a percentage basis, EIA expects oil consumption growth to be fairly even between the countries in the Organization for Economic Cooperation and Development (OECD) and non-OECD countries. EIA forecasts oil demand will grow faster in 2021 as the economy and oil consumption are less affected by travel and other responses to COVID-19 than it was in 2020. Forecast oil demand continues to grow, but at a more moderate pace in 2022, as the effects of 2020's restrictions and behavioral changes fade and as oil demand is increasingly driven by economic growth. Forecast non-OECD liquid fuels consumption grows by 3.1 million b/d in 2021 (6%) and by 1.6 million b/d (3%) in 2022. China and India lead non-OECD liquid fuels consumption growth. EIA forecasts consumption in China will grow by 0.9 million b/d (6%) in 2021 and by 0.4 million b/d (3%) in 2022, and consumption in India is forecast to grow by 0.5 million b/d (12%) in 2021 and by 0.2 million b/d (4%) in 2022.

Forecast consumption of petroleum and other liquid fuels in the OECD grows by 2.5 million b/d (6%) in 2021 and by 1.7 million b/d (4%) in 2022. The United States leads OECD growth in both years, growing by 1.4 million b/d (8%) in 2021 and by 1.0 (5%) million b/d in 2022. EIA forecasts OECD Europe's consumption of petroleum and liquid fuels will grow by 0.6 million b/d (5%) in 2021 and by 0.5 million b/d (4%) in 2022.

Non-OPEC Production of Petroleum and Other Liquid Fuels. EIA estimates that for 2020 as a whole, non-OPEC production declined by 2.3 million b/d from 2019 levels. More than 90% of this decline came from the three largest non-OPEC producers: the United States, Russia, and Canada. Non-OPEC production was its lowest for the year during the second quarter, but production began rising in the third quarter as global oil demand increased. EIA expects production of non-OPEC petroleum and other liquid fuels to increase by 1.2 million b/d in 2021. In 2022, EIA expects non-OPEC production to rise by 2.3 million b/d, surpassing 2019 production levels. Canada and Brazil lead forecast non-OPEC production growth in 2021 and Russia and the United States will lead growth in 2022.

EIA expects that Canada's total liquid fuels production fell by 0.2 million b/d in 2020. This decrease is the result of both 2019 government-ordered production cuts in Alberta that continued into 2020 and economics-driven shut-ins because of the effect of low oil prices and falling demand for oil exports. In late October, the Alberta government announced it would stop setting monthly oil production limits. Although the government will extend its regulatory

authority to curtail oil production through December 2021, pausing production cuts will allow producers to use available export pipeline capacity. As of the end of 2020, EIA estimates that most shut-in production as a result of responses to COVID-19 has been restored, faster than previously estimated. In 2021, EIA expects Canada's production to increase by 0.4 million b/d and surpass first quarter of 2020 production, driven by the removal of government-ordered curtailments and expansions of previously deferred oil sands projects. EIA does not expect any new upstream projects to come online in Canada during the forecast period. Any additional crude oil production will come from expansions or debottlenecking of existing projects. Forecast production in Canada grows by 0.1 million b/d in 2022.

Brazil's production of petroleum and other liquid fuels grew by 0.2 million b/d in 2020, and it is expected to grow by 0.4 million b/d in 2021 and by 0.2 million b/d in 2022. In April 2020, Brazil's national oil company, Petroleo Brasileiro, S.A. (Petrobras), announced production cuts of 0.2 million b/d in response to the COVID-19 pandemic. However, weeks after this announcement, Petrobras reversed these cuts because demand for crude oil exports remained strong, especially for exports to Asia. Even as other Latin American oil producers saw declines in 2020, oil production continued to grow in Brazil, because of the continued ramping of production at floating, production, storage, and offloading vessels (FPSOs) brought online before 2020 and the record production in particular at the Buzios field. One FPSO, P-70, came online in the second half of 2020, bringing on additional volumes. New FPSO units are expected to ramp up through the forecast period, notably at the Sepia, Mero, and Buzios fields. Each of these FPSOs has a production capacity of 180,000 b/d.

After the United States, Russia is the second-largest producer of liquid fuels among non-OPEC countries. EIA expects production in Russia to grow in 2021 and 2022 after declining sharply in 2020 because the OPEC+ agreement, in which Russia participates, limited crude oil production. Russia experienced the largest liquid fuels production decline in 2020 among OPEC+ producers: a decline of 1.0 million b/d from 2019 production. EIA expects Russia's liquid fuels production to increase by 0.1 million b/d in 2021 and by 0.9 million b/d in 2022. After the OPEC+ agreement ends in early 2022, EIA expects Russia's production to return to 11.5 million b/d by April 2022, almost the same level as in the first quarter of 2020.

EIA also expects production growth in Norway during 2021 and 2022. Norway's Ministry of Petroleum and Energy enacted unilateral production limits on the Norwegian continental shelf from June to December 2020. The limits applied to production at existing fields and delayed the start of new fields and kept growth in total liquids production in 2020 to less than 0.3 million b/d. After production limits expire, EIA forecasts production growth of 0.2 million b/d in 2021 and 0.1 million b/d in 2022 as existing fields increase production and new fields come online, including the much-delayed Martin Linge field. The ramp up in new fields during 2021 will contribute to the year-over-year growth in both 2021 and 2022. The Johan Sverdrup field, which was the main driver of growth in Norway's production in 2020, will also contribute to growth in 2021, 2022, and beyond. EIA forecasts Phase 1 of the Johan Sverdrup field to return to its pre-

COVID-19 peak production of 470,000 b/d in early 2021 and surpass that before the end of 2021. In addition, Phase 2 of the Johan Sverdrup field is scheduled to come online in the fourth quarter of 2022 and add more than 0.2 million b/d production at full capacity.

EIA expects liquid fuels production in Mexico to decline the most among non-OPEC countries in 2021 and 2022. Mexico agreed to 100,000 b/d of oil production cuts under the April OPEC+ agreement. Mexico declined to extend cuts past June, and Mexico temporarily stabilized production in 2020 following previous years of declines as Petroleos Mexicanos's (PEMEX) targeted several priority fields for development. Mexico's liquid fuels production averaged 1.9 million b/d in 2020, almost unchanged from 2019. EIA expects oil production in 2021 to fall to 1.8 million b/d, even as PEMEX's priority fields continue to ramp up production and the Ixachi and the Ichalkil/Pokoch projects come online. This output is insufficient to offset declines from PEMEX's older fields, in particular the Maloob field. EIA expects Mexico's oil production to average 1.7 million b/d in 2022, reflecting PEMEX's financial constraints and continued large declines in mature fields.

EIA forecasts a number of other non-OPEC producers to experience production declines in 2021 and 2022, notably Indonesia, the United Kingdom, and Colombia.

OPEC Production of Petroleum and Other Liquid Fuels. The OPEC+ production cuts in April 2020 (extended in June), along with record oil supply disruption levels, reversed the inventory builds that resulted from the historic demand declines during the second quarter of 2020. After global oil inventories built at an estimated rate of 7.5 million b/d during the second quarter of 2020, inventories declined during the second half of 2020. OPEC members' high degree of compliance to the production cut agreement contributed to the falling inventories. EIA estimates that OPEC's crude oil production averaged 25.6 million b/d in 2020, down by 3.7 million b/d from 2019 and the lowest annual average for OPEC crude oil production since 2002.

OPEC crude oil production reached a low of 23.6 million b/d in the third quarter of 2020. However, the return of crude oil production in Libya and elsewhere during the fourth quarter of 2020, combined with a relaxation in OPEC's production cuts as global oil demand increased, contributed to production rising to 24.9 million b/d in the fourth quarter.

On January 5, 2021, OPEC+ announced modest production increases from Russia and Kazakhstan in February and March (totaling 75,000 b/d per month). Saudi Arabia announced that it would voluntarily cut production by an additional 1.0 million b/d during February and March, resulting in lower overall OPEC+ forecast production in the first quarter of 2021 than EIA had previously expected.

The revised OPEC+ agreement still allows for higher production targets in 2021. EIA expects that OPEC will continue to limit production but to a lesser degree as it relaxes its production cuts through 2021 as global oil demand rises. EIA forecasts that OPEC crude oil production will average 27.2 million b/d in 2021, up 1.6 million b/d from 2020. With the OPEC+ agreement

scheduled to expire in April 2022, EIA expects further increases in OPEC production in 2022. EIA forecasts OPEC crude oil production will average 28.2 million b/d in 2022, an increase of 1.1 million b/d.

Venezuela, Libya, and Iran are not subject to the OPEC+ agreement. EIA assumes that the current U.S. sanctions remain in place for Iran and Venezuela. Venezuela's production declines accelerated in 2020 after the United States government imposed new sanctions on Rosneft Trading in mid-February. In addition, the decline in global oil demand following the onset of the COVID-19 pandemic further reduced the demand for Venezuela's oil. EIA expects continued declines in Venezuela's crude oil production in the forecast.

Libya's crude oil production fell during the first five months of 2020 after the January closure of five export terminals in eastern Libya and the pipelines connecting the El Sharara and El Feel oilfields to those terminals. By May 2020, Libya's crude oil production averaged 80,000 b/d, down from 1.2 million b/d at the end of 2019. Libya's national oil company (NOC) lifted force majeure on all ports in September and October following a ceasefire agreement between the eastern and western security forces. Crude oil fields reopened and the national oil company quickly boosted oil production to near capacity in November 2020. However, EIA's Libya production forecast is subject to heightened risk as a result of the political and security situation in Libya, including a lack of agreement for revenue sharing between the eastern and western factions.

EIA estimates that OPEC production of other liquids declined to 5.0 million b/d on average in 2020, down from 5.4 million b/d in 2019. The 2020 production decrease was driven by less associated liquids output stemming from a reduction in crude oil production. EIA expects that this decline will reverse in tandem with OPEC+ production increases.

EIA estimates that OPEC surplus crude oil production capacity, which averaged 2.5 million b/d in 2019, averaged 6.2 million b/d in 2020 (4.0 million b/d more than the 2010–19 average) and peaked during the third quarter of 2020 at 7.9 million b/d. EIA forecasts annual average surplus capacity to decline to 5.1 million b/d in 2021 and 4.1 million b/d in 2022. The fluctuations in surplus capacity are a direct result of crude oil production changes in response to the OPEC+ agreement. These estimates do not include additional capacity that may be available in Iran that is offline because of U.S. sanctions on Iran's oil sales.

Global Petroleum Inventories. EIA estimates that global oil inventories increased by 1.2 billion barrels from the end of 2019 through May 2020. However, from June through December, estimated inventories fell by 0.5 billion barrels. EIA expects global oil inventories to generally draw in 2021 and 2022, as forecast global oil demand continues to gradually return to pre-pandemic levels, outpacing supply increases. EIA expects global oil supply to rise in the forecast, but voluntary production restraint from OPEC+ producers, along with the lingering effects of low oil prices on U.S. tight oil production, will limit global supply increases. As a result, EIA expects global oil inventories to decline at a rate of 0.6 million b/d in 2021 and 0.5 million b/d in 2022.

This rate of inventory withdraw would leave global oil inventories 0.3 billion barrels higher at the end of 2022 than they were at the end of 2019.

Crude Oil Prices. Brent crude oil prices traded within a wide range during 2020. After averaging $64/b in January 2020, Brent prices fell to an average of $18/b in April, the lowest monthly average price in real terms since February 1999. The low prices were the result of significant declines in oil consumption that caused a sharp rise in global oil inventories. However, Brent prices increased through much of the rest of 2020 because rising oil demand and reduced production caused global oil inventories to fall. Brent prices rose to a monthly average of $50/b in December in part because of expectations of future economic recovery based on continued news about the viability of multiple COVID-19 vaccines. Brent prices in early January reached their highest levels in 10 months after Saudi Arabia announced a one-month unilateral cut to its crude oil production for February that is in addition to its OPEC+ commitments.

EIA expects Brent crude oil prices to average $53/b in both 2021 and 2022. Saudi Arabia's unilateral cut means global oil market balances will be tighter in early 2021 than EIA had previously expected. EIA expects global oil inventories will fall by 2.3 million b/d in the first quarter of 2021, which EIA expects will contribute to Brent prices averaging $56/b.

Despite rising forecast oil prices in early 2021, EIA still expects upward price pressures to be limited through the forecast period because of high global oil inventory levels and surplus crude oil production capacity. EIA expects moderate downward oil price pressures to emerge beginning the second quarter of 2021, when global oil production is forecast to rise and cause inventories to draw at a slower pace. Brent spot prices are forecast to average $51/b during the second half of 2021. Upward price pressures reemerge in the forecast during 2022 as a result of global oil inventory draws accelerating compared with the second half of 2021.

Global economic developments and numerous uncertainties surrounding the ongoing COVID-19 pandemic in the coming months could push oil prices higher or lower than EIA's current price forecast. This price path reflects global oil consumption increasing by 6% from 2020 levels to reach an average of 97.8 million b/d in 2021 and by an additional 3% in 2022. But this forecast is dependent on the rate at which populations are vaccinated and the way in which oil consumption behavior changes once populations are widely vaccinated. The duration of, and adherence to, the latest targeted OPEC+ production cuts also remains uncertain. Lastly, the degree to which the U.S. shale industry responds to the recent relative strength in oil prices compared with their recent lows in April will affect the oil price path in the coming quarters.

EIA forecasts West Texas Intermediate (WTI) crude oil prices will average about $3/b less than Brent prices in 2021 and $4/b less than Brent prices in 2022. This price discount is based on EIA's assumption that the current reduced discount of WTI to Brent of $2/b on average in the second half of 2020 reflects significant declines in U.S. crude oil production and reduced available volumes of U.S. crude oil for export to distant markets relative to other global benchmarks. As the global market adjusts to reduced demand and production levels, EIA expects the spread to

return to $4/b by the second half of 2022 based on the relative cost of exporting U.S. crude oil from the Cushing distribution hub to Asia, compared with the cost of exporting Brent crude oil from the North Sea to Asia.

U.S. Liquid Fuels

Consumption. EIA estimates that in 2020, U.S. consumption of liquids fuels averaged 18.1 million b/d, down 2.5 million b/d (12%) from 2019 consumption levels. Reduced travel because of the COVID-19 pandemic drove consumption in the second quarter of 2020 down to 16.1 million b/d, the lowest level for any quarter since 1986. Total liquids consumption then increased, reaching approximately 18.5 million b/d in the fourth quarter of 2020, down from 20.6 million b/d in the fourth quarter of 2019.

As the vaccines for COVID-19 become more widely distributed, however, EIA expects the effects of the pandemic on liquids fuels consumption to moderate. EIA forecasts that total liquids consumption will average 19.5 million b/d in 2021 and 20.5 million b/d in 2022. Although EIA forecast liquids fuels consumption to increase from 2020, consumption in 2021 is forecast to remain lower than 2019 levels of 20.5 million b/d largely because consumption of transportation fuels including gasoline, distillate, and jet fuel is expected to remain lower than 2019 levels. EIA forecasts consumption in 2022 to almost return to 2019 levels; forecast gasoline and jet fuel demand that is less than 2019 levels is offset by distillate and hydrocarbon gas liquids (HGL) consumption that is forecast to be greater than 2019 levels.

In the second quarter of 2020, U.S. gasoline consumption fell to 7.1 million b/d, the lowest quarterly value in EIA data since 1993. Consumption increased to 8.5 million b/d in the third quarter before falling to 8.1 million b/d in the fourth quarter as seasonal declines and responses to increasing COVID-19 cases decreased demand. EIA expects continued responses to COVID-19 in the first half of 2021 to limit gasoline demand, which is forecast to average 8.5 million b/d, about 0.8 million b/d less than the first half of 2019 level. EIA expects consumption to increase to an average of 8.9 million b/d in the second half of 2021, but still almost 0.5 million b/d lower than consumption in the same period in 2019.

In 2022, EIA forecasts that vehicle miles traveled in the United States will be nearly equal to 2019 levels, but, because of increasing fuel efficiency, it expects gasoline consumption to average 0.3 million b/d (3.6%) less than in 2019. EIA assumes that work-from-home options in the future will remain more available than before the pandemic, limiting gasoline demand growth due to reduced commuting needs. EIA forecasts that gasoline consumption will average 8.7 million b/d in 2021 and 9.0 million b/d in 2022.

Distillate consumption in the United States in 2020 was less affected by responses to the COVID-19 pandemic than gasoline and jet fuel because it is driven more by economic activity and freight movement and is less affected by travel restrictions. In the second quarter of 2020, distillate consumption fell to 3.5 million b/d, and annual consumption averaged 3.8 million b/d

in 2020, down 8% from 2019 levels. EIA expects forecast U.S. GDP growth rates of 4.2% in 2021 and 3.8% in 2022 to support growth in distillate consumption. In 2021, EIA forecasts distillate fuel consumption will average 4.0 million b/d, which is about 97% of 2019 consumption. EIA forecasts distillate consumption in 2022 will average 4.1 million b/d, about even with 2019 consumption.

EIA forecasts that U.S. consumption of hydrocarbon gas liquids (HGL) will increase by 170,000 b/d in 2021 and 210,000 b/d in 2022, to reach annual averages of 3.3 million b/d and 3.5 million b/d, respectively. EIA expects that nearly all of the HGL growth in 2021 and 2022 to stem from increased ethane use as petrochemical feedstock. EIA also expects additional ethane cracking capacity to come online in the next two years. The increase in HGL consumption in 2021 also reflects EIA's forecast of increased propane demand as a result of a return to more normal winter weather after mild winter temperatures in the first quarter of 2020.

Crude Oil Supply. EIA estimates that annual U.S. crude oil production averaged 11.3 million b/d in 2020, down 1.0 million b/d from 2019 as a result of well curtailment and a drop in drilling activity related to low oil prices. EIA expects production to again decline in 2021, averaging 11.1 million b/d before increasing to an annual average of 11.5 million b/d in 2022, as prices and drilling conditions become more favorable.

Annual average production numbers can mask monthly trends in oil production. Most crude oil in the U.S. Lower 48 (L48) states excluding Gulf of Mexico (GOM) is tight oil production. L48 production fell from a record 10.4 million b/d in November 2019 to 8.0 million b/d in May 2020. The decline in production not only reflected a decline in drilling activity but also well curtailments because of very low oil prices. L48 production increased to 8.9 million b/d in August, largely because operators reduced curtailments. However, because much of the curtailed production is back online, EIA expects drilling activity and decline rate dynamics to again be the main drivers of production levels going forward. Because tight oil wells have steep decline curves in early years of production, continuous drilling of new wells is required to maintain average production in a region.

EIA expects L48 crude oil production to decline through February 2021 because declining legacy well production will offset production from new wells. For U.S. tight oil production, EIA analysis shows that changes in oil prices affect changes in crude oil production with about a six-month lag. EIA expects that recent increases in the oil price and in active drilling rigs will contribute to L48 production beginning to grow in the second quarter of 2021. Despite the steady increase in L48 crude oil production from the second quarter of 2021 forward, EIA expects that average 2021 L48 production will be 8.9 million b/d, or 3% lower than 2020 production levels.

EIA's forecast WTI prices remain close to $50/b through the forecast period, and with an uncertain capital environment, domestic oil production growth could be limited. As operators' financial conditions and drilling activity improve from the pressure they saw earlier in 2020, EIA expects L48 production in 2022 will rise by 0.4 million b/d on an annual average basis and reach

more than 9.5 million b/d by the end of 2022. Most of the L48 onshore growth will occur in the Permian region. A combination of relatively high average production per well combined with high rig counts make the Permian region's growth higher than the Eagle Ford or Bakken. In 2022, EIA expects almost two-thirds of L48 onshore growth to come from the Permian.

U.S. GOM production fell in 2020 because of an active hurricane season. EIA estimates that annual 2020 GOM production averaged 1.6 million b/d, down 0.3 million b/d from the 2019 average level. In 2020, according to daily estimates from the U.S. Bureau of Safety and Environmental Enforcement (BSEE), Hurricane Laura reduced GOM crude oil production an estimated 14.4 million barrels over a span of 15 days, the most of any hurricane since the combined effect of Hurricanes Gustav and Ike in 2008. GOM crude oil production fell below 1.1 million b/d in October 2020, the lowest monthly value since October 2008. EIA expects 2021 GOM production to average 1.8 million b/d in both 2021 and 2022.

EIA expects little change in Alaska's crude oil production, which will average more than 0.4 million b/d in both 2021 and 2022, down slightly from 2020 levels.

Hydrocarbon Gas Liquids Supply. EIA estimates that natural gas production of HGLs increased in 2020. The commissioning of new, efficient natural gas processing plants allowed HGL production to increase in 2020 even as natural gas production declined. EIA forecasts natural gas plant production of HGLs to increase by 130,000 b/d in 2021 to an average of 5.3 million b/d and increase to 5.6 million b/d in 2022. EIA forecasts ethane production at natural gas processing plants will rise to meet growing demand for ethane as a petrochemical feedstock, increasing by 260,000 b/d and 240,000 b/d in 2021 and 2022, respectively, to an average of 2.5 million b/d in 2022. Propane production at natural gas plants is expected to decline by 80,000 b/d from 2020 to 1.6 million b/d in 2021 and increase by 60,000 b/d in 2022.

Liquid Biofuels. COVID-19-related reductions in economic activity in general, and decreased demand for liquid fuels in particular, had a significant effect on U.S. biofuels markets in 2020, and EIA expects this trend to persist throughout the forecast period. The forecast reflects current targets in the Renewable Fuel Standard (RFS) program, and EIA assumes future RFS targets will primarily affect biomass-based diesel production and net imports, which help to meet multiple RFS targets for biomass-based diesel, advanced biofuel, and total renewable fuel.

EIA estimates that U.S. biodiesel production increased in 2020 and was less affected by COVID-19-related restrictions than many other fuels, despite production capacity that declined slightly. U.S. biodiesel production increased by an estimated 5% from 2019 to 2020, averaging an estimated 118,000 b/d last year. EIA expects biodiesel production will increase by nearly 4% to average 122,000 b/d in 2021 before increasing by an additional 6% to average 130,000 b/d in 2022, driven largely by increasing RFS targets and the existence of the biodiesel production tax credit through 2022.

U.S. net imports of biomass-based diesel increased by an estimated 10% to an average 23,000 b/d in 2020, and EIA expects net imports to increase to an average of 34,000 b/d in 2021 and 47,000 b/d in 2022. Increased net imports of biomass-based diesel are driven primarily by increased volumes of renewable diesel imported to meet both California Low Carbon Fuel Standard requirements and the rising RFS targets.

Because of sharp reductions in motor gasoline demand resulting from the COVID-19 pandemic, U.S. ethanol production was significantly lower in 2020. U.S. ethanol production fell for the second consecutive year in 2020, decreasing by an estimated 12% from 2019 to an average of 0.90 million b/d. As a result, EIA forecasts that persistent reductions in domestic gasoline demand and limited higher-blend ethanol growth potential will result in ethanol production remaining lower than 2019 levels throughout the STEO forecast. EIA expects ethanol production to average 0.98 million b/d in 2021, 9% more than in 2020, and to average 1.02 million b/d in 2022, 3% more than 2021, though still slightly below the 2019 level.

U.S. ethanol consumption averaged 949,000 b/d in 2019, and EIA estimates ethanol consumption fell by 13% to an average of 824,000 b/d in 2020. EIA forecasts that ethanol consumption will gradually rise during the forecast period, largely following the recovery in domestic motor gasoline consumption with limited growth in any higher blending levels. EIA forecasts ethanol consumption will average 887,000 b/d in 2021 and 917,000 b/d in 2022. This level of consumption results in the ethanol share of total gasoline, which was an estimated 10.2% in both 2019 and 2020, remaining near this level during 2021 and 2022. This stable ethanol share assumes that growth in higher-level ethanol blends is limited by a combination of lower gasoline prices reducing incentives for increased ethanol blending and limited consumer demand for higher levels of ethanol blending beyond 10% of gasoline (E10).

Product Prices. Changes in travel patterns because of COVID-19- resulted in significant reductions in crude oil prices and demand for liquid fuels in the United States during 2020, which significantly reduced prices for gasoline and diesel fuel during the same period. U.S. retail prices for regular-grade gasoline averaged $2.18 per gallon (gal) during 2020, and retail diesel prices averaged $2.55/gal, down about 42 cents/gal and 50 cents/gal from their respective 2019 averages.

The U.S. gasoline and diesel price declines largely reflect a drop in crude oil prices. Refinery margins, which fell significantly as gasoline and diesel demand fell quickly in March and April, returned to levels within their normal seasonal ranges in the fourth quarter of 2020. During the same quarter, refiners reduced runs and inventory levels for gasoline and diesel fuel largely returned within their previous five-year ranges. EIA expects that any changes in petroleum product prices will largely follow movements in crude oil prices over the STEO forecast period as overall inventory levels remain above the five-year average and upward price pressures related to demand remain limited.

The U.S. refinery wholesale gasoline margin (the difference between the wholesale price of gasoline and the price of Brent crude oil) averaged 21 cents/gal in April 2020, increased to an average of 35 cents/gal in the third quarter of 2020, and fell back to 28 cents/gal in the fourth quarter. Third and fourth quarter margins both fell within normal recent five-year seasonal ranges. EIA expects the U.S. refinery wholesale gasoline margin will average 36 cents/gal in 2021 and 35 cents/gal in 2021, compared with a five-year (2016–20) average of 35 cents/gal.

EIA expects the retail price of regular gasoline in the United States will average $2.33/gal during the first quarter of 2021, 9 cents/gal lower than at the same time last year. EIA expects the U.S. monthly regular retail gasoline price will increase from an average of $2.28/gal in January 2021 to an annual peak of $2.53/gal in May before falling to $2.29/gal in December 2021. The U.S. regular gasoline retail price, which averaged $2.18/gal in 2020, is forecast to average $2.40/gal in 2021 and $2.42/gal in 2022.

Regional annual average forecast prices for 2021 range from a low of $2.10/gal in the Gulf Coast region—Petroleum Administration for Defense District (PADD) 3—to a high of $3.10/gal in the West Coast region (PADD 5).

The retail price of diesel fuel in the United States averaged $2.55/gal in 2020, which was 50 cents/gal lower than in 2019. EIA forecasts that the diesel price will average $2.71/gal in 2021 and $2.74/gal in 2022. EIA expects that global economic activity returning to pre-pandemic levels will help drive diesel refinery margins higher than their multiyear lows in 2020 during the forecast period. Diesel refinery margins based on Brent crude oil averaged 30 cents/gal in 2020, which was 11 cents/gal lower than the 2015–19 average and the lowest annual average since 2009. EIA expects diesel refinery margins will average 39 cents/gal in 2021 and 42 cents/gal in 2022.

Natural Gas

Natural Gas Consumption. EIA estimates consumption of natural gas in the United States averaged 83.1 billion cubic feet per day (Bcf/d) in 2020, down 2.5% from 2019, and EIA expects U.S. consumption will decrease by 2.3 Bcf/d (2.8%) in 2021 and then decrease by 1.7 Bcf/d (2.1%) in 2022.

The largest natural gas-consuming sector in the United States is the electric power sector. EIA estimates that the power sector will consume an average 28.1 Bcf/d in 2021, which is 11.0% less than in 2020. EIA forecasts that higher prices for natural gas (compared with coal prices) for power generation and rising electricity generation capacity from renewable energy in 2021 will likely cause power sector natural gas consumption to decline in 2021. EIA forecasts power sector consumption of natural gas will fall by an additional 6.2% in 2022, reflecting further growth in renewables and increases in natural gas prices.

EIA expects combined U.S. residential and commercial natural gas consumption will average 22.4 Bcf/d in 2021, up 5.8% from 2020. Compared with the first quarter of 2020, expectations of

cooler temperatures and people spending more time at home because of the COVID-19 pandemic will likely lead to slight increases in heating demand in the first quarter of 2021. Based on NOAA forecasts, EIA assumes colder temperatures with 6.4% more heating degree days (HDDs) across the United States in 2021 compared with 2020. EIA expects natural gas consumption in the U.S. residential and commercial sectors to decline by 1.0% in 2022, as the COVID-19 pandemic subsides, reducing heating demand in the residential sector.

EIA forecasts U.S. consumption of natural gas in the industrial sector will be mostly unchanged in 2021 before increasing by 0.4% in 2022. EIA's natural gas-weighted manufacturing index, based on forecasts from IHS Markit, has steadily increased after falling in the second quarter of 2020; however, EIA's forecast assumes that the natural gas-weighted manufacturing index will not reach 2019 levels until late 2022.

Natural Gas Production. EIA estimates that U.S. production of dry natural gas averaged 90.8 Bcf/d in 2020, down 2.3 Bcf/d (2.5%) from 2019. Natural gas production fell in 2020 as a result of low natural gas and oil prices that reduced drilling activity. EIA expects that natural gas production will decline again in 2021 to an annual average of 88.2 Bcf/d. However, on a monthly basis, EIA expects dry natural gas production will fall down to an average of 87.3 Bcf/d in March 2021, and then rise through the rest of the forecast period. EIA expects that recent increases in oil prices and a forecast of rising natural gas prices will contribute to an overall increase in drilling activity in the coming months that will contribute to production growth after the first quarter.

In 2022, EIA expects dry natural gas production to increase by 1.5 Bcf/d (1.7%) from 2021 to reach 89.7 Bcf/d. EIA forecasts continued increases in natural gas and crude oil prices to drive more drilling activity.

Natural Gas Trade. EIA forecasts net natural gas exports will rise from an average of 6.5 Bcf/d in 2020 to 9.8 Bcf/d in 2021 and 10.7 Bcf/d in 2022. The United States has been exported more natural gas than it imports since the second quarter of 2017 because of both rising liquefied natural gas (LNG) and pipeline exports.

EIA estimates that the United States exported 9.8 Bcf/d of LNG in December 2020, an increase of 0.4 Bcf/d over the previous record set in November. The increase in U.S. LNG exports was driven by rising international natural gas and LNG prices in Europe and Asia, reduction in global supply because of several unplanned outages at LNG export facilities worldwide, and cold weather in key LNG consumption markets, particularly in Asia. Prices at JKM, representing trades in Japan, South Korea, China, and Taiwan, averaged $10.82 per million British thermal units (MMBtu) in December, which was the highest monthly average since 2018.

All six U.S. LNG export facilities operated near full capacity in December exporting a record 89 cargoes (91% utilization of peak LNG export capacity). The third and final train at Corpus Christi LNG facility in Texas was commissioned 6 months ahead of schedule and sent its first cargo in

the middle of December. EIA estimates that the nominal liquefaction capacity of LNG in operation in the United States is 9.5 Bcf/d as a baseload and 10.8 Bcf/d at peak across six facilities that include 15 standard-size liquefaction units and 10 small modular liquefaction units.

EIA forecasts U.S. LNG exports to average 8.5 Bcf/d in 2021 and 9.2 Bcf/d in 2022. Forecast growth in U.S. LNG exports is supported by several factors, including a gradual post-COVID-19 recovery in global LNG demand in established markets, high winter LNG demand in Asia, and expansions in global LNG import infrastructure in existing markets with several new countries expected to become LNG importers in the next two years

Pipeline exports of U.S. natural gas have also increased as more infrastructure has been built to transport natural gas both to and within Mexico. U.S. pipeline exports averaged 8.0 Bcf/d in 2020, an increase of 2.5% compared with 2019. Pipeline exports are expected to increase as more natural gas-fired power plants come online in Mexico and more pipeline infrastructure within Mexico is built. EIA expects gross U.S. pipeline exports to Mexico and Canada to average 8.6 Bcf/d in 2021 and 8.7 Bcf/d in 2022.

U.S. net natural gas pipeline imports (almost all of which come from Canada) decreased from 2019 to 2020, continuing a trend that began in 2008. EIA forecasts natural gas pipeline imports to increase 3.8% in 2021 because the United States will import more natural gas amid a decline in U.S. natural gas production. However, pipeline imports will likely decline in 2022 in response to an increase in U.S. natural gas production in 2022.

Natural Gas Inventories. EIA estimates that end-of-December U.S. working natural gas inventories were 3,375 Bcf, 6% more than both the year-ago level and 6% more than the five-year (2015–19) average. EIA forecasts above-average storage withdrawals in the first quarter of 2021 based on an assumption of cooler-than-normal weather in the January–March time period and because of forecast declines in natural gas production. EIA expects total inventories will be 1,620 Bcf at the end of March, which would be 12% lower than the five-year average for that time of year. For the 2021 April–October storage injection season, EIA expects injections will slightly exceed the five-year average rate, as forecast production begins growing in April and as higher natural gas prices in 2021 will limit the consumption of natural gas in electric power plants during the summer. EIA expects that inventories will reach 3,575 Bcf at the end of October 2021, which would be 5% lower than the previous five-year average for the end of October and 9% lower than at the end of October 2020.

Natural Gas Prices. Henry Hub spot prices averaged $2.03/MMBtu in 2020. Natural gas prices fell through much of 2020 because of sharp declines in LNG exports and industrial-sector natural gas consumption outpaced declines in production and contributed to inventories building at a faster rate than the five-year average.

Although Henry Hub spot prices rose late in 2020 to average $2.59/MMBtu in December, a warm early winter moderated price increases. EIA expects the average spot price of natural gas

to increase to $3.01/MMBtu in the first quarter of 2021. The price forecast is based on expectations of slightly cooler-than-normal weather in the first quarter. However, the fourth quarter of 2020 was warmer than average. If warmer-than-average weather persists in the second half of winter, it could contribute to downward pressure on natural gas spot prices in the January–March period. In 2021, EIA expects general upward price pressures amid relatively low natural gas production, meaning higher prices will be needed in order to increase production and balance the supply and demand of natural gas. EIA forecasts the spot prices to average $3.01/MMBtu in 2021, up 98 cents/MMBtu from 2020, and increase further to an average of $3.27/MMBtu in 2022.

Coal

Coal Supply. EIA estimates U.S. coal production fell by 168 million short tons (MMst) (24%) in 2020 to total 537 MMst for the year. The decline in production was primarily caused by less power sector demand for coal amid low natural gas prices. Coal production declined by an estimated 40 MMst (30%) in the Interior region, 79 MMst (21%) in the Western region, and 50 MMst (26%) in the Appalachian region. EIA expects U.S. coal production to rise as natural gas prices increase in 2021, increasing demand for coal in the electric power sector. EIA expects coal production in 2021 to be 603 MMst, a 12% increase from 2020 levels.

EIA expects increases in coal production to moderate in 2022, rising by 25 MMst (4%), as forecast coal consumption growth slows.

Coal Consumption. EIA estimates that coal consumption for all sectors totaled 476 MMst in 2020, a 110 MMst (19%) decline from the previous year. U.S. coal consumption in the electric power sector for 2020 declined by 104 MMst (19%), driving the decrease in overall coal consumption. Coal consumption at coke plants decreased from 18 MMst in 2019 to an estimated 15 MMst in 2020. EIA expects a 61 MMst rise in coal consumption from all sectors in 2021, largely driven by an increase in demand from the electric power sector, which is expected to consume 494 MMst of coal in 2021. In 2022, EIA forecasts total U.S. coal consumption to increase by 44 MMst to 581 MMst.

Coal Trade. Because of reduced demand from major international consumers, EIA estimates total U.S. coal exports declined by 26 MMst (28%) in 2020 to 66 MMst. This total is the second-lowest annual amount exported over the past 10 years. EIA estimates metallurgical coal exports were 42 MMst in 2020, 24% lower than the previous year, and steam coal exports were 24 MMst, a decrease of 35% from 2019 levels.

U.S. exports of both metallurgical and steam coal to India, a major consumer of U.S. coal, were down by 15% in 2020 through October compared with the same period in 2019. Japan, another major destination for U.S. coal exports, reduced imports of U.S. coal by 50% through October 2020. Exports to Europe have also decreased.

EIA expects total U.S. coal exports to increase by 15 MMst (23%) in 2021, as a result of economic growth in major coal importers that are emerging from lower demand because of the pandemic in 2020. EIA expects coal exports to increase by 10 MMst (12%) in 2022 as market conditions continue to normalize following the pandemic. However, EIA expects that coal exports will total 92 MMst in 2022, slightly less than 2019 levels.

Coal Prices. EIA estimates the delivered coal price to U.S. electricity generators averaged $1.94 per million British thermal units (MMBtu) in 2020, which was 8 cents/MMBtu lower than the 2019 price. EIA forecasts that coal prices will increase to $2.06/MMBtu in 2021 and $2.07 in 2022.

Electricity

Electricity Consumption. EIA forecasts total U.S. electricity consumption, including direct use of electricity by combined-heat-and-power plants, will increase by 1.5% in 2021 and by 1.7% in 2022.

Social distancing guidelines related to the COVID-19 pandemic and restrictions on some economic activity such as limits on the number of customers in restaurants and retail stores have affected electricity consumption patterns over the past year. Residential electricity consumption has risen because people are staying at home for longer periods during the day and because many are working from home. In contrast, electricity consumption in the commercial and industrial sectors has fallen.

During the spring of 2020, retail sales of electricity to the residential sector were about 9% higher than the typical heating and cooling demand given the temperatures at that time. This effect appears to have moderated somewhat in recent months, averaging about 4% above typical consumption since July. EIA expects the effect of increased residential electricity usage to gradually decline through the first half of 2021. In addition, electricity usage for heating during the first quarter of 2021 will likely be more than the same period last year because of colder weather in the United States, with 11% more heating degree days. Annual residential electricity retail sales increased by 1.3% in 2020 and are forecast to grow by 2.4% in 2021 and by 1.6% in 2022.

Electricity consumption in the commercial sector during 2020 was down by an estimated 6.0% from 2019 as a result of the economic contraction related to COVID-19. In addition, electricity use at some office buildings may have been lower as some people were working from home instead of in their offices. EIA expects commercial activity to increase in 2021 with non-farm employment rising by 2.8%. However, some of the changes in working patterns may continue in the long term, reducing the need for electricity use at offices. EIA forecasts commercial sector retail electricity sales will grow by 0.9% in 2021 and by 1.8% in 2022.

Improving economic conditions will also likely increase electricity demand in the industrial sector. EIA forecasts that industrial production by electricity-intensive industries will increase by

2.9% in 2021 after declining 6.9% in 2020. This expected increase in industrial production contributes to EIA's forecast that retail sales of electricity to the industrial sector will rise by 1.2% in 2021. In 2022, EIA forecast retail sales of electricity to the industrial sector will increase by 1.1%.

Electricity Generation. EIA expects 1.2% more power generation in the U.S. electric power sector during 2021 than in 2020. Electric power sector generation in the forecast grows by an additional 1.5% in 2022.

The share of U.S. electricity generation supplied by natural gas-fired power plants has increased significantly during the past decade, rising from 23% of total generation in 2010 to an estimated 39% in 2020. Reduced generation from coal-fired power plants has offset this increase. Coal supplied 46% of U.S. generation in 2010, compared with an estimated 20% in 2019. Much of this change in the generation mix has been the result of sustained low prices for natural gas.

The cost of natural gas delivered to electric power generators was often below $3.00/MMBtu during the past two years. During 2020, the U.S. cost of delivered natural gas averaged an estimated $2.37/MMBtu, which would be the lowest price in nominal dollars since 1995. EIA forecasts the average cost of natural gas for electricity generation to rise by 41% to an average of $3.35/MMBtu in 2021, which is about the same price as in 2017. Forecast average U.S. delivered natural gas prices rise by an additional 8.9% in 2022.

These expected changes in the costs of fuels used for generating power will likely affect the use of coal and natural gas for electricity generation. EIA forecasts that the natural gas-fired share of total U.S. generation will decline to 36% in 2021 and 34% in 2022, which would be about the same natural gas share as in 2018. The expected rise in natural gas fuel costs make coal more economic for electricity generation, with EIA's forecast share of generation from coal-fired power plants rising to 22% in 2021 and 24% in 2022. However, these shares of coal generation would still be the second- and third-lowest share in history after the 20% share in 2020.

EIA expects the share of generation from renewable sources will increase from 20% in 2020 to 21% in 2021 and to 23% in 2022. Within the renewables category, hydropower generally averages about 7% of total generation, and EIA forecasts that it will be about that share in 2021 and in 2022. In the forecast, the share of total generation for renewables other than hydropower, which was 12% in 2020, will rise to 14% in 2021 and to 16% in 2022.

According to the latest information about the U.S. inventory of generating capacity, six nuclear reactors are scheduled to retire in either 2021 or 2022, and two are scheduled to come online. The forecast nuclear share of total electricity generation, which averaged nearly 21% in 2020 will fall to 20% by 2021 and to 19% in 2022, consistent with upcoming retirements.

Renewable Capacity. Over the next two years, renewable generating capacity continues to grow. Wind capacity growth begins to moderate, but solar capacity growth continues. In 2021, large-scale solar capacity growth in gigawatts (GW) exceeds wind growth for the first time. EIA

forecasts that 15 GW of solar photovoltaic (PV) generating capacity in the electric power sector will be added in 2021, with an additional 12 GW forecast for 2022. Small-scale solar PV capacity is forecast to increase by 4 GW in 2021, with another 3 GW forecast for 2022. Residential PV accounts for most of this additional small-scale generating capacity for both 2021 and 2022. EIA's forecast solar capacity growth reflects various state and federal policies to support renewable energy.

Tariffs on PV modules decline to 15% in 2021 and expire thereafter. Growth in PV generating capacity over the STEO forecast reflects, in large part, declining global prices for PV modules and increasing prices for natural gas. This anticipated fall in module price is expected to outweigh price increases incurred by the tariff in 2021.

Generating capacity from wind turbines in the electric power sector is forecast to grow by 12 GW in 2021, with an additional 4GW of growth expected for 2022. This growth in forecasted wind generating capacity for 2021 and 2022 marks a decline from the record of 21 GW added in 2020. Because wind capacity is often added at the end of the calendar year, increases in generation frequently lag behind increases in capacity for the year they occur in, and they are reflected in the generation for the next year.

Much of this slowing growth in wind can be attributed to the expiration of the production tax credit. The credit, which at the end of 2019 was extended through 2020, provided a 2.5 cents per kilowatthour (kWh) benefit for facilities entering service or securing 5% safe harboring (spending at least 5% of total estimated project cost) through the 2020 calendar year. The effect of the tax credit extension included in the Consolidated Appropriation Act 2021, enacted in late-December 2020, is not yet reflected in this forecast. EIA will update its data and forecasts as new information is reported on the EIA-860 survey of planned capacity additions.

Electricity Prices. EIA expects wholesale electricity prices in many areas of the country in 2020 will be higher than last year, reflecting the increased cost of natural gas for power generation. EIA forecasts that annual average wholesale prices in New England will rise 43% this year primarily as a result of expected colder winter weather that contributes to rising natural gas prices. However, in California, forecast wholesale electricity prices in 2021 average 8.1% lower than last year, primarily reflecting fewer spikes in prices related to hot summer weather as happened in 2020.

EIA forecasts the U.S. retail electricity price for the residential sector will average 13.3 cents/kWh in 2021, which is 1.2% higher than the average retail price in 2020. Forecast residential prices increase by an additional 1.2% in 2022.

U.S. Economic Assumptions and Energy-Related Carbon Dioxide Emissions

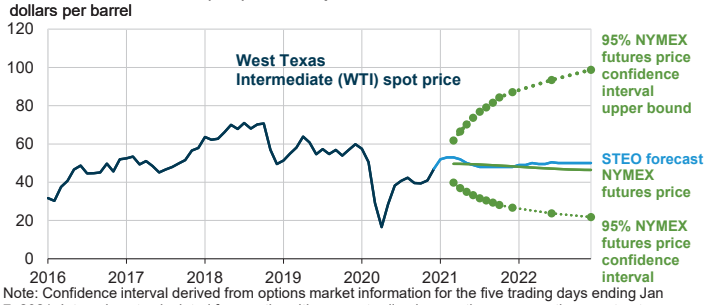
The STEO is based on macroeconomic forecasts by IHS Markit for the United States. EIA used the December 2020 version of the IHS Markit macroeconomic model with EIA's energy price forecasts as model assumptions to develop the economic forecasts in the STEO.

Using the IHS Markit model, EIA assumes U.S. real GDP declined by 3.5% in 2020 and that it will grow by 4.2% in 2021 and by 3.8% in 2022. This compares with 2.2% annual growth in 2019. EIA assumes that total industrial production decreased 6.9% in 2020, and EIA expects that it will increase 4.0% in 2021 and will grow by 4.5% in 2022. This growth compares with 0.9% annual growth in 2019. In the forecast, U.S. nonfarm employment, which grew by 1.4% in 2019, decreased by 5.7% in 2020, will increase by 2.8% in 2021, and will increase by 3.5% in 2022.

Energy-related carbon dioxide emissions. Energy-related carbon dioxide (CO2) emissions, fell by 11.1% in 2020 relative to 2019. CO2 emissions are expected to rise by 4.7% in 2021 and by 3.2% in 2022. EIA forecasts an increase in coal CO2 emissions and a decrease in natural gas CO2 emissions because of higher natural gas prices. EIA expects CO2 emissions from coal to rise by 12.5% in 2021 and by 8.0% in 2022, almost returning to 2019 levels. EIA expects CO2 emissions from natural gas to fall by 3.0% from 2020 to 2021 and by 2.1% from 2021 to 2022. Petroleum-related CO2 emissions increase 7.8% in 2021 and 5.0% in 2022 as transportation patterns begin to return to normal. Energy-related CO2 emissions are sensitive to changes in weather, economic growth, energy prices, and fuel mix.

