See note below from Covington Gas

They have not provided what the current line can provide yet, I have asked for that

Smaller load is the 12MMSCFD/50MW case, $5MM upgrade

Large Load 24MMSCFD/100MW case, 25-30MM which is steep

Going to see when they can have a call to discuss or value on meeting in person if need be

TJ
We have been chasing down preliminary estimates for your project. These are rough estimates without any engineering or project planning.
To serve the smaller load, Covington would need to construct new lines to the facility, potentially add some looping to the system, upgrade the existing tap from Transco and other peak day system integrity upgrades. Those upgrades are estimated to be in the $5 million range.
The bigger load (24,000/day) would require some major infrastructure upgrades. Critically, a new tap from Transco would be required along with 10+ miles of dedicated pipeline would need to be constructed. The preliminary indication for those facilities is in the $25 - $30 million range.
I do want to emphasize that these are preliminary numbers without the benefit of a formal engineering proposal and going through the bid process.
We will continue to work with our engineers and consultants to get these estimates firmed up, but they will need more time to conduct the due diligence.

Thanks
Scott