Notable forecast changes

- For more information, see the detailed table of forecast changes.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the United States Government. The views in this report therefore should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

- = no data available

Prices are not adjusted for inflation.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.

EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).

Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

Notes: EIA completed modeling and analysis for this report on Thursday January 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Weather projections from National Oceanic and Atmospheric Administration.

Residential Sector	**12.90**	**13.24**	**13.36**	**13.14**	*12.82*	*13.31*	*13.54*	*13.37*	*13.10*	*13.62*	*13.78*	*13.55*	**13.17**	*13.27*	*13.53*

- = no data available

Prices are not adjusted for inflation.

(a) Average for all sulfur contents.

(b) Average self-service cash price.

(c) Includes fuel oils No. 4, No. 5, No. 6, and topped crude.

Notes: EIA completed modeling and analysis for this report on Thursday January 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices exclude taxes unless otherwise noted.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Marketing Monthly* , DOE/EIA-0380; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; and *Monthly Energy Review* , DOE/EIA-0035.

WTI and Brent crude oils, and Henry Hub natural gas spot prices from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

Notes: EIA completed modeling and analysis for this report on Thursday January 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on Thursday January 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

STF-3-12 Attachment E

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. GDP data are from Oxford Economics.

(b) Weighted geometric mean of real indices for various countries with weights equal to each country's share of world oil consumption in the base period. Exchange rate is measured in foreign currency per U.S. dollar. Exchange rate data are from Oxford Economics, and oil consumption data are from EIA.

Notes: EIA completed modeling and analysis for this report on Thursday January 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" inludes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

Notes: EIA completed modeling and analysis for this report on Thursday January 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

(a) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

Notes: EIA completed modeling and analysis for this report on Thursday January 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

Notes: EIA completed modeling and analysis for this report on Thursday January 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

LNG: liquefied natural gas.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Prices are not adjusted for inflation.

Notes: EIA completed modeling and analysis for this report on Thursday January 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

Notes: EIA completed modeling and analysis for this report on Thursday January 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on Thursday January 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

Notes: EIA completed modeling and analysis for this report on Thursday January 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 7c. U.S. Regional Retail Electricity Prices (Cents per Kilowatthour)

- = no data available

Prices are not adjusted for inflation.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

Notes: EIA completed modeling and analysis for this report on Thursday January 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on Thursday January 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

Notes: EIA completed modeling and analysis for this report on Thursday January 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226;

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distributed solar photovoltaic systems.

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

Notes: EIA completed modeling and analysis for this report on Thursday January 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly,* DOE/EIA-0226 and *Renewable Energy Annual,* DOE/EIA-0603; *Petroleum Supply Monthly,* DOE/EIA-0109.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

-- = no data available

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to one megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than one megawatt).

(d) Solar photovoltaic systems smaller than one megawatt, as measured in alternating current.

Notes: EIA completed modeling and analysis for this report on Thursday January 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecastss: EIA-860M database, EIA-826 Solar PV database, and EIA Short-Term Integrated Forecasting System.

- = no data available

SAAR = Seasonally-adjusted annual rate

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

Notes: EIA completed modeling and analysis for this report on Thursday January 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Aviation Administration. Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on Thursday January 7, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecast: Macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on Thursday January 7, 2021.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National Oceanic and Atmospheric Administration (NOAA).

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Independent Statistics & Analysis
U.S. Energy Information Administration

February 2021

Short-Term Energy Outlook

Forecast highlights

Global liquid fuels

- The February *Short-Term Energy Outlook* (STEO) remains subject to heightened levels of uncertainty because responses to COVID-19 continue to evolve. Reduced economic activity related to the COVID-19 pandemic has caused changes in energy demand and supply over the past year and will continue to affect these patterns in the future. U.S. gross domestic product (GDP) declined by 3.6% in 2020 from 2019 levels. This STEO assumes U.S. GDP will grow by 3.8% in 2021 and by 4.2% in 2022. The U.S. macroeconomic assumptions in this outlook are based on forecasts by IHS Markit.

- Brent crude oil spot prices averaged $55 per barrel (b) in January, up $5/b from the December average but $9/b lower than the average in January of last year. Higher Brent prices in January largely reflected the January 5 announcement by Saudi Arabia that it would unilaterally cut 1.0 million barrels per day (b/d) of crude oil production in February and March, in addition to the reduced production levels on which the Organization of the Petroleum Exporting Countries (OPEC) and partner countries (OPEC+) previously agreed. The U.S. Energy Information Administration (EIA) expects Brent crude oil prices will average $56/b in the first quarter of 2021 and $52/b over the remainder of the year. EIA expects lower oil prices later in 2021 as a result of rising oil supply that will slow the pace of global oil inventory withdrawals. EIA also expects that high global oil inventory levels and spare production capacity will limit upward price pressures. EIA expects Brent prices will average $55/b in 2022.

- EIA estimates that the world consumed 93.9 million b/d of petroleum and liquid fuels in January, which is down 2.8 million b/d from January 2020. EIA forecasts that global consumption of petroleum and liquid fuels will average 97.7 million b/d for all of 2021, which is up by 5.4 million b/d from 2020. EIA forecasts that consumption of petroleum and liquid fuel will increase by 3.5 million b/d in 2022 to average 101.2 million b/d.

- EIA estimates that U.S. crude oil production averaged 11.0 million b/d in January, which is down slightly from 11.1 million b/d in November (the most recent month for which historical data are available). EIA expects production will continue to decline slightly in the coming months, reaching 10.9 million b/d in June. Although oil-directed drilling has increased in the United States in recent months, the number of active drilling rigs remains lower than year-ago levels. EIA expects production from newly drilled wells will be more

than offset by declining production rates at existing wells in the first half of 2021. However, based on EIA's forecast that West Texas Intermediate crude oil prices will remain near or higher than $50/b during the forecast period, EIA expects drilling will continue to increase. As a result, production from new wells will exceed the declines from legacy wells, and overall crude oil production will increase in the second half of 2021 and in 2022. EIA estimates that U.S. crude oil production will average 11.0 million b/d in 2021—down from 11.3 million b/d in 2020 and 12.2 million b/d in 2019—and will rise to 11.5 million b/d in 2022.

- U.S. regular gasoline retail prices averaged $2.33 per gallon (gal) in January, compared with an average of $2.20/gal in December and $2.55/gal in January 2020. EIA forecasts gasoline prices to average $2.44/gal in 2021 and $2.46/gal in 2022. U.S. diesel fuel prices averaged $2.68/gal in January compared with $2.58/gal in December and $3.05/gal in January 2020, and EIA forecasts it will average $2.70/gal in 2021 and $2.77/gal in 2022.

- On a volume basis, U.S. consumption of gasoline declined by more than other petroleum products in 2020. EIA forecasts that U.S. gasoline consumption will rise in the forecast but remain lower than 2019 levels. U.S. gasoline consumption is forecast to average 8.6 million b/d in 2021 and 8.9 million b/d in 2022, up from 8.0 million b/d in 2020 but lower than the 9.3 million b/d consumed in 2019.

Natural Gas

- EIA expects that total U.S. consumption of natural gas will average 81.7 billion cubic feet per day (Bcf/d) in 2021, down 1.9% from 2020. The decline in total U.S. consumption reflects less natural gas consumed for electric power as a result of higher natural gas prices compared with last year. In 2021, EIA expects residential natural gas demand to average 12.9 Bcf/d (up 0.2 Bcf/d from 2020) and commercial demand to average 9.1 Bcf/d (up 0.6 Bcf/d from 2020). EIA forecasts industrial consumption will average 23.0 Bcf/d in 2021 (up 0.4 Bcf/d from 2020) as a result of increased manufacturing activity amid a recovering economy. Industrial consumption of 23.0 Bcf/d would be 0.1 Bcf/d below the 2019 level. EIA expects total U.S. natural gas consumption will average 81.0 Bcf/d in 2022.

- In January, the Henry Hub natural gas spot price averaged $2.71 per million British thermal units (MMBtu), up from the December average of $2.59/MMBtu. EIA expects Henry Hub spot prices to reach a monthly average of $2.98/MMBtu in February 2021. Higher expected prices in February reflect expectations of continued strong liquefied natural gas (LNG) exports and a shrinking surplus of natural gas in storage compared with the five-year (2016–20) average. EIA uses weather forecasts from the National Oceanic and Atmospheric Administration (NOAA) as an input into the STEO, and the NOAA forecast in this STEO is from late January. More recent forecasts for mid-February weather show cold temperatures could extend across much of the United States, which creates an upside risk to near-term prices in this outlook. EIA expects that Henry Hub spot prices will average $2.95/MMBtu in

2021, which is up from the 2020 average of $2.03/MMBtu. EIA expects that continued growth in LNG exports and in domestic natural gas consumption outside of the electric power sector, as production remains relatively flat, will contribute to Henry Hub spot prices rising to an average of $3.27/MMBtu in 2022.

- U.S. working natural gas in storage ended October at more than 3.9 trillion cubic feet (Tcf), 5% more than the 2015–19 average and the fourth-highest end-of-October level on record. EIA estimates that inventory withdrawals were 703 billion cubic feet (Bcf) in January, compared with a five-year (2016–20) average January withdrawal of 716 Bcf. The January withdrawals occurred at a lower rate than EIA forecast in last month's STEO. The lower-than-expected withdrawal is the result of warmer-than-average January temperatures that reduced natural gas use for space heating. However, EIA forecasts that declines in U.S. natural gas production this winter compared with last winter will more than offset the declines in natural gas consumption, which will contribute to natural gas storage returning to levels near the five-year average by the end of winter. Forecast natural gas inventories end March 2021 at 1.8 Tcf, which is about the same as the five-year average.

- EIA forecasts that U.S. production of dry natural gas will average 90.5 Bcf/d in 2021 and 91.0 Bcf/d in 2022, which are down from an average of 91.3 Bcf/d in 2020 and 93.1 Bcf/d in 2019. In the forecast, dry natural gas production remains relatively flat, averaging between 89.8 Bcf/d and 91.0 Bcf/d in every month from February 2021 through July 2022. Flat natural gas production is the result of falling production in several of the smaller natural gas producing regions being offset by growth in other regions, most notably in the Appalachia and Haynesville regions.

- EIA estimates that the United States exported 9.8 Bcf/d of LNG in January amid high spot natural gas prices in Asia. However, foggy conditions and high winds affected export operations at Sabine Pass LNG, Corpus Christi LNG, and Cameron LNG, leading to several weather-related closures and sporadic suspension of piloting services on several days in January. EIA forecasts that U.S. LNG exports will average 8.5 Bcf/d in 2021. In 2022, EIA forecasts LNG exports will average 9.2 Bcf/d, surpassing the amount of natural gas exported via pipeline for the first time.

Electricity, coal, renewables, and emissions

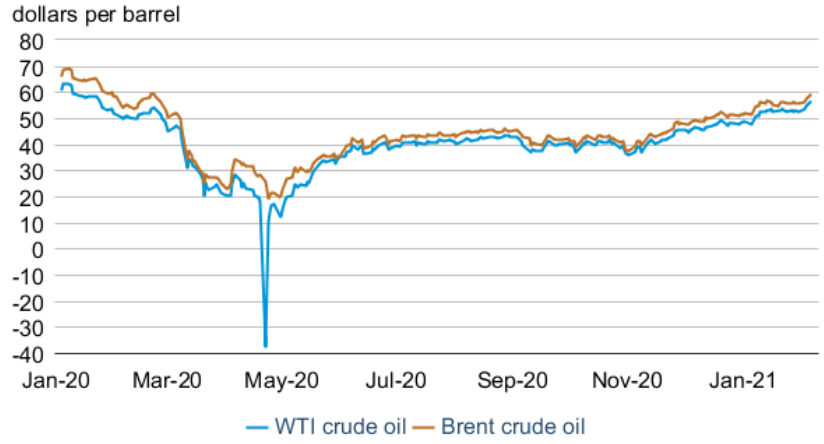
- EIA forecasts that consumption of electricity in the United States will increase by 1.6% in 2021 after falling 3.8% in 2020. EIA forecasts residential sector retail sales will grow by 2.2% in 2021. The increase is primarily a result of colder forecast temperatures in the first quarter of 2021 compared with the same period in 2020, which EIA expects will raise demand for space heating, along with EIA's assumption that more people will be working from home than in the first quarter of 2020. EIA expects retail sales of electricity in the commercial and industrial sectors will increase by 1.2% and 2.3%, respectively. For 2022, EIA forecasts total electricity consumption will grow by another 1.7%.

- EIA expects the share of U.S. electric power generated with natural gas to fall from 39% in 2020 to 37% in 2021 and to 35% in 2022. The forecast natural gas share declines in response to a forecast increase in the price of natural gas delivered to electricity generators from an average of $2.38/MMBtu in 2020 to $3.27/MMBtu in 2021 (a 37% increase). Coal's forecast share of electricity generation rises from 20% in 2020 to 21% in 2021 and to 22% in 2022. Electricity generation from renewable energy sources rises from 20% in 2020 to 21% in 2021 and to 23% in 2022. The nuclear share of U.S. generation declines from 21% in 2020 to 20% in 2021 and to 19% in 2022.

- EIA forecasts that planned additions to U.S. wind and solar generating capacity in 2021 and 2022 will contribute to increasing electricity generation from those sources. EIA estimates that the U.S. electric power sector added 17.5 gigawatts (GW) of new wind capacity in 2020. EIA expects 15.3 GW of wind capacity will be added in 2021 and 3.6 GW in 2022. Utility-scale solar capacity rose by an estimated 11.1 GW in 2020. The forecast for added utility-scale solar capacity is 16.2 GW for 2021 and 12.3 GW for 2022.

- EIA expects U.S. coal production to total 589 MMst in 2021, 50 MMst (9%) more than in 2020. In 2022, EIA expects coal production to rise by a further 5 MMst (1%). These increases reflect higher forecast demand for coal in the electric power sector because of rising natural gas prices, which increases coal's competitiveness relative to natural gas for power generation dispatch. Although EIA expects coal production to rise in 2022, expected production increases will be limited by strong inventory draws. EIA expects significant coal supply to the power sector will come from a reduction in inventory levels in 2022, as the power sector brings inventory levels back in line with historical averages. Coal production in the forecast will also be limited by declining production capacity, as high mine reclamation costs have contributed to mine divestments and closings that may counter the effects of higher coal demand.

- EIA expects rising global economic activity will contribute to rising steel production and power demand, which will lead to increased U.S. exports of both metallurgical and steam coal. EIA forecasts coal exports will total 85 MMst in 2021, up by 24% from 2020, which was the lowest level since 2016. EIA forecasts exports will rise by 6 MMst in 2022 to 91 MMst.



- EIA estimates that U.S. energy-related carbon dioxide (CO2) emissions decreased by 11% in 2020. This decline in emissions is the result of less energy consumption related to economic contraction in response to the COVID-19 pandemic. In 2021, EIA forecasts that energy-related CO2 emissions will increase by about 4% from the 2020 level as economic activity increases leading to rising energy use. Energy-related CO2 emissions are also expected to rise by 3% in 2022 as economic growth continues.

Petroleum and natural gas markets review

Crude oil

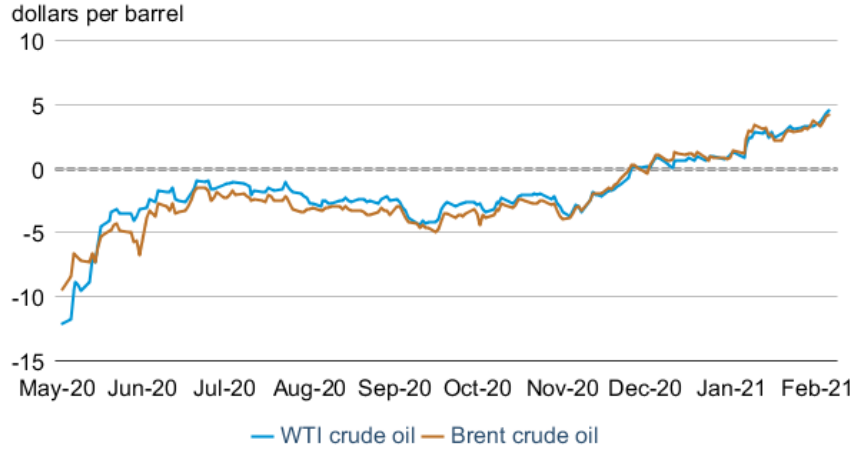
Prices: The front-month futures price for Brent crude oil settled at $58.84 per barrel (b) on February 4, 2021, an increase of $7.75/b from January 4, 2021. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, increased by $8.61/b during the same period, settling at $56.23 on February 4 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices

eia Sources: CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate.

Sustained production cuts by the Organization of the Petroleum Exporting Countries (OPEC) and partner countries (OPEC+) continued to put upward pressure on crude oil prices in January. In early December, OPEC+ announced it would limit production increases planned for early 2021. Then in early January, OPEC+ largely reaffirmed those limits, and Saudi Arabia announced on January 5 that it would unilaterally cut an additional 1.0 million barrels per day (b/d) of production in February and March.

In addition to the OPEC+ supply reductions, expectations for increasing petroleum demand as a result of the rollout of COVID-19 vaccines are further supporting oil prices. Brent crude oil prices settled at more than $55/b on all but one day since January 8, marking the highest levels since the early days of the pandemic in late-February 2020. However, new government mobility restrictions in response to COVID-19 during the Lunar New Year holiday season in China and increased restrictions on travel in Europe both present the potential to keep petroleum demand lower than might otherwise be expected.



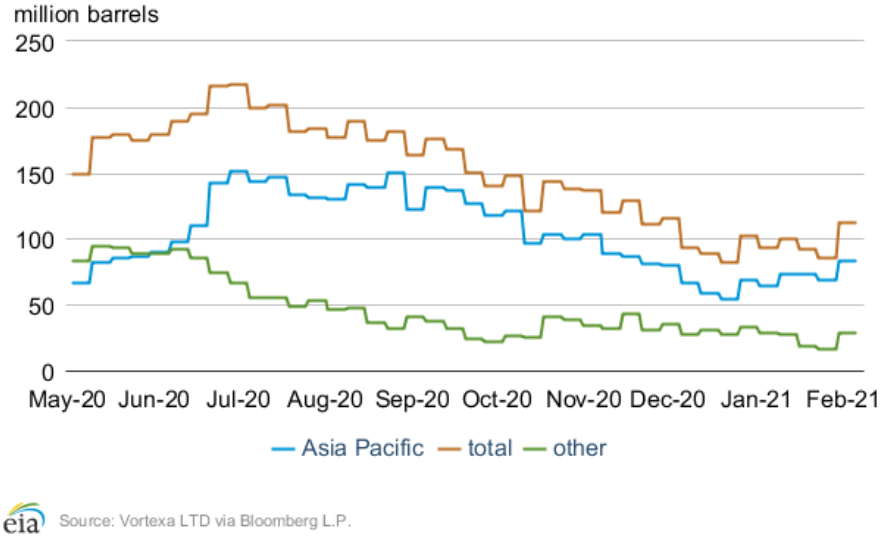
EIA expects that global consumption of petroleum and liquid fuels will rise by 5.4 million b/d in 2021, which is 0.2 million b/d less than forecast in last month's STEO. That pace of growth would bring global petroleum and liquid fuels consumption to an average of 97.7 million b/d for the year, still 3.5 million b/d less than in 2019.

Crude oil futures price spreads and floating storage: The crude oil market developed large contango (when near-term prices are lower than longer-dated ones) in April and May 2020 because a significant reduction in demand for crude oil reduced front-month futures contract prices. The magnitude of the contango narrowed in the summer, as crude oil production decreased and petroleum demand increased.

In early December, when the front-month Brent contract changed to February delivery, the spread became consistently backwardated (when near-term prices are higher than longer-dated ones). Backwardation developed as a result of market assessments that the rollout of the COVID-19 vaccine would contribute to rising oil demand in early 2021, combined with early December announcements of limited production increases from OPEC+ in the first quarter of 2021. EIA weekly data from January confirm near-term tightness in oil markets. EIA estimates U.S. crude oil inventories fell by 9.8 million barrels in January, compared with a five-year average build of 12.1 million barrels. Also, U.S. refinery inputs of crude oil increased in January compared with December. Typically refinery inputs decline in January.

This slight backwardation persisted through December, and then it increased significantly in January, when front-month crude oil prices reached 11-month highs. The Brent 1st–13th spread settled at $4.11/b and the WTI 1st–13th spread settled at $4.43/b on February 4, 2021 **(Figure 2)**. This increase in backwardation is most likely the result of Saudi Arabia's announced supply cuts for February and March, which EIA expects will contribute to global oil stock withdrawals during the first quarter of 2021. EIA forecasts first-quarter 2021 global oil stock withdrawals to average 2.0 million b/d, down only slightly from the high withdrawal rates during the second half of 2020.

Figure 2. Crude oil front-month to 13th month futures price spread

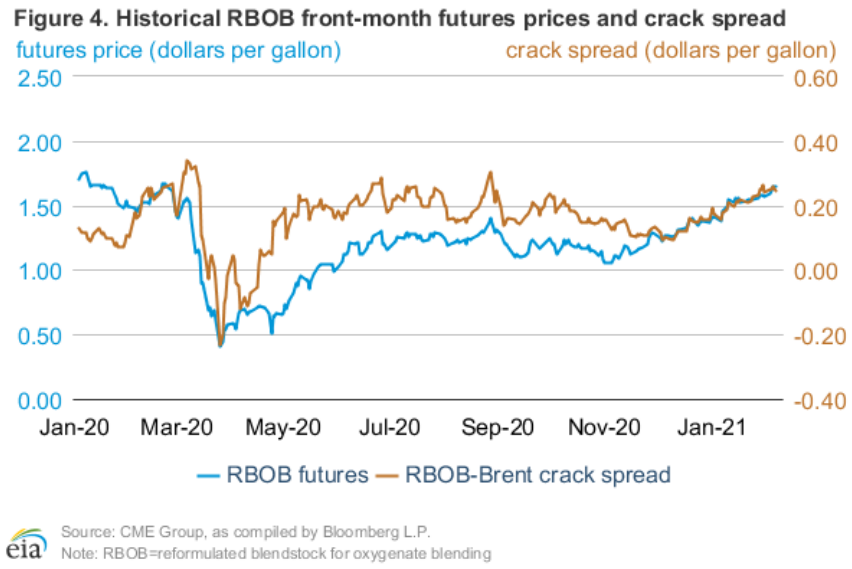


Source: CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate.

The sharp contango in April and May 2020 was the result of substantial decreases in demand for liquid fuels in the first half of 2020 because of responses to the pandemic, which contributed to significant increases in crude oil inventories. As onshore crude oil storage began to fill, many

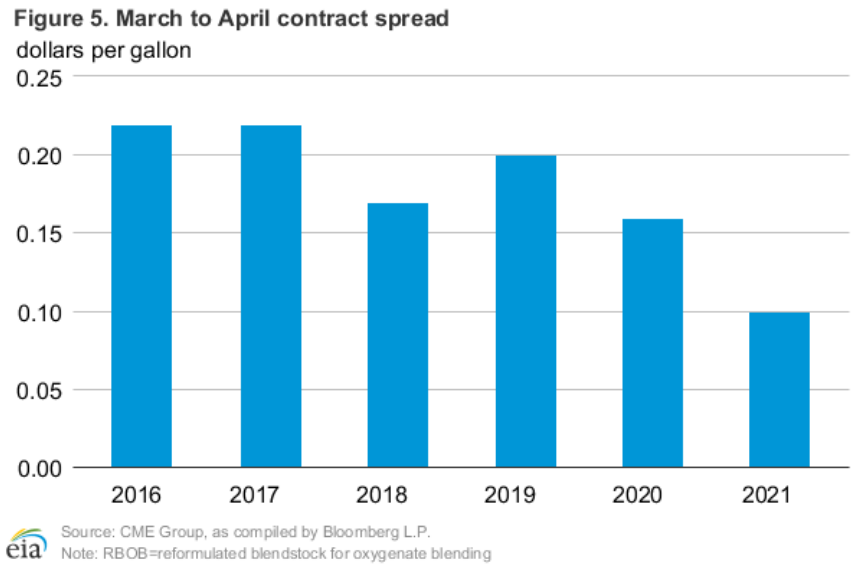
market participants resorted to storing crude oil in floating storage, which peaked at 222 million barrels during the week of June 26, 2020, according to energy analytics company, Vortexa **(Figure 3)**. Vortexa defines floating storage as the amount of crude oil on tankers that has been stationary for at least seven days. The initial growth in floating storage through June occurred across several regions. Both the Pacific and Atlantic basin markets stored crude oil when demand rapidly decreased. Current levels of backwardation indicate a need for inventory drawdowns to meet demand, suggesting current levels of floating storage may continue to decline.

Figure 3. Global oil in floating storage



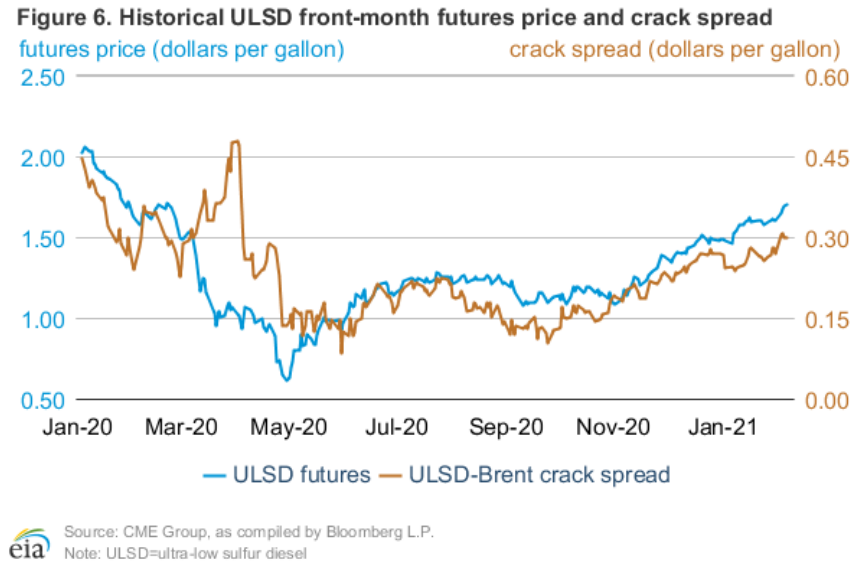
eia Source: Vortexa LTD via Bloomberg L.P.

As crude oil production fell and demand gradually increased, floating storage began to decline in Europe and other Atlantic Basin markets, but high Chinese crude oil purchases amid lower global crude oil prices resulted in increases in port congestion and floating storage off the Chinese coast. Floating storage declined by 32 million barrels globally between when the market entered backwardation in late November through late-January, before increasing at the end of the month. Vortexa reports that floating storage was 110 million barrels as of January 29, 2021, down 111 million barrels since June. EIA discussed the connection between Chinese crude oil imports, floating storage, and crude oil futures last October in *This Week in Petroleum.* Crude oil in floating storage has declined closer to levels observed in first-quarter 2020, but a combination of global oil demand and refinery runs that are still lower than year-ago levels is likely contributing to a near-term plateau of floating storage.



Petroleum products

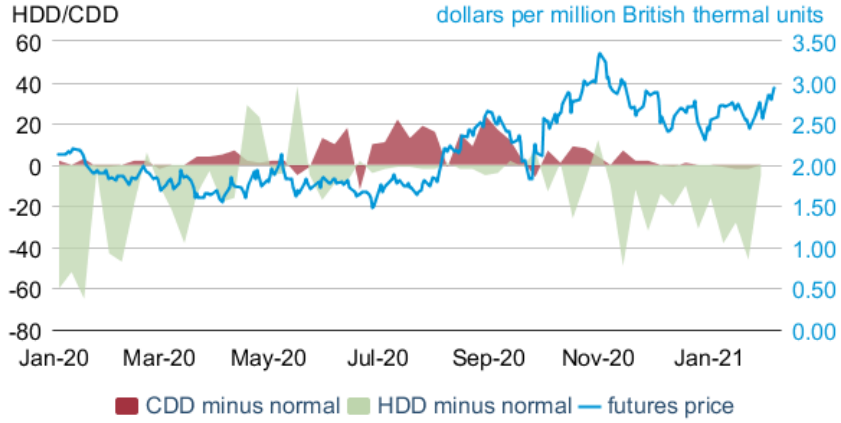
Gasoline prices: The front-month futures price of reformulated blendstock for oxygenate blending (RBOB, the petroleum component of gasoline used in many parts of the country) settled at $1.64 per gallon (gal) on February 4, up 27 cents/gal from January 4 **(Figure 4)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) increased by 9 cents/gal to settle at 24 cents/gal during the same period.



In the United States, expectations of increased domestic consumption likely contributed to upward pressure on the RBOB–Brent crack spread in January. EIA forecasts gasoline consumption will average 8.5 million barrels per day (b/d) from February to June, compared with consumption in January, which EIA estimates at 7.8 million b/d.

March to April RBOB contract spread: The RBOB futures contract for April delivery is the first contract during the year that trades the more-expensive-to-produce summer-grade gasoline. As a result, April contracts typically trade at a premium to March contracts. On the final trading day in January in the past five years, the average spread between RBOB contracts for April delivery and RBOB contracts for March delivery was 19 cents/gal **(Figure 5)**. In 2021, that spread was 10 cents/gal, the lowest since 2009. The relatively low spread this year likely indicates that expectations of a seasonal increase in spring and summer driving will be more subdued than in previous years. Additionally, the spread may be lower because refinery utilization levels are relatively low, and the marginal cost of increasing summer-grade gasoline production from a low baseline may be lower than under normal utilization rates.

Ultra-low sulfur diesel prices: The front-month futures price for ultra-low sulfur diesel (ULSD) for delivery in New York Harbor settled at $1.70/gal on February 4, up 24 cents/gal from January 4 **(Figure 6)**. The ULSD–Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) increased by 5 cents/gal to settle at 30 cents/gal during the same period. January's average ULSD–Brent crack spread of 26 cents/gal was the highest since March 2020.



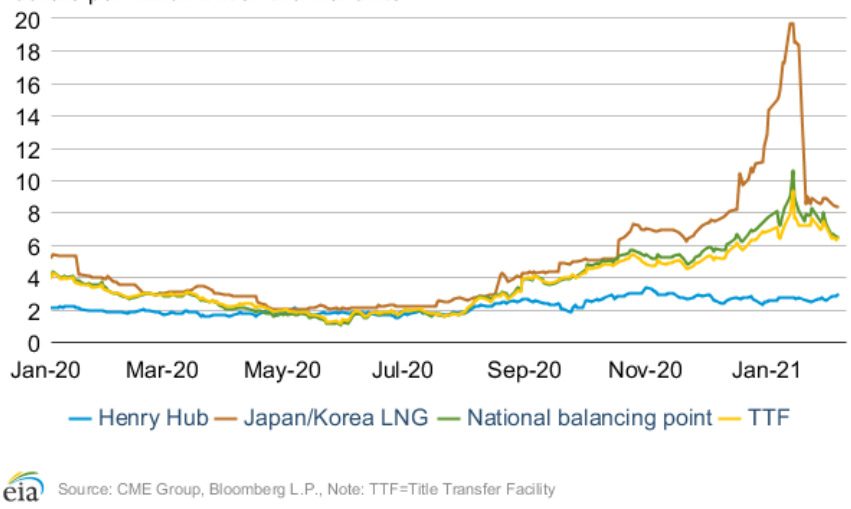
The ULSD-Brent crack spread generally increased throughout January and has continued to increase in early February. Higher estimated consumption in January likely contributed upward pressure to the crack spread, which has increased for four consecutive months. EIA estimates distillate consumption increased 0.36 million b/d (10%) from December to 4.01 million b/d in January. Because of the wide price spread between ULSD traded at New York Harbor and low

sulfur gasoil traded in Europe, U.S. net imports have been relatively high, contributing to a stock build of 3.9 million barrels (2.5%) in January. If confirmed by monthly data, January net imports were the highest for that month since 2011, and the January 2021 closing stock level was the highest for the month since 2017.

Natural Gas

Prices: The front-month natural gas futures contract for delivery at the Henry Hub settled at $2.94 per million British thermal units (MMBtu) on February 4, 2021, which is up 35 cents/MMBtu from January 4, 2021 **(Figure 7)**.

Figure 7. Natural gas front-month futures prices and actual minus historical average HDD and CDD



Sources: CME Group and National Oceanic and Atmospheric Administration, as compiled by Bloomberg L.P.
Note: HDD=heating degree days, CDD=cooling degree days.

A shift to a colder weather outlook for the first half of February contributed to a substantial increase in the futures prices on February 1. The front-month contract settled at a higher price on February 1 than all trading days in January, which was the first time since 2014 that a February price settlement exceeded all of the closing prices from the previous month. U.S. temperatures in January were warmer-than-average but colder than January 2020, which helped to keep consumption nearly unchanged from the previous year and to moderate Henry Hub prices despite significant increases in natural gas prices in Europe and Asia because of colder weather in those regions.

EIA estimates that in January 2021, U.S. LNG exports reached record levels for the third consecutive month. U.S. dry natural gas production in January declined for the second consecutive month, but it experienced the smallest year-on-year decrease in six months. EIA estimates that U.S. inventory levels at the end of January remained 9% higher than the five-year (2016–20) average, but it forecasts that inventories will decline to lower than the five-year average by the end of March 2021.

International natural gas prices: Liquefied natural gas (LNG) spot and forward prices in northern Asia approached an all-time high in mid-January 2021 **(Figure 8)**. Sustained cold temperatures in Japan, China, and South Korea—the world's three largest LNG consumers—prompted an increase in space heating demand, a drawdown in LNG inventories, and an increase in LNG prices. LNG shipping constraints because of congestion at the Panama Canal and unplanned outages at multiple LNG export facilities were also significant contributors.

Figure 8. International natural gas prices

eia Source: CME Group, Bloomberg L.P., Note: TTF=Title Transfer Facility

In Japan, several power utilities were faced with critically low LNG inventories and purchased additional LNG volumes in global spot markets on a short-term basis. In northern China, the decline in temperatures to a five-decade low led to increased LNG imports, which in December 2020 reached the largest monthly LNG import volume in China to date. In South Korea, several coal plants were taken offline during the winter to reduce air pollution, requiring higher output from natural gas power plants.

Aside from the significant demand increase, unplanned outages at a number of LNG export facilities in several countries also contributed to reduced global LNG supply. Typically, LNG export facilities run at maximum capacity in the winter because more than 97% of global LNG consumption occurs in the northern hemisphere, where regasified LNG is used for space heating and the use of LNG depends on prevailing weather conditions. EIA estimates that in December 2020, global LNG export capacity was utilized at 88%—the lowest level for the month in at least six years.

Notable forecast changes

- EIA forecasts Federal U.S. Gulf of Mexico crude oil production will average almost 1.7 million barrels per day (b/d) in both 2021 and 2022, which is 0.1 million b/d lower than previously forecast. The reduced forecast reflects both announcements by operators that they will push back the start dates of several fields as well as initial production rates that were lower than EIA's previous expectations at fields that came online in the second half of 2020.
- EIA expects marketed natural gas production to average 98.3 billion cubic feet per day in the United States (Bcf/d) in 2021 and 98.9 Bcf/d in 2022, up 2.4 Bcf/d and 1.3 Bcf/d, respectively, from the January forecast. The upward revision reflects more forecast associated natural gas production from oil-directed wells in the Permian region.
- EIA expects natural gas use for power generation will total 1,430 billion kilowatthours (kWh) in 2021 and 1,397 billion kWh in 2022, which are up 3% and 5%, respectively, from the January STEO. The higher forecast reflects lower regional natural gas price assumptions in EIA's electricity generation model. The lower prices also reduce coal use for power generation in the forecast. EIA expects coal-fired power generation will total 835 billion kWh in 2021 and 888 billion kWh in 2022, which are down 4% and 7%, respectively, from the January STEO.
- EIA expects coal production to total 594 million short tons in 2022, which is 5% less than forecast in the January STEO. The lower forecast is the result of lower forecast coal use in the electric power sector.
- For more information, see the detailed table of forecast changes.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on February 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109;
Petroleum Supply Annual , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130;
Electric Power Monthly , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on Thursday February 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on Thursday February 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate, natural gas plant liquids, other liquids, refinery processing gain, and other unaccounted-for liquids.

OPEC = Organization of the Petroleum Exporting Countries: Iran, Iraq, Kuwait, Saudi Arabia, and the United Arab Emirates (Middle East); Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Libya, Nigeria, and Venezuela (Other).

Notes: EIA completed modeling and analysis for this report on Thursday February 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Forecasts are not published for individual OPEC countries.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. GDP data are from Oxford Economics.

(b) Weighted geometric mean of real indices for various countries with weights equal to each country's share of world oil consumption in the base period. Exchange rate is measured in foreign currency per U.S. dollar. Exchange rate data are from Oxford Economics, and oil consumption data are from EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" inludes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on Thursday February 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday February 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to Petroleum Administration for Defense Districts (PADD).

See "Petroleum for Administration Defense District" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Marketing Monthly* , DOE/EIA-0380; *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on Thursday February 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday February 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.93**	**1.91**	**1.91**	**1.94**	*2.07*	*2.07*	*2.04*	*2.05*	*2.07*	*2.08*	*2.06*	*2.07*	**1.93**	*2.05*	*2.07*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday February 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on Thursday February 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday February 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday February 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 7d part 1. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continues on Table 7d part 2*

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on Thursday February 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW)

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday February 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday February 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.
Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Raw Steel Production															
(million short tons per day)	**0.268**	**0.174**	**0.197**	**0.224**	*0.259*	*0.246*	*0.249*	*0.285*	*0.280*	*0.250*	*0.248*	*0.259*	**0.216**	*0.260*	*0.259*
Carbon Dioxide (CO2) Emissions (million metric tons)															
Petroleum	**552**	**442**	**518**	**519**	*519*	*538*	*556*	*564*	*555*	*572*	*581*	*581*	**2,031**	*2,178*	*2,289*
Natural Gas	**493**	**351**	**385**	**433**	*486*	*347*	*364*	*429*	*479*	*343*	*364*	*426*	**1,662**	*1,626*	*1,612*
Coal	**202**	**177**	**271**	**223**	*222*	*204*	*285*	*229*	*251*	*215*	*291*	*237*	**874**	*939*	*993*
Total Energy (c)	**1,250**	**973**	**1,177**	**1,177**	*1,229*	*1,093*	*1,208*	*1,224*	*1,287*	*1,133*	*1,238*	*1,247*	**4,578**	*4,754*	*4,905*

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

- = no data available

SAAR = Seasonally-adjusted annual rate

Notes: EIA completed modeling and analysis for this report on Thursday February 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on Thursday February 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on Thursday February 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Appendix to the February 2021 *Short-Term Energy Outlook*

This appendix is prepared in fulfillment of section 1245(d)(4)(A) of the National Defense Authorization Act (NDAA) for Fiscal Year 2012, as amended. The law requires the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy, to submit to Congress a report on the availability and price of petroleum and petroleum products produced in countries other than Iran in the two-month period preceding the submission of the report. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The data in this appendix, therefore, should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

EIA consulted with the U.S. Department of the Treasury, the U.S. Department of State, and the intelligence community in the process of developing the NDAA report, which was previously published as a stand-alone report. Detailed background and contextual information not repeated here can be found in early editions of the NDAA report.

This appendix is published in the *Short-Term Energy Outlook* in even numbered months.

Table a1. Summary of Estimated Petroleum and Other Liquids Quantities

	Dec 2020	Jan 2021	Dec 2020 - Jan 2021 Average	Dec 2019 - Jan 2020 Average	2017 - 2019 Average
Global Petroleum and Other Liquids (million barrels per day)					
Global Petroleum and Other Liquids Production (a)	93.8	94.0	93.9	101.5	99.9
Global Petroleum and Other Liquids Consumption (b)	96.2	93.9	95.1	99.5	100.0
Biofuels Production (c)	2.0	1.9	2.0	2.1	2.5
Biofuels Consumption (c)	2.3	2.2	2.2	2.3	2.3
Iran Liquid Fuels Production	2.9	2.9	2.9	2.9	4.1
Iran Liquid Fuels Consumption	2.0	2.1	2.1	1.8	1.8
Petroleum and Petroleum Products Produced and Consumed in Countries Other Than Iran (million barrels per day)					
Production (d)	88.9	89.1	89.0	96.5	93.3
Consumption (d)	91.9	89.5	90.7	95.4	95.9
Production minus Consumption	-3.0	-0.5	-1.7	1.1	-2.6
World Inventory Net Withdrawals Including Iran	2.4	-0.1	1.2	-2.0	0.1
Estimated OECD Inventory Level (e) (million barrels)	3,045	3,030	3,038	2,891	2,910
Surplus Production Capacity (million barrels per day)					
OPEC Surplus Crude Oil Production Capacity (f)	7.7	6.7	7.2	2.9	2.0

Note: The term "petroleum and other liquids" encompasses crude oil, lease condensate, natural gas liquids, biofuels, coal-to-liquids, gas-to-liquids, and refinery processing gains, which are important to consider in concert due to the inter-related supply, demand, and price dynamics of petroleum, petroleum products, and related fuels.

(a) Production includes crude oil (including lease condensates), natural gas liquids, other liquids, and refinery processing gains.
(b) Consumption of petroleum by the OECD countries is synonymous with “products supplied," defined in the glossary of the EIA Petroleum Supply Monthly, DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel, and loss, and bunkering.
(c) Biofuels production and consumption are based on EIA estimates as published in the International Energy Statistics. Biofuels production in the third quarter tends to be at its highest level in the year as ethanol production in Brazil reaches its seasonal peak and is typically lowest in the first quarter as seasonal production falls in the South/South-Central region of Brazil.
(d) Global production of petroleum and petroleum products outside of Iran is derived by subtracting biofuels production and Iran liquid fuels production from global liquid fuels production. The same method is used to calculate global consumption outside of Iran.
(e) Estimated inventory level is for OECD countries only.
(f) EIA defines surplus oil production capacity as potential oil production that could be brought online within 30 days and sustained for at least 90 days, consistent with sound business practices. This does not include oil production increases that could not be sustained without degrading the future production capacity of a field.

Appendix to the February 2021 *Short-Term Energy Outlook*

This appendix is prepared in fulfillment of section 1245(d)(4)(A) of the National Defense Authorization Act (NDAA) for Fiscal Year 2012, as amended. The law requires the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy, to submit to Congress a report on the availability and price of petroleum and petroleum products produced in countries other than Iran in the two-month period preceding the submission of the report. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The data in this appendix, therefore, should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

EIA consulted with the U.S. Department of the Treasury, the U.S. Department of State, and the intelligence community in the process of developing the NDAA report, which was previously published as a stand-alone report. Detailed background and contextual information not repeated here can be found in early editions of the NDAA report.

This appendix is published in the *Short-Term Energy Outlook* in even numbered months.

Independent Statistics & Analysis
U.S. Energy Information Administration

March 2021

Short-Term Energy Outlook

Forecast highlights

Global liquid fuels

- The March *Short-Term Energy Outlook* (STEO) remains subject to heightened levels of uncertainty because responses to COVID-19 continue to evolve. Reduced economic activity related to the COVID-19 pandemic has caused changes in energy demand and supply during the past year and will continue to affect these patterns in the future. U.S. gross domestic product (GDP) declined by 3.5% in 2020 from 2019 levels. This STEO assumes U.S. GDP will grow by 5.5% in 2021 and by 4.2% in 2022, compared with an assumption of 3.8% in 2021 and 4.2% in 2022 in last month's STEO. The U.S. macroeconomic assumptions in this outlook are based on forecasts by IHS Markit.

- Brent crude oil spot prices averaged $62 per barrel (b) in February, up $8/b from January's average and up $7/b from February 2020. Rising Brent prices in February continued to reflect expectations of rising oil demand as both COVID-19 vaccination rates and global economic activity have increased, combined with ongoing petroleum supply limitations by the Organization of the Petroleum Exporting Countries (OPEC) and partner countries (OPEC+). In addition, disruptions to petroleum supply from extreme winter weather in the United States (notably in Texas) put upward pressure on crude oil prices during February.

- The U.S. Energy Information Administration (EIA) expects OPEC crude oil production will average 25.3 million barrels per day (b/d) in April, which is similar to expected production for March and down 1.6 million b/d from EIA's forecast for April OPEC production in last month's STEO. EIA expects OPEC crude oil production will rise to 26.6 million b/d in May. This increase reflects Saudi Arabia ending voluntary cuts of 1.0 million b/d, along with the relaxation of cuts that were extended through April at the March 4 OPEC+ meeting. This forecast assumes OPEC will produce 27.9 million b/d on average in the second half of 2021, as OPEC+ generally increases crude oil output to supply rising global oil consumption.

- The OPEC+ extension of existing supply cuts through April added significantly to near-term upward oil price pressures. Following the meeting, the Brent crude oil spot price settled at $67/b on March 4, up 4% from the day before. EIA expects Brent prices will average between $65-$70/b during March and April, more than $10/b above EIA's expectation last month. EIA continues to expect downward crude oil price pressures will emerge in the coming months as the oil market becomes more balanced. Brent crude oil prices in the forecast average $58/b in the second half of 2021.

- EIA's forecast of declining crude oil prices and a more balanced oil market reflect global oil supply surpassing oil demand during the second half of 2021. Although EIA expects inventories to fall by 1.2 million b/d in the first half of 2021, increases in global oil supply will contribute to inventories rising by almost 0.4 million b/d in the second half of 2021 and a mostly balanced market in 2022. However, the forecast depends heavily on future production decisions by OPEC+, the responsiveness of U.S. tight oil production to higher oil prices, and the pace of oil demand growth, among other factors. EIA expects Brent prices will average $59/b in 2022.

- EIA estimates that the world consumed 95.9 million b/d of petroleum and liquid fuels in February, which is down 1.6 million b/d from February 2020. If confirmed by final consumption data, the 1.6 million b/d decline would represent the smallest year-over-year decline since the COVID-19 outbreak began affecting oil consumption in January 2020. EIA forecasts that global consumption of petroleum and liquid fuels will average 97.5 million b/d for all of 2021, which is up by 5.3 million b/d from 2020. EIA forecasts that consumption will increase by another 3.8 million b/d in 2022 to average 101.3 million b/d.

- EIA estimates that U.S. crude oil production averaged 10.4 million b/d in February, which is down 0.5 million b/d from estimated January production. Most of the decline reflects the cold temperatures that affected much of the country, particularly Texas. Unlike the relatively winterized oil production infrastructure in northern areas of the country, infrastructure in Texas, such as wellheads, gathering lines, and processing facilities, are more susceptible to the effects of extremely cold weather. Following the freeze-offs, EIA forecasts crude oil production will rise to almost 11.0 million b/d in March. EIA expects U.S. crude oil production will average 11.1 million b/d in 2021 and 12.0 million b/d in 2022. In 2020, production averaged 11.3 million b/d, down from 12.2 million b/d in 2019. EIA's current forecast for U.S. crude oil production in 2022 is 0.5 million b/d higher than in last month's STEO because of higher expected crude oil prices.

Natural Gas

- In February, the Henry Hub natural gas spot price averaged $5.35 per million British thermal units (MMBtu), which was up from the January average of $2.71/MMBtu and the highest nominal monthly average Henry Hub spot price since February 2014. Higher prices in February reflect increased demand for natural gas because of much colder-than-normal temperatures throughout most of the country. Price effects were amplified because the rise in demand occurred amid a drop in natural gas production due to well freeze-offs. EIA expects Henry Hub spot prices to decline to an average of $2.88/MMBtu in the second quarter of 2021. EIA expects that Henry Hub spot prices will average $3.14/MMBtu in 2021, which is up from the 2020 average of $2.03/MMBtu. EIA expects that continued growth in liquefied natural gas (LNG) exports, along with relatively flat production, will contribute to Henry Hub spot prices rising to an average of $3.16/MMBtu in 2022.

- EIA expects that U.S. consumption of natural gas will average 82.5 billion cubic feet per day (Bcf/d) in 2021, down 0.9% from 2020. The decline in U.S. natural gas consumption reflects less natural gas consumed for electric power generation because of higher natural gas prices compared with last year. In 2021, EIA expects residential natural gas consumption to average 13.1 Bcf/d (up 0.4 Bcf/d from 2020) and commercial consumption to average 9.3 Bcf/d (up 0.7 Bcf/d from 2020). EIA forecasts industrial consumption will average 23.8 Bcf/d in 2021 (up 1.3 Bcf/d from 2020) as a result of increasing manufacturing activity amid a recovering economy. EIA estimates that total natural gas consumption in February was the highest on record, at 111.8 Bcf/d, because cold weather affected much of the United States and increased natural gas demand for heating and power generation. However, EIA expects natural gas consumption in March to decline from February levels as temperatures return closer to normal, based on forecasts by the National Oceanic and Atmospheric Administration. EIA expects U.S. natural gas consumption will average 81.6 Bcf/d in 2022.

- The United States ended October 2020 with more than 3.9 trillion cubic feet (Tcf) in working natural gas storage, 5% more than the 2015–19 average and the fourth-highest end-of-October level on record. EIA estimates that inventory withdrawals were 829 billion cubic feet (Bcf) in February, the largest February withdrawal on record. The February 2021 withdrawal was significantly larger than the five-year (2016–20) average February withdrawal of 452 Bcf. In mid-February, the combination of strong natural gas demand and lower production led to the second-largest weekly storage withdrawal on record, including a record weekly withdrawal of 156 Bcf in the South Central region, which includes Texas. The large February withdrawal has resulted in end-of-month storage levels falling lower than their five-year average. EIA forecasts that natural gas inventories will end March 2021 at 1.6 Tcf, which is 13% lower than the five-year average. EIA forecasts that natural gas inventories will ultimately end the 2021 injection season (end of October) at almost 3.7 Tcf, which is 2% less than the five-year average.

- EIA forecasts that U.S. production of dry natural gas averaged 87.8 Bcf/d in February, which is down from 92.4 Bcf/d in December (the most recent month that has final data). The decline in natural gas production was mostly a result of freeze-offs, which occur when water and other liquids in the raw natural gas stream freeze at the wellhead or in natural gas gathering lines near production activities. Unlike the relatively winterized natural gas production infrastructure in northern areas of the country, natural gas production infrastructure, such as wellheads, gathering lines, and processing facilities, in Texas are more susceptible to the effects of extremely cold weather. For 2021, EIA expects that overall dry natural gas production will average 91.4 Bcf/d, which is 0.9 Bcf/d more than the February STEO forecast. The higher forecast largely reflects higher forecast crude oil prices, which EIA expects will contribute to more associated natural gas production.

- In February, U.S. LNG exports averaged 7.5 Bcf/d, a 2.3 Bcf/d (23%) decline from January. LNG exports were affected by the logistical constraints associated with suspending piloting

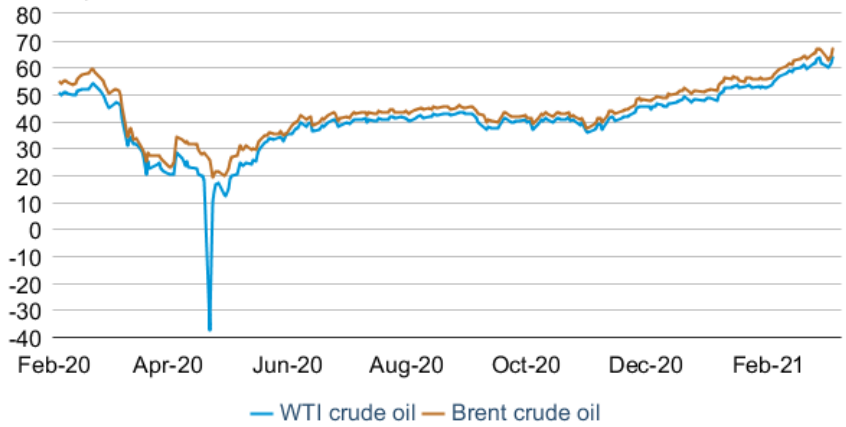
services on several days at some U.S. LNG export ports located in the Gulf of Mexico because of inclement weather. In addition, several U.S. LNG export facilities (including Freeport, Cameron, and Corpus Christi) experienced lower natural gas feedstock supply in mid-February following declines in natural gas production because of extremely cold weather. EIA expects U.S. LNG exports to continue their seasonal decline from March through May, averaging 7.8 Bcf/d in this period.

Electricity, coal, renewables, and emissions

- EIA forecasts that electricity consumption in the United States will increase by 2.1% in 2021 after it fell 3.8% in 2020. EIA forecasts residential sector retail electricity sales will grow by 2.7% in 2021. This increase is primarily a result of colder temperatures in the first quarter of 2021 compared with the same period in 2020. Despite rolling power outages in Texas and some other states in February, estimated U.S. residential consumption during the first quarter of 2021 is 10% higher than at the same time in 2020. EIA expects retail sales of electricity in the commercial and industrial sectors in 2021 will increase by 0.7% and 3.7%, respectively. For 2022, EIA forecasts total electricity consumption will grow by another 1.4%.

- EIA expects the share of U.S. electric power generated with natural gas will average 36% in 2021 and 35% in 2022, which is down from 39% in 2020. The forecast natural gas share declines in response to a forecast increase in the price of natural gas delivered to electricity generators from an average of $2.40/MMBtu in 2020 to $3.46/MMBtu in 2021 (a 44% increase). Coal's forecast share of electricity generation averages 23% in both 2021 and 2022, up from 20% in 2020. Electricity generation from renewable energy sources rises from 20% in 2020 to 21% in 2021 and to 23% in 2022. The nuclear share of U.S. generation declines from 21% in 2020 to 20% in 2021 and to 19% in 2022.

- EIA expects U.S. coal production to total 581 MMst in 2021, 42 MMst (8%) more than in 2020. In 2022, EIA expects coal production to rise by a further 29 MMst (5%). Recent extreme cold weather in much of the country contributed to an increase in coal use for power generation. EIA expects that coal use for power generation will increase by 16% to 505 MMst in 2021. Supply for rising coal-fired generation will be partly met by draws from on-site stockpiles at power plants.



- EIA estimates that U.S. energy-related carbon dioxide (CO_2) emissions decreased by 11% in 2020. This decline in emissions was the result of less energy consumption related to economic contraction resulting from the COVID-19 pandemic. In 2021, EIA forecasts energy-related CO_2 emissions will increase by about 6% from the 2020 level as economic activity increases and leads to rising energy use. EIA also expects energy-related CO_2 emissions to rise in 2022, but by a slower rate of 2%. EIA forecasts coal-related CO_2 emissions will rise by 14% in 2021 and by 2% in 2022.

Petroleum and natural gas markets review

Crude oil

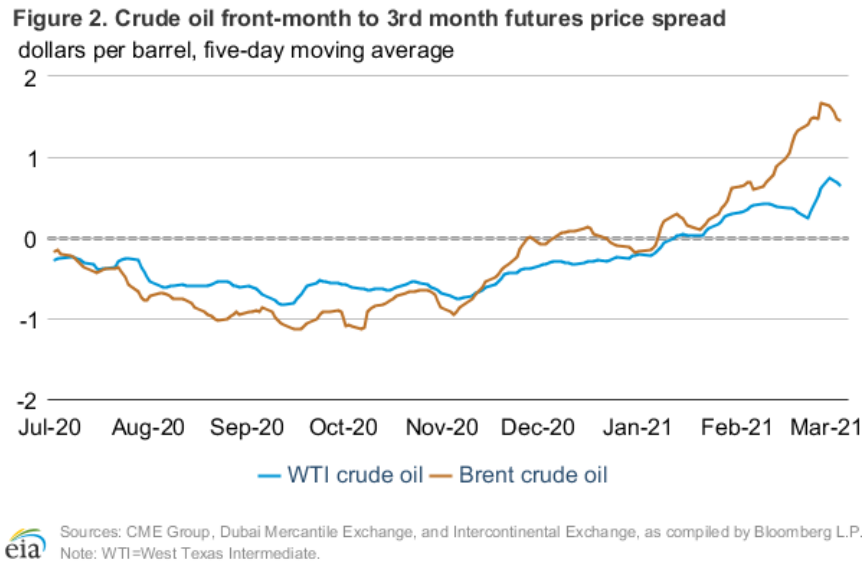
Prices: The front-month futures price for Brent crude oil settled at $66.74 per barrel (b) on March 4, 2021, an increase of $10.39/b from February 1, 2021. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, increased by $10.28/b during the same period, settling at $63.83/b on March 4 **(Figure 1).**

Figure 1. Crude oil front-month futures prices

Sources: CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate.

The increase in crude oil prices during February reflects continuing global oil inventory draws following production cuts by the Organization of the Petroleum Exporting Countries (OPEC), partner countries (OPEC+), as well as a further, unilateral 1.0 million barrels per day (b/d) production cut from Saudi Arabia. In addition, EIA estimates U.S. crude oil production declined by 0.5 million b/d in February as a result of extremely cold weather that caused well freeze-offs. This reduction in supply occurred against a backdrop of rising global oil demand.

Global oil markets significantly tightened in February. EIA estimates February global liquid fuels supply fell by 1.8 million b/d from January while liquid fuels consumption rose 2.2 million b/d, resulting in the strongest monthly global oil inventory draw since inventories began falling in mid-2020. Initial estimates by EIA show February global oil inventory draws were 0.6 million b/d larger than forecast last month.



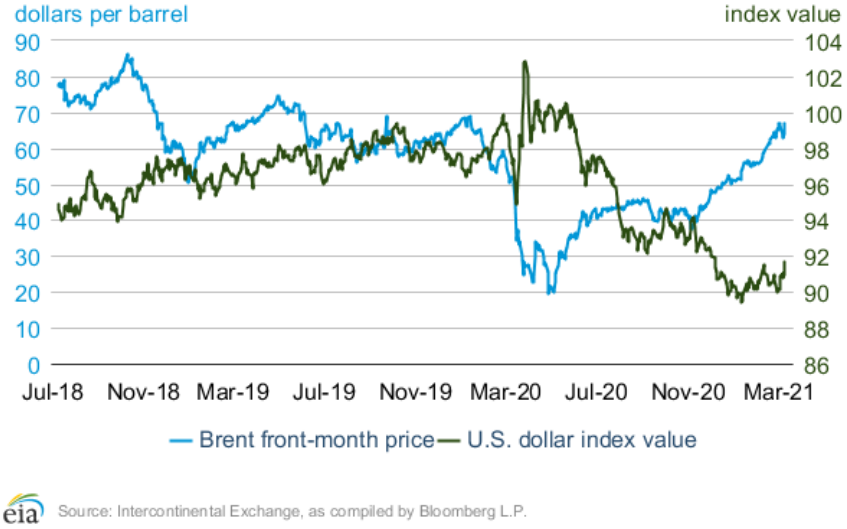
At its meeting on March 4, OPEC+ announced its member countries would maintain crude oil production cuts through April, except for relatively small production increases from Russia and Kazakhstan. The announcement also noted that Saudi Arabia would maintain its voluntary production cut going into April. The announcement from OPEC+ put further upward pressure on crude oil prices, and front-month Brent futures on March 4 increased by $2.67/b compared with the previous day. The sustained production curtailment suggests that supply will remain

constrained in the near term even as demand continues to increase. As a result, EIA expects that further inventory withdrawals to meet rising crude oil demand will support crude oil prices through at least the end of April. In last month's outlook, EIA had forecast that OPEC would begin relaxing production cuts in April, but following the March 4 announcement, EIA now expects that to happen beginning in May. EIA expects OPEC crude oil production will increase to an average 26.6 million b/d in May, which would be an increase of 1.5 million b/d compared with the January–April average. The supply increase contributes to easing pressure on global crude oil prices in the forecast, with global oil inventory draws averaging 0.3 million b/d in May and June compared with 1.7 million b/d in the first four months of the year.

EIA forecasts Brent crude oil prices will average $67/b in March and April 2021. EIA continues to expect downward crude oil price pressures will emerge in the coming months as the oil market becomes more balanced, with EIA's forecast Brent price falling to $65/b in May and then $58/b over the second half of 2021. Even at $58/b, prices would be higher than they were at the end of 2020. The higher crude oil prices also result in rising forecast U.S. crude oil production by the second half of 2021, and particularly in 2022. Rising U.S. production, along with higher production from OPEC+, and continuing high OPEC spare production capacity contributes to EIA's forecast of relatively balanced oil markets during the second half of 2021 and 2022, which moderate price pressures over that period.

EIA's forecast of downward oil price pressure and increased crude oil availability has several key uncertainties. The speed of actual demand recovery, based on vaccination rates and the degree to which travel and employment conditions return to pre-COVID levels, remains an important uncertainty on the demand side. At the same time, the degree to which OPEC+ production cuts will continue after April remains a source of uncertainty on the supply side, especially because increasing crude oil prices will continue to provide an incentive for OPEC+ participants to agree to production increases in later meetings. Finally, the responsiveness of U.S. tight oil production to higher oil prices is also uncertain.

Crude oil futures price spreads: The spread between front-month and 3rd month futures contract prices for Brent and WTI diverged in mid-February, suggesting substantially different market expectations for crude oil availability in the months of March and April **(Figure 2)**. The Brent front-month to 3rd month spread has been climbing steadily since January, exceeding $1/b beginning on February 16. At the same time, the backwardation (when near-term prices are higher than longer-dated ones) in WTI decreased from the beginning of the month, reaching a low point in the aftermath of the extreme cold weather across much of the United States, particularly in Texas. As the WTI front-month contract rolled over from March delivery to April delivery and as the disruptive market effects of the U.S. Gulf Coast weather conditions lessened, the backwardation of the WTI front-month to 3rd month spread contract began to increase in line with the trend in Brent, reaching 66 cents/b as of March 4.

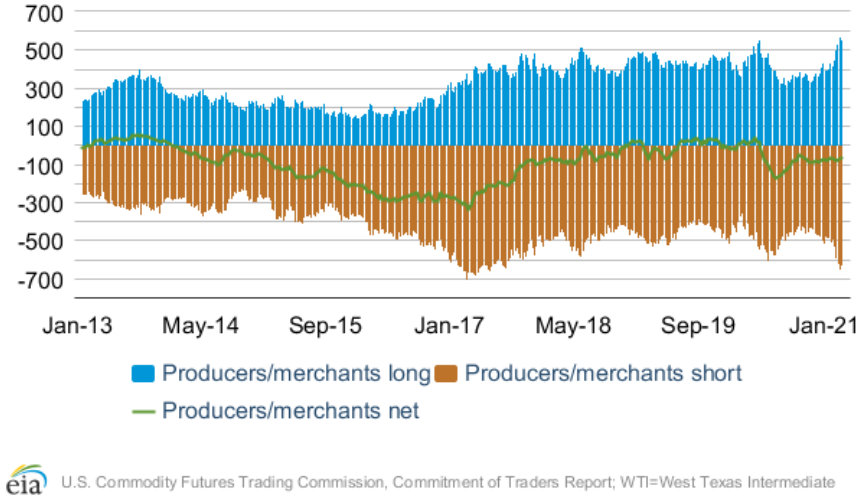


The difference between the contracts for the two crude oil grades reflects both a difference in market demand for crude oil in March compared with April and the relatively longer lead time for global crude oil deliveries, which puts more upward pressure on Brent. Differences in the delivery dates between the Brent and WTI front month contracts suggest that crude oil for April delivery was in higher demand, compared to March. The Brent futures contract trades for April delivery throughout February, but WTI trades for March delivery during most of February. The difference in the front-month to 3rd-month spread likely reflects differing market expectations about crude oil availability during the respective front-month contract periods. April became the front-month for the Brent contract sooner, resulting in increasing front-month prices for Brent because of expectations of higher refinery demand for crude oil in preparation for increased summer demand. The WTI front-month contract, conversely, did not shift to April delivery until near the end of February, and after a brief period of disruption because of weather outages, the WTI front-month contract began to increase at the end of the month, which also likely reflects reports of major inventory draws and greater expected refinery demand in April.

The difference in value between the Brent and WTI front-month to 3rd-month spreads is not necessarily a seasonal one and does not always occur in preparation for summer demand. Lower OPEC+ production through April means many buyers will need to turn to crude oil inventories to acquire product in time for April delivery. As the global benchmark, Brent is likely to reflect substantial international crude oil movements by waterborne cargos that can take weeks or months to arrive at their destinations. WTI, conversely, remains the benchmark of choice for many refiners located closer to the Permian Basin and nearby refining hubs in the U.S. Midwest and Gulf Coast. The relatively shorter supply chain for WTI from production sites in the U.S. Midcontinent to nearby customers, combined with shorter expected lead times to increase crude oil production, could result in a lower call on crude oil inventories from refiners and, therefore, less upward price pressure on WTI compared with Brent.

Brent and the U.S. dollar index: The U.S. dollar index, which measures the relative value of the U.S. dollar against the values of several foreign currencies, has decreased since November 2020, meaning the U.S. dollar has depreciated against other currencies **(Figure 3)**. Most international benchmark crude oils, including Brent crude oil and WTI, are priced in U.S. dollars, so the U.S. dollar's value can meaningfully affect crude oil acquisition costs in other countries where currencies are appreciating or depreciating.

Figure 3. Brent crude oil price vs. the value of the U.S. dollar

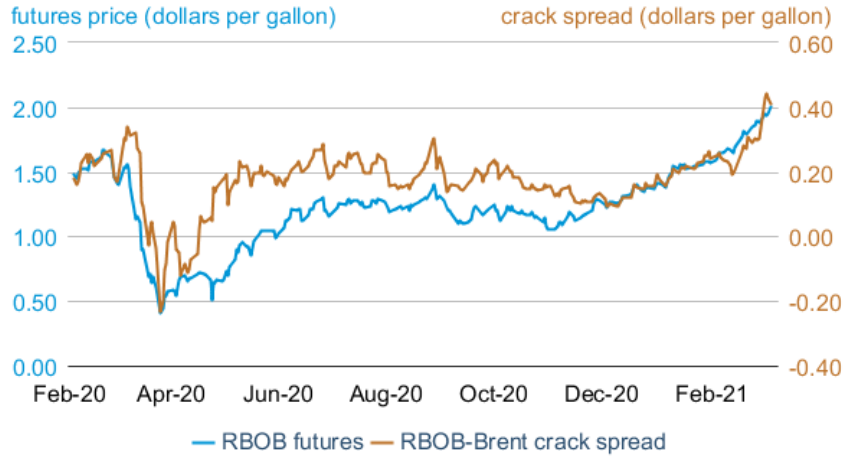


eia Source: Intercontinental Exchange, as compiled by Bloomberg L.P.

Because a strong currency can indicate higher demand for a country's goods and services, a weaker U.S. dollar may indicate strong economic growth in the rest of the world, which would also correlate with stronger crude oil demand. Even in cases where independent monetary policy decisions, rather than underlying economic growth, may be driving the relative value of the dollar, relatively cheaper crude oil acquisition costs allow those actors to pay a higher dollar-denominated price for crude oil by benefitting from the dollar's reduced exchange rate. These factors may help to explain instances of inverse correlations between crude oil prices and the value of the U.S. dollar. The current period of relative weakness in the dollar also corresponds with rising demand and higher prices for other commodities in the agricultural and industrial metals sectors, which suggests expectations for broad economic expansion. The U.S. dollar index was showing signs of relative strength during the height of COVID-19 disruptions, regularly reaching or exceeding 100 from March through May 2020. The strength corresponds to increased demand for dollars as a financial safe haven during a period of increased uncertainty. However, the index hasn't exceeded 100 since May 15, 2020, and averaged 93 each month from August through November 2020. Since December, the U.S. dollar index has averaged 91. The rising demand for crude oil and other commodities, combined with the weaker dollar, reflects an increasing risk tolerance in the market and high economic growth expectations among market participants.

WTI crude oil producer/merchant positions: Rising producer/merchant open interest in WTI futures contracts indicates increased futures market activity in the petroleum market after a period of reduced interest during 2020 **(Figure 4)**. In February 2021, the average total monthly contracts (long position contracts plus short position contracts) for producers/merchants increased to more than 1 million contracts for the first time since May 2020. The Commodity Futures Trading Commission (CFTC) defines producers/merchants as entities engaged in handling the physical commodity. The rise in producer/merchant contracts reflects increased business activity among crude oil producers, shippers, refiners, or other physical market participants. Crude oil producers use short position futures contracts to serve as a hedge against the risk that prices will decrease in the future. Refiners or shippers use long positions to hedge against higher crude oil prices. The increases in Brent and WTI prices since the fourth quarter of 2020 may be contributing to the rising contract open interest. The current prices provide an incentive for crude oil producers to secure a contract rate based on present highs in case prices decrease by expiration. Conversely, the potential for continued crude oil price increases is an incentive for physical market buyers to secure a contract rate at present levels in case prices continue to rise. Despite the increase in open interest contracts overall, the net position of producer/merchant contracts has remained short, suggesting that more producer/merchant contracts continue to serve as a hedge against decreasing crude oil prices rather than rising crude oil prices (long). On a monthly average basis, producer/merchant open interest has been in a net short position since April, and has remained relatively steady at a net short position of between 70,000 and 90,000 contracts since October 2020.

Figure 4. Producer / merchant open interest in WTI futures contracts

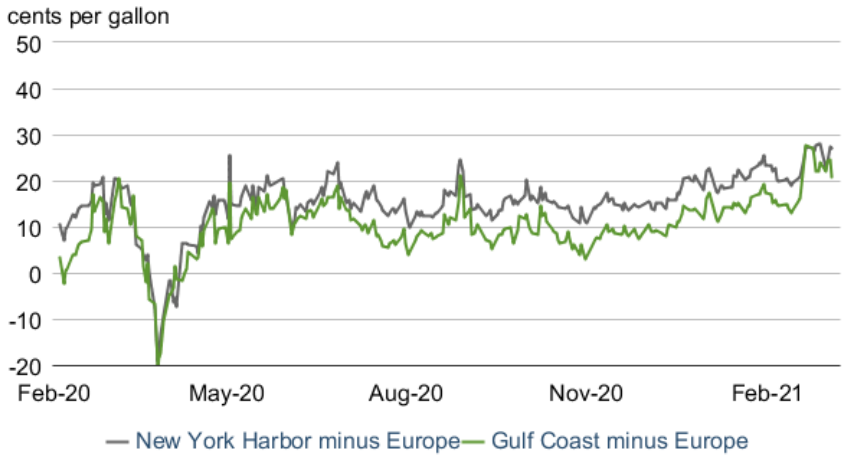


Petroleum products

Gasoline prices: The front-month futures price of reformulated blendstock for oxygenate blending (RBOB, the petroleum component of gasoline used in many parts of the country) settled at $2.00 per gallon (gal) on March 4, up 41 cents/gal from February 1 **(Figure 5)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent

crude oil) increased by 16 cents/gal to settle at 41 cents/gal during the same period. On March 2, the crack spread closed at 44 cents/gal, the highest since September 1, 2017.

Figure 5. Historical RBOB front-month futures prices and crack spread

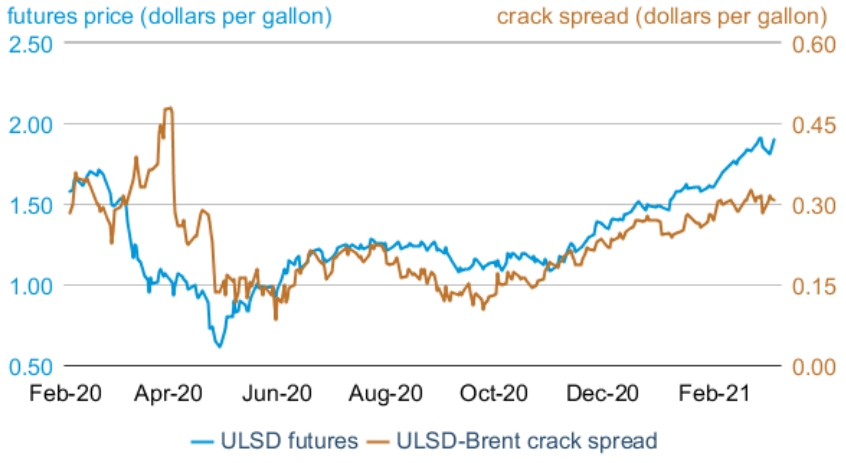


Source: CME Group, as compiled by Bloomberg L.P.
Note: RBOB=reformulated blendstock for oxygenate blending

The increase in the RBOB–Brent crack spread likely reflects unplanned refinery outages in mid-February combined with expectations of increased consumption. The crack spread increased 12 cents/gal from February 10 to February 19 when the extreme cold disrupted energy supply—particularly in Texas, where several refineries fully or partially shut down. Refining activity is not likely to fully recover immediately because the cold weather damaged some refining units, which in some cases, might require longer or more complicated restart processes. EIA estimates that March gasoline production will remain subdued as gasoline demand increases. Expectations of higher gasoline demand and subdued supply likely contributed to the crack spread increase at the end of February.

Gasoline spot prices: Because the refining disruptions were concentrated on the Gulf Coast, that region experienced the highest gasoline spot price increases during the cold spell. These supply disruptions also affected the gasoline spot market more broadly. New York Harbor gasoline spot prices increased and, to a lesser degree, European gasoline spot prices also increased. Spot prices for New York Harbor gasoline were trading at a 6 cent/gal premium to Gulf Coast conventional gasoline on February 10. As Gulf Coast spot prices increased, the spread between the two spot prices decreased, and on February 19, New York Harbor prices were selling at a discount to Gulf Coast conventional gasoline spot prices **(Figure 6)**. Furthermore, both New York Harbor and Gulf Coast spot prices increased relative to Eurobob spot prices, increasing from premiums of 20 cents/gal and 14 cents/gal on February 10, respectively, to both selling at premiums of more than 27 cents/gal on February 19. At the end of the month, Gulf Coast conventional gasoline prices and then New York Harbor gasoline prices decreased slightly as some of the shut-down refining capacity on the Gulf Coast came back online.

Figure 6. Gasoline spot price differentials

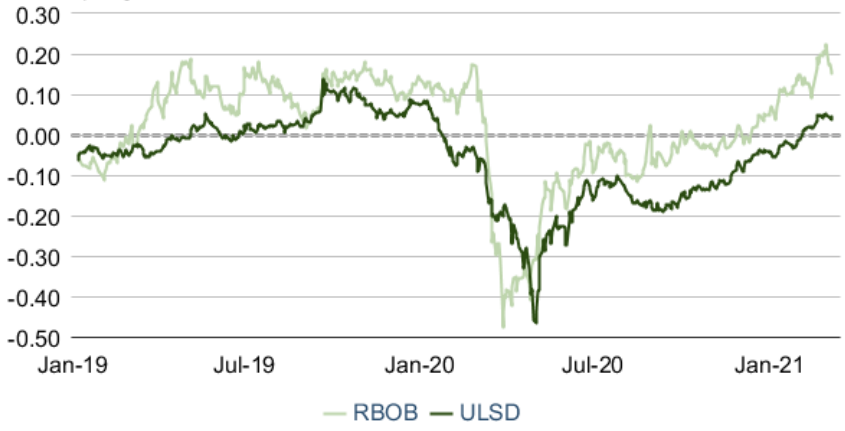


eia Source: Bloomberg L.P.

Because New York Harbor and Gulf Coast gasoline spot prices continue to sell at relatively high premiums to Eurobob spot prices, the United States will likely import more European gasoline in the near future to make up for reduced refining. EIA forecasts the United States will be a net importer of 0.2 million b/d of gasoline in March, which would be the first time the United States is a net importer of gasoline in March since 2015.

Ultra-low sulfur diesel prices: The front-month futures price for ultra-low sulfur diesel (ULSD) for delivery in New York Harbor settled at $1.90/gal on March 4, up 25 cents/gal from February 1 **(Figure 7)**. The ULSD–Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) was unchanged, settling at 31 cents/gal during the same period.

Figure 7. Historical ULSD front-month futures price and crack spread

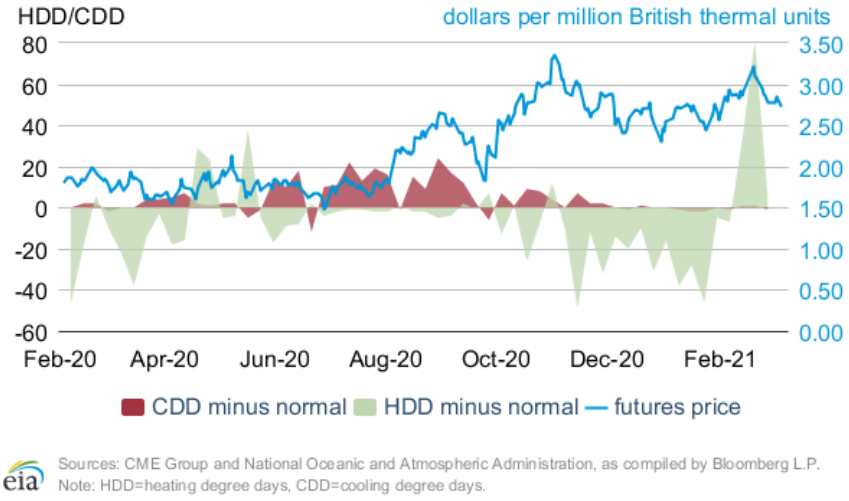


eia Source: CME Group, as compiled by Bloomberg L.P.
Note: ULSD=ultra-low sulfur diesel

The ULSD–Brent crack spread traded within a narrow 4 cent/gal range in February, but an estimated distillate inventory draw of 20.8 million barrels contributed to the February crack spread averaging 4 cents/gal higher than in January. EIA estimates that distillate consumption increased to 4.09 million b/d for February, which is up 1% from 4.05 in January and up 2% from February 2020. Decreases in distillate net imports and production also contributed to the highest February inventory draw since 1986. EIA estimates that distillate inventories decreased to 141.3 million barrels in February, which is 4% lower than the five-year (2016–20) average.

ULSD 1st to 13th contract spread: The ULSD 1st to 13th futures price spread became backwardated (where near-term contract prices are higher than farther-dated ones) on February 1 for the first time since January 2020, but the backwardation is narrower than RBOB's backwardation **(Figure 8)**. The ULSD 1st-13th spread has been increasing as distillate inventories have been decreasing from their high summer 2020 levels. Since August 2020, distillate inventories have decreased from 178.9 million barrels to 141.3 million barrels, a 21% decrease.

Figure 8. Petroleum product front-month to 13th month futures price spread



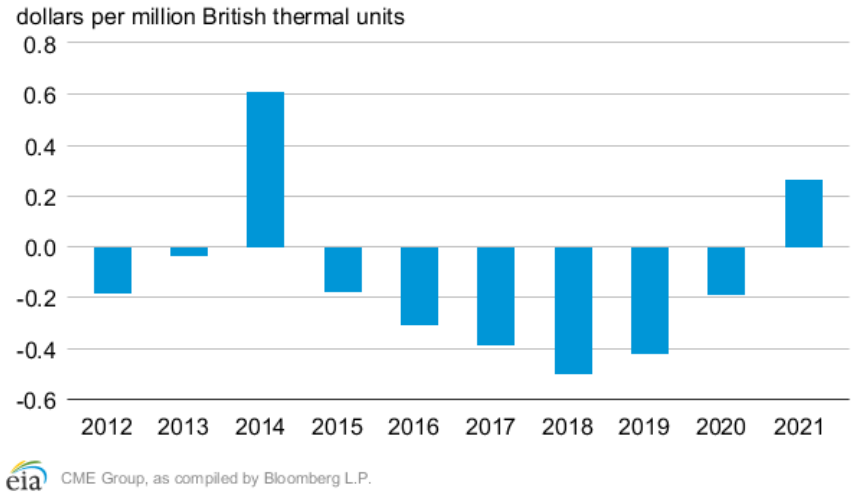
U.S. EIA, Bloomberg LP, RBOB=reformulated blendstock for oxygenate blending, ULSD=ultra-low sulfur diesel

Recent inventory draws reflected a tightening distillate market and coincided with a shift into backwardation on February 1 as well as the increasing backwardation throughout the month. However, ULSD's backwardation remains narrower than RBOB's because distillate inventories remain close to their seasonal average and are not forecasted to decrease by as much as gasoline inventories in March. EIA forecasts that there will be a substantial gasoline inventory draw in March because of refinery outages and an expected increase in consumption. The expected tightness in the gasoline market is likely contributing to the wider backwardation.

Natural Gas

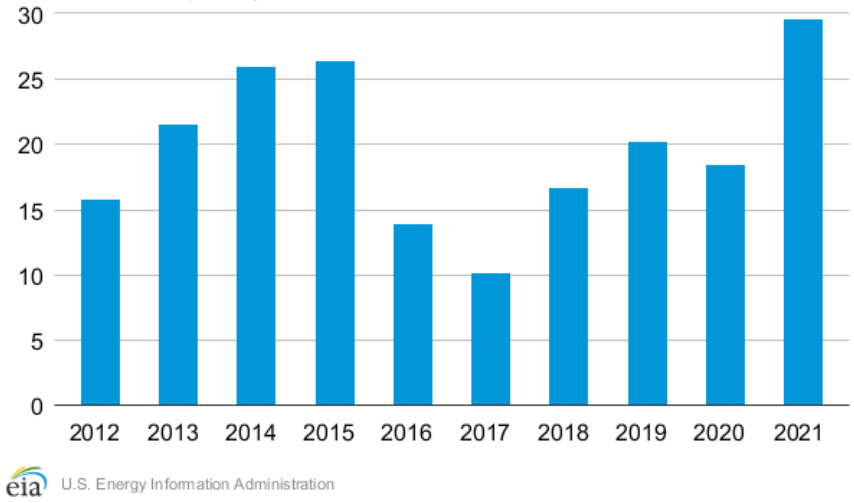
Prices: The front-month natural gas futures contract for delivery at the Henry Hub settled at $2.75 per million British thermal units (MMBtu) on March 4, 2021, which is down 10 cents/MMBtu from February 1, 2021 **(Figure 9)**.

Figure 9. Natural gas front-month futures prices and actual minus historical average HDD and CDD



Sources: CME Group and National Oceanic and Atmospheric Administration, as compiled by Bloomberg L.P.
Note: HDD=heating degree days, CDD=cooling degree days.

Despite February front-month futures prices increasing 37 cents/MMBtu from February 1 to February 17, futures prices ended the month lower than they started after the contract rolled to April delivery, indicating market participants did not expect the weather effects that disrupted natural gas markets last month to be lasting. During the coldest week in the United States since the week ending January 6, 2018, natural gas futures prices peaked at $3.22/MMBtu on February 17. The futures price decreased in all seven of the remaining February trading days, decreasing 45 cents/MMBtu from February 17 to February 26. Disruptions to the production and flow of natural gas during the cold spell also supported a record Henry Hub spot price of $23.86/MMBtu on February 17.



February's combination of cold weather and large inventory draws contributed to the front-month futures price averaging 27 cents/MMBtu higher in February than in January. This increase reflects a 29 cent/MMBtu increase on February 1 and the cold spell in mid-February. The last time the average February front-month futures price was higher than the average January front-month futures price was in 2014, also a colder-than-normal winter **(Figure 10)**.

Figure 10. January to February average front-month natural gas contract price change

EIA estimates U.S. natural gas inventory draws totaled 29.6 billion cubic feet per day (Bcf/d) in February **(Figure 11)**. The draw was a February record and the second-fastest withdrawal rate for any month on record. The cold weather, especially in Texas and the Midwest, contributed to high natural gas consumption. EIA estimates U.S. natural gas consumption was 111.8 Bcf/d in February, which, if confirmed in monthly data, is a record level of U.S. natural gas consumption for any month. Furthermore, production decreased because of weather-related outages in Texas and natural gas exports increased compared with last February's levels. The combination of increased consumption, decreased production, and relatively high exports all contributed to February's high inventory draws.

Figure 11. February natural gas net inventory withdrawal

Although February's cold weather reduced EIA's end-of-March inventory forecast by 178 Bcf compared with last month's forecast, EIA's forecast for the end of 2021 was relatively unchanged from last month's forecast. EIA forecasts that inventories will be 68 Bcf lower than last month's forecast at the end of December 2021, primarily because of higher crude oil prices leading to more drilling activity and higher natural gas production. During the final three quarters of 2021, EIA now expects 1.3 Bcf/d more dry gas production than forecast in February, while forecast demand remains relatively unchanged.

Notable forecast changes

- Based on forecasts from IHS Markit, this STEO includes an increased assumption of economic activity compared with last month's STEO. This forecast assumes that U.S. gross domestic product (GDP) will grow by 5.5% in 2021, which is up from the expected growth of 3.8% in the February STEO, and by 4.2% in 2022, which is largely unchanged from the February STEO.

- EIA forecasts Brent crude oil prices will average $61 per barrel (b) in 2021 and $59/b in 2022. Those forecasts are $7/b and $3/b higher, respectively, than in the February STEO. The increase largely reflects less expected OPEC crude oil production in this STEO.

- This STEO includes a stronger assumption of global GDP from Oxford Economics than in last month's forecast. The increase in expected economic activity contributes to 0.3 million b/d more growth in global liquid fuels consumption in 2022 in this STEO compared with last month. In 2021, however, EIA forecasts similar forecast overall consumption growth compared with the February STEO because the effects of stronger economic activity are offset by a reduced expectation for global jet fuel consumption. EIA reduced expectations for jet fuel consumption in 2021 in response to lower than expected first-quarter flight activity, along with reduced air travel expectations from the International Civil Aviation Organization during the second quarter of 2021.

- EIA expects U.S. crude oil production to average 11.1 million barrels per day (b/d) in 2021, 0.1 million b/d more than in the February STEO. Forecast production rises to 12.0 million b/d in 2022, which is up 0.5 million b/d from the February STEO. The increase in EIA's U.S. crude oil production forecast reflects higher expected crude oil prices.

- In this STEO, EIA included initial adjustments arising from the effects of the pause on federal oil and natural gas leasing outlined in Executive Order 14008. EIA assumes that no new federal leases are granted during the STEO forecast period but that permitting and drilling on currently held federal leases continues pursuant to Section 3, Subsection G of Department of Interior Order SO-3395. No effects will likely occur until 2022 because there is roughly a minimum eight-to-ten month delay from leasing to production in onshore areas

and longer in offshore areas. Incorporating this change reduced U.S. crude oil production by less than 0.1 million b/d on average in 2022.

- Higher GDP assumptions in this forecast contribute to higher forecast U.S. distillate fuel consumption. In this STEO, EIA forecasts that distillate consumption in 2021 will average 4.1 million b/d and 4.2 million b/d in 2022. Both forecasts are 0.1 million b/d higher than in the February STEO.

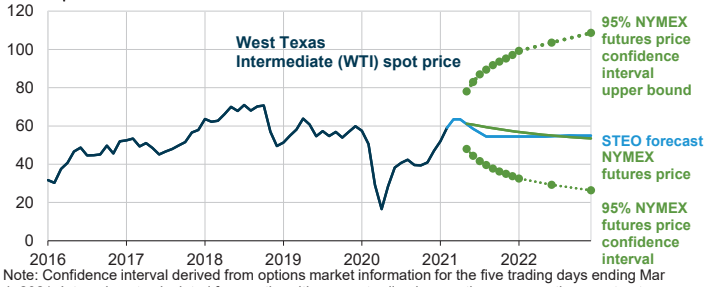
- EIA expects U.S. dry natural gas production will average 91.4 billion cubic feet per day (Bcf/d) in 2021, which is up 0.9 Bcf/d from the February STEO. EIA expects production to rise to 92.8 Bcf/d in 2022, which is up 1.9 Bcf/d from last month's forecast. The higher forecast mostly reflects increased associated natural gas production because of the upward revision to EIA's crude oil production forecast.

- EIA expects natural gas storage inventories to be 13% lower than the five-year average for March, compared with 3% lower than the end-of-March five-year average in the February STEO forecast. The lower storage forecast reflects large natural gas withdrawals during mid-February.

- EIA forecasts industrial natural gas consumption to increase to 23.8 Bcf/d in 2021, a 0.8 Bcf/d increase from the February STEO forecast. This increase reflects increased manufacturing activity because of improved economic conditions expected in 2021.

- EIA expects coal-fired electric power generation will total 887 billion kilowatthours in 2021, which is up 6% from last month's forecast. The increase mostly reflects more coal use in the first quarter because of extremely cold weather that raised natural gas prices and made coal more competitive compared with natural gas for electricity generation.

- Secondary forecast coal inventories are lower by 40 million short tons (MMst) (27%) in 2021 and by 36 MMst (32%) in 2022 compared with the February forecast. Lower expected inventories reflect EIA's expectation that coal-fired electricity generation will increase at a faster rate than the forecast increase in coal production, which reflects a general decline in coal production capacity coupled with historically high on-site coal inventories.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the United States Government. The views in this report therefore should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

Note: Winter covers the period October 1 through March 31. Fuel prices are nominal prices. Fuel consumption per household is based only on households that use that fuel as the primary space-heating fuel. Included in fuel consumption is consumption for water heating, appliances, electronics, and lighting (electricity). Per-household consumption based on EIA's 2015 Residential Energy Consumption Surveys corrected for actual and projected heating degree days. Number of households using heating oil includes kerosene.

* Prices exclude taxes
** thousand cubic feet
*** kilowatthour

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday March 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on Thursday March 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on Thursday March 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. GDP data are from Oxford Economics.

(b) Weighted geometric mean of real indices for various countries with weights equal to each country's share of world oil consumption in the base period. Exchange rate is measured in foreign currency per U.S. dollar. Exchange rate data are from Oxford Economics, and oil consumption data are from EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" inludes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on Thursday March 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday March 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on Thursday March 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday March 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Coal Miner Productivity (Tons per hour)	**6.37**	**6.37**	**6.37**	**6.37**	*6.32*	*6.32*	*6.32*	*6.32*	*6.30*	*6.30*	*6.30*	*6.30*	**6.37**	*6.32*	*6.30*
Total Raw Steel Production (Million short tons per day)	**0.268**	**0.174**	**0.197**	**0.224**	*0.250*	*0.250*	*0.257*	*0.291*	*0.281*	*0.252*	*0.247*	*0.255*	**0.216**	*0.262*	*0.259*
Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.92**	**1.90**	**1.93**	**1.91**	*1.95*	*1.99*	*1.98*	*1.95*	*1.96*	*1.98*	*1.96*	*1.93*	**1.91**	*1.97*	*1.96*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday March 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on Thursday March 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday March 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday March 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on Thursday March 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on Thursday March 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

Table 8a. U.S. Renewable Energy Consumption (Quadrillion Btu)

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW)

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday March 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday March 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.
Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Total Energy (c)	**1,250**	**973**	**1,177**	**1,182**	*1,277*	*1,104*	*1,226*	*1,236*	*1,306*	*1,149*	*1,250*	*1,249*	**4,583**	*4,843*	*4,954*

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

- = no data available

SAAR = Seasonally-adjusted annual rate

Notes: EIA completed modeling and analysis for this report on Thursday March 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday March 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on Thursday March 4, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Independent Statistics & Analysis
U.S. Energy Information Administration

April 2021

Short-Term Energy Outlook

Forecast highlights

Global liquid fuels

- The April *Short-Term Energy Outlook* (STEO) remains subject to heightened levels of uncertainty because responses to COVID-19 continue to evolve. Reduced economic activity related to the COVID-19 pandemic has caused changes in energy demand and supply during the past year and will continue to affect these patterns in the future. U.S. gross domestic product (GDP) declined by 3.5% in 2020 from 2019 levels. This STEO assumes U.S. GDP will grow by 5.6% in 2021 and by 4.2% in 2022. The U.S. macroeconomic assumptions in this outlook are based on forecasts by IHS Markit.

- For the 2021 summer driving season (April–September), the U.S. Energy Information Administration (EIA) forecasts U.S. regular gasoline retail prices will average $2.78 per gallon (gal), up from an average of $2.07/gal last summer (*Summer Fuels Outlook*). Higher forecast gasoline prices reflect higher forecast crude oil prices, higher wholesale gasoline refining margins, and higher U.S. consumption of motor gasoline. For all of 2021, we expect U.S. retail prices of regular-grade gasoline to average $2.66/gal and retail prices for all grades to average $2.78/gal, which would result in the average U.S. household spending about $480 (31%) more on motor fuel in 2021 compared with 2020.

- EIA expects U.S. gasoline consumption to rise in response to growing levels of GDP and employment. In addition, as COVID-19 vaccines are more widely distributed, we expect that driving will increase, causing gasoline consumption to rise. We forecast that U.S. gasoline consumption in 2021 will average 8.6 million barrels per day (b/d), which is up from consumption in 2020 of 8.0 million b/d but down from consumption in 2019 of 9.3 million b/d.

- Brent crude oil spot prices averaged $65 per barrel (b) in March, up $3/b from February and up $33/b from March 2020, the onset of the COVID-19 pandemic in the United States. Rising Brent prices in March continued to reflect expectations of rising oil demand as both COVID-19 vaccination rates and global economic activity have increased, combined with ongoing crude oil production limits from members of the Organization of the Petroleum Exporting Countries (OPEC) and partner countries (OPEC+). EIA forecasts that Brent prices will average $65/b in the second quarter of 2021, $61/b during the second half of 2021, and $60/b in 2022.

- EIA expects global oil inventories to fall by 1.8 million b/d in the first half of 2021. Forecast increases in global oil supply will contribute to a mostly balanced market during the second half of 2021. However, the forecast depends heavily on future production decisions by OPEC+, the responsiveness of U.S. tight oil production to oil prices, and the pace of oil demand growth, among other factors.

- EIA expects OPEC crude oil production will rise from an average of 25.1 million b/d in the first quarter of 2021 to 25.8 million b/d in the second quarter. The increase is the result of the April 1 OPEC+ announcement to begin raising production targets in May. It also reflects Saudi Arabia unwinding voluntary cuts of 1.0 million b/d between May and July. We expect OPEC crude oil production will rise to almost 27.9 million b/d in the second half of 2021.

- EIA estimates that the world consumed 96.0 million b/d of petroleum and liquid fuels in March, an increase of 4.7 million b/d from March 2020. We forecast that global consumption of petroleum and liquid fuels will average 97.7 million b/d for all of 2021, which is up by 5.5 million b/d from 2020. We forecast that consumption will increase by 3.7 million b/d in 2022 to average 101.3 million b/d. We revised growth in global liquid fuels consumption in 2021 higher from last STEO. The higher forecast is primarily a result of higher global GDP growth forecasts from Oxford Economics, which increased 0.4 percentage points from the March STEO to 6.2% for 2021.

- According to EIA's most recent data, U.S. domestic crude oil production averaged 11.1 million b/d in January 2021. We estimate that U.S. domestic crude oil production declined by 0.8 million b/d in February, mostly because of cold temperatures that affected much of the country, particularly Texas. We forecast crude oil production will average 10.9 million b/d in the second quarter of 2021 and increase to almost 11.4 million b/d by the fourth quarter of 2021. We expect U.S. crude oil production will average 11.9 million b/d in 2022. The forecast of rising U.S. crude oil production is the result of our expectation that West Texas Intermediate crude oil prices will remain above $55/b through the forecast period.

Natural Gas

- In March, the U.S. benchmark Henry Hub natural gas spot price averaged $2.62 per million British thermal units (MMBtu), which is down from the February average of $5.35/MMBtu. The Henry Hub price declined primarily because the cold weather and related high demand and market disruptions that drove prices to recent highs in February abated in March. EIA expects Henry Hub spot prices will average $2.73/MMBtu in the second quarter of 2021 and will average $3.04/MMBtu for all of 2021, which is up from the 2020 average of $2.03/MMBtu. We expect that continued growth in liquefied natural gas (LNG) exports, with only a slight corresponding increase in dry natural gas

production, will contribute to the average Henry Hub spot price rising to $3.11/MMBtu in 2022.

- EIA expects that U.S. consumption of natural gas will average 82.9 billion cubic feet per day (Bcf/d) in 2021, down 0.4% from 2020. The decline in U.S. natural gas consumption is a result of less natural gas consumed for electric power generation because of higher natural gas prices compared with last year. In 2021, we expect residential and commercial natural gas consumption will rise by a total of 1.1 Bcf/d from 2020 and industrial consumption will rise by 1.4 Bcf/d from 2020. Rising consumption outside of the power sector results from expanding economic activity and colder temperatures in 2021 compared with 2020. We expect U.S. natural gas consumption will average 82.1 Bcf/d in 2022.

- EIA estimates that natural gas inventories ended March 2021 at nearly 1.8 Tcf, which is 2% lower than the five-year (2016–20) average. The winter of 2020–21 had more natural gas withdrawn from storage than the five-year average largely as a result of the cold February temperatures that occurred amid low natural gas production. We expect that rising natural gas production and lower natural gas consumption for power generation than in the past two summers will contribute to storage injections outpacing the five-year average in 2021. We forecast that natural gas inventories will end the 2021 injection season (end of October) at more than 3.7 Tcf, which is equal to the five-year average.

- EIA forecasts that U.S. production of dry natural gas will average 91.4 Bcf/d in 2021, which is about the same as the 2020 average. In our forecast, dry natural gas production falls to a low point of 90.8 Bcf/d in May 2021 before steadily increasing through most of the remainder of 2021, reaching a high of 92.4 Bcf/d in November 2021. The increase in production in 2021 reflects higher forecast natural gas prices as well as higher forecast crude oil prices, which we expect will contribute to more associated natural gas production, especially in the Permian region.

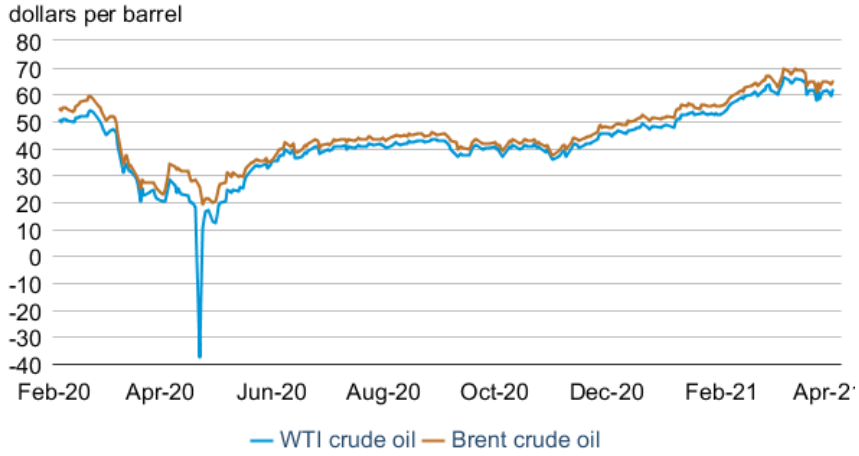
Electricity, coal, renewables, and emissions

- EIA forecasts that electricity consumption in the United States will increase by 2.1% in 2021 after falling 3.8% in 2020. We forecast electricity sales to the industrial sector will grow by 4.2% in 2021. We forecast that retail electricity sales to the residential sector will grow by 2.3% in 2021. This increase is primarily a result of colder temperatures in the first quarter of 2021 compared with the same period in 2020. We expect retail sales of electricity to the commercial sector will increase by 0.7% in 2021. Much of the increased electricity consumption across the sectors reflects improving economic conditions in 2021. For 2022, we forecast that U.S. electricity consumption will grow by another 1.3%.

- EIA expects that the share of electric power generated with natural gas in the United States will average 36% in 2021 and 35% in 2022, down from 39% in 2020. The forecast share for natural gas declines in response to a 39% increase in the price of natural gas delivered to electricity generators from an average of $2.39/MMBtu in 2020 to $3.31/MMBtu in 2021. The higher expected natural gas prices cause the forecast share of generation from coal to rise from 20% in 2020 to 22% this year, and to 23% next year. New additions of solar and wind generating capacity contribute to our forecast that the share of U.S. generation from renewable energy sources will rise from 20% in 2020 to 21% in 2021 and to 22% in 2022. The nuclear share of U.S. generation declines from 21% in 2020 to 20% in 2021 and to 19% in 2022, reflecting the retirement of capacity at some nuclear power plants.

- EIA forecasts that planned additions to generating capacity from wind and solar energy in 2021 and 2022 will contribute to increasing electricity generation from those sources. We estimate that the U.S. electric power sector added 14.5 gigawatts (GW) of new wind capacity in 2020. We expect 16.1 GW of new capacity will be added in 2021 and 5.8 GW in 2022. U.S. utility-scale solar capacity rose by an estimated 10.4 GW in 2020. Our forecast for added utility-scale solar capacity is 15.8 GW in 2021 and 14.9 GW in 2022. In addition, about 5 GW of small-scale solar (projects with less than 1 megawatt of capacity) are added annually over the 2021–22 STEO forecast.

- EIA expects U.S. coal production to total 585 MMst in 2021, 46 MMst (9%) more than in 2020. In 2022, we expect coal production to grow by an additional 16 MMst (3%). We expect that coal used to generate electric power will increase by 13% to 495 MMst in 2021 and by 4% to 514 MMst in 2022. The increase in coal production in 2021 will be the largest on a percentage basis in the Interior region, owing to increased domestic electricity generation. In 2022, EIA expects it will be largest in the Appalachia region, partly as a result of metallurgical coal exports rising to 54 MMst next year, up 27% from 2020 levels.



- EIA estimates that U.S. energy-related carbon dioxide (CO_2) emissions decreased by 11% in 2020. This decline in emissions was the result of less energy consumption related to the economic contraction resulting from the COVID-19 pandemic. In 2021, we forecast energy-related CO_2 emissions will increase by about 5% from the 2020 level as economic activity increases and leads to rising energy use. We also expect energy-related CO_2 emissions to rise in 2022, but by a slower rate of 2%. We forecast that after declining by 19% in 2020, coal-related CO_2 emissions will rise by 13% in 2021 and by 4% in 2022.

Petroleum and natural gas markets review

Crude oil

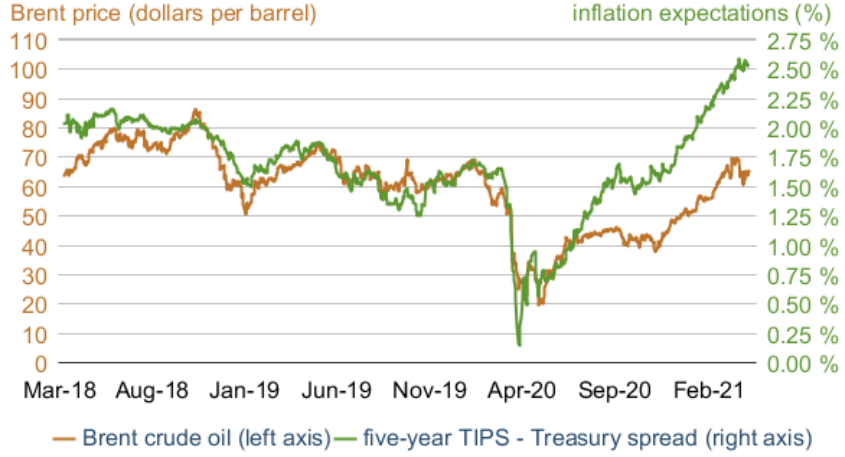
Prices: The front-month futures price for Brent crude oil settled at $64.86 per barrel (b) on April 1, 2021, down from an intraday high of $71.38/b on March 8 but up from $63.69/b from March 1. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, increased by 81 cents/b during the same period, settling at $61.45/b on April 1 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices

Sources: CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate.

Monthly average Brent crude oil prices in March were the highest since late 2019. Crude oil prices in early March reached $70/b following OPEC+'s March 4 announcement that it was extending production limits through April. However, prices subsequently declined, which partly reflected slowing global oil demand growth as COVID-19 cases increased, notably in Europe.

On April 1, OPEC+ announced it would ease existing limits on production beginning in May. This announcement was generally consistent with EIA's assumption in last month's STEO. However, Saudi Arabia also announced they would gradually relax its voluntary 1.0 million barrel per day (b/d) cut over the May–July period. If implemented as announced, Saudi Arabia's increase would occur more slowly than we had previously assumed. We revised our forecast for second quarter 2021 OPEC crude oil production down by 0.5 million b/d from the March STEO.



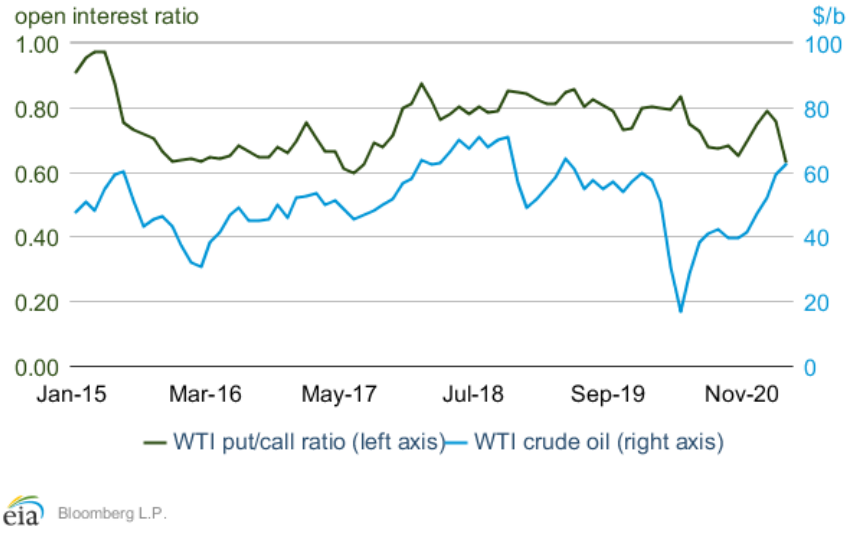
With lower production from OPEC than in the March STEO, EIA expects markets will be somewhat tighter in the second quarter than previously forecast, contributing to some upward price pressures. We forecast that the Brent crude oil price will average $65/b in the second quarter, when quarterly stock draws average 1.5 million b/d. Although that rate represents a significant draw in stocks, it is down slightly from the first quarter of 2021, when we estimated stock draws averaged 2.1 million b/d.

In the second half of 2021, EIA expects global oil markets to become much more balanced, with forecast global stock draws averaging 0.2 million b/d. From the second quarter to the third quarter, our forecast for global liquid fuels production grows by 3.2 million b/d. Of this increase, 1.9 million b/d is from OPEC. Additional supply growth in the forecast comes from Brazil, Canada, and the United States. We forecast global growth in oil demand between the second and third quarters will be 1.9 million b/d.

As global stock draws moderate, EIA expects upward price pressure on crude oil to ease. The higher crude oil price forecast reflects tighter markets through the second quarter, resulting from a slower relaxation of Saudi Arabia's voluntary cuts than we had forecast. Stronger second-quarter inventory draws will leave global oil inventories during the second half of the year lower than previously expected. We forecast that the price of Brent crude oil will average $61/b in the second half of the year, which is $3/b higher than forecast in the March STEO. However, as recent increases in price volatility indicate, significant uncertainty remains both in market expectations and in our forecasts.

Crude oil and inflation expectations: The percentage difference in yields for five-year Treasury Inflation-Protected Securities (TIPS) compared with U.S. treasury bonds is often used to measure market expectations of inflation. Economic responses to the COVID-19 pandemic resulted in a dramatic decline in demand for goods, significantly reducing petroleum and other commodity prices in early 2020. Because crude oil and other commodity prices are inputs to other sectors of the economy, changes in crude oil prices can also affect inflation expectations. The TIPS-Treasury spread decreased to a monthly average of 0.7% in March 2020, reflecting low inflation expectations as a result of lower prices and economic contraction **(Figure 2)**.

Figure 2. Crude oil and inflation expectations



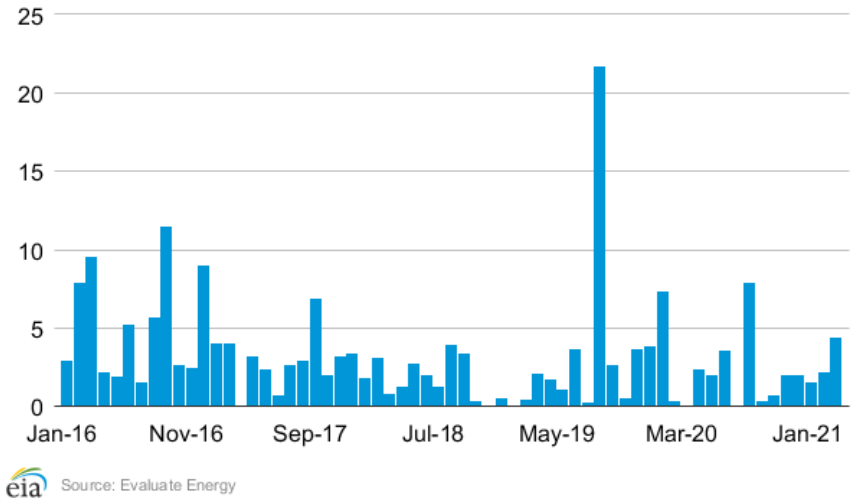
Source: Bloomberg L.P., Federal Reserve Bank of St. Louis
Note: TIPS=Treasury Inflation Protected Securities

Increasing crude oil and other commodity prices over the summer of 2020 contributed to increasing inflation expectations through the end of August, and the TIPS-Treasury spread

increased from 0.8% in May to 1.6% in August. Since then, however, inflation expectations have increased at a faster pace than crude oil prices. Rising prices of non-energy commodities, combined with fiscal and monetary stimulus in response to the COVID-19 pandemic increased inflation expectations more rapidly than crude oil prices over the summer. In addition, reports of supply bottlenecks for various goods may have also contributed to higher inflation expectations. By December 2020, the TIPS-Treasury spread increased to 1.9%, before increasing higher than 2% in January 2021, averaging 2.3% in February and 2.5% in March. On March 16, the TIPS-treasury spread reached its widest point since July 2008. Improved demand outlooks because of the distribution of the COVID-19 vaccine as well as continued fiscal and monetary stimulus has further contributed to rising prices across most commodities and higher inflation expectations.

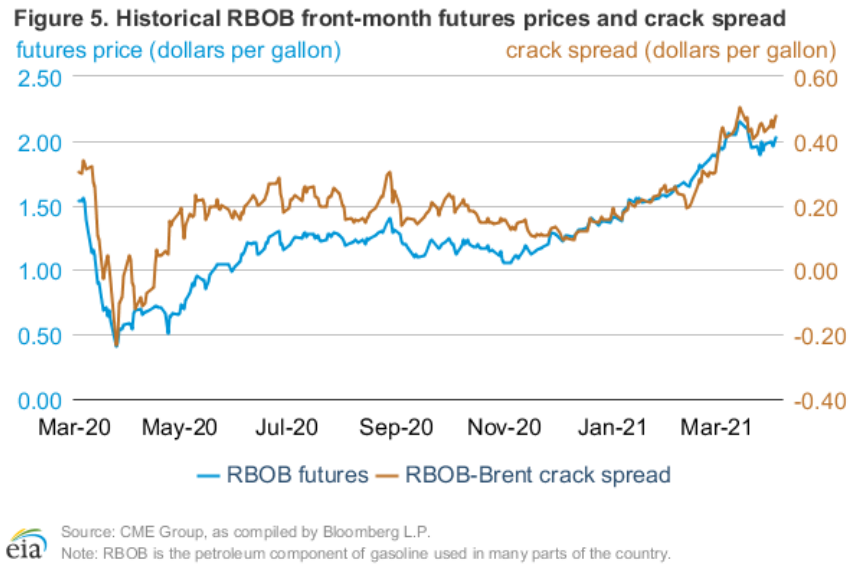
WTI options open interest ratio: The put-to-call WTI open interest ratio decreased in March, suggesting a change in market expectations around future crude oil prices, and potentially hedging against future crude oil price increases. The monthly aggregate put-to-call open interest ratio for WTI crude oil options decreased in March to 0.63, down from 0.75 in February and the lowest for any month since July 2017 **(Figure 3)**. The decrease was driven by an increase in call option open interest compared with small changes in put options from February. The total number of call option contracts increased from 0.96 million contracts in February to 1.17 million contracts in March, while the number of put option contracts increased from 0.72 million in February to 0.75 million in March.

Figure 3. Monthly average aggregate WTI option open interest ratio



eia Bloomberg L.P.

U.S. oil company debt and equity issuance: Since September 2020, debt and equity issuance has increased in all but one month, suggesting that increasing crude oil prices are encouraging U.S. crude oil producers to raise money to refinance debts, resume drilling activities, or purchase acreage. In March 2021, debt and equity issuance announcements among publicly traded independent U.S. exploration and production companies totaled $4.4 billion, the highest since

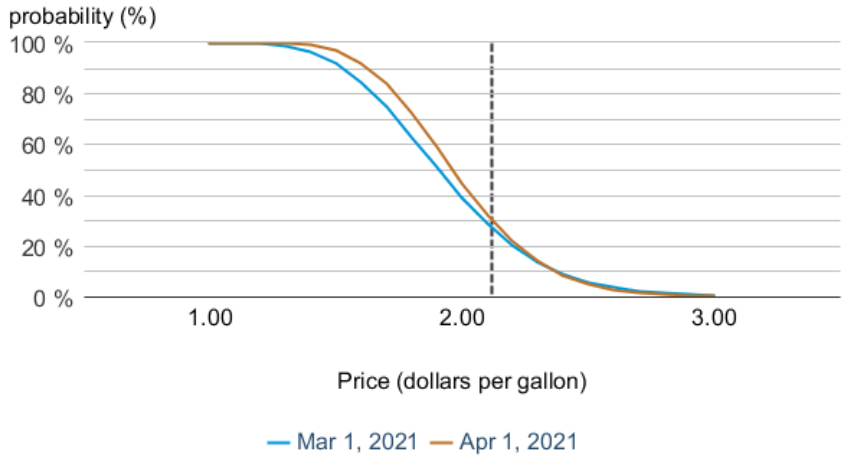


August 2020 and higher than the five-year (2016–20) median of $2.4 billion **(Figure 4)**. In addition, low interest rates have lowered the cost of issuing debt and have likely contributed to the recent growth in debt and equity issuance. The federal funds rate, which affects interest rates across the market, has been held at a target of 0.00%–0.25% since March 2020, according to the Federal Open Market Committee. In addition, the Moody's seasoned AAA corporate bond yield, which represents average bond yields for investment grade companies, averaged 2.70% in February, which is less than the 2011–20 average of 3.78%. Lastly, energy sector corporate bond yields for companies with a rating lower than investment grade are also at multi-year lows. Although primarily a result of higher crude oil prices, high capital availability for U.S. producers also supports EIA's forecast for U.S. crude oil production to increase from 10.7 million b/d in first-quarter 2021 to 12.2 million b/d by fourth-quarter 2022.

Figure 4. Announced debt and equity issuance among U.S. oil companies

Petroleum products

Gasoline prices: The front-month futures price of RBOB (the petroleum component of gasoline used in many parts of the country) settled at $2.02 per gallon (gal) on April 1, up 8 cents/gal from March 1 **(Figure 5)**.



The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) increased by 5 cents/gal to settle at 48 cents/gal during the same period. On March 12, the crack spread closed at 50 cents/gal, the highest since August 31, 2017. The average RBOB–Brent crack spread increased by 19 cents/gal from February to reach 44 cents/gal in March. The increase reflected a decline in refinery production of gasoline, stemming from refinery shutdowns on the U.S. Gulf Coast early in the month as a result of severely cold weather. The drop in refinery production caused gasoline inventories to end March at the lowest March level since 2014. In addition, higher gasoline crack spreads were the result of the seasonal shift to producing summer-grade gasoline, which is more expensive to produce.

EIA estimates that gasoline inventories decreased to 228.2 million barrels, a 3.4 million barrel draw from February (1.4%). The draw was a result of a combination of a decrease in production resulting from unplanned refinery outages that began during February's cold spell in Texas and an increase in consumption. We estimate gasoline production of 9.2 million barrels per day (b/d) in March, 5% less than the five-year (2016–20) average for March. Meanwhile, we estimate gasoline consumption increased 0.5 million b/d (7%) from February. We forecast gasoline inventories to remain lower than the five-year average for the remainder of the year, which may support continued higher-than-usual crack spreads. We forecast that gasoline refining margins will average 45 cents/gal from April through September, the summer driving season, which is 5 cents/gal higher than the five-year average over this period.

Market-derived probabilities: Based on futures and options prices, the market-derived probability of the June 2021 RBOB futures contract expiring higher than $2.00/gal was 45% on April 1, and the probability of it expiring higher than $2.10/gal was 32% **(Figure 6)**. At the beginning of March, the market-derived probability of the June 2021 RBOB contract expiring at more than $2.00/gal was 39%, and the probability of the same contract expiring at more than $2.10/gal was 29%. In recent years, RBOB futures contracts have averaged about 90 cents/gal

less than the U.S. average regular retail gasoline price because the price of retail gasoline includes taxes, distribution, and marketing costs. Therefore, futures and options prices as of April 1 suggest about a 32% probability U.S. average retail gasoline prices could be at $3.00/gal or higher following the expiry of the June RBOB contract.

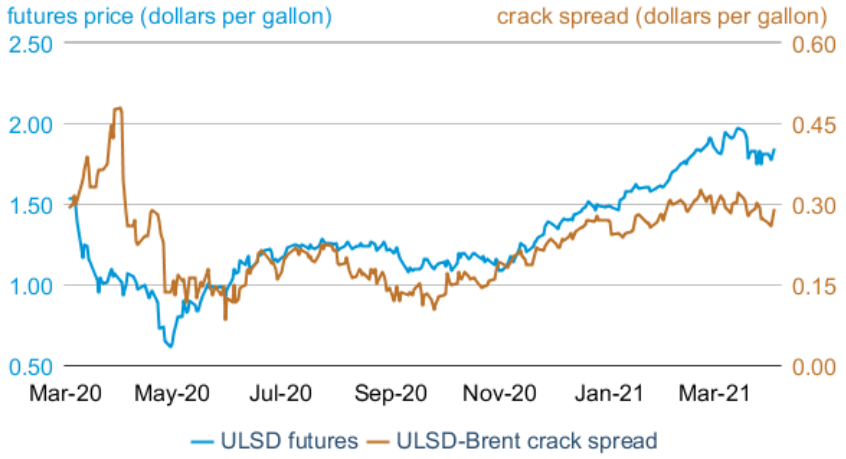


Figure 6. Probability of June 2021 RBOB expiring above different price levels

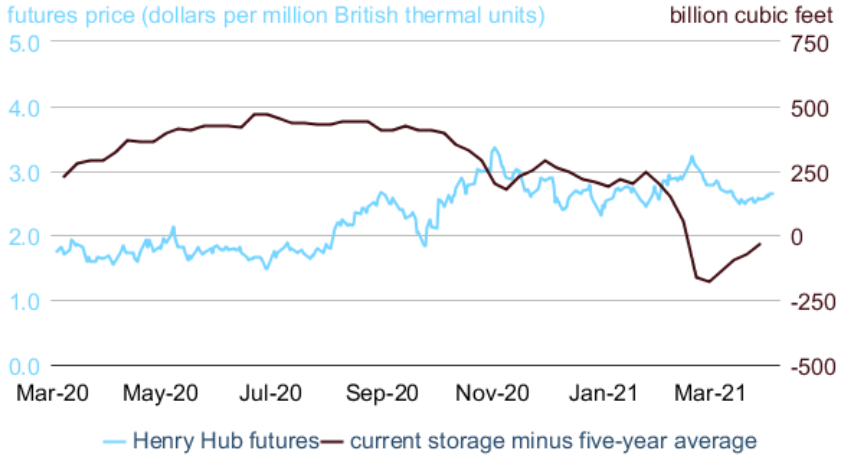
eia U.S. Energy Information Administration, CME Group, Bloomberg L.P.

Ultra-low sulfur diesel prices: The front-month futures price for ultra-low sulfur diesel (ULSD) for delivery in New York Harbor settled at $1.83/gal on April 1, up 1 cent/gal from March 1 **(Figure 7)**. The ULSD–Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) decreased 2 cents/gal and settled at 29 cents/gal during the same period.

Figure 7. Historical ULSD front-month futures price and crack spread



eia Source: CME Group, as compiled by Bloomberg L.P.
Note: ULSD=ultra-low sulfur diesel

The continuation of below-average ULSD–Brent crack spreads was likely a result of higher production and the lowest U.S. distillate net exports since January 2010. The higher production and lower net exports contributed to our estimate that U.S. distillate inventories increased by 5.5 million barrels (4%) from February, and likely provided downward pressure on the crack spread. The average daily crack spread decreased to 29 cents/gal in March, 1 cent/gal lower than in February, and the lowest average daily crack spread for March since 2017.

Natural Gas

Prices: The front-month natural gas futures contract for delivery at the Henry Hub settled at $2.64 per million British thermal units (MMBtu) on April 1, 2021, which was down 14 cents/MMBtu from March 1, 2021 **(Figure 8)**.

Figure 8. U.S. natural gas front-month futures prices and storage

Source: U.S. Energy Information Administration, CME Group, as compiled by Bloomberg L.P.

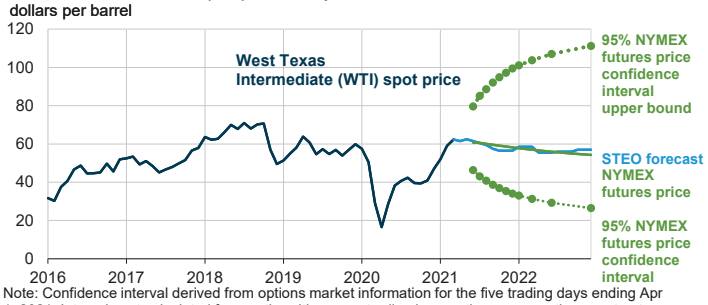
Natural gas futures prices averaged $2.62/MMBtu in March, a decrease of 29 cents/MMBtu from the February average, which was the highest monthly average since January 2019. EIA estimates March natural gas withdrawals were 62.3 Bcf, 65% less than the five-year (2016–20) average for March. The low March withdrawals partly reflected a decrease in natural gas demand. We estimate that natural gas consumption in March decreased to 84.4 billion cubic feet per day (Bcf/d), down 24.6 Bcf/d (23%) from February's record levels and the lowest consumption for March since 2017. We expect prices will rise from March levels and the Henry Hub spot price will average $2.86/MMBtu for the final three quarters of 2021. We forecast higher prices will result from relatively low, albeit rising, U.S. natural gas production compared with previous years amid increases in U.S. natural gas exports.

Notable forecast changes

- EIA forecasts that Brent crude oil prices will average $62/b in 2021 and $60/b in 2022. The forecast for both years is $2/b higher than in the March STEO. The higher forecast reflects larger draws from global oil inventories in 2021, particularly in the second quarter, than previously expected, which will reduce global oil inventory levels through the forecast period. The larger draws are the result of lower expected OPEC crude oil production in the second quarter of 2021.

- EIA forecasts U.S. crude oil production will average 11.0 million b/d in 2021 and 11.9 million b/d in 2022. Compared with the March STEO, those forecasts are 0.1 million b/d and 0.2 million b/d lower, respectively. We are forecasting lower production despite higher expected crude oil prices (about $2/b higher in both 2021 and 2022) because we now forecast that rig activity in producing areas outside the Permian—such as Bakken, Eagle Ford, and Anadarko—will be lower than previously expected.

- This STEO incorporates EIA's changes to its reporting of biofuels data. In STEO Table 4a, renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning with January 2021 data, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel. Additionally, we are now reporting product supplied (a proxy for consumption) of renewable fuels excluding fuel ethanol. In STEO Table 4a consumption data, these data will be included in the "other oils" category.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the United States Government. The views in this report therefore should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday April 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on Thursday April 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on Thursday April 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Index, 2015 Q1 = 100	**106.4**	**108.3**	**106.8**	**105.5**	**104.3**	*104.6*	*104.3*	*104.1*	*103.8*	*103.7*	*103.5*	*103.3*	**106.7**	*104.3*	*103.6*
Percent change from prior year	**0.9**	**2.0**	**0.3**	**-0.7**	**-2.0**	*-3.3*	*-2.3*	*-1.3*	*-0.4*	*-0.9*	*-0.8*	*-0.8*	**0.6**	*-2.3*	*-0.7*

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. GDP data are from Oxford Economics.

(b) Weighted geometric mean of real indices for various countries with weights equal to each country's share of world oil consumption in the base period. Exchange rate is measured in foreign currency per U.S. dollar. Exchange rate data are from Oxford Economics, and oil consumption data are from EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on Thursday April 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) For net imports and inventories “Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products; for consumption “Other Oils” also includes renewable fuels except fuel ethanol.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on Thursday April 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday April 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to Petroleum Administration for Defense Districts (PADD).

See "Petroleum for Administration Defense District" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Marketing Monthly* , DOE/EIA-0380; *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on Thursday April 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday April 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.93**	**1.91**	**1.93**	**1.91**	**1.92**	*1.95*	*1.93*	*1.90*	*1.92*	*1.93*	*1.92*	*1.89*	**1.92**	*1.92*	*1.92*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday April 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on Thursday April 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday April 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday April 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 7d part 1. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continues on Table 7d part 2*

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on Thursday April 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW)

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday April 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday April 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.
Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Total Energy (c)	**1,247**	**971**	**1,175**	**1,178**	**1,246**	*1,104*	*1,224*	*1,245*	*1,294*	*1,141*	*1,247*	*1,256*	**4,571**	*4,820*	*4,938*

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

- = no data available

SAAR = Seasonally-adjusted annual rate

Notes: EIA completed modeling and analysis for this report on Thursday April 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on Thursday April 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on Thursday April 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Appendix to the April 2021 *Short-Term Energy Outlook*

This appendix is prepared in fulfillment of section 1245(d)(4)(A) of the National Defense Authorization Act (NDAA) for Fiscal Year 2012, as amended. The law requires the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy, to submit to Congress a report on the availability and price of petroleum and petroleum products produced in countries other than Iran in the two-month period preceding the submission of the report. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The data in this appendix, therefore, should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

EIA consulted with the U.S. Department of the Treasury, the U.S. Department of State, and the intelligence community in the process of developing the NDAA report, which was previously published as a stand-alone report. Detailed background and contextual information not repeated here can be found in early editions of the NDAA report.

This appendix is published in the *Short-Term Energy Outlook* in even numbered months.

Table a1. Summary of Estimated Petroleum and Other Liquids Quantities

	Feb-21	Mar-21	Feb 2021 - Mar 2021 Average	Feb 2020 - Mar 2020 Average	2018 - 2020 Average
Global Petroleum and Other Liquids (million barrels per day)					
Global Petroleum and Other Liquids Production (a)	92.0	93.5	92.8	100.4	98.6
Global Petroleum and Other Liquids Consumption (b)	96.0	96.0	96.0	94.5	97.8
Biofuels Production (c)	1.9	2.0	1.9	2.0	2.5
Biofuels Consumption (c)	2.2	2.2	2.2	2.2	2.3
Iran Liquid Fuels Production	3.1	3.1	3.1	3.0	3.5
Iran Liquid Fuels Consumption	1.9	1.9	1.9	2.0	1.8
Petroleum and Petroleum Products Produced and Consumed in Countries Other Than Iran (million barrels per day)					
Production (d)	87.0	88.3	87.7	95.4	92.6
Consumption (d)	91.9	91.9	91.9	90.3	93.7
Production minus Consumption	-4.9	-3.6	-4.2	5.1	-1.1
World Inventory Net Withdrawals Including Iran	4.0	2.5	3.2	-5.9	-0.8
Estimated OECD Inventory Level (e) (million barrels)	2,951	2,932	2,941	2,918	2,942
Surplus Production Capacity (million barrels per day)					
OPEC Surplus Crude Oil Production Capacity (f)	8.5	8.5	8.5	3.2	3.4

Note: The term "petroleum and other liquids" encompasses crude oil, lease condensate, natural gas liquids, biofuels, coal-to-liquids, gas-to-liquids, and refinery processing gains, which are important to consider in concert due to the inter-related supply, demand, and price dynamics of petroleum, petroleum products, and related fuels.

(a) Production includes crude oil (including lease condensates), natural gas liquids, other liquids, and refinery processing gains.

(b) Consumption of petroleum by the OECD countries is synonymous with "products supplied," defined in the glossary of the EIA Petroleum Supply Monthly, DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel, and loss, and bunkering.

(c) Biofuels production and consumption are based on EIA estimates as published in the International Energy Statistics. Biofuels production in the third quarter tends to be at its highest level in the year as ethanol production in Brazil reaches its seasonal peak and is typically lowest in the first quarter as seasonal production falls in the South/South-Central region of Brazil.

(d) Global production of petroleum and petroleum products outside of Iran is derived by subtracting biofuels production and Iran liquid fuels production from global liquid fuels production. The same method is used to calculate global consumption outside of Iran.

(e) Estimated inventory level is for OECD countries only.
(f) EIA defines surplus oil production capacity as potential oil production that could be brought online within 30 days and sustained for at least 90 days, consistent with sound business practices. This does not include oil production increases that could not be sustained without degrading the future production capacity of a field.

Independent Statistics & Analysis
U.S. Energy Information Administration

May 2021

Short-Term Energy Outlook

Forecast highlights

Global liquid fuels

- The May *Short-Term Energy Outlook* (STEO) remains subject to heightened levels of uncertainty because responses to COVID-19 continue to evolve. Economic activity has increased significantly after reaching multiyear lows in the second quarter of 2020. The increase in economic activity and easing of COVID-19-related restrictions have contributed to rising energy use. U.S. gross domestic product (GDP) declined by 3.5% in 2020 from 2019 levels. This STEO assumes U.S. GDP will grow by 6.2% in 2021 and by 4.3% in 2022. The U.S. macroeconomic assumptions in this outlook are based on forecasts by IHS Markit. Our forecast assumes continuing economic growth and increasing mobility with easing COVID-19-related restrictions, and any developments that would cause deviations from these assumptions would likely cause energy consumption and prices to deviate from our forecast.

- We completed modeling and analysis for this report before the temporary closure of the Colonial Pipeline on May 7 as a result of a cyberattack. Although effects of the outage are not reflected in this report, we are closely following supply and price developments related to the outage. Updates related to the outage will be reflected in *Today in Energy*, *This Week in Petroleum*, and the *Weekly Petroleum Status Report* as they become available.

- Brent crude oil spot prices averaged $65 per barrel (b) in April, unchanged from the average in March. Brent prices were steady in April as market participants considered diverging trends in global COVID-19 cases. In some regions, notably the United States, oil demand is rising as both COVID-19 vaccination rates and economic activity increase. In other regions, notably India, oil demand is declining because of a sharp rise in COVID-19 cases. EIA forecasts that Brent prices will average $65/b in the second quarter of 2021, $61/b during the second half of 2021, and $61/b in 2022.

- We estimate that the world consumed 96.2 million barrels per day (b/d) of petroleum and liquid fuels in April, an increase of 15.8 million b/d from April 2020 but 4.0 million b/d less than April 2019 levels. We forecast that global consumption of petroleum and liquid fuels will average 97.7 million b/d for all of 2021, which is a 5.4 million b/d increase from 2020. We forecast that consumption of petroleum and liquid fuels will increase by 3.7 million b/d in 2022 to average 101.4 million b/d.

- We expect that gasoline consumption in the United States will average almost 9.0 million b/d this summer (April–September), which is 1.2 million b/d more than last summer but almost 0.6 million b/d less than summer 2019. We increased our summer gasoline consumption forecast by 0.1 million b/d from last month based on weekly data that suggested more gasoline consumption than we had previously forecast. The increase also reflects IHS Markit's increased employment forecast. For all of 2021, we forecast that U.S. gasoline consumption will average 8.7 million b/d, which is up from 2020 (8.0 million b/d) but down from 2019 (9.3 million b/d).

- According to our most recent data, U.S. crude oil production averaged 9.9 million b/d in February 2021, which was down by 1.2 million b/d from January. In February, cold temperatures caused significant declines in crude oil production in Texas, as well as smaller declines in other states. We estimate that production outages were generally limited to February and that U.S. crude oil production rose to 10.9 million b/d in March and to almost 11.0 million b/d in April. Because the average price of West Texas Intermediate crude oil remains above $55/b in our forecast, we expect producers will drill and complete enough wells in the coming months to offset declines at existing wells. In addition, new projects in the Federal Offshore Gulf of Mexico contribute to rising production in the forecast. U.S. crude oil production in the forecast averages 11.3 million b/d in the fourth quarter of 2021 and then rises to average 11.8 million b/d in 2022.

Natural Gas

- In April, the natural gas spot price at Henry Hub averaged $2.66 per million British thermal units (MMBtu), which is slightly higher than the March average of $2.62/MMBtu. We expect the Henry Hub spot price will average $2.78/MMBtu in the second quarter of 2021 and will average $3.05/MMBtu for all of 2021, which is up from the 2020 average of $2.03/MMBtu. We expect natural gas prices will rise this year, primarily as a result of two factors: growth in liquefied natural gas (LNG) exports and rising domestic natural gas consumption in the residential, commercial, and industrial sectors. In 2022, we expect the Henry Hub price will fall to an average $3.02/MMBtu amid slowing growth in LNG exports and rising production.

- We expect that U.S. consumption of natural gas will average 82.6 billion cubic feet per day (Bcf/d) in 2021, down 0.7% from 2020. U.S. natural gas consumption declines in the forecast, in part, because electric power generators switch to coal from natural as a result of rising natural gas prices. In 2021, we expect residential and commercial natural gas consumption together will rise by 1.0 Bcf/d from 2020 and industrial consumption will rise by 0.8 Bcf/d from 2020. Rising consumption outside of the power sector results from expanding economic activity and colder temperatures in 2021 compared with 2020. We expect U.S. natural gas consumption will average 82.5 Bcf/d in 2022.

- We estimate that natural gas inventories ended April 2021 at almost 2.0 trillion cubic feet (Tcf), which is 3% lower than the five-year (2016–20) average. Natural gas withdrawals from storage during the winter of 2020–21 were higher than the five-year average, largely as a result of the cold February temperatures that contributed to a drop in natural gas production. We forecast that natural gas inventories will end the 2021 injection season (end of October) at more than 3.6 Tcf, which is 3% below the five-year average.

- We forecast that U.S. production of dry natural gas will average 91.1 Bcf/d in 2021, which is down 0.3% from 2020. Dry natural gas production fell by 6.0 Bcf/d in February to 86.3 Bcf/d because of cold weather that largely affected Texas. We estimate production increased to 91.3 Bcf/d in March. We expect relatively flat dry natural gas production in May ahead of production beginning to rise in mid-2021. We forecast dry natural gas production will reach 92.0 Bcf/d in the fourth quarter of 2021 and average 93.1 Bcf/d in 2022. The increase in production reflects sustained higher forecast prices for natural gas and crude oil compared with 2020.

- U.S. LNG exports set an all-time record in March 2021 at 10.5 Bcf/d and averaged 9.2 Bcf/d in April—the most exported LNG for those months since the United States began exporting it in 2016. Throughout 2020 and in January 2021, more than half of U.S. LNG exports went to Asia. However, in February and March 2021, more than half of U.S. LNG exports went to Europe as a result of spot natural gas prices in Europe reaching levels similar to spot natural gas prices in Asia. For May, we forecast a decline in U.S. LNG exports to 8.6 Bcf/d (more than 90% of baseload export capacity utilization) before exports rise above 9.0 Bcf/d in the summer months to meet summer peak demand in Europe and Asia. We expect LNG exports will average 9.2 Bcf/d in both 2021 and 2022, up from 6.5 Bcf/d in 2020. Flat LNG exports in 2022 reflect our expectation that limited new export capacity will come online during the forecast period.

Electricity, coal, renewables, and emissions

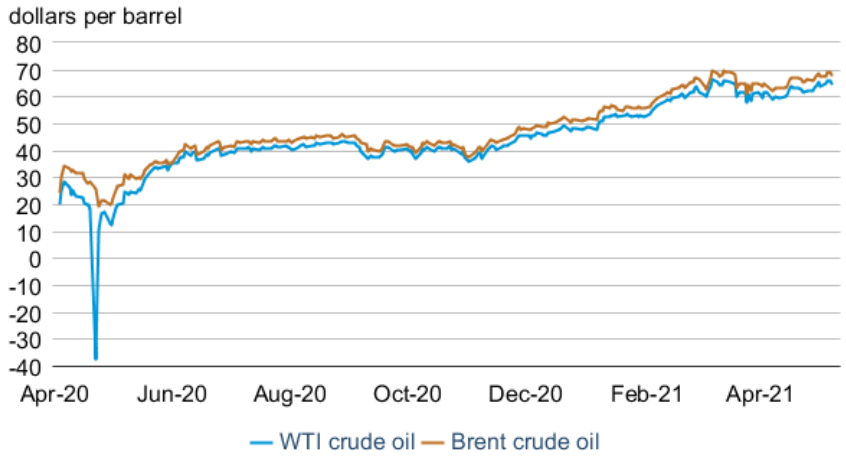
- We forecast that electricity consumption in the United States will increase by 2.2% in 2021 after falling 3.9% in 2020. We forecast electricity sales to the industrial sector will grow by 3.3% in 2021. We forecast that retail electricity sales to the residential sector will grow by 2.9% in 2021, which is primarily a result of colder temperatures in the first quarter of 2021 compared with the same period in 2020. We expect retail electricity sales to the commercial sector will increase by 1.4% in 2021. Much of the increased electricity consumption across the sectors reflects improving economic conditions in 2021. For 2022, we forecast that U.S. electricity consumption will grow by another 1.0%.

- We expect the share of electric power generated from natural gas in the United States will average 35% in both 2021 and 2022, down from 39% in 2020. The forecast share for natural gas as a generation fuel declines in response to an 85% increase in the average

delivered natural gas price for electricity generators, from an average $2.39/MMBtu in 2020 to an average $4.41/MMBtu in 2021. As a result of the higher expected natural gas prices, the forecast share of generation from coal rises from 20% in 2020 to 24% this year and to 23% next year. New additions of solar and wind generating capacity contribute to our expectation that the renewables share of U.S. generation will rise from 20% in 2020 to 21% in 2021 and to 22% in 2022. The nuclear share of U.S. generation declines from 21% in 2020 to 20% in 2021 and to 19% in 2022 as a result of retiring capacity at some nuclear power plants.

- We forecast that planned additions to U.S. wind and solar generating capacity in 2021 and 2022 will contribute to rising electricity generation from those sources. We estimate that the U.S. electric power sector added 14.8 gigawatts (GW) of new wind capacity in 2020. We expect 15.9 GW of new wind capacity will come online in 2021 and 5.2 GW in 2022. Utility-scale solar capacity rose by an estimated 10.5 GW in 2020. Our forecast for added utility-scale solar capacity is 15.7 GW and 15.9 GW for 2021 and 2022, respectively. We expect significant solar capacity additions in Texas during the forecast period. In addition, about 5 GW of small-scale solar (systems less than 1 megawatt) will come online each year during the 2021–22 STEO forecast.

- We expect U.S. coal production to total 582 million short tons (MMst) in 2021, 43 MMst (8%) more than in 2020. The increase in coal production is primarily driven by rising use of coal for electricity generation in response to rising natural gas prices. Recent strikes in Appalachia metallurgical coal mines likely limited production increases in April, but we do not expect them to significantly affect production through the rest of 2021. In 2022, we expect coal production to grow by an additional 23 MMst (4%).



- We estimate that U.S. energy-related carbon dioxide (CO_2) emissions decreased by 11% in 2020 as a result of less energy consumption related to reduced economic activity and responses to COVID-19. In 2021, we forecast energy-related CO_2 emissions will increase about 6% from the 2020 level as economic activity increases and leads to rising energy use. We also expect energy-related CO_2 emissions to rise in 2022, but by a slower rate of 2%. We forecast that after declining by 19% in 2020, coal-related CO_2 emissions will rise by 17% in 2021 and then fall by 1% in 2022.

Petroleum and natural gas markets review

Crude oil

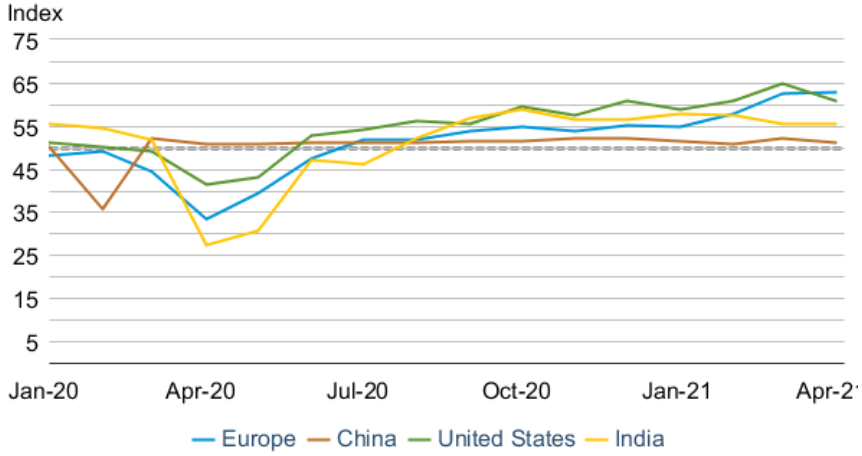
Prices: The front-month futures price for Brent crude oil settled at $68.09 per barrel (b) on May 6, 2021, up $3.23/b from April 1. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, increased by $3.26/b during the same period, settling at $64.71 on May 6 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices

Sources: CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate.

After approaching a 2021 high in early March of almost $70/b, Brent crude oil prices declined to between $60/b and $65/b in mid-March through the first half of April. However, in the second half of April and into early May, crude oil prices began to rise, likely as a result of crude oil and petroleum product inventory draws and higher expectations for summer gasoline demand, particularly in the United States. The rise in oil prices was likely reinforced by macroeconomic indicators that pointed to continued economic recovery and led to price increases across a broad range of commodities, discussed in detail below. News of rising COVID-19 cases in India offset some of the expectation of rising demand globally, but India's increase in cases has not prevented crude oil prices from rising; they climbed to their monthly highs of $68.56/b for Brent and $65.01/b for WTI as of April 29. Oil market developments during the past month occurred against a backdrop of continuing production restraint from OPEC+, which likely contributed to some upward price pressure. However, we expect OPEC+ to begin increasing production in May, which is consistent with the production targets announced at its early April meeting. OPEC+ plans to revisit its production targets at the next meeting, scheduled for June 1.

In the May STEO, we expect upward pressure on the Brent price to ease and the Brent price to decrease to average $65/b in the second quarter. This decrease comes as OPEC+ crude oil production rises to meet gradually increasing crude oil demand. We expect global consumption



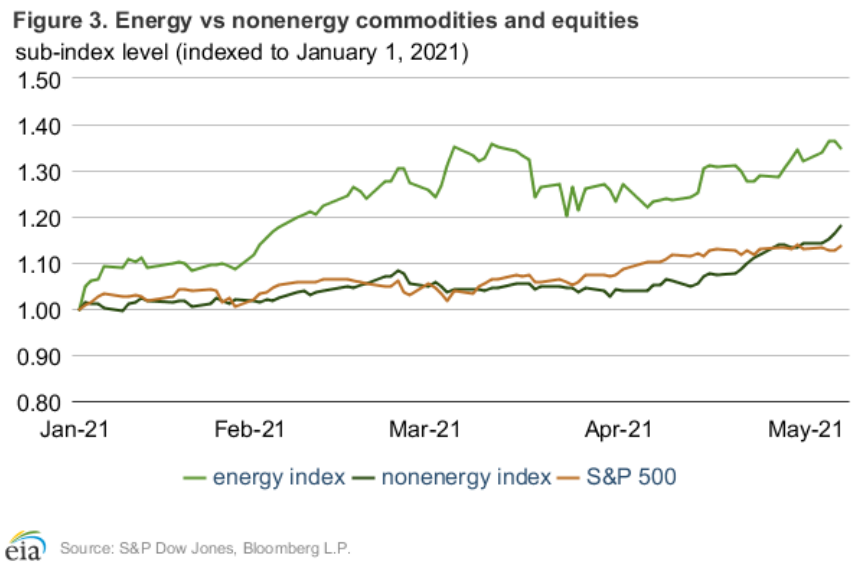
to average almost 97.0 million b/d in the second quarter, a 2.2 million b/d increase from the first quarter, before increasing to 98.9 million b/d in the third quarter and to 100.0 million b/d in the fourth quarter, which is largely unchanged from the April STEO.

Oil demand in Asia presents a downside risk to the forecast. India, the world's third largest consumer of oil, has rising COVID-19 cases. The degree to which the increase in cases will affect oil demand is currently unclear. We reduced oil consumption in India by 0.3 million b/d on average during the second quarter of 2021 from the April STEO. This forecast is highly uncertain, as future case counts and their effect on mobility is unclear.

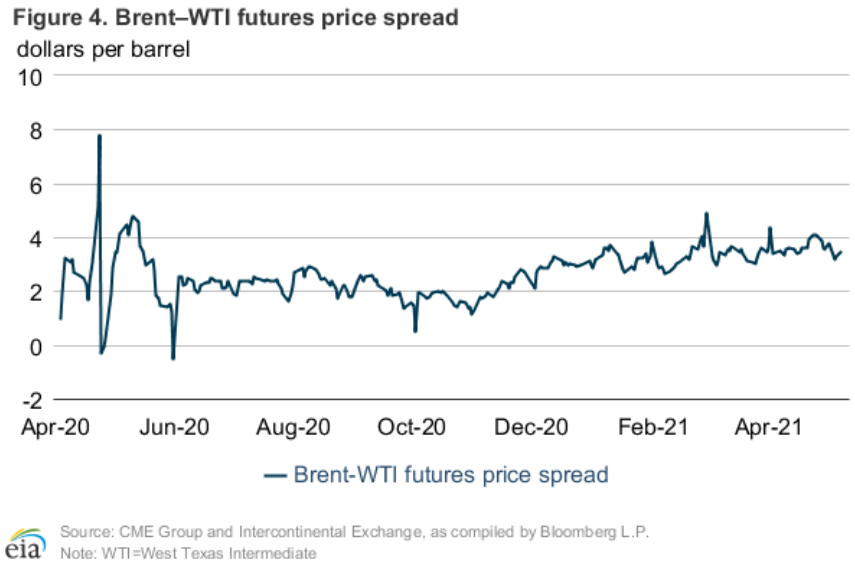
We expect global oil production to continue to increase in the second half of the year to keep pace with rising demand. Increased production puts downward pressure on crude oil prices: the Brent price falls to $63/b in the third quarter and $60/b in the fourth quarter of 2021.

Commodity prices and manufacturing indexes: Purchasing managers' indexes (PMIs) for regional manufacturing in the United States and Europe remained firmly expansionary in April, suggesting increasing overall economic activity. PMIs are based on surveys sent to managerial staff of industry participants in the relevant country or region, in this case, within manufacturing sector companies. A PMI reading below 50 represents net expectations of a contraction in manufacturing activity, and a rating above 50 represents net expectations of manufacturing expansion. The PMI of the United States (data compiled by the Institute for Supply Management) decreased to 60.7 in April, down from its March high of 64.7, while Europe's PMI (data compiled by IHS Markit) increased to 62.9 in April from 62.5 in March **(Figure 2)**. The March 2021 PMI for the United States and the April 2021 PMI for Europe were the highest PMI index values for their respective regions since the pandemic began in early 2020, reflecting increased expectations for growing manufacturing activity in those regions.

Figure 2. Regional Manufacturing Purchasing Managers' Index (PMI)



eia Bloomberg L.P., IHS Markit, Institute for Supply Management

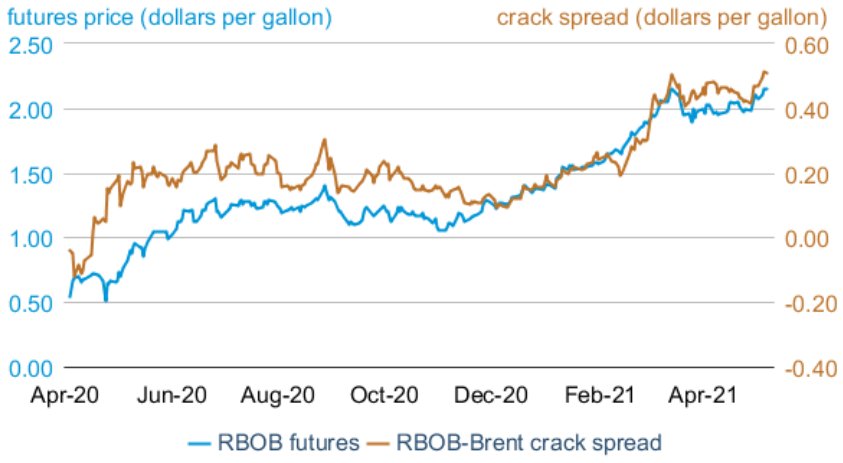


In Europe, the manufacturing PMI was less than 50 from January through June in 2020, and the United States' manufacturing PMI was less than 50 from March through May 2020. At 51.1 in April 2021, China's PMI was less than its November 2020 level (52.1) and was down from its March 2021 value of 51.9. China's PMI has historically trended closer to 50 than other regional PMIs. The increasing PMIs for the United States and Europe in March and April 2021 coincided with rising numbers of vaccinated persons, which has increased the available workforce who can return to work and leisure activities, stimulating demand for goods and services. The rising PMIs lend support to our expectation of rising oil consumption in the coming months.

Similar to higher PMI manufacturing surveys, increases in non-energy commodity prices in April 2021 also suggest increases in economic growth. Commodity prices, including copper, lumber, grains, and agricultural goods, have all increased in response to increasing economic activity. In addition to rising demand, commodity prices are also affected by a lower supply because low demand in 2020 led wholesalers and retailers to adjust inventory levels to changing demand. As demand increases, prices will face upward pressure as long as supply chains are strained to meet higher levels of demand.

The renewed demands and strain on supply chains is also reflected in recent upward pressure on broad commodity price indexes. The S&P GSCI (formerly the Goldman Sachs Commodity Index) is an index of commodity prices, based on weighted indexes for energy, agricultural commodities, livestock, precious metals, and industrial metals. As of May 6, the S&P GSCI non-energy index, increased 18% from January 1, 2021 **(Figure 3)**. The majority of that growth occurred in April, as the sub-index started the month at just 4% above January 1. The upward pressure on non-energy commodities reflects more recent increases in economic activity, even as equities have shown steadier increases since the start of the year. Total returns on the S&P 500 have been showing steady growth since the start of 2021, posting record highs in April 2021. The S&P GSCI energy index has been increasing since mid-April, and during the first week of May, surpassed its previous highs from early March. The S&P GSCI energy index is largely weighted toward crude oil and petroleum products, although it also includes natural gas.

Brent–WTI spread: The difference between Brent and WTI crude oil futures prices has been increasing on a monthly average basis since November 2020. In the past two months, the reduction in and subsequent return of U.S. crude oil production following outages resulting from widespread cold weather in February and lower Brent volumes resulting from production platform maintenance in the North Sea introduced increased volatility into the spread that has been gradually stabilizing at a wider level since March **(Figure 4)**.



The Brent–WTI spread can reflect a wide range of factors, including the relative supply compared with demand for crude oils in their local markets—the U.S. Gulf Coast and Midwest for WTI and Northwest Europe for Brent. The spread also reflects the relative economics of shipping the two crude oils to refining markets around the world. The spread increased to more than $3/b on a monthly average basis beginning in January 2021. After averaging $3.38/b in

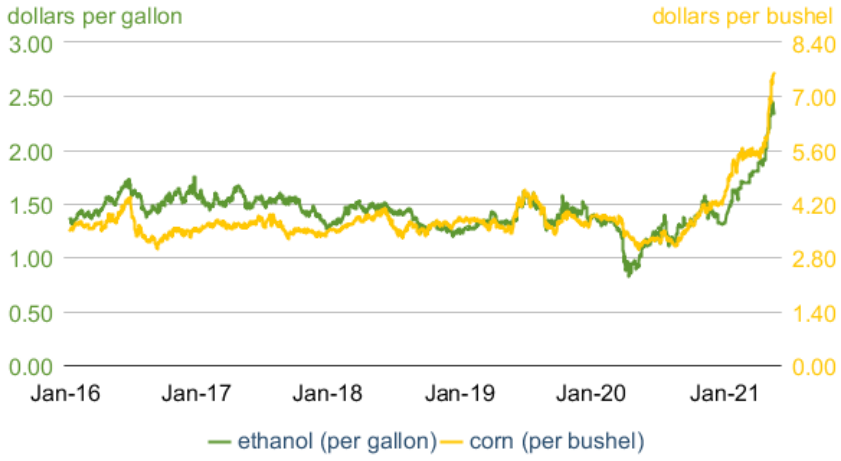
March, the April 2021 average Brent–WTI spread was $3.63/b, a $0.25/b monthly increase. Although the February weather events in U.S. producing regions appear to have increased volatility in the spread, the widening of the spread in March and April reflects both rising U.S. crude oil production and a longer-term widening of the spread since the fourth quarter of 2020. The spread between grades has widened each month, on average, since October 2020, after it narrowed to a monthly average of $1.68/b in October 2020, its lowest point since the pandemic began in early 2020.

Petroleum products

Gasoline prices: The front-month futures price of RBOB (the petroleum component of gasoline used in many parts of the country) settled at $2.11 per gallon (gal) on May 6, up 9 cents/gal from April 1 **(Figure 5)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) increased by 1 cent/gal to settle at 49 cents/gal during the same period.

Figure 5. Historical RBOB front-month futures prices and crack spreads

Source: CME Group, as compiled by Bloomberg L.P.
Note: RBOB is the petroleum component of gasoline used in many parts of the country.



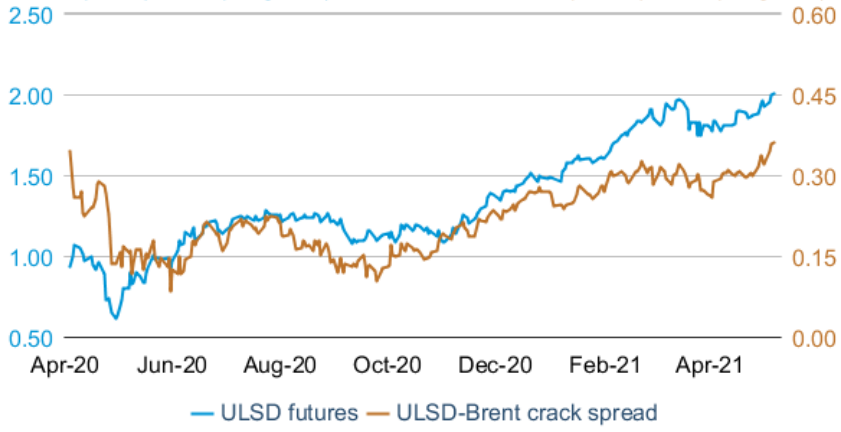
The RBOB–Brent crack spread remains higher than average for this time of year, likely as a result of higher demand expectations, relatively low gasoline stocks, and higher ethanol costs. Gasoline stocks were relatively unchanged in April as the increase in consumption offset increases in production and net imports. We estimate the combined net imports of motor gasoline blending components and finished motor gasoline to be 173,000 b/d, which is higher than the five-year (2016–20) average, and we estimate production of 9.6 million b/d, the most on a monthly basis since February 2020. However, we also estimate that U.S. gasoline consumption increased to 8.8 million b/d in April, a 0.2 million b/d (2.3%) increase from March and the most gasoline consumption since February 2020. April's gasoline stocks ended the month 3% below the month's five-year (2016–20) average. We forecast that gasoline stocks will remain low through the rest of 2021 because of increased driving in upcoming months as a

result of typical summer travel, higher numbers of people who are willing to travel as a result of increasing vaccination rates, and continued increases in employment.

Recently, record-high prices for Renewable Identification Number (RIN) credits have been another contributing factor to higher-than-average RBOB prices. RINs are the compliance mechanisms used for the Renewable Fuel Standard (RFS) program, which the U.S. Environmental Protection Agency (EPA) administers. In recent years, RIN prices have typically been at a level that only minimally affected RBOB prices. In recent months, however, RIN prices have increased sharply, resulting, in part, from uncertainty concerning Renewable Volume Obligations (RVO) for 2021 and increasing ethanol feedstock costs, which have led to higher ethanol prices relative to gasoline. The higher cost of RFS compliance for gasoline producers and importers as a result of higher RIN prices may pass through to affect RBOB prices.

Fuel ethanol and corn prices: The front-month futures price of fuel ethanol closed higher than $2.00/gal on April 14, 2021, for the first time since December 3, 2014. Fuel ethanol prices increased further throughout the remainder of April and settled at $2.34 on May 6, 2021, 23 cents/gal higher than the front-month RBOB contract **(Figure 6)**.

Figure 6. Corn and fuel ethanol futures prices



Source: CME Group, as compiled by Bloomberg L.P.
Note: About 2.8 bushels of corn go into each gallon of ethanol.

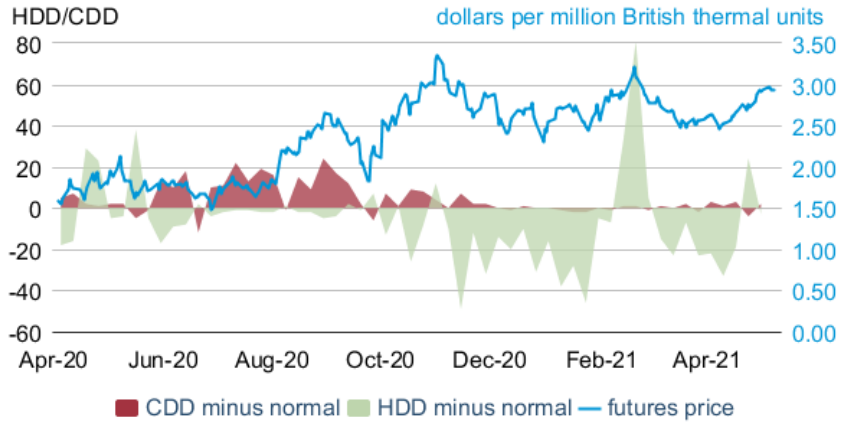
These higher fuel ethanol prices, which have contributed to higher RIN prices, are mostly the result of higher prices for corn, which is the feedstock for fuel ethanol. On May 6, the front-month futures price of corn closed at $7.60 per bushel, a 144% increase from $3.12 per bushel on the same day a year ago and its highest price since November 2012. Corn prices have been increasing, in part, because of factors unique to corn and grains, such as high demand in China, concerns of reduced supply in the United States as a result of cold weather in the Midwest, and lower production in Brazil as a result of hot and dry weather. Corn prices may also be increasing because of rising gasoline demand contributing to more demand for fuel ethanol blending and, therefore, more demand for corn as a feedstock.

Nevertheless, because some of the factors contributing to increased corn prices are separate from fuel ethanol demand, the fuel ethanol–corn crush spread (the difference between the price of fuel ethanol and the price of its corn inputs) has decreased and has been largely negative since November 2020. Before late 2020, the last time corn sold at a more-than 10 cent premium to fuel ethanol for at least 10 consecutive days was during the demand shock in March and April 2020. During that time, fuel ethanol production was disproportionately affected, falling by more than 45% in April 2020 compared with the previous year, but largely tracking decreases in motor gasoline demand. Whereas the negative economics of blending corn ethanol likely contributed to a decrease in fuel ethanol production in April 2020, RIN prices at that time were low. In 2021 however, some portion of the currently high RIN values is likely being captured by fuel ethanol producers to offset the high operating costs and support fuel ethanol production closer to typical seasonal levels compared with last year.

Ultra-low sulfur diesel prices: The front-month futures price for ultra-low sulfur diesel (ULSD) for delivery in New York Harbor settled at $1.99/gal on May 6, up 16 cents/gal from April 1 **(Figure 7)**. The ULSD–Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) increased 8 cents/gal, settling at 37 cents/gal during the same period.

Figure 7. Historical ULSD front-month futures prices and crack spreads

Source: CME Group, as compiled by Bloomberg L.P.
Note: ULSD=ultra-low sulfur diesel



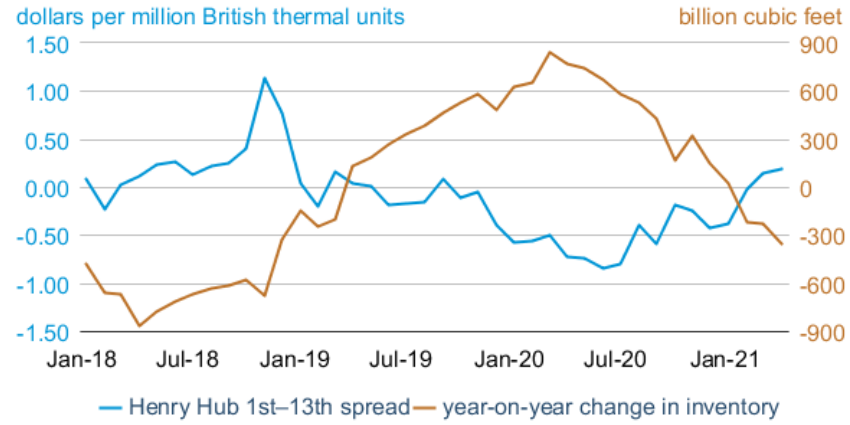
The ULSD–Brent crack spread increased in the first week of May to its highest level in more than a year because of increases in consumption and exports. We estimate that U.S. distillate consumption increased to almost 4.1 million b/d in April, which, if confirmed by monthly data, is the most U.S. distillate consumption since November 2019. The increase in demand is likely related to high freight demand, which we expect to continue as economic activity increases with improved vaccination and employment rates. We also estimate an increase in net exports during April to more than 0.8 million b/d, the most since September 2020, if confirmed by monthly data. The increases in U.S. consumption and exports contributed to a 9.5 million barrel (7%)

decrease in distillate stocks from March. This stock draw occurred despite an increase in distillate production.

Natural Gas

Prices: The front-month natural gas futures contract for delivery at the Henry Hub settled at $2.93 per million British thermal units (MMBtu) on May 6, 2021, which was up 29 cents/MMBtu from April 1, 2021 **(Figure 8)**.

Figure 8. Natural gas front-month futures prices and actual minus historical average HDD and CDD



Sources: CME Group and National Oceanic and Atmospheric Administration, as compiled by Bloomberg L.P.
Note: HDD=heating degree days, CDD=cooling degree days.

The high levels of LNG exports have likely helped support natural gas prices. We estimate LNG exports of 9.2 million billion cubic feet per day (Bcf/d) in April, which is a decrease from the record 10.5 million Bcf/d of LNG exports in March but a 2.3 million Bcf/d (34%) increase from the previous 12-month average. April's natural gas stock builds were lower than the five-year (2016–20) average as a result of the high LNG exports, as well as lower production and seasonally-high consumption resulting from relatively cold temperatures during the week ending April 22.

Futures price spreads: The natural gas 1st–13th price spread averaged 19 cents per MMBtu in April, the highest backwardation (where near-term contract prices are higher than longer-dated ones) since December 2018 **(Figure 9)**. Often, the 1st–13th price spread increases when natural gas inventories decrease, and the price spread often decreases when inventories increase. For example, in June 2020, when inventories were 672 billion cubic feet (Bcf) greater than their year-ago levels, the 1st–13th price spread was decreasing and averaged -84 cents/MMBtu for the month. In April 2021, natural gas inventories ended the month 353 Bcf lower than in April 2020, mostly as a result of high heating demand and production outages in February as well as several months of high export demand. Inventory draws from December through March, including February's draw that was a record high for that month, have contributed to low natural gas inventories and generally increasing front-month price spreads.

Figure 9. Natural gas 1st–13th futures spread and year-on-year change in inventory

Source: CME Group, as complied by Bloomberg L.P.; U.S. Energy Information Administration
Note: Futures spreads are monthly averages.

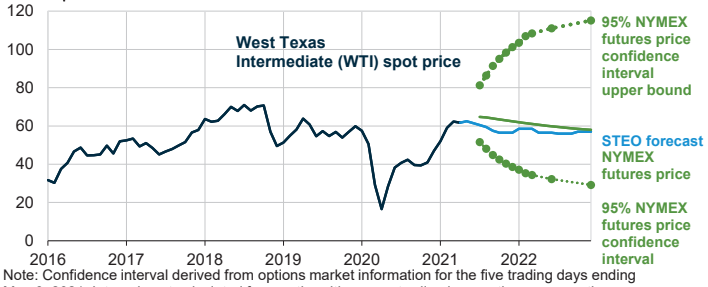
We expect U.S. natural gas storage injections from April through October will be slightly less than, but close to, the five-year average injection rate for those months. In our forecast, natural gas inventories end October at 3,630 Bcf, which would be 122 Bcf (3%) less than the five-year average. We expect the slightly less-than-average storage injections to put some upward pressure on natural gas prices and that the third-quarter 2021 Henry Hub spot price will average $2.90/MMBtu as a result.

Notable forecast changes

- We increased our April and May U.S. gasoline consumption forecast by 140,000 b/d and 270,000 b/d, respectively. Overall, we revised up the summer (April–September) gasoline consumption forecast by 130,000 b/d from last month based on weekly data (which suggested gasoline consumption was higher than we had forecast) and IHS Markit's upward revision in the employment forecast.

- We forecast OPEC crude oil production will average 26.9 million b/d in 2021 and 28.5 million b/d in 2022, which are 0.2 million b/d and 0.4 million b/d higher, respectively, than last month's STEO. The higher forecast OPEC production mainly reflects our expectation that crude oil production in Iran will continue to increase, continuing the rising output trend that started in November 2020. Even though sanctions that target Iran's crude oil exports remain in place, crude oil exports from Iran have been rising since the end of 2020, driving up crude oil production.

- Our forecast are secondary coal inventories are lower by 26 MMst (22%) in 2021 and by 20 MMst (24%) in 2022 compared with our April forecast. Lower inventories reflect EIA's expectation that coal-fired electricity generation will increase at a faster rate than the forecast increase in coal production, which reflects a general decline in coal production capacity.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the United States Government. The views in this report therefore should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday May 6, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109;
Petroleum Supply Annual , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130;
Electric Power Monthly , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.
Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Average for all sulfur contents.

(b) Average self-service cash price.

(c) Includes fuel oils No. 4, No. 5, No. 6, and topped crude.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday May 6, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation; prices exclude taxes unless otherwise noted.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Marketing Monthly* , DOE/EIA-0380; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; and *Monthly Energy Review* , DOE/EIA-0035.

Natural gas Henry Hub and WTI crude oil spot prices from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on Thursday May 6, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on Thursday May 6, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on Thursday May 6, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) For net imports and inventories “Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products; for consumption “Other Oils” also includes renewable fuels except fuel ethanol.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on Thursday May 6, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday May 6, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on Thursday May 6, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday May 6, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Coal Miner Productivity (Tons per hour)	**6.37**	**6.37**	**6.37**	**6.37**	**6.32**	*6.32*	*6.32*	*6.32*	*6.30*	*6.30*	*6.30*	*6.30*	**6.37**	*6.32*	*6.30*
Total Raw Steel Production (Million short tons per day)	**0.268**	**0.174**	**0.197**	**0.224**	**0.246**	*0.257*	*0.268*	*0.303*	*0.290*	*0.255*	*0.251*	*0.258*	**0.216**	*0.269*	*0.263*
Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.93**	**1.91**	**1.93**	**1.92**	**1.93**	*1.98*	*1.98*	*1.95*	*1.99*	*1.99*	*1.97*	*1.95*	**1.92**	*1.96*	*1.98*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday May 6, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on Thursday May 6, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday May 6, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on Thursday May 6, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on Thursday May 6, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW)

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday May 6, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday May 6, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.
Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Carbon Dioxide (CO2) Emissions (million metric tons)															
Petroleum	**553**	**442**	**518**	**522**	**509**	*550*	*564*	*571*	*555*	*573*	*587*	*585*	**2,035**	*2,193*	*2,300*
Natural Gas	**490**	**349**	**383**	**429**	**485**	*348*	*367*	*436*	*481*	*347*	*370*	*435*	**1,651**	*1,636*	*1,633*
Coal	**201**	**177**	**271**	**224**	**251**	*227*	*304*	*242*	*264*	*223*	*291*	*232*	**873**	*1,023*	*1,011*
Total Energy (c)	**1,247**	**971**	**1,174**	**1,178**	**1,247**	*1,127*	*1,237*	*1,251*	*1,303*	*1,146*	*1,251*	*1,255*	**4,571**	*4,863*	*4,955*

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

- = no data available

SAAR = Seasonally-adjusted annual rate

Notes: EIA completed modeling and analysis for this report on Thursday May 6, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday May 6, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on Thursday May 6, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Independent Statistics & Analysis
U.S. Energy Information Administration

June 2021

Short-Term Energy Outlook

Forecast highlights

Global liquid fuels

- The June *Short-Term Energy Outlook* (STEO) remains subject to heightened levels of uncertainty related to the ongoing economic recovery from the COVID-19 pandemic. The U.S. economy continues to rise after reaching multiyear lows in the second quarter of 2020 (2Q20). The increase in economic activity and easing of the COVID-19 pandemic have contributed to rising energy use. U.S. gross domestic product (GDP) declined by 3.5% in 2020 from 2019 levels. This STEO assumes U.S. GDP will grow by 6.7% in 2021 and by 4.9% in 2022. The U.S. macroeconomic assumptions in this outlook are based on forecasts by IHS Markit. Our forecast assumes continuing economic growth and increasing mobility as a result of the easing of the COVID-19 pandemic. Any developments that would cause deviations from these assumptions would likely cause energy consumption and prices to deviate from our forecast.

- Brent crude oil spot prices averaged $68 per barrel (b) in May, up $4/b from April. Brent prices were higher in May as global oil inventories continued to decline, albeit at a slower pace than in the first four months of the year. In the coming months, we expect that global oil production will increase to match rising levels of global oil consumption. The rising oil production in the forecast is largely a result of the OPEC+ decision to raise production. We expect rising production will end the persistent global oil inventory draws that have occurred for much of the past year and lead to relatively balanced global oil markets in the second half of 2021 (2H21). We expect Brent prices will remain near current levels in 3Q21, averaging $68/b. However, in 2022, we expect that continuing growth in production from OPEC+ and accelerating growth in U.S. tight oil production—along with other supply growth—will outpace decelerating growth in global oil consumption and contribute to declining oil prices. Based on these factors, we expect Brent to average $60/b in 2022.

- We expect U.S. gasoline consumption will average 9.1 million barrels per day (b/d) this summer (April–September), which is 1.3 million b/d more than last summer but still more than 0.4 million b/d less than summer 2019. Weekly consumption data reflect the Colonial Pipeline outage and subsequent increase in gasoline demand, but consumption both before and after this event indicate more gasoline demand than we had previously forecast. Our latest forecast also reflects IHS Markit's increased employment forecast.

We expect U.S. gasoline consumption to average 8.7 million b/d in for all of 2021 and 9.0 million b/d in 2022.

- For the 2021 April–September summer driving season, we forecast U.S. regular gasoline retail prices will average $2.92 per gallon (gal), up from an average of $2.07/gal last summer. The higher forecast gasoline prices reflect higher crude oil prices and higher wholesale gasoline margins. Wholesale gasoline margins have risen as a result of relatively low inventories and rising gasoline demand. Margins also temporarily widened because of outages on the Colonial Pipeline. These developments caused U.S. average regular gasoline retail prices to reach a monthly average of $2.99/gal in May, peaking at $3.03/gal on May 17, which were the highest monthly and weekly prices since 2014. We expect that prices will average $3.03/gal in June before falling to $2.76/gal by September. The drop in forecast retail gasoline prices reflects our forecast that gasoline margins will fall this summer in response to rising refinery utilization. For all of 2021, we expect U.S. regular gasoline retail prices to average $2.77/gal and gasoline retail prices for all grades to average $2.87/gal. Higher prices and more gasoline consumption would result in the average U.S. household spending about $570 (38%) more on motor fuel in 2021 compared with 2020.

- We estimate that 96.2 million b/d of petroleum and liquid fuels was consumed globally in May, an increase of 11.9 million b/d from May 2020 but 3.7 million b/d less than in May 2019. We forecast that global consumption of petroleum and liquid fuels will average 97.7 million b/d for all of 2021, which is a 5.4 million b/d increase from 2020. We forecast that global consumption of petroleum and liquid fuels will increase by 3.6 million b/d in 2022 to average 101.3 million b/d.

- We forecast OPEC crude oil production will average 26.9 million b/d in 2021 and 28.7 million b/d in 2022. OPEC crude oil production in the forecast rises from 25.0 million b/d in April to an average of 28.0 million b/d in 3Q21. Our expectation of rising OPEC production is primarily based on our assumption that OPEC will raise production by about 1 million b/d in both June and in July in response to rising global oil demand and seasonal increases in oil consumption for power generation for some OPEC members. It also reflects an assumption that Iran's crude oil production will continue to increase this year. Although sanctions that target Iran's crude oil exports remain in place, crude oil exports—according to ClipperData, LLC.—and production from Iran are up from most of 2020.

- According to our most recent data, U.S. crude oil production averaged 11.2 million b/d in March 2021, an increase of 1.4 million b/d from February. The March rise indicates that the production outages caused by the February winter freeze were temporary and that production came back online quickly. Because prices of West Texas Intermediate crude oil remain above $60/b during 2021 in the current forecast, we expect that producers will drill and complete enough wells to raise 2022 production from 2021

levels. We estimate that 2022 production will average 11.8 million b/d, up from a forecast average of 11.1 million b/d in 2021.

Natural Gas

- In May, the natural gas spot price at Henry Hub averaged $2.91 per million British thermal units (MMBtu), which is up from the April average of $2.66/MMBtu. We expect the Henry Hub spot price will average $2.92/MMBtu in 3Q21 and $3.07/MMBtu for all of 2021, which is up from the 2020 average of $2.03/MMBtu. Higher natural gas prices this year primarily reflect two factors: growth in liquefied natural gas (LNG) exports and rising domestic natural gas consumption outside of the power sector. In 2022, we expect the Henry Hub price will average $2.93/MMBtu amid slowing growth in LNG exports and rising U.S. natural gas production.

- We expect that U.S. consumption of natural gas will average 82.9 billion cubic feet per day (Bcf/d) in 2021, down 0.5% from 2020. U.S. natural gas consumption declines in the forecast, in part, because electric power generators switch to coal from natural gas as a result of rising natural gas prices. In 2021, we expect residential and commercial natural gas consumption combined will rise by 1.2 Bcf/d from 2020 and industrial consumption will rise by 0.7 Bcf/d from 2020. Rising consumption outside of the power sector results from expanding economic activity and colder winter temperatures in 2021 compared with 2020. We expect U.S. natural gas consumption will average 82.8 Bcf/d in 2022.

- We estimate that natural gas inventories ended May 2021 at almost 2.4 trillion cubic feet (Tcf), which is 3% lower than the five-year (2016–20) average. More natural gas was withdrawn from storage during the winter of 2020–21 than the previous five-year average, largely as a result of the colder-than-average February temperatures that contributed to a drop in natural gas production. We forecast that inventories will end the 2021 injection season (end of October) at 3.6 Tcf, which would be 4% below the five-year average.

- Following a significant weather-related decline in U.S. natural gas production in February, U.S. dry natural gas production rose by 6.0 Bcf/d in March to 92.3 Bcf/d. We expect dry natural gas production will average 92.9 Bcf/d in 2H21 and then rise to 93.9 Bcf/d in 2022.

Electricity, coal, renewables, and emissions

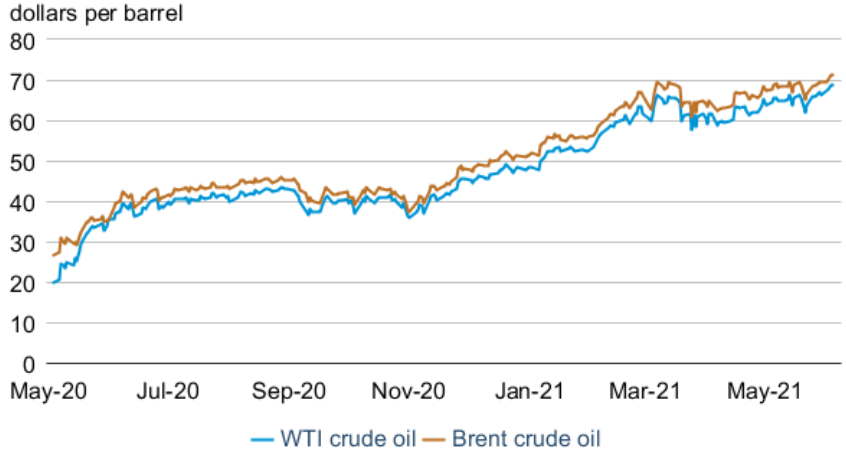
- We forecast that retail sales of electricity in the United States will increase by 2.3% in 2021 after falling by 3.9% in 2020. The largest increase in consumption will occur in the residential sector, where we forecast retail sales of electricity will grow by 2.8% this year. This growth is primarily a result of colder temperatures in the first quarter of 2021 compared with the same period in 2020. Much of the forecast increase in electricity consumption in the commercial and industrial sectors reflects improving economic

conditions in 2021. We expect retail electricity sales to these two sectors combined will increase by 2.0% in 2021. For 2022, we forecast that U.S. retail sales of electricity will grow by another 1.4%.

- We expect the share of electric power generation produced by natural gas in the United States will average 36% in 2021 and 35% in 2022, down from 39% in 2020. The forecast share for natural gas as a generation fuel declines in response to our expectation of a higher delivered natural gas price for electricity generators, which we forecast will average $4.09/MMBtu in 2021 compared with an average of $2.39/MMBtu in 2020. As a result of the higher expected natural gas prices, the forecast share of generation from coal rises from 20% in 2020 to 23% this year but falls to 22% next year. New additions of solar and wind generating capacity support our expectation that the renewables share of U.S. generation will rise from 20% in 2020 to 21% in 2021 and to 23% in 2022. The nuclear share of U.S. electricity generation declines from 21% in 2020 to 20% in 2021 and to 19% in 2022 as a result of retiring capacity at some nuclear power plants.

- We forecast that planned additions to U.S. wind and solar generating capacity in 2021 and 2022 will contribute to rising electricity generation from those sources. We estimate that the U.S. electric power sector added 14.8 gigawatts (GW) of new wind capacity in 2020. We expect 16.0 GW of new wind capacity will come online in 2021 and 5.3 GW in 2022. Utility-scale solar capacity rose by an estimated 10.5 GW in 2020. Our forecast for added utility-scale solar capacity is 15.5 GW 2021 and 16.6 GW for 2022. We expect significant solar capacity additions in Texas during the forecast period. In addition, 4 GW to 5 GW of small-scale solar capacity (systems less than 1 megawatt) will come online each year during the 2021–22 STEO forecast.

- We expect U.S. coal production to total 600 million short tons (MMst) in 2021, which is 61 MMst (11%) more than in 2020. The increase is driven primarily by rising electricity demand. In 2022, we expect coal production to grow by an additional 5 MMst (1%).



- We expect U.S. coal exports to be about 81 MMst in 2021, 12 MMst (17%) more than in 2020. We expect most of this growth to come from rising demand for steam coal in Europe and Asia as increased steel prices during 2021 and 2022 drive exports. Forecast U.S. coal exports in 2022 rise by an additional 12 MMst (14%).

- We estimate that U.S. energy-related carbon dioxide (CO_2) emissions decreased by 11% in 2020 as a result of less energy consumption related to reduced economic activity and responses to COVID-19. In 2021, we forecast energy-related CO_2 emissions will increase about 6% from the 2020 level as economic activity increases and leads to rising energy use. We also expect energy-related CO_2 emissions to rise in 2022, but by a slower rate of 2%. We forecast that after declining by 19% in 2020, coal-related CO_2 emissions will rise by 15% in 2021 and then decrease by 1% in 2022.

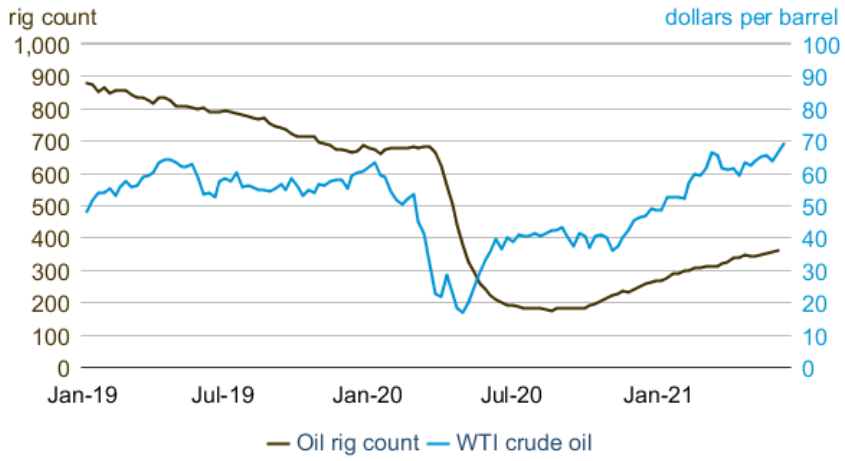
Petroleum and natural gas markets review

Prices: The front month futures price for Brent crude oil settled at $71.31 per barrel (b) on June 3, up $3.75/b from $67.56/b on May 3. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, increased by $4.32/b during the same period, settling at $68.81/b on June 3 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices

Sources: Graph by EIA, based on CME Group and Intercontinental Exchange, compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate

After declining in April, crude oil prices in May moved toward post-pandemic daily highs at nearly $70/b. Continuing draws on global oil inventories contributed to upward crude oil price pressures. Despite rising COVID-19 case counts in some countries, particularly India, global oil demand remained higher than supply in May, contributing to continued global withdrawals from inventories of crude oil and petroleum products. However, we estimate withdrawals fell to 1.2 million barrels per day (b/d) in May, compared with average monthly withdrawals of 2.1 million b/d since June 2020.



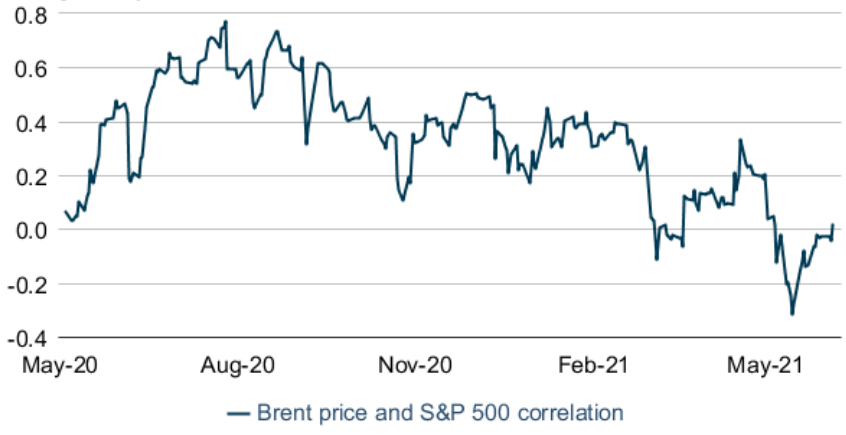
On June 1, front-month Brent futures prices closed above $70/b for the first time since January 2020. At its June 1 meeting, OPEC+ reaffirmed its commitment to continued production increases in the coming months. Despite the group's plans to raise production, prices increased as the market weighed the planned increases relative to expected increases in consumption. Scheduled increases in production targets contributed to OPEC crude oil production reaching 25.5 million barrels per day (b/d) in May, its highest level since April 2020. This increase brought global supply to an estimated 95.0 million b/d compared with consumption of 96.2 million b/d. We expect OPEC crude oil production will increase to an average of 28.0 million b/d in the third quarter of 2021 (3Q21).

In the June STEO, we raised our Brent price forecast for the coming months. We now expect Brent prices to average $69/b in June and $68/b in 3Q21, which are $4/b and $5/b higher, respectively, than in last month's forecast. This price forecast keeps prices near or slightly below

current levels through 3Q21, and it incorporates the recent price increases and our forecast of mostly balanced oil markets in the coming months. Given announced increases in OPEC crude oil production, we expect production to increase more rapidly in the second half of 2021 (2H21) to keep pace with rising demand. In the forecast, global oil consumption rises by 2.8 million b/d from 2Q21 to 2H21 while global oil production rises by 4.3 million b/d during the same period, balancing out the 1.5 million b/d of global oil inventory draws from 2Q21. We expect more significant downward oil price pressures to emerge later in 2021 and into 2022 as forecast global oil supply outpaces slowing oil demand growth.

U.S. oil rigs and WTI prices: Baker Hughes' U.S. crude oil rotary rig count, which serves as an indicator of active U.S. crude oil production capacity, reached a low of 172 active rigs on August 14, 2020 **(Figure 2)**. Since then, the number of U.S. oil rigs has more than doubled, increasing by 187 rigs to a total of 359 rigs as of May 28. The pace at which crude oil producers deploy drilling rigs at any price level is an important driver of crude oil production in U.S. tight oil basins.

Figure 2. U.S. oil rigs and WTI prices



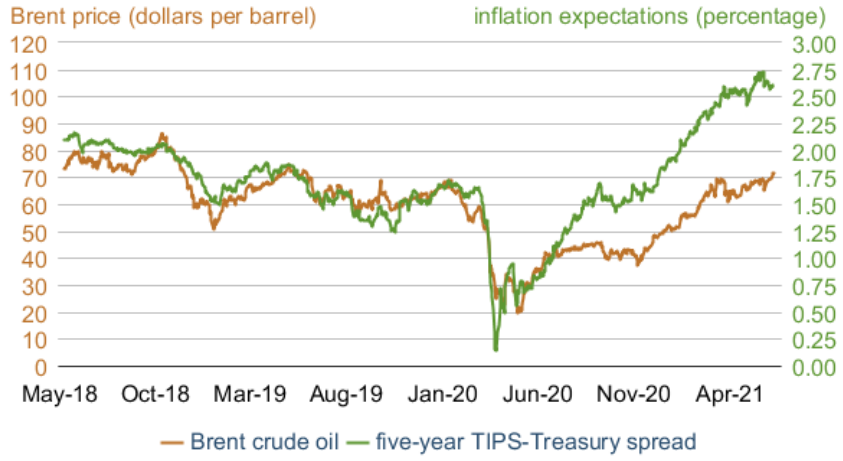
Source: Graph by EIA, based on data from Baker Hughes and CME Group, as compiled by Bloomberg, L.P.
Note: WTI=West Texas Intermediate

We expect that the rig count is likely to continue to increase in response to WTI crude oil prices rising from less than $50/b in late 2020 to a monthly average of $65/b in May. Our models show changes in rig counts typically lag behind changes in the WTI price from between three and six months, and production typically comes online about two months after rig deployment. Assuming that other factors remain constant, price increases over the past month will likely continue to drive rig deployments through much of the rest of 2021. However, the recent changes in rig counts indicate operators, notably in the Permian, could be deploying fewer rigs at current oil prices than they have previously deployed when oil prices were at similar levels. In the forecast, we have slightly reduced the responsiveness of rig deployments in the Permian to upward oil price movements.

Although U.S. crude oil producers have some incentive to remain cautious about deploying rigs and increasing production because of overall market uncertainty, if WTI crude oil prices remain near $65/b in the coming months, as we forecast, prices will continue to provide an incentive for producers to deploy additional rigs and resume production. Onshore U.S. crude oil production in the Lower 48 states during May 2021 was 8.9 million b/d, near its highest level so far in 2021, and we expect production to reach almost 9.3 million b/d by December 2021 with further increases into 2022. However, our crude oil production forecast is lower than in recent STEOs because of relatively fewer rig deployments at existing price levels, particularly in the Permian. In the March STEO, we forecast slightly more onshore U.S. crude oil production at almost 9.4 million b/d by December 2021, while we forecast WTI prices in 2Q21 and 3Q21 to average $6/b less than in our current forecast. Assumptions about the oil price levels at which rigs are deployed are one of the key uncertainties in our forecast.

Brent Price and S&P 500 correlation: In 2020, the widespread impact of the COVID-19 pandemic across sectors resulted in an increased correlation between the Brent crude oil price and S&P 500, an equity index of widely traded U.S. public companies **(Figure 3)**. Historically, the relationship between Brent prices and publicly traded equities is often mixed. Among many factors, rising oil prices present the risk of inflation and can increase transportation fuel costs for most firms, contributing to negative correlation. However, rising oil prices can also reflect strong economic growth, which leads to rising profitability for many companies, contributing to positive correlation. Rising oil prices can also indicate potentially higher earnings for many large companies in the S&P 500 that produce and refine petroleum, also contributing to a positive correlation. A positive correlation between the two can suggest that both asset prices are being determined primarily by demand-side factors, such as global economic growth, which can influence both demand for crude oil and for goods and services from other sectors. The rolling 30-day correlation between the Brent price and the S&P 500 reached a high point of 0.77 during July 2020, the highest correlation between the two series since December 2010.

Figure 3. Brent price and S&P 500 correlation



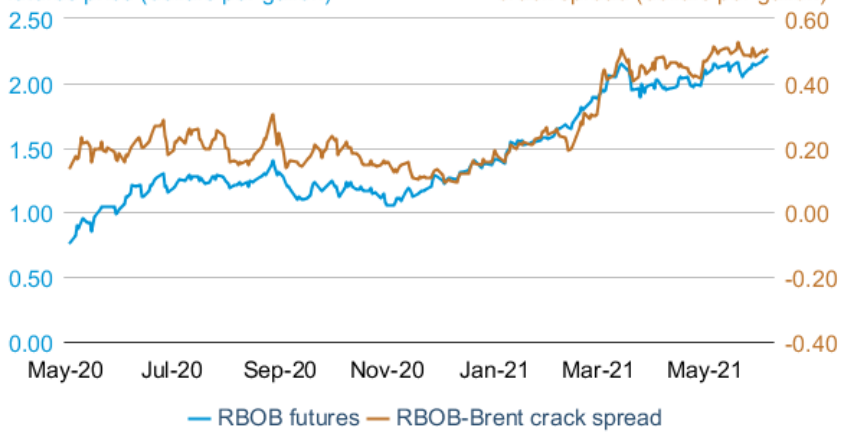
eia Source: Graph by EIA, based on data from Bloomberg L.P.

Uneven increases in crude oil prices and equity values contributed to a gradual decrease in the correlation since July 2020, suggesting that drivers of the crude oil price are driven more by sector-specific, supply-side factors and less by macroeconomic conditions or global demand. In March 2021, the correlation decreased when crude oil prices increased more rapidly than the S&P 500 overall, which was after OPEC+ producers announced they would maintain production curtailments amid rising crude oil demand. After crude oil prices decreased later in March, and remained relatively flat through April, the S&P 500 climbed to record highs. The opposite directional movements between the two series resulted in a shift to a negative correlation between them. The correlation between the Brent crude oil price and the S&P 500 index reached -0.32 on May 13, the largest negative correlation since July 2014.

Crude oil and inflation expectations: The percentage difference in yields for five-year Treasury Inflation-Protected Securities (TIPS) compared with U.S. treasury bonds is often used to measure market expectations of inflation. Responses to the COVID-19 pandemic resulted in a dramatic decline in demand for goods, which significantly reduced petroleum and other commodity prices in early 2020. Because crude oil and other commodity prices are inputs to other sectors of the economy, changes in crude oil prices can also affect inflation expectations. The TIPS-Treasury spread decreased to an average of 0.7% in March 2020, reflecting low inflation expectations as a result of lower prices and reduced economic activity **(Figure 4)**.

Figure 4. Crude oil and inflation expectations

Source: Graph by EIA, based on data from Bloomberg L.P. and Federal Reserve Bank of St. Louis
Note: TIPS=Treasury Inflation Protected Securities



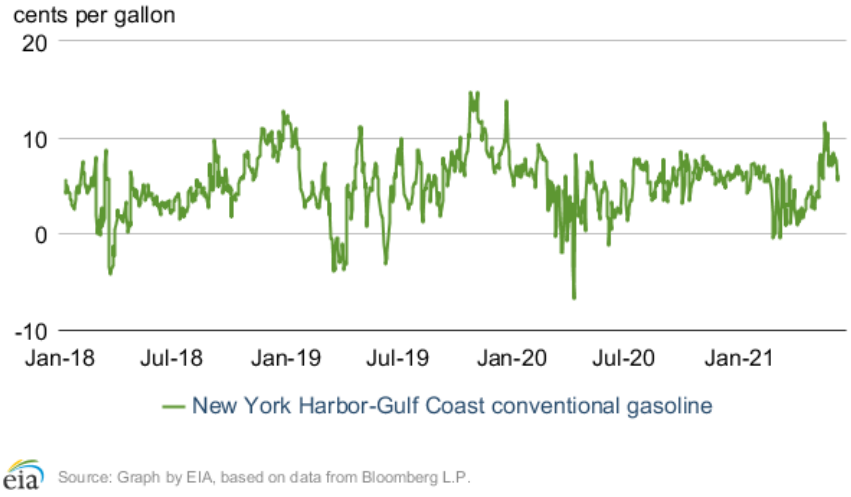
Inflation expectations have generally increased since August 2020. The TIPS-Treasury spread increased from 2.55% on April 1, 2021, to 2.60% on May 3 (the first trading day of May), before reaching a high of 2.72% on May 12, the spread's highest point since 2008. The increasing inflation expectations correspond to increases in the Brent crude oil price, which increased from $65/b on April 1 to $68/b on May 3 and $69/b on May 12. Fuel price increases for consumers and firms as a result of high crude oil prices are an important contributor to inflation expectations. However, the TIPS-Treasury spread also increased at the end of March and into

April, while Brent prices remained below their mid-March levels. Differing directional movements between the spread and the crude oil price reflect the effects of other goods and commodity prices on inflation expectations.

Petroleum products

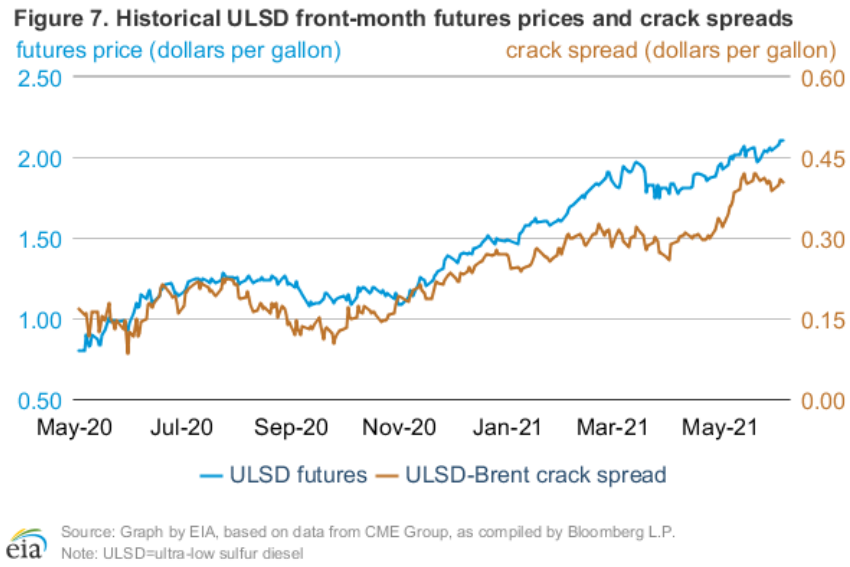
Gasoline prices: The front-month futures price of RBOB (the petroleum component of gasoline used in many parts of the country) settled at $2.20 per gallon (gal) on June 3, up 10 cents/gal from May 3 **(Figure 5)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) increased by 1 cent/gal to settle at 50 cents/gal during the same period.

Figure 5. Historical RBOB front-month futures prices and crack spreads



Source: Graph by EIA, based on data from CME Group, as compiled by Bloomberg L.P.
Note: RBOB is the petroleum component of gasoline used in many parts of the country.

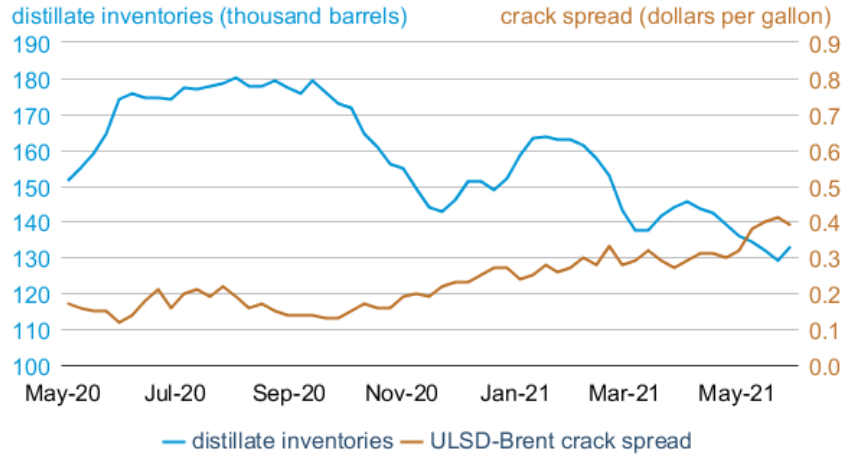
The average RBOB–Brent crack spread of 50 cents/gal in May was the highest since July 2015. The high spread reflected increasing demand, low inventories, and disruptions to the flow of gasoline along the U.S. East Coast because of the Colonial Pipeline outage. We estimate U.S. gasoline consumption averaged 9.1 million b/d in May, a 4% increase from April and the highest level since November 2019. The increase in gasoline demand likely reflected typical seasonal factors such as Memorial Day travel, as well as increased willingness to travel as a result of rising vaccinations, rising employment, and increased gasoline purchases in response to outages at many gas stations during the Colonial Pipeline disruption in early May. In addition, refinery production has not kept up with the increases in demand the past few months. Gasoline stocks fell sharply because of weather-related outages in February. Those disruptions were followed by increasing gasoline consumption from March through May. The increase in gasoline consumption and supply disruptions have resulted in gasoline inventories being below the five-year average for every month in 2021. Low gasoline inventories have supported the high gasoline crack spread, and helped push retail gasoline prices above $3.00/gal. We forecast that as refineries increase runs in the coming months and increases in gasoline consumption slow, it



will put some downward pressure on gasoline crack spreads and contribute to U.S. average retail gasoline prices falling to $2.76/gal by September. However, we expect gasoline stocks to remain near five-year lows for the rest of 2021, keeping gasoline crack spreads higher than the five-year average.

Regional gasoline prices: The Colonial Pipeline outage interrupted the flow of gasoline from the U.S. Gulf Coast to the East Coast and led to a short-term increase in the spread between New York Harbor gasoline spot prices and Gulf Coast conventional gasoline spot prices **(Figure 6)**. The spread peaked on May 13 at 11.5 cents/gal, the highest spread since December 16, 2019. The New York Harbor gasoline price increased relative to the Gulf Coast conventional gasoline price likely because of a combination of increasing stocks in the U.S. Gulf Coast, decreasing stocks in the East Coast, and increased demand in the Lower Atlantic. The Lower Atlantic, which receives much of its gasoline from the pipeline, had lower-than-average gasoline stocks at the time of the pipeline outage, and as a result had the highest demand for substitute supply sources. Although the spread exceeded 10 cents/gal for only four days in the month, the spread remained slightly elevated through May, averaging 8 cents/gal, which is higher than the five-year May average of 5 cents/gal and higher than the April 2021 average of 3 cents/gal. The spread decreased in early June, settling at 6 cents/gal on June 3.

Figure 6. New York Harbor-Gulf Coast conventional gasoline spot price differentials



Ultra-low sulfur diesel prices: The front-month futures price for ultra-low sulfur diesel (ULSD) for delivery in New York Harbor settled at $2.10/gal on June 3, up 15 cent/gal from May 3 **(Figure 7)**. The ULSD–Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) increased 6 cents/gal, settling at 40 cents/gal during the same period.

May had the highest average ULSD–Brent crack spread since December 2019. The crack spread increase was likely the result of the most U.S. consumption of distillate fuel since November 2019 and relatively low distillate production. We estimate May distillate consumption of 4.1 million b/d, an increase of 0.5 million b/d (15%) from the May 2020 levels and 3% higher than the average from the five previous years (2015–2019). Although distillate consumption has increased above the five-year average for May, distillate production was at its lowest May level since 2012.

Because increases in distillate consumption have been outpacing increases in production and net imports in recent months, distillate inventories have been decreasing, which has supported increases in the ULSD–Brent crack spread **(Figure 8)**. From August 2020 to April 2021, distillate inventories decreased from 179 million barrels, the highest level since 1982, to approximately 136 million barrels. During that same period, the ULSD–Brent crack spread increased from 17 cents/gal to 31 cents/gal. In May, we estimate inventories fell to about 133 million barrels, which is lower than the five-year average, and this reduction has coincided with steeper increases in the crack spread. On May 11, the crack spread exceeded 40 cents/gal for the first time since March 2020 and remained close to 40 cents/gal through June 3.

Figure 8. Weekly U.S. distillate inventories and crack spreads

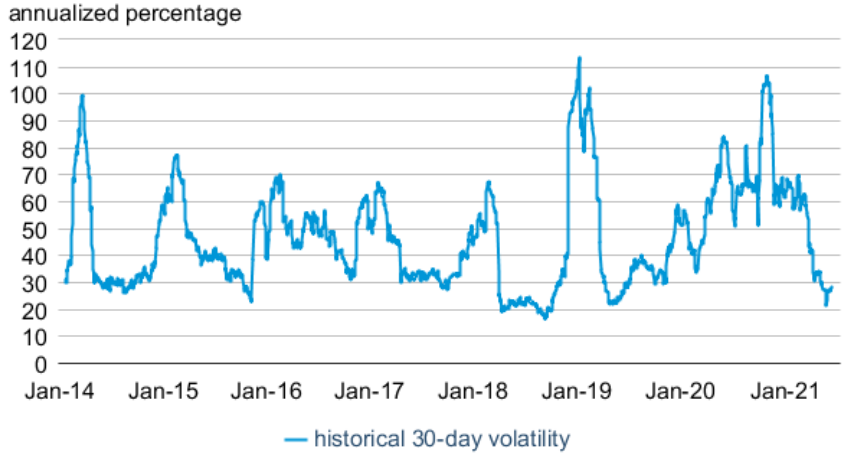
Note: ULSD=ultra-low sulfur diesel

Natural Gas

Prices: The front-month natural gas futures contract for delivery at the Henry Hub settled at $3.04 per million British thermal units (MMBtu) on June 3, 2021, which was up 7 cents/MMBtu from May 3, 2021 **(Figure 9)**. The average price for front-month natural gas futures contracts in May was $2.96/MMBtu, the highest May average since 2017.

Figure 9. U.S. natural gas front-month futures prices and storage deviation from 5-year average



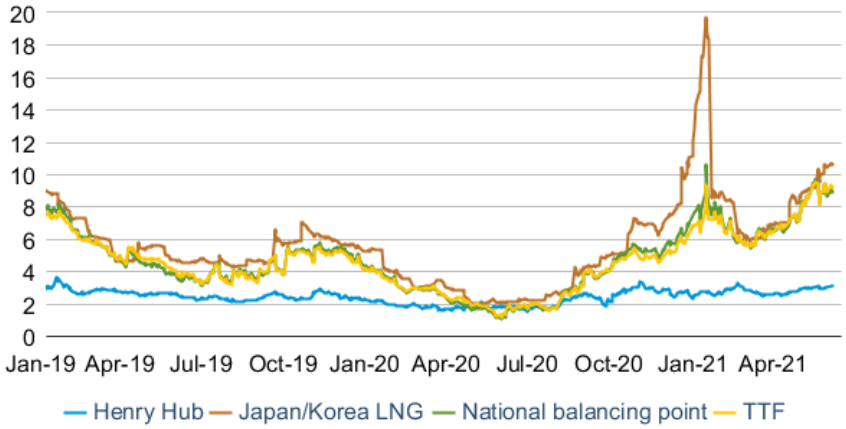
Source: Graph by EIA, based on data from CME Group, as compiled by Bloomberg L.P.

High levels of U.S. LNG exports continued in May and supported Henry Hub natural gas futures prices above $3.00/MMBtu. We estimate U.S. LNG exports of 10.0 billion cubic feet per day (Bcf/d) in May, the most on record for the month. Every month since November 2020 has been among the 10 highest months for U.S. LNG exports on record. Stable U.S. production during this

period in combination with high exports reduced storage levels below their previous five-year average. Although natural gas stocks were 191 Bcf higher than the five-year (2016–20) average at the start of the year, they were 61 Bcf lower than the five-year average as of the week ending May 28. Front-month natural gas futures prices have increased as stocks have decreased, starting the year at $2.58/MMBtu and closing at $3.04/MMBtu on June 3.

Although U.S. natural gas futures prices have risen, futures price volatility has declined to low levels. Historical volatility measures the magnitude of daily changes in closing prices for a commodity during a given time in the past. Based on rolling front-month contracts, the 30-day historical volatility of U.S. natural gas futures prices was 27.9% on June 3, a significant decrease from 73.5% a year ago. **(Figure 10)**. However, the May 2020 historical volatility was unusually high as a result of COVID-19-related disruptions, and historical volatility tends to be low around May because of less demand for natural gas as a fuel for heating or cooling. The previous five-year (2015–19) average historical volatility for the first trading day of June was 35.7%. This year, historical volatility has been even lower so far than the seasonal average. Prices have hovered within a somewhat narrow range around $3.00/MMBtu, likely because of stable U.S. production and relatively stable U.S. consumption as a result of slightly below-average cooling demand during May.

Figure 10. Natural gas historical volatility



Source: Graph by EIA, based on data from Bloomberg L.P.

International natural gas prices: International LNG spot prices often reach yearly lows in May, but this year they have climbed to the high prices typically seen in winter months. The Japan-Korea Marker (JKM) price exceeded $10/MMBtu this May, compared with May 2019 and 2020 averages near $5/MMBtu and $2/MMBtu, respectively. The Title Transfer Facility (TTF) and National Balancing Point (NBP) prices in Europe have shown similar trends **(Figure 11)**. In Asia, efforts to build stocks in anticipation of demand for summer electricity and to prepare for heating demand next winter has increased demand for LNG imports and supported high prices. Because LNG stocks in Asia have been lower than usual this year as a result of significant draws

during the extremely cold winter, demand in Asia for LNG imports has been much greater than usual. In Europe, the coldest April in nearly a century and low inventories also supported higher global demand and higher prices for LNG. Because of this strong global demand for LNG, we forecast that U.S. LNG exports will continue to be high and average more than 9.0 Bcf/d during the remainder of 2021.

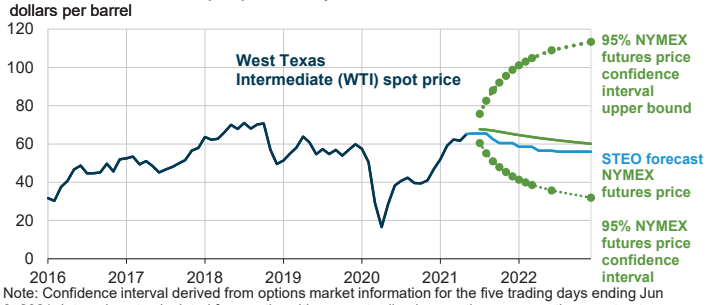
Note: TTF=Title Transfer Facility

Notable forecast changes

- We forecast Brent and WTI crude oil spot prices will average $65/b and $62/b, respectively, in 2021. Both of these forecasts are $3/b higher than forecast in the May STEO. The higher forecasts reflect the incorporation of higher-than-forecast actual prices during May, along with our expectation that crude oil markets will be in balance through much of the second half of the year, limiting downward price pressures. However, we expect that Brent crude oil prices will decline to $60/b on average in 2022 as global oil supply begins to outpace global oil demand.

- We expect global oil inventories will build by 0.5 million b/d in 2022, compared with our expectation of generally unchanged inventories in the May STEO. Our forecast of inventory growth is the result of our expectation of higher global oil supply in 2022. We raised expectations of supply growth across several key producers in the June STEO including OPEC, China, and Mexico.

- We forecast U.S. coal production to total 600 MMst in 2021, up 18 MMst (3%) from last month's STEO. High U.S. coal production in this forecast is the result of our expectation of higher inventory levels and more exports compared with the May STEO.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. (a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday June 3 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on Thursday June 3 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on Thursday June 3 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on Thursday June 3 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 4a. U.S. Petroleum and Other Liquids Supply, Consumption, and Inventories

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) For net imports and inventories “Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products; for consumption “Other Oils” also includes renewable fuels except fuel ethanol.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on Thursday June 3 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday June 3 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to Petroleum Administration for Defense Districts (PADD).

See "Petroleum for Administration Defense District" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Marketing Monthly* , DOE/EIA-0380; *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on Thursday June 3 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday June 3 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Total Raw Steel Production (Million short tons per day)	**0.268**	**0.174**	**0.197**	**0.224**	**0.246**	*0.256*	*0.270*	*0.304*	*0.289*	*0.251*	*0.251*	*0.260*	**0.216**	*0.269*	*0.263*
Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.93**	**1.91**	**1.93**	**1.92**	**1.91**	*1.90*	*1.88*	*1.85*	*1.87*	*1.87*	*1.85*	*1.82*	**1.92**	*1.88*	*1.85*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday June 3 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on Thursday June 3 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday June 3 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday June 3 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*
Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 7d part 1. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continues on Table 7d part 2*

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on Thursday June 3 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW)

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday June 3 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from EIA databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226 and *Renewable Energy Annual* , DOE/EIA-0603; *Petroleum*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday June 3 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.
Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Raw Steel Production															
(million short tons per day)	**0.268**	**0.174**	**0.197**	**0.224**	**0.246**	*0.256*	*0.270*	*0.304*	*0.289*	*0.251*	*0.251*	*0.260*	**0.216**	*0.269*	*0.263*
Carbon Dioxide (CO2) Emissions (million metric tons)															
Petroleum	**553**	**442**	**518**	**522**	**515**	*553*	*568*	*572*	*558*	*577*	*589*	*588*	**2,035**	*2,207*	*2,312*
Natural Gas	**490**	**349**	**383**	**429**	**485**	*349*	*368*	*438*	*483*	*350*	*372*	*434*	**1,651**	*1,640*	*1,640*
Coal	**201**	**177**	**271**	**224**	**247**	*224*	*296*	*238*	*255*	*219*	*286*	*232*	**873**	*1,006*	*993*
Total Energy (c)	**1,247**	**971**	**1,174**	**1,178**	**1,250**	*1,128*	*1,235*	*1,251*	*1,299*	*1,149*	*1,250*	*1,257*	**4,571**	*4,864*	*4,955*

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

- = no data available

SAAR = Seasonally-adjusted annual rate

Notes: EIA completed modeling and analysis for this report on Thursday June 3 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on Thursday June 3 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on Thursday June 3 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Appendix to the June 2021 *Short-Term Energy Outlook*

This appendix is prepared in fulfillment of section 1245(d)(4)(A) of the National Defense Authorization Act (NDAA) for Fiscal Year 2012, as amended. The law requires the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy, to submit to Congress a report on the availability and price of petroleum and petroleum products produced in countries other than Iran in the two-month period preceding the submission of the report. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the U.S. Government. The data in this appendix, therefore, should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

EIA consulted with the U.S. Department of the Treasury, the U.S. Department of State, and the intelligence community in the process of developing the NDAA report, which was previously published as a stand-alone report. Detailed background and contextual information not repeated here can be found in early editions of the NDAA report.

This appendix is published in the *Short-Term Energy Outlook* in even numbered months.

Table a1. Summary of Estimated Petroleum and Other Liquids Quantities

	Apr 2021	May 2021	Apr 2021 - May 2021 Average	Apr 2020 - May 2020 Average	2018 - 2020 Average
Global Petroleum and Other Liquids (million barrels per day)					
Global Petroleum and Other Liquids Production (a)	94.0	95.0	94.5	94.3	98.6
Global Petroleum and Other Liquids Consumption (b)	96.2	96.2	96.2	82.4	97.7
Biofuels Production (c)	2.6	2.9	2.7	2.4	2.6
Biofuels Consumption (c)	2.5	2.6	2.6	2.4	2.6
Iran Liquid Fuels Production	3.5	3.5	3.5	3.0	3.6
Iran Liquid Fuels Consumption	1.5	1.6	1.5	1.4	1.8
Petroleum and Petroleum Products Produced and Consumed in Countries Other Than Iran (million barrels per day)					
Production (d)	87.9	88.6	88.3	88.9	92.3
Consumption (d)	92.2	92.1	92.1	78.6	93.4
Production minus Consumption	-4.4	-3.4	-3.9	10.3	-1.1
World Inventory Net Withdrawals Including Iran	2.3	1.2	1.7	-12.0	-0.8
Estimated OECD Inventory Level (e) (million barrels)	2910	2903	2906	3156	2942
Surplus Production Capacity (million barrels per day)					
OPEC Surplus Crude Oil Production Capacity (f)	8.5	8.1	8.3	4.4	3.4

Note: The term "petroleum and other liquids" encompasses crude oil, lease condensate, natural gas liquids, biofuels, coal-to-liquids, gas-to-liquids, and refinery processing gains, which are important to consider in concert due to the inter-related supply, demand, and price dynamics of petroleum, petroleum products, and related fuels.

(a) Production includes crude oil (including lease condensates), natural gas liquids, other liquids, and refinery processing gains.

(b) Consumption of petroleum by the OECD countries is synonymous with "products supplied," defined in the glossary of the EIA Petroleum Supply Monthly, DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel, and loss, and bunkering.

(c) Biofuels production and consumption are based on EIA estimates as published in the International Energy Statistics. Biofuels production in the third quarter tends to be at its highest level in the year as ethanol production in Brazil reaches its seasonal peak and is typically lowest in the first quarter as seasonal production falls in the South/South-Central region of Brazil.

(d) Global production of petroleum and petroleum products outside of Iran is derived by subtracting biofuels production and Iran liquid fuels production from global liquid fuels production. The same method is used to calculate global consumption outside of Iran.

(e) Estimated inventory level is for OECD countries only.
(f) EIA defines surplus oil production capacity as potential oil production that could be brought online within 30 days and sustained for at least 90 days, consistent with sound business practices. This does not include oil production increases that could not be sustained without degrading the future production capacity of a field.

Independent Statistics & Analysis
U.S. Energy Information Administration

July 2021

Short-Term Energy Outlook

Forecast highlights

- The July *Short-Term Energy Outlook* (STEO) remains subject to heightened levels of uncertainty related to the ongoing economic recovery from the COVID-19 pandemic. U.S. economic activity continues to rise after reaching multiyear lows in the second quarter of 2020 (2Q20). The increase in economic activity and easing of the COVID-19 pandemic have contributed to rising energy use. U.S. gross domestic product (GDP) declined by 3.5% in 2020 from 2019 levels. This STEO assumes U.S. GDP will grow by 7.4% in 2021 and by 5.0% in 2022. We based the U.S. macroeconomic assumptions in this outlook on forecasts by IHS Markit.

- Brent crude oil spot prices averaged $73 per barrel (b) in June, up $5/b from May and $33/b higher than in June of last year. In the coming months, we expect that global oil production, largely from OPEC+ members (OPEC and partner nonmember countries), will increase by more than global oil consumption. We expect rising production will reduce the persistent global oil inventory draws that have occurred for much of the past year and keep prices similar to current levels, averaging $72/b during the second half of 2021 (2H21). However, in 2022, we expect that continuing growth in production from OPEC+ and accelerating growth in U.S. tight oil production, along with other supply growth, will outpace growth in global oil consumption and contribute to declining oil prices. Based on these factors, we expect Brent to average $67/b in 2022.

- We estimate that global consumption of petroleum and liquid fuels averaged 92.3 million barrels per day (b/d) for all of 2020, down by 8.6 million b/d from 2019. We expect that global liquid fuels consumption will grow by 5.3 million b/d in 2021. In our forecast, global consumption of liquid fuels rises by an additional 3.7 million b/d in 2022 to 101.4 million b/d, which would surpass 2019 levels.

- Based on our estimates, global liquid fuels inventories rose by 6.3 million b/d in 1H20 before declining at an average rate of 2.1 million b/d in 2H20 and 1H21. We forecast global inventories will continue to fall in the near term but at a slower rate, with global inventories falling by 0.2 million b/d in 2H21. We then expect inventories to rise by almost 0.5 million b/d in 2022.

- U.S. regular gasoline retail prices averaged $2.78 per gallon (gal) in 1H21, compared with an average of $2.20/gal in 1H20. In June, monthly retail gasoline prices averaged $3.06/gal, the first time the monthly average was more than $3.00/gal since October

2014 (in nominal terms). We forecast regular-grade gasoline prices to average $2.92/gal in 2H21 and $2.74/gal for all of 2022.

- U.S. liquid fuels consumption in 2020 averaged 18.1 million b/d, down 2.4 million b/d (12%) from 2019 consumption. We forecast U.S. liquid fuels consumption will rise to 19.6 million b/d in 2021 and then to 20.7 million b/d in 2022, which would surpass the 2019 level.

- Henry Hub natural gas spot prices averaged $2.03 per million British thermal units (MMBtu) in 2020. We expect Henry Hub prices will rise to an annual average of $3.22/MMBtu in 2021, and we forecast prices will then fall to an average of $3.00/MMBtu in 2022.

- We expect U.S. dry natural gas production to average 92.6 billion cubic feet per day (Bcf/d) in 2021, up by 1.3% from 2020, and then rise to 94.7 Bcf/d in 2022.

- U.S. natural gas consumption averaged 83.3 Bcf/d in 2020, down 2.2% from 2019. We expect that natural gas consumption will decline by 1.1% in 2021 and then grow by 0.7% in 2022. Most of the forecast decline in natural gas consumption this year is the result of less natural gas use in the electric power sector, which we expect to continue to decline because of rising natural gas prices.

- U.S. working natural gas in storage ended the winter withdrawal season in March 2021 at 1.8 trillion cubic feet (Tcf), slightly less than the five-year (2016–20) average. We forecast that flat U.S. natural gas production this summer combined with record U.S. natural gas exports will contribute to slightly lower-than-average inventory builds during the remainder of the summer build season, which ends in October. Forecast natural gas inventories end October 2021 at 3.6 Tcf, which is 3% lower than the five-year average.

- We forecast that U.S. retail sales of electricity will increase by 2.8% in 2021 after falling by 3.9% in 2020. The largest forecast increase in electricity consumption occurs in the industrial sector, driven by rising levels of economic output. We forecast U.S. retail sales of electricity to the industrial sector will grow by 5.1% this year. Retail sales of electricity to the commercial sector also grow in the forecast, but they grow at the slightly slower pace of 2.1% in 2021 as some workers continue working from home instead of in office buildings. We forecast U.S. residential electricity sales will grow by 1.9% in 2021, as a result of colder temperatures in 1Q21 compared with 1Q20 and a hot start to the summer.

- We expect the share of electric power generation produced by natural gas in the United States will average 36% in both 2021 and 2022, down from 39% in 2020. Our forecast for the natural gas share as a generation fuel declines because we expect a higher delivered natural gas price for electricity generators. Because we expect higher natural gas prices, we forecast coal's generation share to rise from 20% in 2020 to 24% this year

but to fall to 22% next year. New additions of solar and wind generating capacity support our expectation that the share of U.S. generation from these two energy sources will rise from 11% in 2020 to 15% by 2022. Extreme drought conditions in the West drive our expectation that the share of U.S. generation from hydropower will fall from 8% in 2020 to 6% in 2021 and 7% in 2022. The nuclear share of U.S. electricity generation declines from 21% in 2020 to 20% in 2021 and to 19% in 2022 as a result of retiring capacity at some nuclear power plants.

- The U.S. retail electricity price for the residential sector in our forecast averages 13.6 cents per kilowatthour in 2021, which is 2.8% higher than the average retail price in 2020. Forecast residential prices increase by an additional 1.8% in 2022.

- During the next 18 months, we expect electricity generation capacity from renewable energy sources to continue growing. Our forecast includes both wind and solar capacity growth, and solar capacity grows at a faster rate. Based on our survey data, large-scale solar capacity growth in gigawatts (GW) will exceed wind growth for the first time in 2022.

- We expect U.S. coal production to total 617 million short tons (MMst) in 2021, which is 78 MMst (15%) more than in 2020. Rising electricity demand for coal amid higher natural gas prices is driving this production increase. In 2022, we expect coal production to fall by 7 MMst (1%).

- We forecast that total energy-related carbon dioxide (CO_2) emissions will increase by 7.1% in 2021 and by 1.5% in 2022 after declining by 11.1% in 2020. Even with growth over the next two years, forecast emissions in 2022 remain 3.3% lower than in 2019.

Global Liquid Fuels

***Global Petroleum and Other Liquid Fuels Consumption*.** Based on preliminary data and estimates from 1Q21, as well as our assumptions of continued economic recovery, we forecast consumption of global petroleum and other liquid fuels will grow by 5.3 million b/d in 2021. This growth follows a decline of 8.6 million b/d in 2020. Forecast growth in global oil consumption of 3.7 million b/d in 2022 would bring global oil consumption to 101.4 million b/d, which would be 0.4 million b/d higher than in 2019. Our global economic growth forecasts come from Oxford Economics, which forecasts GDP in 2021 will increase by 6.3% and by 4.8% in 2022, compared with a decline of 3.4% in 2020.

We expect oil demand growth in 2021 to be fairly evenly split between the OECD and non-OECD. OECD oil demand grows by 2.5 million b/d, and non-OECD demand grows by 2.8 million b/d. Our forecast assumes that business activity and travel will continue to increase throughout 2021 and into 2022. For 2021, in addition to rising economic activity, oil consumption growth is driven by reopening economies and a return to travel patterns more similar to pre-pandemic norms. In 2022, economic growth alone becomes the main driver of oil consumption growth.

We expect U.S. liquid fuels consumption in 2021 to rise by 1.5 million b/d from 2020, making it the largest contributor to global consumption growth in the forecast. Since the beginning of 2021, some of the most significant increases in our expectations for oil demand have been for Europe. Strict travel restrictions imposed by many of the European OECD countries in 1Q21 gradually eased in the second quarter as a result of successful large-scale vaccination campaigns. As a result, Europe has experienced a significant increase in economic activity in 2Q21 as capacity limits and restrictions on mobility and non-essential business activity have either been reduced or eliminated. We estimate that 2Q21 liquid fuels consumption in OECD Europe was up 1.8 million b/d from the same period in 2020, contributing to our expectation that liquids consumption in OECD Europe will be up 0.5 million b/d for all 2021 compared with 2020.

Oil consumption growth in many of the non-OECD regions remains more uncertain. Large-scale vaccination campaigns in Asia, Latin America, the Middle East, and Africa have been relatively slower—with some exceptions—than in Europe and the United States. Outbreaks of COVID-19 infections and the re-imposition of restrictions on mobility and business activity still pose a significant downside risk in these regions. In 1H21, Malaysia, Thailand, and Vietnam, where a majority of the populations remain unvaccinated, imposed mobility and business activity restrictions after experiencing large outbreaks of COVID-19 infections.

In addition, the spread of COVID-19 variants and the effectiveness of the vaccines against these variants are significant risk factors to a full and sustained global recovery. India experienced its worst outbreak of COVID-19 infections in 2Q21 when the Delta variant spread, which is reportedly more virulent and contagious than other variants, and the outbreak led to a sharp reduction in economic activity from which the country is now slowly recovering. If the vaccines currently available are not effective against the Delta or other variants, countries will have to continue to rely on mobility and activity restrictions to mitigate the spread, which will lead to a longer, more drawn-out return in global oil demand.

For 2021, we forecast liquid fuels consumption in India to grow by 0.3 million b/d (6%), consumption in China to grow by 0.9 million b/d (6%), and consumption in the rest of non-OECD to grow by 1.7 million b/d (5%).

Non-OPEC Production of Petroleum and Other Liquid Fuels. Following a 2.5 million b/d decrease in 2020, with declines extending into 1Q21, we estimate that non-OPEC liquid fuels production increased by 2.6 million b/d in 2Q21 from 2Q20. Almost three quarters of this increase came from two non-OPEC producers: the United States and Russia. We expect non-OPEC production to rise by 1.1 million b/d in 2021 and by 3.1 million b/d in 2022. We expect Canada and Brazil to lead non-OPEC production growth in 2021 and the United States and Russia to lead growth in 2022.

We expect Canada's production of petroleum and other liquid fuels to increase by more than 0.3 million b/d in 2021, which would make it the leading source of non-OPEC liquid fuels supply

growth this year. Despite heavier-than-normal turnarounds at a number of oil sands projects in 1H21, we forecast Canada's production to reach new record highs in 2H21. Output growth in 2021 is driven by increasing refinery demand for crude oil in the United States, the end of Canadian government-ordered curtailments, and the restart of oil sands expansion projects that were deferred during 2020. We do not expect any new upstream projects to come online in Canada during the forecast period. Forecast crude oil production growth comes from expansions or debottlenecking of existing projects.

In January 2021, President Biden revoked the presidential permit authorizing the construction of the Keystone XL pipeline, and in June 2021, owner TC Energy officially canceled the project. The pipeline would have expanded Canada's crude oil export capacity to the United States by 830,000 b/d. The cancellation of the Keystone XL does not materially affect our production outlook for Canada, and we expect Canada's pipeline export capacity will be adequate through the end of the forecast period. Enbridge's Line 3 replacement (370,000 b/d) will come online at the end of 2021, the TransMountain expansion project (590,000 b/d) in 2022, and additional Enbridge expansion and optimizations to its existing pipeline system can bring more than 400,000 b/d of increased export capacity over the forecast period. Forecast production in Canada grows by 0.2 million b/d in 2022.

Even as production in most non-OPEC producers declined in 2020, Brazil's liquid fuels supply grew by 0.1 million b/d during 2020. We expect Brazil's production to grow by more than 0.2 million b/d in 2021. However, our current forecast is 0.1 million b/d lower on average compared with the January 2021 STEO and reflects the difficulties Brazil's national oil company, Petrobras, experienced at the beginning of 2021 with restarting fields that had undergone heavy maintenance in 4Q20. Growth in 2021 is further limited as a result of delayed startups. Petrobras has postponed the start-up of the first phase of the Mero oil field development, the floating production storage and offloading vessel (FPSO) Guanabara, from 4Q21 to 1H22. The restart of the Equinor-operated Peregrino field has also been delayed to 2022. The current operational asset in the Peregrino field has been offline since 2019 because of technical issues and was delayed again in 2020 because of COVID-19 safety protocols. The startup of its second phase of development has also been delayed to 2022 because of work disruptions caused by the pandemic. Forecast production in Brazil will grow by 0.3 million b/d in 2022. We expect that five new FPSO units will ramp up through the forecast period and continue to drive growth, notably at the Sepia, Mero, and Buzios fields. Each of these FPSOs has a production capacity of 180,000 b/d.

Russia is the second-largest producer of liquid fuels among non-OPEC countries after the United States. Production in Russia grew by 0.5 million b/d in 1H21 from 2H20, as OPEC+ participants eased crude oil production cuts. We expect Russia's liquid fuels production to increase by 0.2 million b/d for all of 2021 and by 0.8 million b/d in 2022. After the OPEC+ agreement ends in early 2022, we expect Russia's production to rise above 11.5 million b/d during 2H22, with annual average production in 2022 equal to 2019 levels.

China's liquid fuels production in our forecast increases by more than 0.1 million b/d in 2021. China's government outlined its goals for national oil companies to increase upstream crude oil and natural gas production during the next few years to help meet its outlined energy security goals. We expect slight declines in crude oil production in 2022 will be offset by both increasing production of other liquids and by increasing refinery gains, resulting in a small increase in China's overall production.

Norway's liquid fuels production rises in our forecast by about 0.1 million b/d in both 2021 and 2022. Norway's Ministry of Petroleum and Energy enacted unilateral production limits on the Norwegian continental shelf from June 2020 to December 2020. When production limits expired, Norway's liquid fuels production was up slightly in 1H21 compared with 1H20. We expect liquid fuels production to continue to grow in 2H21 and in 2022 as new fields come online and ramp up production, including the much-delayed Martin Linge field. The Johan Sverdrup field, which was the main driver of growth in Norway's liquid fuels production in 2020, will also contribute to growth in 2021 and 2022.

Mexico's forecast liquid fuels production averages 1.9 million b/d in 2021, almost unchanged from 2019 and 2020. We have revised our 2021 production forecast upwards from its January 2021 STEO estimate of 1.8 million b/d because private operators have surpassed our expectations regarding their ability to ramp up the Ixachi, Pokoch, and Hokchi fields. We expect Mexico's oil production to fall to 1.8 million b/d on average in 2022, reflecting financial constraints at Mexico's national oil company, PEMEX, and continued large declines in mature fields. New growth in foreign-operated fields in 2021 is insufficient to offset declines from PEMEX's older fields, in particular the Maloob field.

We forecast that output across a number of other non-OPEC producers will decline in 2021 and 2022, notably Indonesia, the United Kingdom, and Colombia.

OPEC Production of Petroleum and Other Liquid Fuels. At the April 2021 OPEC+ meeting, the OPEC+ countries agreed to incrementally raise their production from May through July 2021, including a full reversal of Saudi Arabia's voluntary production cut of 1 million b/d. They reaffirmed this agreement at their June meeting. This forecast was completed on July 1, prior to OPEC+ calling off its most recent meeting on July 5. However, we forecast that OPEC and its OPEC+ partners will continue to increase crude oil production beyond July in response to rising global oil consumption.

Although our forecast assumes current U.S. sanctions remain in place for Iran and Venezuela for the entire forecast period, we expect Iran will increase crude oil supply somewhat in the coming months. We also expect that OPEC+ will not implement further production cuts to accommodate any potential increases in oil output from Iran or Venezuela.

After holding crude oil production near 25 million b/d during the first four months of 2021, OPEC began increasing production in May based on its agreement with OPEC+ partners. We

expect OPEC will increase production by 2.4 million b/d from May through August, raising production in response to rising global oil consumption. In our forecast OPEC crude oil production averages 28.2 million b/d in 2H21, up 2.9 million b/d from 1H21 and up 4.0 million b/d from 2H20. For all of 2021, we forecast that OPEC crude oil production will average 26.8 million b/d, up 1.2 million b/d from 2020. We forecast OPEC will raise crude oil production by an additional 1.8 million b/d in 2022 to 28.6 million b/d.

Our OPEC crude oil production forecast is subject to considerable uncertainty. OPEC+ implemented monthly meetings to assess global oil market conditions, and the group's production targets are potentially subject to regular adjustments. OPEC+ has indicated it will adjust production targets in response to changes in global oil demand, but the path of global oil demand in the comings months remains highly uncertain. Also, the manner in which OPEC+ would change production targets in response to higher production from Iran, or other changes in the oil market, is not clear. Finally, country compliance with existing production targets as the oil price rises is uncertain.

Even with increased OPEC crude oil production, remaining surplus production capacity will be more than sufficient to meet additional demand should consumption exceed our expectations. We expect that OPEC surplus crude oil production capacity, which averaged 6.2 million b/d in 2020, will average 6.7 million b/d in 2021 and 4.8 million b/d in 2022, compared with average surplus capacity of 2.2 million b/d from 2010–19. These estimates do not include additional capacity that may be available in Iran that is offline because of U.S. sanctions on Iran's oil sales. All else equal, elevated levels of OPEC surplus production capacity tend to have a moderating effect on crude oil price increases.

Venezuela is not subject to the current OPEC+ production target, and in contrast to the rest of OPEC, we expect Venezuela's crude oil production to continue to decline as a result of ongoing operational difficulties, lack of field and facility maintenance, and continuing sanctions. Venezuela's production declines accelerated in 2020 after the United States government imposed new sanctions on its main oil trader, Rosneft Trading, in mid-February 2021. In addition, the decline in global oil demand following the onset of the COVID-19 pandemic further reduced the demand for Venezuela's oil.

OPEC Non-Crude Oil Liquids. We estimate that OPEC production of other liquids declined to 5.1 million b/d on average in 2020, down from 5.4 million b/d in 2019. The 2020 production decrease was driven by reduced output of associated condensate stemming from reduced crude oil production. In the forecast, associated liquids production rises as OPEC relaxes its crude oil production cuts. We expect OPEC non-crude oil liquids production will rise to 5.3 million b/d in 2021 and to 5.5 million b/d in 2022.

Global Oil Inventories. We estimate global oil inventories increased by 1.2 billion barrels during the first five months of 2020. Inventories subsequently fell by 0.8 billion barrels from June 2020 through June 2021. However, we expect that markets will be much more balanced

during 2H21 and in 2022. Although global oil demand continues to rise, relaxed OPEC+ production targets during the second half of the year, rising oil supplies in Iran, and rising non-OPEC production will result in global oil inventory draws of 0.2 million b/d during 2H21, compared with our estimate that inventory draws were 1.7 million b/d in 1H21. We expect inventories to build at a rate of nearly 0.5 million b/d in 2022 as OPEC continues to raise production in response to rising demand and as non-OPEC production growth, particularly in the United States, accelerates.

Crude Oil Prices. Brent crude oil prices averaged $73/b in June 2021, up $5/b from May. June was the first month when Brent crude oil prices averaged more than $70/b since May 2019. The increase likely reflected market expectations of continuing near-term tightness in global oil markets, which were evident in ongoing declines in global oil inventories. As vaccination rollouts have continued to ramp up in parts of the world, personal travel and mobility have been rising during much of 2021. Increasing oil consumption combined with production restraint from OPEC+ and relatively flat crude oil output in the United States have kept global oil consumption above global oil supply, draining inventories. Although global oil inventories during May and June fell at a slower rate than earlier in the year, the inventory draws of 1.2 million b/d over the past two months indicate the oil market was still in a structural deficit. Crude oil prices received additional support from increasing global economic activity and decreasing global COVID-19 cases. These factors have also contributed to rising prices across a wide range of assets including equities and other commodities.

We expect that recent increases in crude oil prices along with the OPEC+ decision to raise production will help meet the expected increase in global oil demand and lead to relatively balanced global oil markets for the remainder of the forecast period. Despite strength in oil prices during 1H21, we expect moderate downward oil price pressures to emerge beginning in 2H21, when we forecast global oil production to rise and cause inventories to draw at a slower pace. We expect global oil inventories will fall by 0.2 million b/d in 2H21, compared with an average draw of 1.7 million b/d in 1H21. We forecast Brent spot prices to average $71/b during 4Q21 compared with the average of $73/b in June.

Although we expect oil markets to be fairly balanced in 2022, in our forecast, global oil production begins to outpace global oil demand in 2022, which we expect will continue to put moderate downward pressure on oil prices. Higher oil price levels realized in 2021 drive increases in U.S. tight oil production in 2022. In addition, we expect more barrels from OPEC+ members to reach the market. We expect U.S. crude oil production to increase by 0.8 million b/d in 2022 and OPEC crude oil production to increase by 1.8 million b/d in 2022. Paired with a forecast deceleration in global oil demand growth to 3.7 million b/d in 2022—compared with 5.3 million b/d in 2021—rising oil production contributes to our forecast that Brent crude oil spot prices will average $67/b next year.

Global economic developments and numerous uncertainties surrounding the ongoing COVID-19 pandemic in the coming months could push oil prices higher or lower than our current price

forecast. The current forecast price path reflects global oil consumption increasing by 6% from 2020 levels in 2021 and by an additional 4% in 2022. However, this forecast depends on the rate at which current vaccinations continue and the way oil consumption behavior changes once populations are widely vaccinated. The duration of, and compliance with, the latest OPEC+ production targets also remains uncertain. Lastly, the degree to which the U.S. shale industry responds to the recent relative strength in oil prices will affect the oil price path in the coming quarters.

We forecast West Texas Intermediate (WTI) crude oil prices will average about $3/b less than Brent prices in 2021 and $4/b less than Brent prices in 2022. This price discount is based on our assumption that the recent discount of WTI to Brent, which averaged less than $3/b in 2Q21, reflected low global demand for oil exports and relatively low levels of U.S. crude oil production. As global refinery demand for crude oil increase and U.S. crude oil supply also increases, we expect the WTI discount to return to $4/b by 2H22. This discount reflects the relative cost of exporting U.S. crude oil from the Cushing distribution hub to Asia, compared with the cost of exporting Brent crude oil from the North Sea to Asia.

U.S. Liquid Fuels

Consumption. Although U.S. liquid fuels consumption has increased since reaching a recent low in 2Q20, lingering effects from COVID-19 continue to limit consumption. We estimate that in 1H21, U.S. consumption of liquids fuels averaged 19.1 million b/d, down 1.3 million b/d (6%) from 1H19. We expect the effects of the COVID-19 pandemic on liquid fuels consumption will continue to abate and liquids consumption will increase through the forecast period. Although we expect the direct effects from the pandemic on U.S. petroleum consumption to decrease, some consumption patterns may be more lasting, including increased working from home and changes in travel behavior, which could limit growth in gasoline and jet fuel consumption.

In 2021, we forecast that total U.S. liquids consumption will average 19.6 million b/d, down from 20.5 million b/d in 2019. Although we expect consumption of distillate fuel to be approximately equal to 2019 levels, we expect consumption of gasoline and jet fuel to remain below 2019 levels. We expect consumption of hydrocarbon gas liquids (HGL) to remain above 2019 levels in 2021, offsetting some of the declines in gasoline and jet fuel consumption.

In 2022, we expect distillate and HGL consumption to rise above 2019 levels, while gasoline and jet consumption will remain below 2019 levels. In the forecast, distillate and HGL consumption drive 2022 total liquids consumption to an average of 20.7 million b/d, surpassing 2019 consumption by about 0.1 million b/d.

In 1H21, we estimate U.S. gasoline consumption averaged 8.5 million b/d, down from 9.3 million b/d in 1H19 and the lowest level for the first half of a year since 2001 (except in 2020). Consumption in 1Q21 averaged 8.0 million b/d and increased to an estimated 9.0 million b/d in 2Q21 as the effects of COVID-19 decreased (driven by falling COVID-19 infections and increased

vaccinations) and seasonal driving increased. We expect the effects of COVID-19 will continue to decrease and gasoline consumption will increase to an average of 8.9 million b/d in 2H21, up from 8.3 million b/d from 2H20, but still lower than the 9.3 million b/d consumed in the same period during 2019. For all of 2021, we forecast U.S. gasoline consumption to average 8.7 million b/d and increase to 9.0 million b/d in 2022, compared with 9.3 million b/d in 2019.

We do not expect U.S. gasoline consumption to exceed 2019 levels in the forecast period. In 2021, we forecast that U.S. vehicle miles traveled (VMT) will average 8.6 million miles per day, up from 7.7 million miles per day in 2020 but below the average of 8.9 million miles per day in 2019. In 2022, however, we expect VMT to average 9.0 million miles per day, slightly above the level seen in 2019. Increased vehicle efficiency, however, partly offsets the increases in VMT, keeping gasoline consumption below 2019 levels. We assume that work-from-home options in the future will remain more available than before the pandemic, limiting gasoline demand growth.

Responses to the COVID-19 pandemic affected distillate consumption in the United States in 2020 less than gasoline and jet fuel because it is driven more by economic activity and freight movement and less by reduced travel. In weekly data, distillate consumption recently returned to 2019 levels, and we estimate that distillate consumption in June 2021 surpassed distillate consumption in June 2019 by 70,000 b/d. For 1H21, distillate consumption averaged an estimated 4.0 million b/d, which is below the 1H19 average of 4.2 million b/d. However, we forecast distillate consumption to average 4.2 million b/d in 4Q21, surpassing the 4Q19 average by 0.1 million b/d. We forecast distillate consumption to average almost 4.3 million b/d in 2022, the highest level on record in our data, which dates back to 1945.

In 1H21, jet fuel consumption averaged 1.2 million b/d, up from 1.1 million b/d in 2020 but below 2019 consumption of 1.7 million b/d. We expect jet fuel consumption will average 1.4 million b/d in 2021, down from 1.7 million b/d in 2019. In 2022, forecast jet fuel consumption almost returns to 2019 levels, averaging 1.7 million b/d.

U.S. consumption of HGLs in our forecast increases by 0.1 million b/d to an average 3.3 million b/d in 2021 and then increase by 0.3 million b/d to 3.6 million b/d in 2022. The growth in HGL consumption in 2021 and 2022 reflects more demand for ethane as a petrochemical feedstock in the United States. We forecast ethane consumption will increase by 30,000 b/d in 2021 and by a further 300,000 b/d in 2022 with new demand coming from additional ethylene cracking capacity.

Crude Oil Supply. We forecast that annual U.S. crude oil production will average 11.1 million b/d in 2021, which is a 0.2 million b/d decrease from 2020 levels. However, annual average numbers somewhat obscure production trends. Production in 1Q21 was down by more than 2.0 million b/d from 1Q20, the quarter before 2Q20 when production fell sharply in response to falling oil prices. However, from 2Q21 through 4Q21, we forecast U.S. crude oil production will

be up 0.4 million b/d on average year over year. We forecast U.S. crude oil production will rise to an average of 11.9 million b/d in 2022.

Most crude oil production in the Lower 48 (L48) states, excluding the Federal Offshore Gulf of Mexico (GOM), is tight oil production, and we expect trends in L48 production to drive overall U.S. crude oil production levels. Our forecast crude oil production growth is based on WTI prices that indicate a favorable environment for drilling activity. In June, WTI prices averaged more than $70/b for the first time since October 2018, and we expect that through the end of 2022, WTI prices will remain above $60/b—a price that has signaled robust activity among U.S. operators in the past. Because changes in rig counts typically lag changes in the WTI price by three to six months and production changes typically occur about two months after rig deployment, current crude oil price levels will not likely affect production until late 2021. We forecast U.S. crude oil production to average about 11.2 million b/d in both 2Q21 and 3Q21 before beginning to rise more steadily. Forecast U.S. crude oil production reaches 11.3 million b/d in 4Q21 and increases to 12.2 million b/d by 4Q22.

Assuming that other factors remain constant, recent and forecast crude oil price levels will likely continue to drive rig deployments through the end of 2022. However, this forecast depends on the capital decisions of operators. The recent pace of rig deployment indicates that operators are adding rigs more slowly than during past periods when prices reached similar levels. If operators take a more cautious approach to rig deployment than we are expecting, crude oil production could be lower than in our forecast.

In the GOM, we expect crude oil production to average 1.8 million b/d in both 2021 and 2022. Ten new projects that will likely begin operations during the forecast period will help offset declines at existing GOM projects.

We expect little change in Alaska's crude oil production, which will average more than 0.4 million b/d in both 2021 and 2022, down slightly from 2020 levels. We do not expect the U.S. federal moratorium on new federal oil and natural gas leases that occurred earlier this year to affect the short-term outlook for the GOM or Alaska.

Hydrocarbon Gas Liquids Supply. We forecast natural gas plant production of HGLs to increase by 0.1 million b/d in 2021 and by almost 0.5 million b/d in 2022. Rising HGL production in the forecast is mostly driven by increased ethane production. Higher rates of ethane recovery at natural gas processing plants occur in the forecast to meet growing demand for ethane as a petrochemical feedstock in the United States and abroad during both 2021 and 2022.

Liquid Biofuels. COVID-19-related reductions in economic activity in general, and decreased demand for liquid fuels in particular, significantly affected U.S. biofuels markets in 2020, and we expect some of these impacts to persist through the forecast period. The current forecast reflects the most recent 2020 targets in the Renewable Fuel Standard (RFS) program, and given the delays in finalizing 2021 RFS targets, we assume those 2020 target levels to remain

unchanged throughout the forecast period. In the forecast, these RFS targets primarily affect biomass-based diesel production and net imports, which help meet multiple RFS targets for biomass-based diesel, advanced biofuel, and total renewable fuel.

Because of sharp reductions in motor gasoline demand resulting from responses to COVID-19, U.S. fuel ethanol production was significantly lower in 2020 than in previous years. U.S. fuel ethanol production fell by 12% from 2019 to an average of 0.91 million b/d in 2020. As a result, we forecast that persistent reductions in domestic gasoline demand and limited higher-blend fuel ethanol growth potential will result in fuel ethanol production remaining lower than 2019 levels throughout the STEO forecast. We expect fuel ethanol production to average 0.97 million b/d in 2021, 7% more than in 2020, and to average 1.00 million b/d in 2022, 4% more than 2021, but still slightly below the 2019 level.

U.S. fuel ethanol consumption averaged 949,000 b/d in 2019, and we estimate fuel ethanol consumption fell by 13% to an average of 822,000 b/d in 2020. We forecast that fuel ethanol consumption will gradually rise during the forecast period, largely following the growth in domestic motor gasoline consumption with limited growth in any higher blending levels. In our forecast, U.S. fuel ethanol consumption averages 896,000 b/d in 2021 and 917,000 b/d in 2022. This level of consumption results in the fuel ethanol share of total gasoline, which was an estimated 10.2% in both 2019 and 2020, remaining near this level during 2021 and 2022. This stable fuel ethanol share assumes that growth in higher-level fuel ethanol blends is limited by a lack in consumer demand for higher levels of fuel ethanol blending beyond 10% of gasoline (E10) despite significantly elevated renewable identification number (RIN) prices which could incentivize increased fuel ethanol blending by some gasoline blenders and retailers.

We estimate that U.S. biodiesel production increased in 2020 and was less affected by COVID-19-related restrictions than many other fuels, despite production capacity that declined slightly. U.S. biodiesel production increased by an estimated 5% from 2019 to 2020, averaging an estimated 118,000 b/d last year. We expect biodiesel production will fall slightly to 117,000 b/d in 2021 before increasing by 10% to 129,000 b/d in 2022, driven largely by biodiesel's role in meeting multiple RFS targets and the existence of the biodiesel production tax credit through 2022. Despite RIN prices that have recently been at all-time highs, record-high feedstock costs are expected to limit biodiesel production growth over the forecast period.

U.S. net imports of biomass-based diesel increased by an estimated 6% to an average of 22,000 b/d in 2020, and we expect net imports to increase to an average of 29,000 b/d in 2021 and 44,000 b/d in 2022. Increased net imports of biomass-based diesel primarily reflect increased volumes of renewable diesel imported to meet both California Low Carbon Fuel Standard requirements and RFS targets for biomass-based diesel and advanced biofuels.

Product Prices. Changes in travel patterns in response to COVID-19 resulted in significant reductions in crude oil prices and demand for liquid fuels in the United States during 2020, which significantly reduced prices for gasoline and diesel fuel during the same period. In 2021,

as vaccination levels have increased and general economic activity has begun to recover, personal mobility and seasonal driving demand has grown sharply year-over-year, leading to increasing prices for crude oil, gasoline, and diesel fuel compared with the same time last year.

Although much of the increase in U.S. gasoline and diesel prices so far in 2021 reflects rising crude oil prices, higher refinery margins have also contributed. Refinery margins (the difference between the wholesale price of gasoline and the price of Brent crude oil), which fell significantly along with gasoline and diesel demand in March and April 2020, returned to levels within their seasonal ranges in 4Q20. Since then, margins have increased significantly beyond their recent five-year averages, driven in part by significant increases in RIN prices, which are embedded to some degree in wholesale product prices. So, although refinery margins have increased beyond seasonal averages for both gasoline and diesel fuel, RIN costs have likely limited actual refinery profitability to some degree. This dynamic is reflected in refinery production of gasoline, which has not increased in line with growing gasoline demand, resulting in U.S. gasoline inventories that have been lower than in recent years and in upward pressure on prices.

The U.S. refinery wholesale gasoline margin averaged 30 cents/gal in February 2021. It then increased to an average of 52 cents/gal in June, which was 17 cents/gal higher than at the same time last year and 11 cents/gal higher than the recent five-year average. We expect the U.S. refinery wholesale gasoline margin will average 42 cents/gal in 2021 and 36 cents/gal in 2022, compared with a five-year (2016–20) average of 35 cents/gal. Because some of the strength in margins is attributable to elevated RIN costs, the margins remain uncertain throughout the year because RIN markets can be highly volatile and are currently driven by both agricultural commodity markets as well as uncertainty around future RFS rulemakings. Our forecast assumes current elevated agricultural commodity prices will not persist to the same degree, and future RFS rulemakings will add clarity and reduce some tightness in RIN markets.

In addition to elevated refinery margins, supply disruptions as a result of the Colonial Pipeline Cyberattack added upward retail gasoline price pressure in May, when the U.S. weekly average gasoline retail prices surpassed $3.00/gal for the first time since late 2014. Since then, U.S. regular gasoline retail prices have remained above $3.00/gal, averaging $3.06/gal in June. We expect that gradual reductions in U.S. refinery margins, driven partially by increased refinery output along with falling crude oil prices, will result in lower retail gasoline prices for the remainder of the year. We forecast the retail price of regular gasoline in the United States will average $3.04/gal during 3Q21, 85 cents/gal higher than at the same time last year. We expect the U.S. monthly regular retail gasoline price will fall from an average of $3.11/gal in July 2021 to $2.93/gal in September before falling to $2.76/gal in December 2021. We forecast the U.S. regular gasoline retail price, which averaged $2.18/gal in 2020, to average $2.85/gal in 2021 and $2.74/gal in 2022.

Regional annual average forecast prices for 2021 range from a low of $2.56/gal in the Gulf Coast region (PADD 3) to a high of $3.51/gal in the West Coast region (PADD 5).

The retail price of diesel fuel in the United States averaged $2.55/gal in 2020, which was 50 cents/gal lower than in 2019. We forecast that the diesel price will average $3.16/gal in 2021 and $3.09/gal in 2022. We expect that global economic activity returning to pre-pandemic levels will help drive diesel refinery margins higher during the forecast period than their multiyear lows in 2020. Diesel refinery margins based on the Brent crude oil price averaged 30 cents/gal in 2020, which was 11 cents/gal lower than the 2015–19 average and the lowest annual average since 2009. We expect diesel refinery margins will average 40 cents/gal in 2021 and 44 cents/gal in 2022.

Natural Gas

Natural Gas Consumption. U.S. consumption of natural gas averaged 83.3 billion cubic feet per day (Bcf/d) in 2020, and we expect consumption will decrease by 0.9 Bcf/d (1.1%) in 2021 and then increase by 0.6 Bcf/d (0.7%) 2022 to average 82.9 Bcf/d for the year.

The largest natural gas-consuming sector in the United States is the electric power sector. We estimate that the electric power sector will consume an average of 29.3 Bcf/d in 2021, which is 7.7% less than in 2020. We forecast that higher prices for natural gas (compared with coal prices) for power generation and rising electricity generation capacity from renewable energy will likely cause natural gas consumption in the electric power sector to decline in 2021. We forecast electric power sector consumption of natural gas will increase by 1.3% in 2022, based on an expected decline in natural gas prices next year.

We expect combined U.S. residential and commercial natural gas consumption will average 22.6 Bcf/d in 2021, up 6.0% from 2020. Compared with 1Q20, colder temperatures and people spending more time at home because of the COVID-19 pandemic led to increases in heating demand in 1Q21. Based on forecasts by the National Oceanic and Atmospheric Administration (NOAA), we assume colder temperatures with 7.0% more heating degree days (HDD) across the United States in 2021 compared with 2020. We expect natural gas consumption in the U.S. residential and commercial sectors to decline by 0.4% in 2022.

We forecast U.S. consumption of natural gas in the industrial sector will increase 1.2% in 2021 to 22.8 Bcf/d and an additional 0.9% to 23.0 Bcf/d in 2022. Our natural gas-weighted manufacturing index, based on forecasts from IHS Markit, has steadily increased after falling in 2Q20, and our forecast assumes that the natural gas-weighted manufacturing index will reach 2019 levels in 2H21.

Natural Gas Production. We forecast that U.S. dry natural gas production will average 92.6 Bcf/d in 2021, which would be up 1.3% from 2020. Natural gas production rises in response to higher crude oil and natural gas prices. We forecast Henry Hub spot prices in 2021 will average more than $1 per million British thermal units (MMBtu), or 58%, higher than the average in 2020. In addition, we expect associated natural gas production from oil directed rigs in the Permian Basin to increase in 2021 as WTI prices average almost $27/b (68%) more than in 2020.

In 2022, we expect dry natural gas production to average 94.7 Bcf/d, which would be up 2.3% from 2021.

Natural Gas Trade. We forecast U.S. liquefied natural gas (LNG) exports to average 9.6 Bcf/d in 2021 and 10.2 Bcf/d in 2022, surpassing pipeline exports for the first time on an annual basis in both years. Several factors support this forecast: gradual recovery in global LNG demand, high winter LNG demand, particularly in Asia, and expansions in global LNG regasification capacity in both existing and new markets in the next two years. U.S. LNG exports are projected to increase in 2022 because of commissioning of additional LNG trains at Sabine Pass and Calcasieu Pass.

U.S. LNG exports have reached record high levels this spring, averaging 10.3 Bcf/d from March through May, supported by high spot LNG prices in Asia and Europe, and a continuous recovery in global LNG demand. We estimate that U.S. LNG exports declined to 9.0 Bcf/d in June, likely because of planned and unplanned outages at several U.S. liquefaction facilities.

Pipeline exports of U.S. natural gas have also increased as more infrastructure has been built to transport natural gas both to and within Mexico. U.S. pipeline exports averaged 7.9 Bcf/d in 2020, an increase of 1.7% compared with 2019. We expect pipeline exports to increase as more natural gas-fired power plants come online in Mexico and more pipeline infrastructure is built within Mexico and the United States. We expect gross U.S. pipeline exports to Mexico and Canada to average 9.0 Bcf/d in 2021 and 9.2 Bcf/d in 2022.

U.S. natural gas pipeline imports (almost all of which come from Canada) decreased from 2019 to 2020, continuing a trend that began in 2008. We forecast natural gas pipeline imports to increase 5.7% in 2021 because the United States will import more natural gas amid relatively flat U.S. natural gas production along with record U.S. exports of natural gas. However, pipeline imports will likely decline in 2022 in response to an increase in U.S. natural gas production in 2022.

Natural Gas Inventories. Storage withdrawals in 1Q21 were 14% higher than the five-year average because severely cold temperatures in February caused near-record storage withdrawals and because of declines in natural gas production. Total inventories were 1.8 trillion cubic feet (Tcf) at the end of March, about 2% lower than the five-year average for that time of year. For the 2021 April–October storage injection season, we expect injections will be 5% below the five-year average rate because record exports outpace increases in natural gas production. We expect that inventories will reach more than 3.6 Tcf at the end of October 2021, which would be 3% lower than the previous five-year average for the end of October and 8% lower than at the end of October 2020.

Natural Gas Prices. The Henry Hub spot price averaged $2.03/MMBtu in 2020. Natural gas prices fell through much of 2020 as U.S. natural gas consumption outside of the electric power sector declined and LNG exports also dropped. These declines outpaced declines in production and contributed to inventories building at a faster rate than the five-year average.

The Henry Hub spot price rose to an average of $3.25/MMBtu in 1H21, somewhat elevated by the February monthly average price of $5.35/MMBtu, which was strongly influenced by cold weather. More recently, the daily spot price reached $3.79/MMBtu on June 30. U.S. natural gas prices rose in 1H21 as growth in demand for natural gas outpaced supply. The combination of U.S. consumption of natural gas outside of the power sector and exports together were up almost 6 Bcf/d in 1H21 compared with the same period in 2020. At the same time, domestic dry natural gas production plus imports were almost unchanged in 1H21 compared in 1H20.

We expect the Henry Hub spot price to fall from recent highs and average $3.22/MMBtu in 3Q21 and also average $3.22/MMBtu for all of 2021. For the remaining months in 2021, we expect prices to remain more than $3.00/MMBtu, driven by continuing record natural gas exports and rising demand for natural gas outside of the electric power sector amid relatively flat natural gas production. We expect downward price pressure to emerge in 2022 as U.S. natural gas production increases and export growth slows. We forecast the Henry Hub spot price to average $3.00/MMBtu in 2022.

Coal

Coal Production. We forecast U.S. coal production will increase by 78 million short tons (MMst) (15%) in 2021 to total 617 MMst for the year. The expected increase in production reflects greater electric power sector demand for coal. Higher natural gas prices make coal more economically competitive relative to natural gas for electricity generation dispatch. In the forecast, coal production increases by 13 MMst (9%) in the Appalachia region, 14 MMst (16%) in the Interior region, and 51 MMst (17%) in the Western region.

Coal production in the forecast falls by 7 MMst (1%) in 2022 to 610 MMst. The decline is in response to falling natural gas prices in our forecast, which tends to reduce coal use for power generation. Western region production is expected to decline by 6% in 2022, offsetting gains in the Interior (7%) and Appalachia (5%) regions.

Overall production capacity decreased in 2020, and the lost capacity is unlikely to come back online. We expect an increased draw on electric power sector coal inventories in 2021 (25 MMst) and 2022 (23 MMst).

Coal Consumption. We expect a 92 MMst (19%) increase in U.S. coal consumption in 2021. Rising consumption is largely driven by an increase in demand from the electric power sector, which is expected to consume 522 MMst of coal in 2021, 20% more than 2020. We forecast total U.S. coal consumption to decrease 32 MMst (6%), in 2022 to 537 MMst.

Coal Trade. Annual U.S. coal exports dropped 26% between 2019 and 2020, from 94 MMst to 69 MMst. Metallurgical coal exports were 42 MMst in 2020, 20% lower than the previous year, and steam coal exports were 27 MMst, 34% lower than in 2019.

Four of the top 10 U.S. coal export destinations—Brazil, Turkey, the Dominican Republic, and China—increased their imports of U.S. coal in 2020. Exports to the Dominican Republic increased by 1.3 MMst, more than double its 2019 imports of U.S. coal. In particular, an ongoing trade dispute between Australia and China has opened up opportunities for swing suppliers, such as the United States, to gain market share and increase overall exports especially for steam coal.

In our forecast, we assume the seaborne steam coal market in 2021 will be more robust with higher demand for U.S. coal. Forecast U.S. steam coal exports reach 37 MMst in 2021, which is a 37% increase from 2020. Rising U.S. exports in the forecast reflect smaller export volumes from other global suppliers and seaborne coal prices that are supportive of U.S. exports. We expect total U.S. coal exports to increase by 15 MMst (21%) in 2021 as a result of economic growth for major coal importers that are emerging from a lower demand market because of the pandemic in 2020. Steel production, which was limited by pandemic shutdowns, is expected to return to average levels during the remainder of 2021 and bring U.S. metallurgical coal exports to 47 MMst. We expect coal exports to increase by 15 MMst (18%) in 2022 as overall seaborne supply comes back into line with 2019 levels. We expect that U.S. coal exports will total 99 MMst in 2022.

Coal Prices. The delivered coal price to U.S. electricity generators averaged $1.92/MMBtu in 2020, which was 10 cents/MMBtu lower than the 2019 price. We forecast that coal prices will decrease to $1.88/MMBtu in 2021 and $1.85/MMBtu in 2022.

Electricity

Electricity Consumption. We forecast total retail sales of electricity by U.S. utilities and electricity suppliers will increase by 2.8% in 2021 and by 1.0% in 2022. So far this year, estimated U.S. retail electricity sales during 1H21 were 4.5% more than for the same period of 2020. We forecast that electricity sales during 2H21 will grow by 1.2% compared with 2H20.

The relaxing of social distancing guidelines and growing COVID-19 vaccinations have led to increased economic activity compared with last year, especially in restaurants and retail stores, which were most affected by pandemic-related restrictions in 2020. Residential electricity consumption in 2020 noticeably increased because people were staying at home for longer periods during the day and because many were working from home. Residential electricity use is likely to remain elevated as work-from-home arrangements continue for some workers.

Year-to-year changes in residential electricity consumption are most related to changes in temperature, often measured using heating degree days (HDD) and cooling degree days (CDD). We estimate residential electricity sales during 1H21 to be 5.7% more than during the same period in 2020. Much of this increase reflected colder winter temperatures compared with last year's mild winter and a hot June across much of the country. HDDs in the United States during 1H21 were 6.9% more than in 2020. Based on forecasts from NOAA, our forecast assumes U.S.

HDDs to be higher than last year during 2H21, but the effect on electricity consumption is offset by CDDs in the forecast that are 9.7% lower than in 2H20. We forecast residential electricity sales during 2H21 will be 1.4% lower than residential sales in 2020. Forecast annual residential electricity use grows by 1.9% in 2021 and falls by 0.5% in 2022.

Weather and overall economic activity affect electricity consumption in the commercial sector. Although the colder winter weather earlier this year supported electricity consumption in the commercial sector, economic activity and growth in private-sector jobs were still restrained, especially during 1Q21 compared with the same period in 2020, before the pandemic-related lockdowns began. Nonfarm employment during 1Q21 was 5.6% lower during the same period in 2020, while retail electricity sales to the commercial sector were 2.9% lower. For 2H21, we forecast commercial sector retail electricity sales will grow by 1.7% compared with last year, driven in part by an expected 4.8% increase in nonfarm employment. For 2022, forecast commercial sector electricity use grows by 1.4% on an annual basis.

Improving economic conditions will also likely increase electricity demand in the industrial sector. The U.S. industrial production index for electricity-intensive industries in the forecast increases by 6.5% in 2021 after declining by a similar percentage in 2020. This expected increase in industrial production contributes to our forecast that retail sales of electricity to the industrial sector will rise by 5.1% in 2021. In 2022, we forecast retail sales of electricity to the industrial sector will increase by 2.6%.

Electricity Generation. We expect the U.S. electric power sector will generate 2.1% more power during 2021 than in 2020. Electric power sector generation in the forecast grows by an additional 0.7% in 2022.

One of the largest shifts in fuels for electricity generation in recent years has been the industry's reduced use of coal and increased use of natural gas. Coal-fired electricity generation in the United States has declined almost every year over the past decade. The amount of U.S. coal generation in 2020 was 62% below its high in 2007. In contrast, natural gas generation grew by 86% between 2007 and 2020.

Both regulatory and economic factors are driving this trend of declining coal use and rising natural gas use. One of the most important drivers has been the sustained low cost of natural gas, which reached the lowest level in decades last year. In 2020, the price of natural gas delivered to electric generators averaged $2.39/MMBtu. However, natural gas prices have been rising in recent months now that the economy is beginning to recover from the effects of the pandemic, but U.S. production of natural gas is growing at a slower pace. In April 2021, the most recent available history, the delivered natural gas price to electricity generators averaged $3.04/MMBtu. Expected natural gas costs remain relatively elevated through the forecast and delivered prices average $3.44/MMBtu in 2H21.

These expected changes in the costs of fuels used for generating power will likely reverse some of the recent trends in the use of coal and natural gas for electricity generation, at least temporarily. We forecast that the natural gas-fired share of total U.S. generation will decline from 39% in 2020 to 36% in both 2021 and 2022, which would be close to what the natural gas share was in 2019. The expected rise in natural gas costs make coal more economical for electricity generation. The forecast share of generation from coal-fired power plants rises from 20% last year to 24% in 2021 and 22% in 2022.

We forecast the share of generation from renewable sources will increase from 20% in 2020 to 21% in 2021 and to 23% in 2022. Most of this increase will come from new solar and wind generating capacity expansions in the electric power sector. The current drought in the West has restrained electricity generation by hydropower. U.S. hydropower generation contributes about 6.5% of total generation in the 2021 forecast, which would be the lowest share since 2015. In 2022, the forecast hydropower share rises to 6.8% but is still below the 7.5% share last year.

The forecast nuclear share of total electricity generation, which averaged nearly 21% in 2020 will fall to 20% by 2021 and to 19% in 2022. The declining share partly reflects retirements of nuclear capacity. In April, New York's Indian Point nuclear power plant retired. Reactors at three other nuclear plants in the Midwest are scheduled to retire in either 2021 or 2022. The retirements are partly offset by two reactors at the Vogtle plant in Georgia that are scheduled to come online next year.

Renewable Capacity. We expect that generating capacity from renewable energy sources will continue to grow through the STEO forecast horizon. By the end of 2022, electric power sector total renewables capacity increases by 81 gigawatts (GW) from 2019. An additional 15 GW in all other sectors brings the total to 96 GW.

We forecast that in 2022 large-scale solar capacity growth will exceed wind growth for the first time. We forecast that 16 GW of solar photovoltaic (PV) generating capacity in the electric power sector will be added in 2021 and an additional 17 GW is forecast for 2022. We forecast small-scale solar PV capacity to increase by about 5 GW per year through the STEO forecast period. Residential PV accounts for most of this additional small-scale generating capacity for both 2021 and 2022. Solar capacity growth in the forecast reflects various state and federal policies that support renewable energy.

We forecast generating capacity from wind turbines in the electric power sector to grow by 17 GW in 2021 and by 6 GW in 2022. Because wind capacity is often added at the end of the calendar year, increases in wind generation frequently lag behind increases in capacity for the year they occur in, and they are reflected in the generation for the next year.

Much of this slowing growth in wind capacity can be attributed to the expiration of the production tax credit. The credit, which at the end of 2019 was extended through 2020,

provided a 2.5 cents per kilowatthour (kWh) benefit for facilities entering service or securing 5% safe harbor (spending at least 5% of total estimated project cost) through the 2020 calendar year. The effect of the tax credit extension included in the Consolidated Appropriation Act 2021, enacted in late-December 2020, is now reflected in this forecast. This extension caused capacity additions to move from 2020 to 2021 and the slowing wind growth in 2022.

Electricity Prices. Wholesale electricity prices throughout the country so far in 2021 have been higher than last year, reflecting the increased cost of natural gas for power generation. During 2Q21, wholesale prices ranged from $31 per megawatthour (MWh) in the Central region, which is 58% higher than 2Q20, to $52/MWh in the Northwest region, which is 256% higher than in 2020. Wholesale prices are likely to remain relatively volatile over the next few months. Forecast prices during 2H21 average from a low of $24/MWh in Texas to a high of $46/MWh in California.

We forecast the U.S. retail electricity price for the residential sector will average 13.6 cents/kWh in 2021, which is 2.8% higher than the average retail price in 2020. Forecast residential prices increase by an additional 1.8% in 2022.

U.S. Economic Assumptions and Energy-Related Carbon Dioxide Emissions

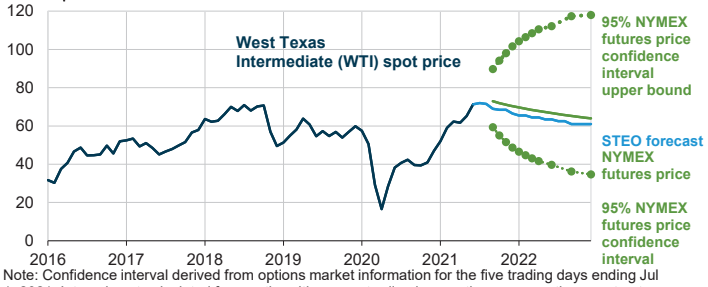
U.S. Economy. We base the STEO on macroeconomic forecasts for the United States by IHS Markit. We used the June 2021 version of the IHS Markit macroeconomic model with our own energy price forecasts as model assumptions to develop the economic forecasts in the STEO.

Using the IHS Markit model, we assume U.S. real GDP will grow by 7.4% in 2021 and by 5.0% in 2022. These rates compare with a 3.5% decline in annual GDP growth in 2020. We assume that total U.S. industrial production will increase 6.5% in 2021 and 4.8% in 2022. This growth contrasts with the 7.2% decline in annual growth in 2020. In the forecast, U.S. nonfarm employment, which decreased by 5.7% in 2020, will increase by 2.9% in 2021 and 3.8% in 2022.

Energy-Related Carbon Dioxide Emissions. Energy-related carbon dioxide (CO_2) emissions in the United States fell by 11.1% in 2020 relative to 2019. We expect CO_2 emissions to rise by 7.1% in 2021 and by 1.5% in 2022. We forecast an increase in coal CO_2 emissions and a decrease in natural gas CO_2 emissions because higher natural gas prices make coal more economically competitive for electric power generation. We expect CO_2 emissions from coal to rise by 18.5% in 2021 and to decline by 4.9% in 2022. We expect CO_2 emissions from natural gas to fall by 1.3% from 2020 to 2021 and then increase by less than 1% in 2022. Petroleum-related CO_2 emissions increase 9.0% in 2021 and 5.2% in 2022 as transportation patterns begin to return to normal. Energy-related CO_2 emissions are sensitive to changes in weather, economic growth, energy prices, and fuel mix.

Notable forecast changes

- For more information, see the detailed table of forecast changes.



This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the United States Government. The views in this report therefore should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday July 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130; *Electric Power Monthly* , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

(c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Petroleum Supply Monthly* , DOE/EIA-0109. Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on Thursday July 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates, Venezuela.

Notes: EIA completed modeling and analysis for this report on Thursday July 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate, natural gas plant liquids, other liquids, refinery processing gain, and other unaccounted-for liquids.

OPEC = Organization of the Petroleum Exporting Countries: Iran, Iraq, Kuwait, Saudi Arabia, and the United Arab Emirates (Middle East); Algeria, Angola, Congo (Brazzaville), Equatorial Guinea, Gabon, Libya, Nigeria, and Venezuela (Other).

Notes: EIA completed modeling and analysis for this report on Thursday July 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Forecasts are not published for individual OPEC countries.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) GDP values for the individual countries in the indexes are converted to U.S. dollars at purchasing power parity and then summed to create values for the world, OECD, and non-OECD. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

(b) Data source is the Board of Governors of the U.S. Federal Reserve System Nominal Broad Trade-Weighted Dollar Index. An increase in the index indicates an appreciation of the U.S. dollar against a basket of currencies and a decrease in the index indicates a depreciation of the U.S. dollar against a basket of currencies. Historical and forecast data are from Oxford Economics, and quarterly values are reindexed to 2015 Q1 by EIA.

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

Notes: EIA completed modeling and analysis for this report on Thursday July 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels. Beginning in January 2021, renewable fuels includes biodiesel, renewable diesel, renewable jet fuel, renewable heating oil, renewable naphtha and gasoline, and other renewable fuels. For December 2020 and prior, renewable fuels includes only biodiesel.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) For net imports and inventories “Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products; for consumption “Other Oils” also includes renewable fuels except fuel ethanol.

- = no data available

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

Notes: EIA completed modeling and analysis for this report on Thursday July 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; and *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday July 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109; *Petroleum Supply Annual* , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions (http://ir.eia.gov/ngs/notes.html)* .

- = no data available

LNG: liquefied natural gas.

Notes: EIA completed modeling and analysis for this report on Thursday July 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday July 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the *Natural Gas Monthly* , DOE/EIA-0130.

Natural gas Henry Hub spot price from Reuter's News Service (http://www.reuters.com).

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Cost of Coal to Electric Utilities (Dollars per million Btu)	**1.93**	**1.91**	**1.93**	**1.92**	**1.91**	**1.89**	*1.89*	*1.85*	*1.87*	*1.86*	*1.84*	*1.82*	**1.92**	*1.88*	*1.85*

(a) Waste coal includes waste coal and cloal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday July 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report* , DOE/EIA-0121; and *Electric Power Monthly* , Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Notes: EIA completed modeling and analysis for this report on Thursday July 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by power plants with capacity of at least 1 megawatt operated by electric utilities and independent power producers.

(b) Generation supplied by power plants with capacity of at least 1 megawatt operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

(d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or colocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

Historical data sources:

(1) Electricity supply, consumption, fuel costs, and retail electricity prices: Latest data available from U.S. Energy Information Administration databases supporting the following reports: Electric Power Monthly, DOE/EIA-0226; and Electric Power Annual, DOE/EIA-0348

(2) Wholesale electricity prices (except for PJM RTO price): S&P Global Market Intelligence, SNL Energy Data

(3) PJM ISO Western Hub wholesale electricity prices: PJM Data Miner website

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday July 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

Table 7c. U.S. Regional Retail Electricity Prices (Cents per Kilowatthour)

(a) Volume-weighted average of retail prices to residential, commercial, industrial, and transportation sectors.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday July 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Regions refer to U.S. Census divisions.

See "Census division" in EIA's Energy Glossary (http://www.eia.doe.gov/glossary/index.html) for a list of States in each region.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric*

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Solar generation from large-scale power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on Thursday July 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

Table 7d part 2. U.S. Regional Electricity Generation, Electric Power Sector (billion kilowatthours), *continued from Table 7d part 1*

(a) Large-scale solar generation from power plants with more than 1 megawatt of capacity. Excludes generation from small-scale solar photovoltaic systems.

(b) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(c) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(d) Wind, large-scale solar, biomass, and geothermal

(e) Pumped storage hydroelectric, petroleum, other gases, batteries, and other nonrenewable fuels. See notes (b) and (c).

(f) Regional generation from generating units operated by electric power sector, plus energy receipts from minus energy deliveries to U.S. balancing authorities outside region.

Notes: EIA completed modeling and analysis for this report on Thursday July 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Data reflect generation supplied by power plants with a combined capacity of at least 1 megawatt operated by electric utilities and independent power producers.

Historical data: Latest data available from U.S. Energy Information Administration databases supporting the following reports: *Electric Power Monthly* , DOE/EIA-0226; and *Electric Power Annual* , DOE/EIA-0348.

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW)

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to 1 megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than 1 megawatt).

(d) Solar photovoltaic systems smaller than one megawatt.

- = no data available

Notes: EIA completed modeling and analysis for this report on Thursday July 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.
Historical data: Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System.

(a) Fuel share weights of individual sector indices based on EIA *Manufacturing Energy Consumption Survey* .

(b) Total highway travel includes gasoline and diesel fuel vehicles.

(c) Includes electric power sector use of geothermal energy and non-biomass waste.

- = no data available

SAAR = Seasonally-adjusted annual rate

Notes: EIA completed modeling and analysis for this report on Thursday July 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Historical data: Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17; Federal Highway Administration; and Federal Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.

Notes: EIA completed modeling and analysis for this report on Thursday July 1, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National

See *Change in Regional and U.S. Degree-Day Calculations* (http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (http://www.eia.gov/tools/glossary/) for a list of states in each region.

Historical data: Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

Forecasts: Based on forecasts by the NOAA Climate Prediction Center (http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml).

Independent Statistics & Analysis
U.S. Energy Information Administration

August 2021

Short-Term Energy Outlook

Forecast highlights

Global liquid fuels

- The August *Short-Term Energy Outlook* (STEO) remains subject to heightened levels of uncertainty related to the ongoing recovery from the COVID-19 pandemic. U.S. economic activity continues to rise after reaching multiyear lows in the second quarter of 2020 (2Q20). U.S. gross domestic product (GDP) declined by 3.5% in 2020 from 2019 levels. This STEO assumes U.S. GDP will grow by 6.6% in 2021 and by 5.0% in 2022. The U.S. macroeconomic assumptions in this outlook are based on forecasts by IHS Markit. Our forecast assumes continuing economic growth and increasing mobility. Any developments that would cause deviations from these assumptions would likely cause energy consumption and prices to deviate from our forecast.

- Brent crude oil spot prices averaged $75 per barrel (b) in July, up $2/b from June and up $25/b from the end of 2020. Brent prices have been rising this year as result of steady draws on global oil inventories, which averaged 1.8 million barrels per day (b/d) during the first half of 2021 (1H21) and remained at almost 1.4 million b/d in July. We expect Brent prices will remain near current levels for the remainder of 2021, averaging $72/b from August through November. However, in 2022, we expect that continuing growth in production from OPEC+ and accelerating growth in U.S. tight oil production—along with other supply growth—will outpace decelerating growth in global oil consumption and contribute to Brent prices declining to an average of $66/b in 2022.

- We estimate that 98.8 million b/d of petroleum and liquid fuels were consumed globally in July, an increase of 6.0 million b/d from July 2020 but 3.4 million b/d less than in July 2019. We forecast that global consumption of petroleum and liquid fuels will average 97.6 million b/d for all of 2021, which is a 5.3 million b/d increase from 2020. We forecast that global consumption of petroleum and liquid fuels will increase by 3.6 million b/d in 2022 to average 101.2 million b/d.

- U.S. gasoline consumption averaged 8.6 million b/d in 1H21, up from 8.3 million b/d in 2H20 but below the 9.3 million b/d in 2H19. Our latest estimates show that gasoline consumption in May through July was higher than we had previously expected. Growth in employment and increasing mobility have led to rising gasoline consumption so far in 2021. In this STEO, forecast U.S. gasoline consumption averages 8.8 million b/d in 2021, up from 8.0 million b/d in 2020. We expect the trend of rising employment and mobility

to continue into next year, and as a result, we forecast gasoline consumption to average almost 9.0 million b/d in 2022. However, our assumption that a relatively high share of the workforce will continue working from home next year compared with before the pandemic keeps our forecast gasoline consumption below the 2019 level of 9.3 million b/d.

- U.S. regular gasoline retail prices averaged $3.14 per gallon (gal) in July, the highest monthly average price since October 2014. Recent gasoline price increases reflect rising crude oil prices and rising wholesale gasoline margins, amid relatively low gasoline inventories. We expect that prices will average $3.12/gal in August before falling to $2.82/gal, on average, in 4Q21. The expected drop in retail gasoline prices reflects our forecast that gasoline margins will decline from elevated levels, as is typical in the United States during the second half of the year.

- We forecast OPEC crude oil production will average 26.5 million b/d in 2021, up from 25.6 million b/d in 2020. OPEC crude oil production in the forecast rises from 25.0 million b/d in April to an average of 27.1 million b/d in 3Q21. Our expectation of rising OPEC production is primarily based on our assumption that OPEC will raise production through the end of 2021 in line with targets it announced on July 18. We expect OPEC crude oil production will rise to an average of 28.7 million b/d in 2022

- EIA's most recent monthly data show U.S. crude oil production was 11.2 million b/d in May. We expect production to be relatively flat through October before it starts rising in November and December and throughout 2022. Forecast U.S. crude oil production for 2022 averages 11.8 million b/d, up from 11.1 million b/d in 2021.

Natural Gas

- In July, the natural gas spot price at Henry Hub averaged $3.84 per million British thermal units (MMBtu), which is up from the June average of $3.26/MMBtu. We expect the Henry Hub spot price will average $3.71/MMBtu in 3Q21 and $3.42/MMBtu for all of 2021, which is up from the 2020 average of $2.03/MMBtu. Higher natural gas prices this year primarily reflect two factors: growth in liquefied natural gas (LNG) exports and rising domestic natural gas consumption for sectors other than electric power. In 2022, we expect the Henry Hub price will average $3.08/MMBtu amid rising U.S. natural gas production.

- We expect that U.S. consumption of natural gas will average 82.5 billion cubic feet per day (Bcf/d) in 2021, down 1.0% from 2020. U.S. natural gas consumption declines in the forecast, in part, because electric power generators switch to coal from natural gas as a result of rising natural gas prices. In 2021, we expect residential and commercial natural gas consumption combined will rise by 1.2 Bcf/d from 2020 and industrial consumption will rise by 0.2 Bcf/d from 2020. Rising natural gas consumption in sectors other than

the electric power results from expanding economic activity and colder winter temperatures in 2021 compared with 2020. We expect U.S. natural gas consumption will average 83.8 Bcf/d in 2022.

- We estimate that U.S. natural gas inventories ended July 2021 at almost 2.8 trillion cubic feet (Tcf), which is 6% lower than the five-year (2016–20) average for this time of year. More natural gas was withdrawn from storage during the winter of 2020–21 than the previous five-year average, largely as a result of the colder-than-average February temperatures that constrained natural gas production while it increased consumption. We forecast that inventories will end the 2021 injection season (end of October) at 3.6 Tcf, which would be 4% below the five-year average.

- We expect dry natural gas production will average 92.9 Bcf/d in the United States during 2H21—up from 91.4 Bcf/d in 1H21—and then rise to 94.9 Bcf/d in 2022, driven by natural gas and crude oil prices, which we expect to remain at levels that will support enough drilling to sustain production growth.

Electricity, coal, renewables, and emissions

- We forecast that U.S. retail sales of electricity will increase by 2.7% in 2021 after falling by 3.9% in 2020. The largest forecast increase in electricity consumption occurs in the industrial sector, driven by rising levels of economic output. We forecast U.S. retail sales of electricity to the industrial sector will grow by 5.3% this year. Retail sales of electricity to the commercial sector also grow in the forecast, but they grow at the slightly slower pace of 2.2% in 2021 because some workers will continue working from home instead of in office buildings. We forecast U.S. residential electricity sales will grow by 1.5% in 2021 as a result of colder temperatures in 1Q21 compared with 1Q20 and because of hot temperatures in June.

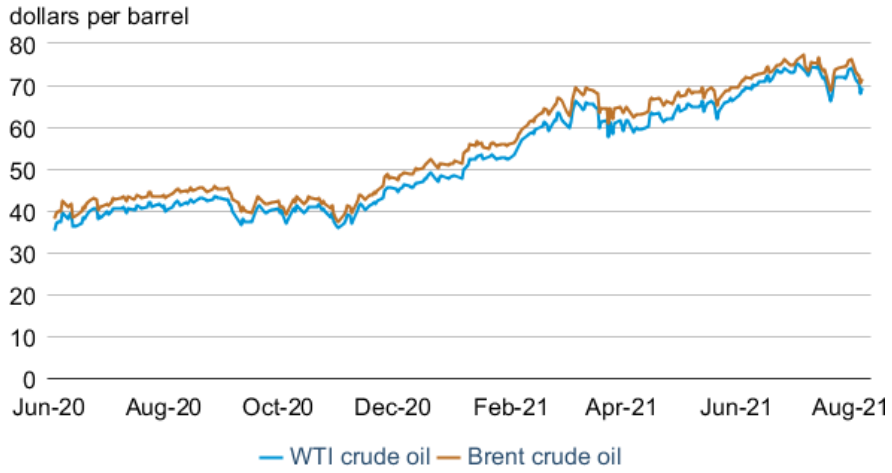
- We expect the share of electric power generation produced by natural gas in the United States will average 36% in 2021 and 37% in 2022, down from 39% in 2020. The forecast share for natural gas as a generation fuel declines in response to our expectation of a higher delivered natural gas price for electricity generators, which we forecast will average $4.46/MMBtu in 2021 compared with an average of $2.39/MMBtu in 2020. As a result of the higher expected natural gas prices, the forecast share of generation from coal rises from 20% in 2020 to 23% this year but falls to 21% next year. New additions of solar and wind generating capacity are offset somewhat by reduced generation from hydropower this year, resulting in the forecast share of all renewables in U.S. generation to average 20% in 2021, about the same as last year, before rising to nearly 23% in 2022. The nuclear share of U.S. electricity generation declines from 21% in 2020 to 20% in 2021 and to 19% in 2022 as a result of retiring capacity at some nuclear power plants.

- We forecast that planned additions to U.S. wind and solar generating capacity in 2021 and 2022 will increase electricity generation from those sources. We estimate that the U.S. electric power sector added 14.7 gigawatts (GW) of new wind capacity in 2020. We expect 17.6 GW of new wind capacity will come online in 2021 and 6.3 GW in 2022. Utility-scale solar capacity rose by an estimated 10.6 GW in 2020. Our forecast for added utility-scale solar capacity is 16.2 GW in 2021 and 16.6 GW for 2022. We expect significant solar capacity additions in Texas during the forecast period. In addition, about 5 GW of small-scale solar capacity (systems less than 1 megawatt) will come online each year during 2021–22 in the STEO forecast.

- Coal production in our forecast totals 607 million short tons (MMst) in 2021, an increase of 13% over 2020. We expect total consumption of coal to be 33 MMst greater than primary coal supply in 2021, contributing to significant inventory draws. In 2022, we expect coal production to decline by 7 MMst (1%).

- We expect coal consumption for electricity generation to grow by 75 MMst (17%) in 2021 as a result of relatively high natural gas prices that make coal more competitive for dispatch in the electric power sector. Forecast electric power sector demand for coal then falls by 47 MMst (9%) in 2022. We expect demand for coal for other uses to rise by 5 MMst (13%) in 2021 and by 3 MMst (7%) in 2022. This increase is mostly for coking coal, which is used in steelmaking.

- We expect coal exports to total 90 MMst in 2021, a 21 MMst (30%) increase from 2020. In 2022, forecast coal exports rise an additional 16 MMst to 106 MMst. High global steel prices are driving these increases in coal exports, and trade tensions between China and Australia continue to support U.S. thermal coal exports.



- We estimate that U.S. energy-related carbon dioxide (CO_2) emissions decreased by 11% in 2020 as a result of less energy consumption related to reduced economic activity and responses to COVID-19. For 2021, we forecast energy-related CO_2 emissions will increase about 7% from the 2020 level as economic activity increases and leads to rising energy use. We also expect energy-related CO_2 emissions to rise in 2022 but by a slower rate, 1%. We forecast that after declining by 19% in 2020, coal-related CO_2 emissions will rise by 17% in 2021 and then decrease by 7% in 2022. Short-term changes in energy-related CO_2 can be affected by temperature. A recent STEO supplement examines these dynamics.

Petroleum and natural gas markets review

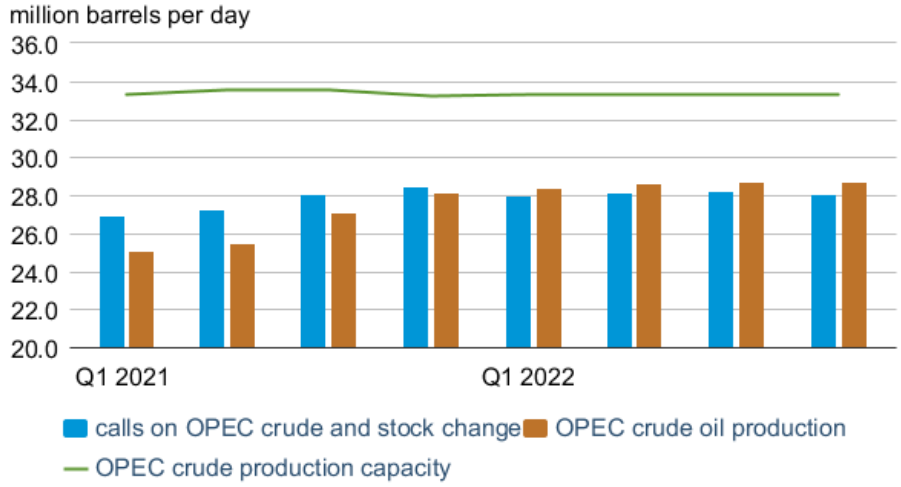
Crude oil

Prices: The front month futures price for Brent crude oil settled at $71.29 per barrel (b) on August 5, 2021, down $4.55/b from $75.84/b on July 1. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, decreased by $6.14/b during the same period, settling at $69.09/b on August 5 **(Figure 1)**.

Figure 1. Crude oil front-month futures prices

eia Sources: Graph by EIA, based on CME Group and Intercontinental Exchange, compiled by Bloomberg L.P.
Note: WTI=West Texas Intermediate

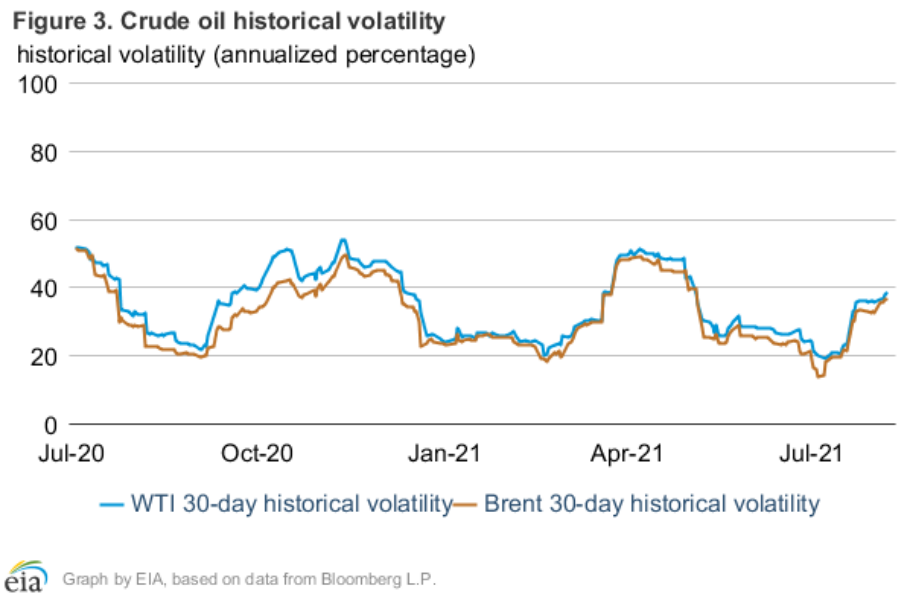
After several months of steadily increasing crude oil prices, price volatility increased in July when members of OPEC+ concluded their ministerial meeting on July 5 without reaching an agreement on future production cuts and adjustments to baseline production levels. On Sunday, July 18, the OPEC+ members met again and announced they had reached an agreement after concluding another round of discussion. They decided to ease production cuts by 400,000 barrels per day (b/d) each month, beginning in August 2021. The agreement also included adjustments to the baseline crude production levels of some OPEC+ members, including Saudi Arabia, Russia, and the United Arab Emirates, to take effect in May 2022, though more specific details of the implementation have not been announced. Rising cases of the Delta variant of the COVID-19 virus present an additional downside price risk because of potentially lower demand for petroleum, which add to the volatility. Potential increases in crude oil supply, combined with the risk of lower demand contributed to lower prices in late July and early August, with prices decreasing to their monthly lows of $69/b for Brent and $66/b for WTI on July 19, the first trading day after the OPEC+ deal was announced, and a $5/b decrease compared with their closing price from the previous trading day.



Our Brent crude oil price outlook for the 2021 average has increased to $68.71/b, $0.07/b (0.1%) lower than the July STEO, while the price forecast for 2022 is $0.60/b (0.9%) lower at

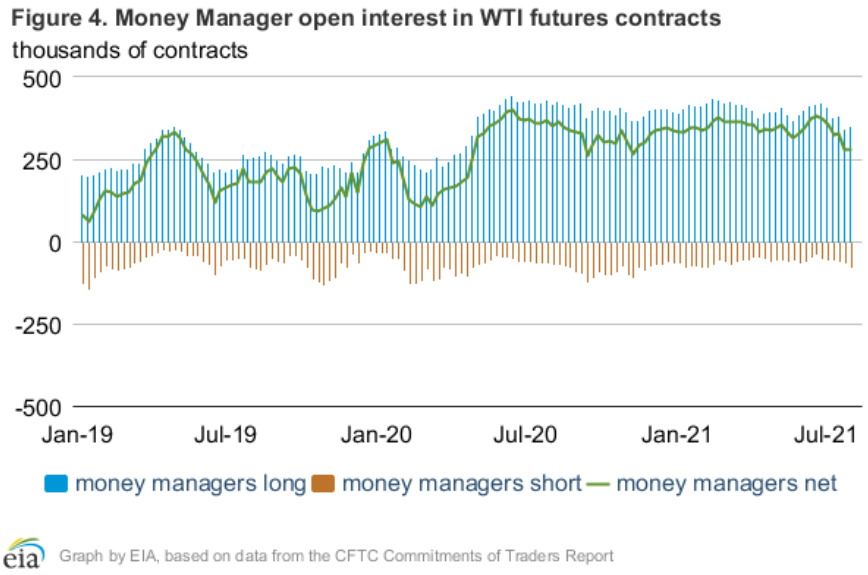
$66.04/b, based on concerns about future demand and lower crude oil prices in late July and early August. In our July STEO, we anticipated a larger increase in OPEC production levels than the organization announced, as well as some degree of new crude oil production in response to rising crude oil demand globally. In this month's STEO we have adjusted OPEC crude production in 2021 down by 300,000 b/d (0.9%) and production in 2022 up by 40,000 b/d (0.1%) in response to the final OPEC+ announcement, while global production has been reduced by 290,000 b/d (0.3%) in 2021 and by 20,000 b/d (less than 0.1%) in 2022.

Calls on OPEC and OPEC production: In the August STEO, we expect increased crude oil production by OPEC members is happening within the context of a broad trend of increasing global petroleum consumption. To estimate how much crude oil the global market will need from OPEC member states, we calculate the call on OPEC crude oil production by subtracting non-OPEC production of petroleum and other liquids and OPEC production of non-crude oil liquids from our forecast of global consumption of crude oil and other liquids. This metric assumes that petroleum production from non-OPEC countries is at its maximum level, leaving OPEC or available petroleum inventories to fill the gap between supply and demand. This metric does not account for spare production capacity from non-OPEC members of the OPEC+ agreement, most notably, Russia. Nonetheless, calls on OPEC can serve as one measure of whether OPEC crude oil production is less than or greater than global markets would otherwise demand. If calls on OPEC are greater than forecast OPEC crude oil production, it implies that the market will be short crude oil, and conversely, if calls on OPEC are less than expected OPEC crude oil production, it implies that the market will build crude oil inventories.



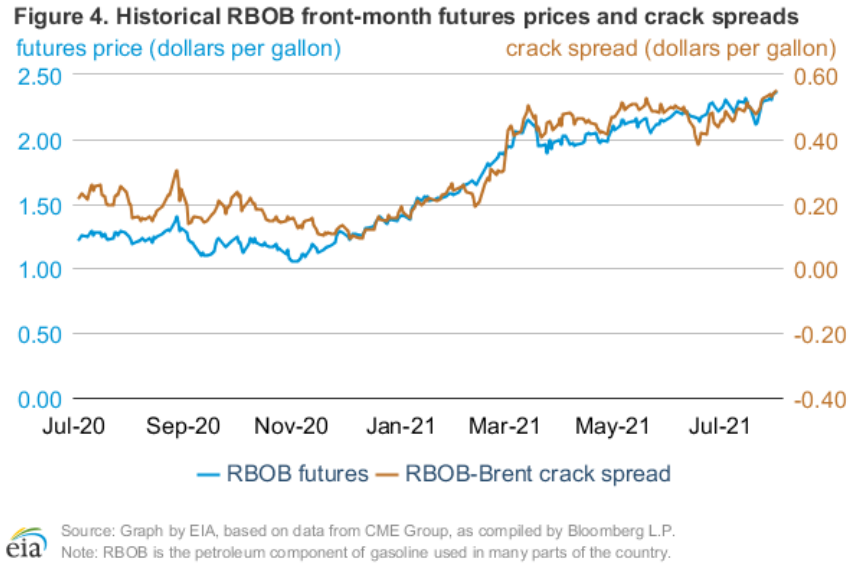
In the August STEO, we estimate that OPEC crude oil production will remain lower than calls on OPEC through the third quarter (3Q) and fourth quarter (4Q) of 2021 **(Figure 2)**. In 3Q21, we estimate calls on OPEC will exceed OPEC production by 1.0 million b/d, and this difference will drop to 0.3 million b/d in 4Q21. However, beginning in 1Q22, we forecast OPEC crude oil production will outpace calls on OPEC production, contributing to increased crude oil inventories and lower crude oil prices. OPEC+ leaders are expected to reconvene in December 2021, when we expect some adjustments to their curtailment plan. Any significant changes in future OPEC+ production decisions would present noteworthy uncertainty for our forecast.

Figure 2. STEO OPEC crude oil production



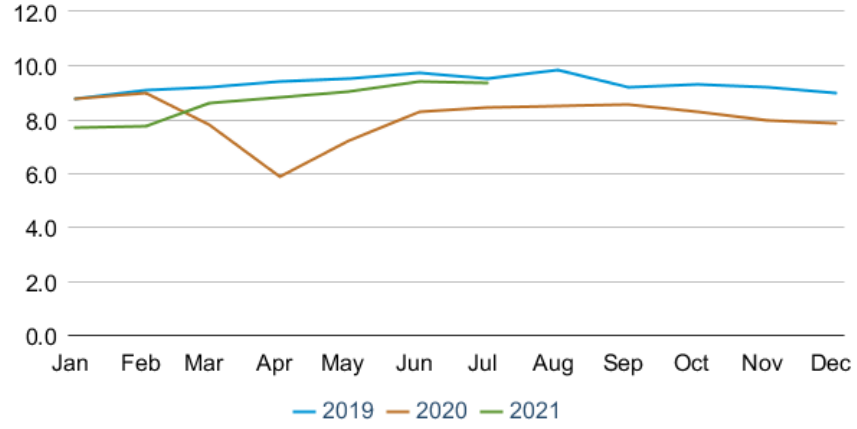
Source: U.S. Energy Information Administration, Short-Term Energy Outlook
Note: Calls on OPEC = total world consumption minus non-OPEC supply and OPEC other liquids production

Crude oil historical volatility: July's OPEC+ announcements and heightened uncertainty in the COVID-19 outlook with rising cases of new viral variants have likely contributed to heightened uncertainty and price volatility. The 30-day historical volatility for WTI crude oil futures prices rose above 30% on July 19, and volatility for Brent crude oil followed suit the following day, on July 20. Both benchmarks had historical volatility less than 30% throughout June and most of May **(Figure 3)**. As of August 5, WTI 30-day historical volatility was 38%, and Brent 30-day historical volatility was 36%, up 18 percentage points and 23 percentage points, respectively, compared with the beginning of July. The increasing volatility coincides with the substantial drop in crude oil prices on July 19, before they returned to the previous week's levels by the end of the week. The drop in crude oil prices on August 2 contributed to additional volatility, as the rolling 30-day historical volatility for Brent crude oil moved higher than 35% and WTI increased to higher than 36% (its highest level since early May, 2021). So far, volatility remains below its 2021 peak in early April, when it was just over 51% for WTI and just under 49% for Brent. Volatility in early April was lower than the high volatility in early November 2020, at just under 54% for WTI and just over 49% for Brent.



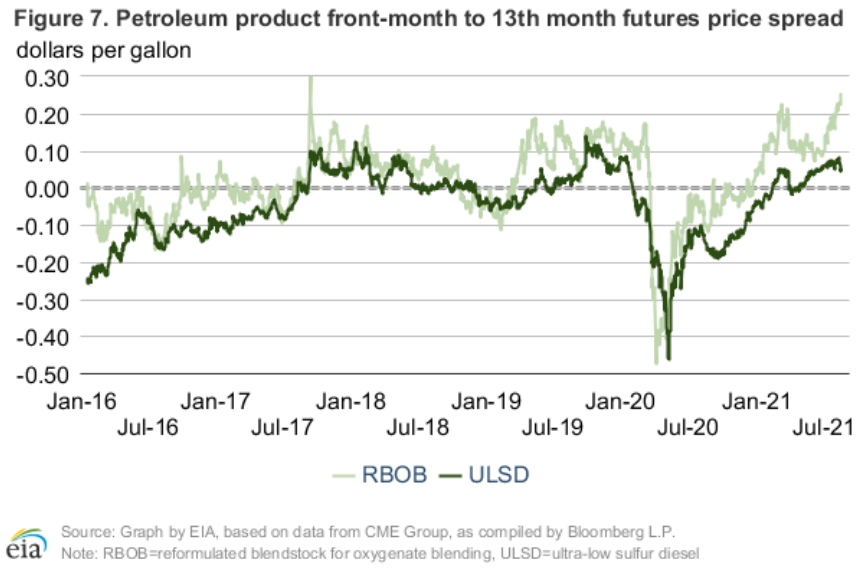
Money Manager open interest in WTI futures: Some of the factors that contributed to price declines in late July may also be affecting long positions held by Money Managers, particularly the risk of lower demand as a result of increases in COVID-19 cases. On July 20, 2021, open interest long positions held by Money Managers in the WTI futures contract decreased to 344,000 contracts, their lowest level since April 2020 **(Figure 4)**. 2020 and 2021 have seen a greater-than-average volume of Money Managers' long positions, according to the weekly Commitments of Traders report from the Commodity Futures Trading Commission (CFTC). Although open interest long positions held by Money Managers have been generally declining since late June, they remain elevated compared with contract open interest prior to the onset of the COVID-19 pandemic. For comparison, the average number of long positions during 2019 was 256,000. The recent decrease in long positions was matched by an increase in short positions to 76,000 contracts, the largest volume of short positions since February 2, 2021. Increased short positions and lower long positions both contributed to a decrease in net long open interest, which totaled 278,000 contracts on July 27, down from 383,000 contracts at the previous month's high on June 21.

Petroleum products



Gasoline prices: The front-month futures price of RBOB (the petroleum component of gasoline used in many parts of the country) settled at $2.29 per gallon (gal) on August 5, up 3 cents/gal from July 1 **(Figure 5)**. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) increased by 13 cents/gal to settle at 60 cents/gal during the same period. The crack spread on July 30 of 55 cents/gal was the highest July crack spread since July 31, 2015.

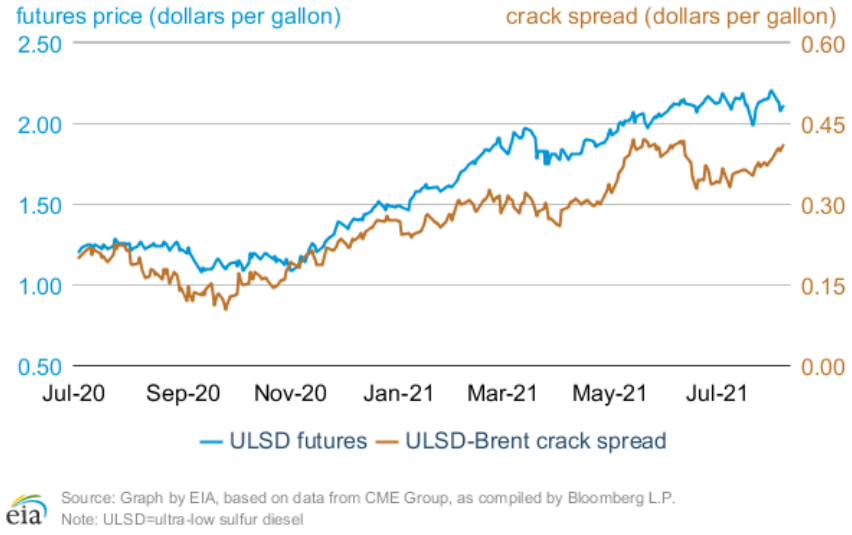
July's high RBOB–Brent crack spread reflected increasing demand and decreasing inventories. We estimate U.S. gasoline consumption averaged 9.4 million barrels per day (b/d) in July, which is 0.9 million b/d (11%) higher than in July 2020, and only 0.2 million b/d (2%) lower than the



pre-COVID-19 July 2019 level. The increase in gasoline demand likely reflects typical seasonal factors such as increased summer driving demand, especially around the July 4th holiday weekend. For the week ending July 2, we reported in our *Weekly Petroleum Status Report* that gasoline product supplied was 10.0 million b/d, a record high in our data, which goes back to 1991. Product supplied is the volume of petroleum products delivered out of the primary supply chain, rather than the actual amount of gasoline consumed by end users that week. An individual week's amount of product supplied could be affected by a number of factors, such as the timing of when import or export cargoes clear customs. Nevertheless, this record product supplied level likely indicates that driving demand was high in late June and early July. Although gasoline consumption remains below 2019 levels, the July 2021 estimate is the closest gasoline consumption has been to its corresponding 2019 level so far in 2021 **(Figure 6)**. The relatively high consumption has contributed to gasoline stocks decreasing to 228.5 million barrels in July, the lowest July level since 2015. We forecast lower gasoline stocks between August and November, which will likely continue to support relatively high crack spreads.

Figure 6. U.S. gasoline consumption

eia Source: U.S. Energy Information Administration, Short-Term Energy Outlook

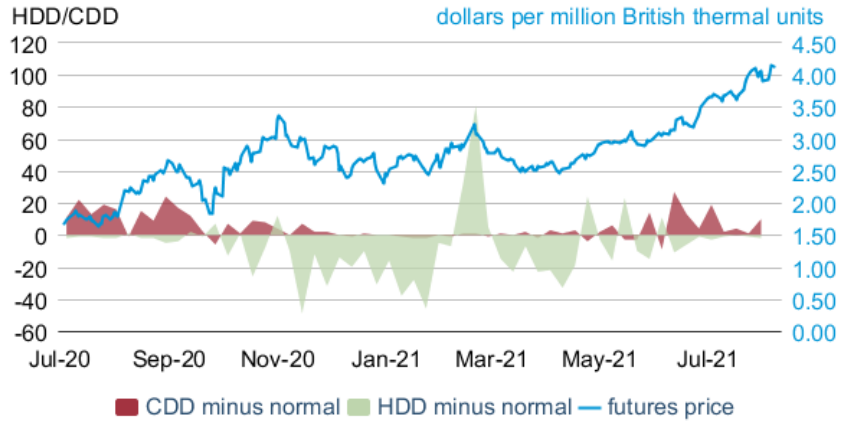


RBOB 1st to 13th contract spread: The RBOB 1st to 13th futures price spread settled at 25 cents/gal on August 5, the highest level of backwardation (when near-term contract prices are higher than farther-dated ones) since August 31, 2017, which was when Hurricane Harvey disrupted U.S. Gulf Coast refineries. The 1st to 13th futures price spread for ULSD has also been increasing but is not at multiyear highs like the RBOB spread **(Figure 7)**.

Recent inventory draws for gasoline have contributed to the high 1st to 13th futures price spread. We estimate that gasoline inventories in July were 228.5 million barrels, which is the lowest they have been since October 2020 and is 4% lower than the five-year (2016–2020) average for the month of July. Expectations of continued strong gasoline demand through August and lower gasoline production in the fall are contributing to our expectations of low gasoline stocks in the short term. Distillate stocks are also lower than average, but they have been relatively flat in the summer and we expect them to increase in August in advance of growth in demand in the fall and winter, when diesel-powered agricultural equipment is used to harvest crops and the winter heating season begins. The futures price spread is likely lower for distillate than gasoline because distillate stocks are relatively flat, whereas gasoline stocks have been decreasing due to high summer demand.

Ultra-low sulfur diesel prices: The front-month futures price for ultra-low sulfur diesel (ULSD) for delivery in New York Harbor settled at $2.11/gal on August 5, down 5 cent/gal from July 1 **(Figure 8)**. The ULSD–Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) increased 6 cents/gal, settling at 41 cents/gal during the same period.

Figure 8. Historical ULSD front-month futures prices and crack spreads



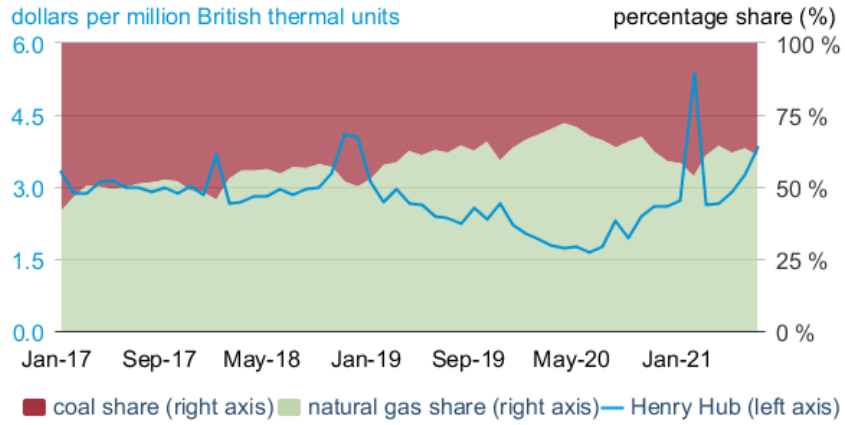
Source: Graph by EIA, based on data from CME Group, as compiled by Bloomberg L.P.
Note: ULSD=ultra-low sulfur diesel

Seasonally low production has not kept up with distillate demand and has likely helped sustain the above-average ULSD–Brent crack spread. We estimate distillate production was 4.8 million b/d in July, which would be the lowest for that month since 2012. In contrast, our distillate consumption estimate of 3.8 million b/d is 2% higher than the five-year average. Several months of seasonally low production and relatively average demand has led to low distillate stocks. We estimate distillate stocks of 138.9 million barrels in July, which is 7% lower than the five-year average.

Natural Gas

Prices: The front-month natural gas futures contract for delivery at the Henry Hub settled at $4.14 per million British thermal units (MMBtu) on August 5, 2021, which was up 48 cents/MMBtu from July 1, 2021 **(Figure 9)**. The average price for front-month natural gas futures contracts in July was $3.82/MMBtu, the highest July average since 2014.

Figure 9. Natural gas front-month futures prices and actual minus historical average HDD and CDD



Sources: Graph by EIA, based on data from CME Group and NOAA, as compiled by Bloomberg L.P.
Note: HDD=heating degree days, CDD=cooling degree days.

Henry Hub natural gas futures prices increased in July as cooling demand increased, especially in the western United States. We estimate that U.S. consumption of natural gas in July increased by 3.9 billion cubic feet per day (Bcf/d) from June to 75.8 Bcf/d, driven by an increase in consumption in the electric power sector. Cooling demand was particularly strong in the western United States (Pacific and Mountain regions) which had 684 cooling degree days in July, 9% more than the 10-year average. Regional prices in the West increased along with the demand increase. The price at PG&E Citygate in California increased 16% from June to July to $5.16/MMBtu, a 107% increase over the July 2020 price, according to data from Natural Gas Intelligence.

Natural gas exports (pipeline and LNG) also increased in July from 17.8 Bcf/d in June to 18.2 Bcf/d in July. At the same time, dry production of natural gas declined slightly from 92.7 Bcf/d in June to 92.5 Bcf/d in July, prompting an increase in the Henry Hub price. The 17.9% increase in the Henry Hub price from June to July is the largest month-on-month percentage change for June to July since 2012, when the price increased 20.3%.

Natural gas consumption amid high prices: The relative share of fossil-fuel electricity generation from natural gas was greater than coal in the eastern United States (United States excluding the Pacific and Mountain regions) in July despite relatively high natural gas prices **(Figure 10)**. Typically, higher natural gas prices will prompt gas-to-coal switching for electricity generation. For example, in February–September 2018, when the Henry Hub price was less than $3.00/MMBtu, natural gas made up an average of 56% of the share of fossil-fuel generation. In November and December of the same year, when the price increased to more than $4.00/MMBtu, the natural gas share of fossil-fuel generation decreased to 51%.

Figure 10. Shares of thermal electricity generation in the eastern United States and Henry Hub spot price

Source: U.S. Energy Information Administration, Short-Term Energy Outlook
Note: Eastern United States is the United States minus the Pacific and Mountain regions.

In the first half of 2020, natural gas made up a 69% share of fossil-fuel generation and Henry Hub prices averaged $1.81/MMBtu. For the same period in 2021, natural gas made up a 60% share of fossil fuel generation, and Henry Hub prices averaged $3.25/MMBtu. Since March 2021, the Henry Hub price has steadily increased, approaching $4.00/MMBtu, yet the natural gas share of fossil-fuel generation has remained higher than 60%. Except for the February price spike as a result of extremely cold weather, July Henry Hub prices were at their highest this year. Natural gas made up a 61% share of fossil-fuel generation and coal made up 39%. This difference is partially because of a longer-term trend of decreasing capacity for coal-fired electricity generation and increasing natural gas-fired capacity. Capacity for coal-fired electricity generation has decreased every year since 2011, and natural gas-fired capacity has increased every year since at least 2009.

Notable forecast changes

- We expect OPEC crude oil production to average 27.6 million barrels per day (b/d) in the second half of 2021 (2H21), about 0.6 million b/d lower compared with our previous forecast. Our forecast of lower OPEC crude oil production reflects the July 18 OPEC+ announcement that calls for participating countries to collectively increase supply by 0.4 million b/d per month from August to December 2021, a production increase that is lower than we previously anticipated. Forecast OPEC crude oil production in 2022 is about 0the same as our July forecast, with higher-than-expected output in the second half of the year offsetting lower forecast production in 1Q22, which is consistent with higher OPEC production baselines that were also announced on July 18.

- In our August STEO, we revised down our 2022 jet fuel consumption forecast by 80,000 b/d to 1.6 million b/d. The lower jet fuel forecast reflects a lower GDP forecast by IHS Markit. It also reflects our assumption that increases in jet fuel consumption will occur more slowly than we has previously forecast. The largest downward revision is for 2H22, when we forecast jet fuel consumption will average 1.7 million b/d, down from 1.8 million b/d in the July forecast.

- We forecast Henry Hub spot prices will average $3.59 per million British thermal unit (MMBtu) in 2H21, an increase of 40 cents/MMBtu from last month's STEO. High demand for electricity generation because of record-high temperatures in June led to strong consumption of natural gas in the electric power sector, supporting higher prices into July and August. We expect Henry Hub spot prices to decline over the forecast period as temperatures return closer to historical averages, U.S. dry natural gas production increases, and growth in liquefied natural gas export growth slows.

- We have updated our modeling of electricity generation to better account for regional emissions restrictions and fuel contracts. These changes have the general effect of limiting future growth in coal-fired generation. As a result, the impact on forecast coal-fired generation in 2021 from our increased forecast for natural gas prices is generally offset by the effect of the new model constraints that limit growth in coal-fired generation. Thus, our forecast for U.S. coal and natural gas generation are relatively unchanged from last STEO.

- We corrected calculations for several of the industrial production indexes in tables 9a and 9b. Most of the changes were minor. For more information on these corrections please contact us.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.
EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review (MER).
Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

(e) Refers to the refiner average acquisition cost (RAC) of crude oil.

- = no data available

Notes: EIA completed modeling and analysis for this report on August 5, 2021.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Prices are not adjusted for inflation.

Historical data: Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly* , DOE/EIA-0109;
Petroleum Supply Annual , DOE/EIA-0340/2; *Weekly Petroleum Status Report* , DOE/EIA-0208; *Petroleum Marketing Monthly* , DOE/EIA-0380; *Natural Gas Monthly* , DOE/EIA-0130;
Electric Power Monthly , DOE/EIA-0226; *Quarterly Coal Report* , DOE/EIA-0121; and *International Petroleum Monthly* , DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

Forecasts: EIA Short-Term Integrated Forecasting System. U.S. macroeconomic forecasts are based on the IHS Markit model of the U.S. Economy.
Weather forecasts from National Oceanic and Atmospheric Administration.
